Gibbes President Columbus Club—Frank H. Gibbes has been elected president of the Columbus Automobile Club to succeed F. S. Terry, who resigned. Dr. E. C. L. Adams was chosen vice-president of the club.

Vancouver's Big Fire Loss—Between fifty and sixty cars were destroyed in a recent fire in Vancouver, B. C., it is estimated by the A. B. C. Motor Company, whose loss amounted to $225,000. The total loss amounted to about $2,000,000.

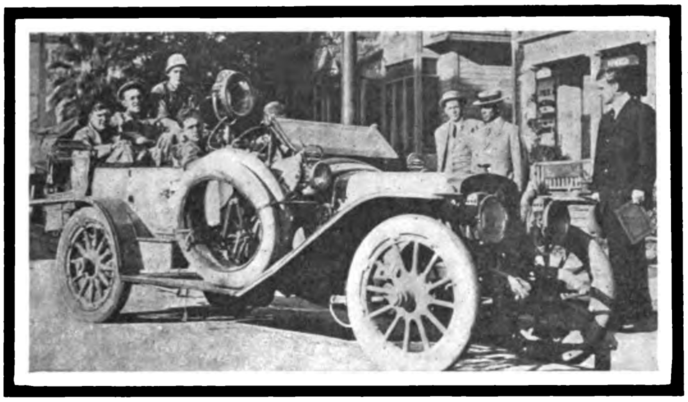
Kelly Experimenting with New Truck—The Kelly Motor Truck Company, of Springfield, O., builders of 3-ton motor trucks, have been experimenting with a 5-ton truck of their own make, which it is thought will be added to their list of models for 1913.

Displacing the Army Mule—Recently seven White motor vehicles ranging in capacity from 1,500 pounds to 5 tons left New York City to be used by the Red and Blue armies now maneuvering for possession of the city. The trucks are to be utilized in carrying the luggage of the men, besides the tents and camp supplies.

Russia Field for American Cars—The field for American-made automobiles in Russia is commented upon at considerable length by Vice-Consul Frederick W. W. Cauldwell, at Batum, to the State Department, who points out that a good market for lightweight, low-priced American machines should be found in the Caucasus. The American car is peculiarly suited to road conditions there, he points out, as the roads are practically the same as those found in America.

Mobile Drawing Tourists—Mobile, Ala., is making every effort to attract the automobile tourists of its whole section. The greatest interest is in a first-class highway to New Orleans. Other plans include a model road to Jackson, the capital city of Mississippi, a road leading to Selma and intermediate Alabama points, and still another will follow the coast to Pensacola, Fla. The road to Selma will be a link in the proposed highway from Tennessee to the Gulf, which has been promised federal support.

One of the fleet of White trucks engaged in army maneuvers around New York City



How five Western college men are going to Princeton

New Remy Service Station—The Remy Electric Company, Anderson, Ind., has opened a service station at the Frey Auto Supply Company, Buffalo, N. Y.

Meeley Has Philadelphia Office—In addition to his shop at No. 1331 Mount Vernon street, Philadelphia, Pa., George Meeley has established a sales office at No. 702 North Broad street.

Hughes Now Superintendent—Oswald V. Hughes has become superintendent of the gasoline pleasure vehicle department of the Empire State General Vehicle Company, Rochester, N. Y.

Opens Detroit Branch—The E. R. Van Wagener Company, Syracuse, N. Y., maker of castings and die-cast bearings, has opened a sales office in Detroit, Mich., with H. J. McCallam, Jr., in charge.

To Handle Staggard—The Licking Motor Car Company, Newark, O., has closed a contract with the Republic Tire & Rubber Company, Columbus, O., to handle the Staggard tread tire in the Newark territory.

Cross Continent to College—Woodward W. Duke and four other young men are on their way across the continent in a six-cylinder Lozier automobile. They are making the trip from Los Angeles to Princeton.

Smith Slowly Recovering—Frank E. Smith, manager of the New Castle, Ind., plant of the United States Motor Company, is slowly recovering from the serious illness sustained in an automobile accident on May 23 last.

Hartford Suspension Branch—D. E. Harvey, New England manager for the Hartford Suspension Company, has opened a branch at Bretton Woods, N. H., for the sale of the various accessories made by that company.

Campbell-Ewald Branches Out—A branch office of the Campbell-Ewald advertising service of Detroit, Mich., is to be opened in Saginaw. The members of the firm are F. J. Campbell and H. T. Ewald, both of whom have been long connected in Detroit advertising circles.

East with Amplex—George L. East has resigned as director of advertising of the Olds Motor Works to be affiliated in a similar capacity with the Amplex Motor Car Company, Mishawaka, Ind. He will conduct the sales and advertising departments at his Chicago offices.

To Handle Wholesale End—The W. L. Russell Company, handler of the Regal in Boston, Mass., doing a retail business, has decided to take on the wholesale end also. The retail business will be conducted in the Park square salesrooms with the Haynes and Veerac truck, while the wholesale business will be conducted from the Motor Mart.

Starter Company Active—The Ignition Starter Company has opened a branch in Indianapolis, Ind., with H. L. Morgan in charge as manager. The company has closed a deal for a plant in Detroit, Mich., which will give them a floorspace of 100,000 square feet for the manufacture of their new electric starting device. It has also contracted with the Buick company for 25,000 starters of the acetylene type for the 1913 Buick cars.

Need Paved Roadway—Carl G. Fisher and James A. Allison, owners of the Prest-O-Lite Company, Indianapolis, Ind., and promoters of Speedway, the horseless city, have called on city officials demanding that they keep a promise made some months ago that a paved roadway would be provided connecting the paved streets of the city with the Crawfordsville road. The Prest-O-Lite Company is building a new plant at Speedway, which is located on that road.

Radford Has Great Responsibility—At a recent meeting of the board of directors of the General Motors Company, Harry R. Radford was elected to the office of vice-president and general manager of the Cartercar Company, with complete charge of the factories at Pontiac, Mich. It brings the engineering department, purchasing department, manufacturing, advertising department and selling organization, with all of the branches in New York, Philadelphia, Detroit, Chicago, Kansas City, Omaha and San Francisco, entirely under Mr. Radford's direction and he alone will be responsible for their success.

Automobile Incorporations

AUTOMOBILES AND PARTS

Buffalo, N. Y.—Gardner-Hotte Sales Company of Buffalo; capital, $10,000; to deal in automobiles, tires, tubes and other accessories. Incorporators: J. H. Gardner, G. Hotte, W. E. Hotte.

Buffalo, N. Y.—Studebaker Sales Company; capital, $25,000; to deal in pleasure automobiles and accessories. Incorporators: Arthur W. Maile, Bradley M. Phillips, E. C. Schlenker.

Buffalo, N. Y.—William Guillott Manufacturing Company; capital, $10,000; to deal in automobile frames and stamped metals. Incorporators: William Guillott, Anna G. Guillott, Edward B. Reynolds.

Chicago, Ill.—Modoc Motor Car Company; capital, $2,500; to deal in automobiles and parts. Incorporators: Otto S. Heberling, William A. Curtis, George R. Daurgana.

Chicago, Ill.—E. C. Kadow & Company; capital, $25,000; to engage in the manufacture and sale of automobiles, trucks, wagons, etc. Benjamin Garler, Bertha Spever, Simon La Grou.

Columbia, S. C.—Consolidated Auto Company; capital ,$5,000; to engage in the automobile business. Incorporators: J. B. Roddey, John J. Cain, J. P. Matthews.

Indianapolis, Ind.—A. & M. Sales Company; capital, $2,000; to deal in automobiles and parts. Incorporators: J. I. Handley, T. L. Marshall, L. R. Wilbur, C. C. Perrin, F. G. Sudrow.

Middletown, N. Y.—Industrial Motor Car Company; capital, $350,000; to manufacture and sell automobiles and parts. Incorporators: William A. Courtland, Cuthbert W. Jewell, M. G. Crawford, Harris H. Rayl, Montecelle A. Bonneford.

Milwaukee, Wis.—George W. Browne, Automobiles; capital, $5,000; to deal in automobiles and parts. Incorporators: George W. Browne, T. C. McMillan, Mark F. Browne.

Milwaukee, Wis.—Overland Wisconsin Company; capital, $50,000; to engage in the automobile business. Incorporators: George W. Browne, T. C. McMillan, Mark F. Browne.

Newport, Ky.—Central Automobile Company of Kentucky; capital, $15,000; to engage in the automobile business. Incorporators: Walter P. Dickerson, Gus Koehler, Clyde S. Enrick.

New York City.—Harmon-Yount Company; capital, $100,500; to buy and sell automobiles. Incorporators: Daniel H. Hanckel, Frederick B. Hunt, Helen M. Kelly.

New York City.—Holt-Chandler Company; capital, $25,000; to deal in automobiles. Incorporators: H. E. Holt, W. E. Chandler, F. E. Tucker.

New York City.—Regal Auto Sales Company; capital, $5,000; to engage in the automobile business. Incorporators: Max Hart, William M. Botto, Norman E. Manwaring.

Peru, Ind.—Brown Commercial Car Company; capital, $100,000; to manufacture automobile trucks and parts. Incorporator: R. H. Bouslog.

Richmond Hill, N. Y.—Dillman-Helin Motor Company; capital, $20,000; to engage in the automobile business. Incorporators: William C. Dillman, Richard A. Dillman, E. W. Helin, Fred G. Hoerlein.

Tampa, Fla.—West Coast Auto Company; capital, $25,000; to deal in automobiles and parts. Incorporators: Victor A. James, Frank A. James.

Toledo, O.—W. H. McIntyre Company; capital, $10,000; to deal in automobiles and trucks and to operate a repair shop. Incorporators: W. H. McInytre, Edward L. Laskey, Clara McIntyre, William G. Vollamayer, Frank C. Kelley.

Toronto, Ont.—Consolidated Motors, Ltd.; capital, $40,000; to manufacture automobiles and other vehicles. Incorporators: Alfred Hunter, Andrew H. Paterson, Garrett Tyrell and others.

Youngstown, O.—Folberth Carbureter Company; capital, $70,000; to manufacture carbureters and other automobile parts and accessories. Incorporators: E. A. Hegg, H. A. Emery, E. A. Tobey, Joseph F. Williams, Thomas L. Morgan.

GARAGES AND ACCESSORIES

Brooklyn, N. Y.—Chinnock Garage; capital, $3,000. Incorporators: Beatrice H. Mattoon, Adelaide Kenny, Edgar Chinnock.

Charlotte, N. C.—McManaway's Garage; capital, $20,000. Incorporators: I. M. McManaway, C. R. McManaway and C. G. McManaway.

Gets Tire Agency—The Brandeis Machinery & Supply Company has secured the agency for Imperial tires in Louisville, Ky.

Page Resigns from Shawmut—G. Page has resigned his position as sales and advertising manager for the Shawmut Tire Company.

Taxicab Company Moves—The Taxicab Company of Baltimore, Md., has moved into its spacious new quarters on Cathedral street near Chase.

Car Helps Advertising—Advertising the Wyoming County fair fifty-five automobiles filled with business men are touring that county in New York state.

University Adds Engine Course—The University of Southern California has added a course in the study of the Silent Knight engines to its engineering curriculum.

Garfords for Postal Work—Eleven Garford trucks, each with a carrying capacity of 3 tons, have been purchased for the handling of United States mail in New York City.

Pullman Is 6-66—In the issue of THE AUTOMOBILE for July 25 an error occurred in the name of the Pullman Motor Car Company's 1913 six-cylinder car. The correct appellation is model 6-66.

Johnston Leaves Washington—T. S. Johnston has resigned as manager of the Buick Motor Company's branch in Washington, D. C., to accept a position as manager of the Republic Motor Company's branch in Philadelphia.

Robinson Goes to Detroit—Hanson Robinson, for the past five years in charge of the sales of the Studebaker electric trucks in South Bend, has gone to Detroit, where he will take a position as manager of the truck sales department.

Mitchell to Double Its Output—A meeting of the distributors of Mitchell automobiles has just closed at the factory where the visitors inspected the new 1913 cars. Orders have been issued at the factory to double the output over that of 1912.

Holt Now in Charge—L. W. Holt, factory representative of the Matheson Automobile Company, has gone to Boston, Mass., where he is now in charge of the branch in that city. He is going to reorganize the service and sales-force in Boston.

Velie Employees to Picnic—The annual picnic of the employees of the Velie Motor Vehicle Company, Moline, Ill., will take place August 15 at Campbell's Island in the Mississippi River near Moline. All expenses of the outing are met by the company.

Strong Transferred to Indianapolis—E. T. Strong, manager of the Buffalo, N. Y., branch of the Buick Motor car Company, has been transferred to the Indianapolis branch of that concern and is succeeded at the Buffalo office by J. S. Collins, of Saginaw, Mich.

Porto Rico Buys Trucks—Manager John L. Snow, of the Boston, Mass., branch of the Peerless Company, shipped three trucks to Porto Rico last week, each of which will be equipped with 30-passenger bodies, for use on the island, to transport people from coast to coast.

Columbus Goodyear Branch Moves—The Columbus, Ohio, branch of the Goodyear Tire & Rubber Company, Ross A. White, Manager, which is located at 54 North Fourth street, Columbus, Ohio, will move about the 15th of August to a new building at 87 North Fourth street.

Conde Republic Sales Manager—After 4 years with the Indianapolis sales branch of the Buick Motor Company, L. H. Conde has resigned to become associated with R. H. Losey, general sales manager of the Republic Motor Car Company with headquarters in New York City.

Invents Kerosene Automobile Carbureter—Henry Reichenbach, of Chicago, states that he has invented a new carbureter that will utilize kerosene in motors instead of gasoline. Mr. Reichenbach recently tested the kerosene in a motor at Harvard University and the result was highly satisfactory.

Battle Creek Club Organized—The Battle Creek, Mich., Automobile Club has been organized with the following officers: G. H. Bathrick, president; I. Fell, vice-president; H. W. Johnson, secretary and treasurer. The club's object is to obtain fair laws, see that they are enforced, encourage good roads campaigns, aid victims of automobile thieves and discourage speeding.

Start of the Flanders electric on A. A. A. pathfinding trip

Automobile Incorporations

CHICAGO, ILL.—Automobile Supply Company of Illinois; capital, $10,000; to make automobile supplies. Incorporators: A. Norwald, S. Rubinsky, H. Simmons.

CHICAGO, ILL.—Tesla Automobile Light Company; capital, $6,000; to manufacture automobile supplies. Incorporators: C. B. Stafford, H. C. Levinson, A. Jacobs.

CHICAGO, ILL.—Thirty-five Per Cent. Automobile Supply Company; capital, $10,000; to manufacture automobile supplies. Incorporators: A. R. Norwald, S. Rubinsky, H. D. Simmons, S. Kohan.

CLEVELAND, O.—No-Shammy Funnel Company; capital, $1,000; to handle automobiles. Incorporators: F. T. Kovar, G. Dantel, L. Dantel, D. P. Bowden, R. K. McKay.

COLUMBUS, O.—Davis-Bach Manufacturing Company; capital $300,000; to manufacture tires and vehicles. Incorporators: R. Nash, C. H. Davies, O. Nelson, G. Lampus, P. D. Metzer.

GAINESVILLE, FLA.—Kelly Self-Starter Company; capital, $50,000; to manufacture a self-starter. Incorporators: W. R. Thomas, M. H. De Pass, J. W. Blanding, P. Miller.

MACON, GA.—Wade Garage Company; capital, $12,000; to conduct a garage. Incorporators: P. Wade, E. T. Wadley, M. E. Richardson.

NEWPORT, IND.—Newport Motor Club; to conduct a club. Incorporators: I. M. Casebeer, J. B. Groves, J. Barker.

NEW YORK CITY.—A. H. Kasner Tire Company; capital, $10,000; to manufacture automobile tires, etc. Incorporators: Alexander H. Kasner, Hattie Kasner.

NEW YORK CITY.—Cukor Safety Crank Company; capital, $40,000; to manufacture automobile parts. Incorporators: B. Cukor, Isidore Neustaedter, H. J. Rosenblum.

NEW YORK CITY.—Curran Patent Company; capital, $10,000; to manufacture devices for automobiles. Incorporators: H. L. Curran, C. D. Curran.

NEW YORK CITY.—Duffy Lubricants Manufacturing Company; capital, $25,000; to manufacture and deal in automobile oils. Incorporators: J. F. Duffy, H. W. Conklin, H. K. Halikman.

NEW YORK CITY.—Electric Spark Appliance Company; capital, $5,000; to manufacture electrical and other devices for automobiles. Incorporators: M. M. Lint, P. Ross, A. Miller.

NEW YORK CITY.—Maxi Company; capital, $200,000; to manufacture carbureters. Incorporators: E. A. McCoy, E. Hopkinson, F. V. W. Richardson, J. C. McCoy.

NEW YORK CITY.—Silvex Company, capital, $100,000; to manufacture cleaners for metals. Incorporators: E. H. Schwab, J. H. Ward, C. M. Schwab.

PHILADELPHIA, PA.—International Automobile League Tire & Rubber Company; capital, $1,000,000; to manufacture tires. Incorporators: Clarence J. Jacobs, R. Boyd Cooling.

ST. LOUIS, MO.—Cabanne Automobile Club of St. Louis; capital, $50,000. Incorporators: C. F. Haanel, H. L. Hagerman, M. A. Nicholson.

URICHSVILLE, O.—Union Delivery Company; capital, $5,000; to do a general delivery business. Incorporators: J. E. Smith, John F. Cappel, Ernest C. Fox, C. W. Rosel, P. W. McCue, W. B. Devine.

WEBSTER GROVES, MO.—Pugh Automobile Chain Company; capital, $5,000; to manufacture automobile chains. Incorporators: Arville Vancleave, C. C. Knight, John Schulz, Harry Schulz, Webster Groves, Edward Brocksmith.

WILMINGTON, DEL.—Automobile Pilot Lamp Company; capital, $25,000; to manufacture lighting devices for automobiles. Incorporators: George H. B. Martin, E. T. Vinnell, C. M. Martin.

CHANGES OF CAPITAL

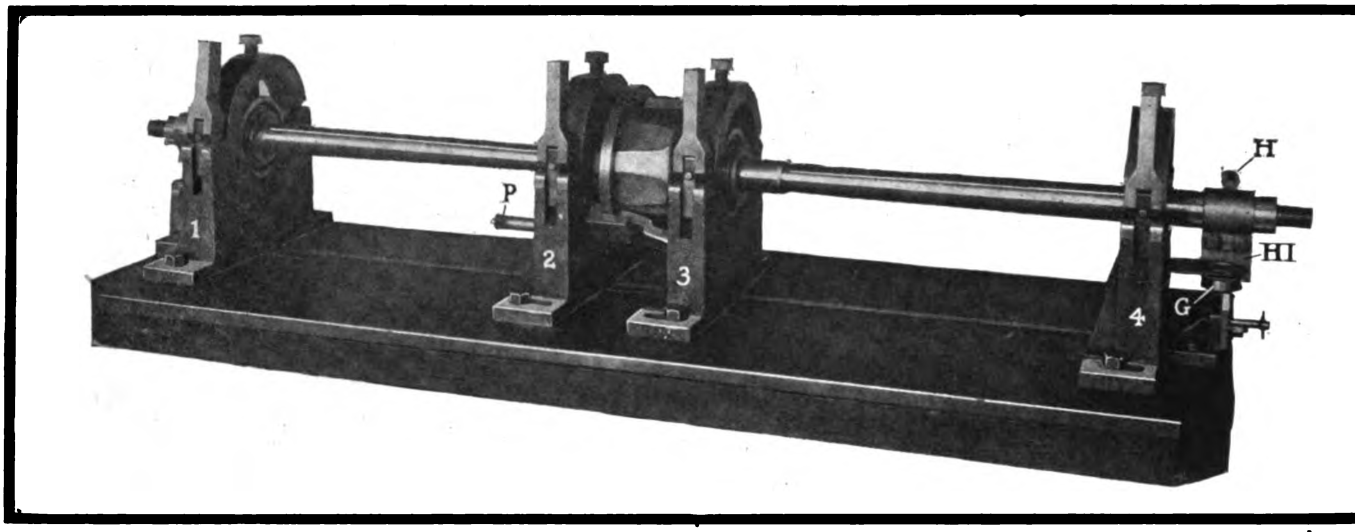
AKRON, O.—Miller Rubber Company; capital stock increased from $500,000 to $1,000,000.

NASHVILLE, TENN.—Imperial Motor Car Company; capital stock increased from $6,000 to $20,000.

PITTSBURGH, PA.—Pittsburgh School of Automobile Engineering; capital stock increased from $5,000 to $100,000.

YOUNGSTOWN, O.—Republic Rubber Company; capital stock increased from $4,000,000 to $9,000,000.

Factory Miscellany



Instrument used in the Pierce-Arrow factory at Buffalo for testing for back-lash in rear axle

The Pierce-Arrow Motor Car Company uses in its factory a delicate instrument for testing for back-lash in the rear axles of all its cars. The testing apparatus consists of four bearing supports 1, 2, 3 and 4 to carry the axle drive shafts and differential. The left side device shaft is located by pin PP; onto the end of the other axle drive shaft is attached the handle H with a short arm H1, which is set to bear lightly upon the arm of a pressure gauge G. When making a test the tester works the handle back and forth endeavoring to turn the drive shaft, and the amount of possible movement is indicated on the pressure gauge, this showing the back-lash in the axle unit.

In order to eliminate back-lash the inspection department of the factory exercises every effort to select the planetary spur gears in the differential set with respect to their size. The gears are assembled in uits in the differential housing in this department and the amount of free movement noted. If too much, a new selection of a gear or two is made and a re-arrangement results. In this selection work frequently a dozen or more gears are discarded, being over or under size by a slight variation; these eventually find their place into another unit with others of their exact size. After all of this care the testing machine illustrated herewith comes into place and gives the final test. If the back-lash is too much, the entire set of spur differential pinions is returned to the inspection department for a re-selection.

David Fergusson, the Pierce-Arrow engineer, ascribes some of the chattering gearbox noises to ill-fitting differential sets, and the company has taken this signal step in noise elimination to meet the requirements for the silent rear axle, so much demanded by car users to-day.

OAKLAND Factory's Coming Increase—That the Oakland Motor Car Company, of Pontiac, Mich., will turn out 11,500 cars next season is the announcement made by George E. Daniels, vice-president and general manager of the company. To provide for this increase in output a number of factory additions will be made, providing in all for 300,000 square feet of additional space. The fiscal year just closed has been the most successful in the history of the company, according to Mr. Daniels. For 1913 the company have added a six-cylinder chassis and another popular-priced car to sell at $1,075. The Greyhound 60, the new six-cylinder chassis, has a wheelbase of 130 inches, double-drop frame, unit power plant, cone clutch, sliding-gear transmission, floating rear axle, demountable rims, V-shaped German-silver radiator, 10-inch upholstering, full nickel trimmings, electric lights and a self-starter.

Moline is Expanding—The Moline Auto Company is to build an extension to its East Moline, Ill., plant, a building 60 by 60 feet to be constructed for use as repair shop and repair stock room.

Piston Ring Makers May Move—The Muskegon Piston Ring Company, of Muskegon, Mich., now manufacturing motor specialties here, is considering the removal of its plant to Muskegon Heights.

Fisk to Make Additions—The Fisk Rubber Company is making extensive additions to their plant in Chicopee Falls, Mass., in order to take care of the increased demand for automobile tires. The contracts have been let to the Fred T. Ley Company, of Springfield, for two buildings. Buildings are to be completed and machinery installed by November 1, 1912.

American Castings Company Alive—The American Castings Company, of Mishawaka, Ind., has just installed new equipment, including molding machinery, pneumatic tools and other apparatus. It is also erecting an addition to its plant and has taken on a number of men in the mechanical department. The company has just received an extensive order from an automobile engine company at Harvey, Ill. The company manufactures aluminum castings.

Irvin Body Factory Enlarged—An additional factory building is being erected at Morris and Division streets, Indianapolis, Ind., for the R. J. Irvin Manufacturing Company, which manufactures motor car bodies and tops. The building will be two stories high, of brick construction, 50 by 407 feet, and will cost about $50,000. The Irvin company also has one building 50 by 275 feet and another building 50 by 126 feet.

Commercial Club Activities—The Commercial Club of Columbus, Ind., has completed selling 150 building lots, which sale was necessary to obtain a $250,000 factory which will manufacture motor cylinder castings. Of the $45,000 obtained by the sale of lots, $25,000 is to be used in paying the debts of the Caldwell Manufacturing Company, whose plant is to be taken over by the new company, which will be incorporated with $75,000. Those interested in the new company are J. I. Handley, of Indianapolis, president of the Marion Motor Car Company and of the American Motors Company; S. H. Penfield, Fletcher Goodwell and Benjamin S. Dean, of Jamestown, N. Y.

Mercer Adds to Plant—The Mercer Automobile Company of Trenton, N. J., will build a new factory, measuring 160 by 161 feet. Plans are also being drawn for a new office building. It expects to occupy the new quarters before Fall.

Steiner Wants to Remove—The H. A. Steiner Company, of Chilton, Wis., manufacturing gasoline engines and motors, is negotiating with local capitalists for re-location of its works. A bonus of $13,000, to be subscribed for its stock, is demanded.

Buick Not Moving Yet—The Boston, Mass., branch of the Buick company has been delayed in getting into its new salesrooms at the corner of Massachusetts avenue and Newbury street because the work of alteration, which is very extensive, has not been completed.

Chevrolet Buys Imperial Factory—It is reported on good authority that the Chevrolet Motor Company has purchased the Imperial Wheel Works plant in Flint, Mich., and will open a factory there on September 1. This factory has been secured as a branch plant to the Detroit factory and it will be used for the manufacture of motors for the new Chevrolet cars.

Mason Motor Company Growing—The Mason Motor Company, of Flint, Mich., after a year of business, has found it necessary to add 15,000 square feet of space to its present plant. The fiscal year of the company closes September 1 and it is expected that by that time 2,500 motors will have been turned out. The company manufactures motors for the Little Motor Company's cars.

Champion Ignition Company's Increase—Work has been begun on an addition to the plant of the Champion Ignition Company, Flint, Mich. At the present time the company is supplying about eighty-six manufacturers of automobiles with spark-plugs and the number will be increased to 120 within the next two months. The company employs about 120 persons, of whom about eighty-five are women.

Marvel Carbureter to Remove—Announcement is made that the Marvel Carbureter Company, Flint, Mich., has entered into a contract with the local board of commerce to remove its plant to this city from Indianapolis, Ind. The company has a well-established business in Michigan and the change is said to be largely due to a desire to get into the center of the automobile manufacturing industry.

Durant-Dort Develops Departure—After more than a year of experimenting the Durant-Dort Company, of Flint, Mich., has decided upon a new departure. The company has decided to engage in the manufacture of light motor delivery wagons and has secured the material for the first 100. The class of car will be similar to that of the horse-drawn vehicle now manufactured by the company.

Pharis Brothers Go to Ohio—The Pharis Brothers Rubber Company, of 121 East Gay street, Columbus, O., has closed a deal for the purchase of the Newark Tire & Rubber Company, of Newark, O., and will remove the plant to Columbus as soon as a suitable location is secured. The Pharis Brothers Company has been selling the Pharis tire manufactured by the Mansfield Tire & Rubber Company, of Mansfield.

Rambler Wants to Expand—Nine acres of ground adjoining the present holdings have been purchased by the Thomas B. Jeffery Company, of Kenosha, Wis., to provide for future extensions. The increased output planned for 1913 necessitates several enlargements, which will be made in the course of the coming six months. Definite plans are now being prepared under the direction of Charles T. Jeffery, president and general manager.

Leech Company Ready to Build—The Leech Automobile Company, Lima, O., which was incorporated three years ago for the purpose of carrying on experiments with a new style of gasoline engine, is now ready to erect a plant for the manufacture of the engine. In addition to manufacturing automobile engines, the company will also make a line of parts for motor cars and commercial vehicles. It is believed the plant will be located at Lima.

United States Tire Activities—The Kenosha Industrial Association, of Kenosha, Wis., is negotiating with the United States Tire Company for the location of its proposed new tire and rubber plant, which will have an output of between 500,000 and 750,000 tires annually. The United States Tire Company is looking for a location in a small city near Chicago, and if the Kenosha association can offer sufficient inducements the location is promised.

Stegeman Plans Increase—The Stegeman Motor Car Company, 1148-1160 Holton street, Milwaukee, Wis., manufacturing the Stegeman commercial vehicles, has leased the big manufacturing plant at Woodworth, Linus and Kinnickinnic avenues, Milwaukee, in the Bay View manufacturing district, and will at once increase its capacity to one truck per day, or 360 per year. The work of removing the equipment from the Holton street works has already begun and will be completed by August 10.

Rajah Spark-Plugs; Electrically-Driven Tire Pump; Shaler Garage Steam Vulcanizer; Single-Hole Imported Acetylene Burner; Radiator Cleaning Compound; Jiffy Side Curtains; Glasses Excluding Ultra-Violet Rays

Rajah Giant and Starter Plugs

IN Fig. 1 are shown two plugs manufactured by the Rajah Auto-Supply Company, Bloomfield, N. J. Both types are shown in a side view and an inclined one, and their principal feature is their evident strength of construction. Both plugs are high-duty designs, in which the insulation is of imported porcelain while the metal parts are correspondingly strong. The electrodes are of imported wire made of a special alloy designed to withstand the exigencies of hard service and the sparks produced by powerful magnetos. The shapes of shell and porcelain are such as to prevent short-circuits even if the cylinders are oiled very liberally. A copper gasket is inserted between shell and porcelain, so that the whole plug consists of but four parts, not considering the clip terminal which is supplied with every plug.

The self-starter plug shown in the same figure has a shoulder at its lower end carrying a yoke which is held in place by a jam nut. There is a gasket on each side of the yoke between shoulder and jam nut, forming a gastight connection. The yoke is grooved with a passage continued by one which is bored in the plug shell and through which the acetylene coming from the tank and through the dashboard distributer valve enters the cylinder, surrounding the sparking points and being ready for ignition when the switch is thrown on. The porcelain of this plug is held in a brass bushing, which may be removed by a wrench without disturbing the position of the plug in the cylinder or disconnecting the gas line through which the acetylene enters. All parts of this plug are made interchangeable and reserve parts may be procured from any agent of the manufacturer. The starter plug is made in two thread sizes, 1-2 inch standard and 7-8 inch S. A. E.

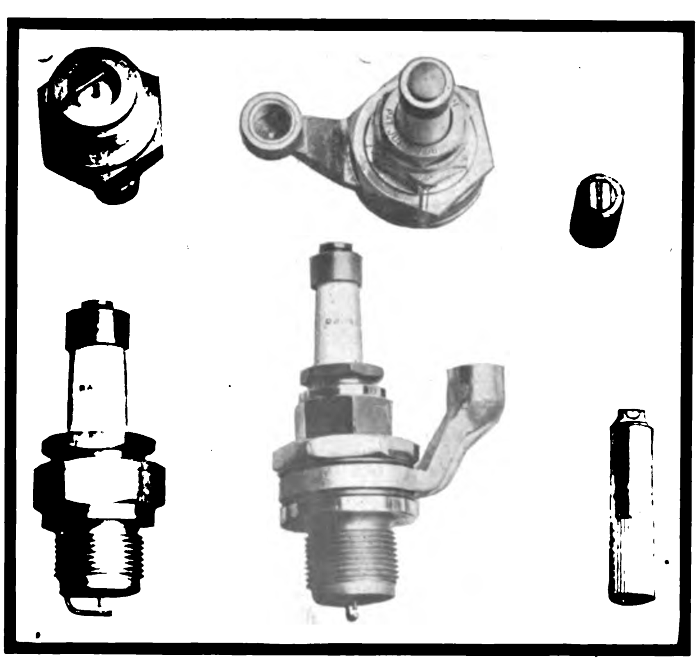

Fig. 1—Rajah Giant and starter plug. Fig. 2—Bray-Roni burner

The illustration indicates the pleasing appearance of both types of plug, the dimensions of which indicate strength. The 7-8 inch self-starter plug has a diameter of 1 5-16 inches at the copper gaskets and a total height, from negative electrode to binding-post cap, of 3 3-4 inches.

Ingersoll-Rand Tire Pump

A recent addition to the line of electrically-driven garage tire pumps is the one shown in Fig. 6, and made by the Ingersoll-Rand Company, of New York City. The pump equipment, comprising an electric motor and a piston pump, is mounted upon a base plate supported on two short feet and two casters and fitted with a handle. The entire outfit weighs 75 pounds, is 27 inches long, 11 wide and 23 inches high. The pump, which has a cylinder of 1 by 1 1-2 inches, is driven by a 1-2-horsepower electric motor, and is of the air-cooled type. It is capable of pumping a 35 by 4-inch tire in 3 minutes from flat to 70 pounds, or, in 3 1-2 minutes, to 80 pounds. The electric motor may be connected to any current socket furnished with city installations. To transmit the air from the pump to the tire 6 feet of 1-2-inch hose is included in the equipment.

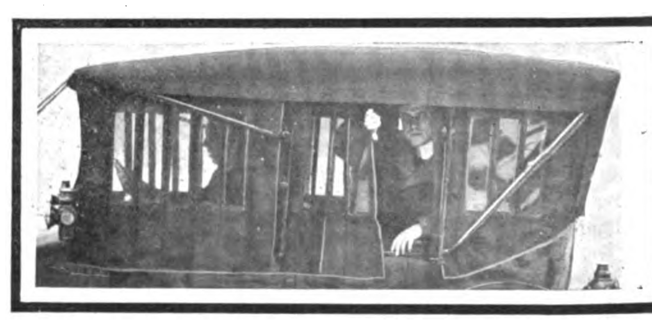

Fig. 3—Jiffy automobile side curtains folding into the top

New Shaler Garage Vulcanizer

The latest product of the C. A. Shaler Company, Waupun, Wis., is the garage type of vulcanizer shown in Fig. 5. This device is operated by steam, the heat being produced by a gasoline burner fed from an overhead reservoir. The apparatus is equally suitable for the repair of casings and inner tubes, molds serving the former purpose and plates heated inside the latter. The equipment, which stands on two legs L, is arranged at such a height as to insure ease of operation, where a man of medium height does the repair work. The casings treated in this vulcanizer, which is of the wrapped-tread type, are covered with a piece of material protecting the damaged portion from direct contact with the hot surfaces. When an injured casing is vulcanized in this machine the wound is first cleaned, then the worn-out sections are replaced by live rubber and fabric, after which the heat treatment is resorted to. The heat is applied to the inner and outer surface of the casing, the inner mold being carried by the two supports S, while the outer one is shown at M. They are tightened on the casing by bolts held in a channel clamp. Both these molds are connected by flexible steam pipes to the coiled copper-tube boiler, to which the gasoline is fed by gravity through tubes T. Inner tubes are vulcanized between the plate P and upper plates Q, being pressed in place by clamps K. The supports S1 serve for hanging inner tubes thereon, while other work is being done on the equipment. The pressure of the steam and its temperature are automatically regulated by a thermostat, which prevents under-curing or burning of casings and tubes. A gauge which is attached to the boiler shows the steam pressure at any moment. The water contained in the boiler is transformed into steam very quickly, so that after 20 minutes it is ready for the vulcanization of tires.

Bray-Roni Acetylene Burner

The William M. Crane Company, 18 West Thirty-second street, New York City, is the distributor for the imported Bray-Roni acetylene burners, Fig. 2. These burners, which are

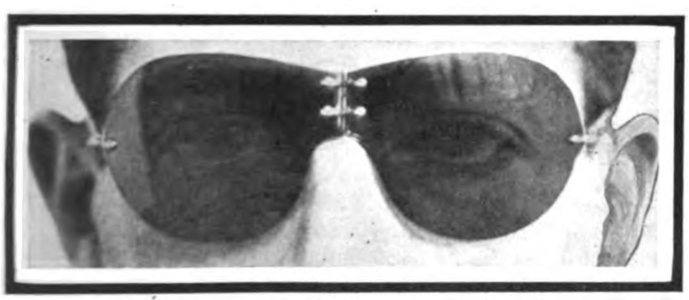

Fig. 4—Hardy Autosun glasses absorb rays which fatigue the eye

made of an imported material held in a nickel-plate brass base, are without the conventional prongs and have but one outlet for the gas coming from the tank, which is located in the center of the top end of the burner. On both sides of this hole there is an elevation in the burner material and between these portions there are two lateral openings between which the air used in the combustion of the gas is admitted, being sucked in by the fast-ejected acetylene. The air, rushing into the flame at two sides, produces a wide, flat flame having the same appearance as one produced in a burner with two prongs from which two pointed flames impinge upon each other. One of the chief features of this burner is that one small gas aperture cannot be clogged up as the pressure of the gas flowing out of it forces out all small foreign matter, so that there is no place for it to accumulate except in the passageway between the elevations at each side of the gas hole. This foreign matter is easily cleaned from these points by means of an old toothbrush.

Apex Cleanser for Radiators

A compound which dissolves the scale deposits in the water-cooling system is sold, under the name Apex Radiator Cleanser, by the U. S. Compound Company, Buffalo, N. Y. The liquid, which comes in cans of various sizes, is mixed with the radiator water in the proportion of 1 ounce to a gallon of water and is left in the system, being drained after a week with the dissolved deposits. The appearance of the liquid is somewhat similar to honey, both as regards color and viscosity.

Jiffy Invisible Side Curtains

A waterproof side curtain, which is operated from the seat, perfectly shields the passengers of a car from inclement weather, and, when not in use, folds invisibly up into the top, is made by the Jiffy Auto Curtain Company, Detroit, Mich. As shown in Fig. 3, each curtain consists of a number of sections made of

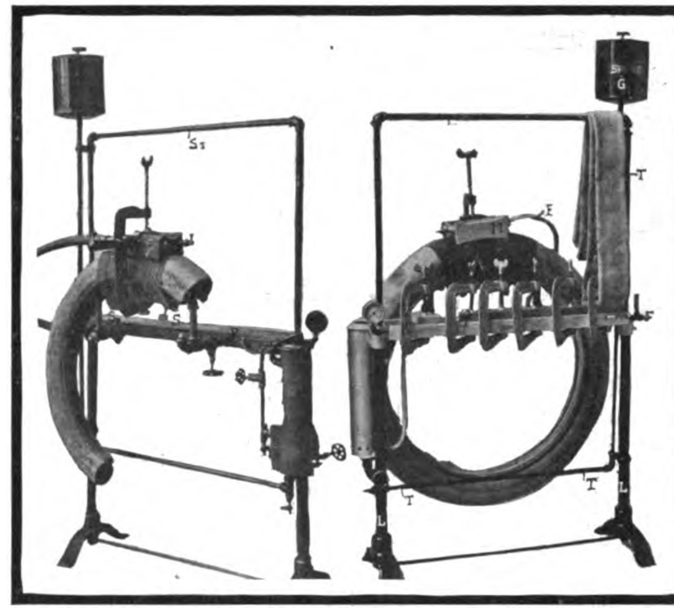

Fig. 5—New Shaler wrapped-tread, garage steam vulcanizer

waterproof material and fitted with windows of celluloid or another transparent material. Adjacent sections are connected by hinge joints which permit of folding one section around another. The top edge of each section has apertures through which extend wire-cable supports along the side of the automobile top. When this is the case, all the curtain sections are in the same plane and form practically one continuous curtain, but it is possible to slide the sections along the cable supports, arrange two or more behind one another, roll them together and attach them to the material of the top by straps. Adjoining sections are held together, when in service, by a snap button, so that the whole device may readily be put into or out of operation. The Jiffy side curtains may be installed upon an automobile of any make.

The Hardy Autosun Eye-Shield

A new addition to the line of automobile goggles made by F. A. Hardy & Company, 31 Wabash avenue, Chicago, Ill., are the Autosun glasses, Fig. 4. These glasses are made in the conventional Hardy design, but are distinguished by the peculiar shade of smoking which gives the glasses a brownish tint, making their use very easy on the eye. This particular smoking of the glass is effective in absorbing the ultra-violet rays, which otherwise prove very tiring to the eye, so that through the use of the Autosun glasses the eyes of the driver are kept fresh and guarded against strains, while the color scheme of the impression he receives of his surroundings is almost the same that he would get with eyes unshielded. The glasses are held together by a simple bridge which is so formed as to be easy on the nose, and the same idea is carried out in the design of the elastic braces which attach the glasses to the ears and are covered with a soft fabric.

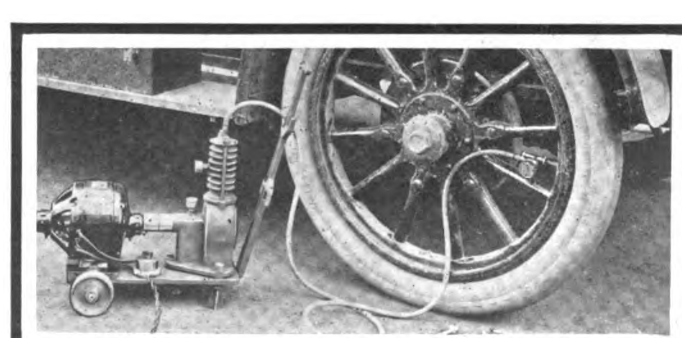

Fig. 6—Ingersoll-Rand electrically-driven garage tire pump

AUTOMOBILE SHOCK-ABSORBING DEVICE—In which a piston moving in a liquid together with a coiled spring effects the absorption.

The shock-absorber described in this patent consists of a pair of reciprocal supports R, Fig. 1, forming a housing which incloses a chamber partly filled with a liquid. Along the entire length of these supports extends a coiled shock-absorbing spring S which returns the two supports to their original relative position after it has been disturbed by the movement of either support. Within the chamber there is a piston P and a partition P1 spaced from the piston; the partition has a port in it and with the piston forms two walls of an auxiliary chamber in which there is a valve moved by and subject to the liquid pressure.

No. 1,033,348—to Emile Rimailho, Neuilly-sur-Seine, France. Granted July 23, 1912; filed December 30, 1909.

Spring Suspension for Automobiles—Composed of two rigid bars secured to each other by movable end-connections.

This patent refers to a spring device, Fig. 2, which consists of two elongated, curved, rigid metal bars B1, B2, extending in the same direction. They are separate from each other, but curve against each other, one being attached to the axle of the automobile and the other to the body. The ends E1, E2 of the two bars are connected to one another, and at least one of these two connections is movable. At different points between the bar ends are coiled springs fastened in vertical position to the bars.

No. 1,033,429—to Thomas J. Magner, Olean, N. Y.; George A. Larkin. Granted July 23, 1912; filed October 12, 1910.

Rear End Indicator Signal—In which a rotatable casing carries indicator signs.

This device, Fig. 3, combines the use of a substantially triangular casing C with a shaft S upon which the casing is mounted. The casing is so attached to the shaft as to rotate with it when the latter is turned. A pair of cranks set off against each other at an angle of 120 degrees are carried by the shaft, and an operating rod is connected to each crank.

No. 1,033,305—to Arthur B. Demuth, Diego, Cal. Granted July 23, 1912; filed June 26, 1911.

Recoil Checking Mechanism—Being a cylinder filled with a liquid in which a piston reciprocates.

The subject-matter of this patent, a shock and recoil absorber, is shown in Fig. 4. It consists of a cylinder C in which there is a piston P, a piston rod R attached to the piston and having a guiding bore and a valve chamber C1. Lateral ports open into this valve chamber presenting passageways with the main interior space of the cylinder. A sliding piston valve V in the chamber C1 is provided with a head having a cylindrical surface; the latter co-operates with the cylinder ports. The cylinder C carries an axial guide rod in engagement with the valve.

Wrench Construction—In which a rack on the shank end on the movable jaw are held in engagement to insure a fast grip.

This wrench, Fig. 5, comprises a shank S, the front side of which carries a rack R which is not as wide as the shank. The outer end of S carries a jaw J, and a jaw body B embraces the shank; a stem S1 has its inner end pivoted at P in the jaw body and is beveled to engage the rear side of the shank S. A longitudinal groove G is formed in the front side of the stem, in which one end of a flat spring S2 is mounted, the spring bearing against the rear side of the shank, thereby maintaining it at a fixed angle to the stem. A gripping block B1 is movably arranged in recesses formed in the jaw body engaging the shank.

No. 1,034,138—to William G. Natzmer, McKeesport, Pa. Granted July 30, 1912; filed March 29, 1912.

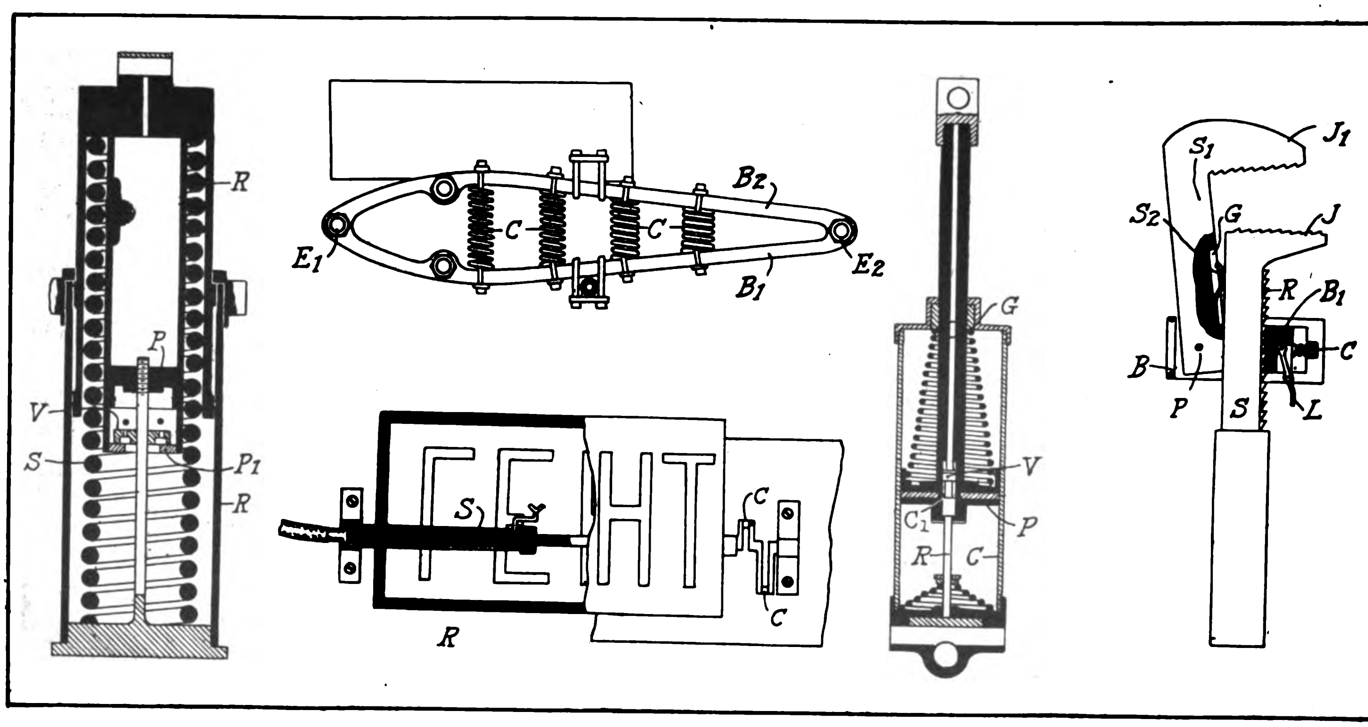

Fig. 1—Rimailho's shock absorber. Fig. 2—Wagner suspension. Fig. 3—Demuth rear-end signal. Fig. 4—Johnson recoil check. Fig. 5—Natzmer wrench

VOL. XXVII NEW YORK—THURSDAY, AUGUST 22, 1912—CHICAGO No. 8

The AUTOMOBILE

Metric or English Measurements?

Although American Automobile Engineers and Scientists Are in Favor of the French Units of Weight and Measure, Economic Considerations Render Their Adoption a Problem

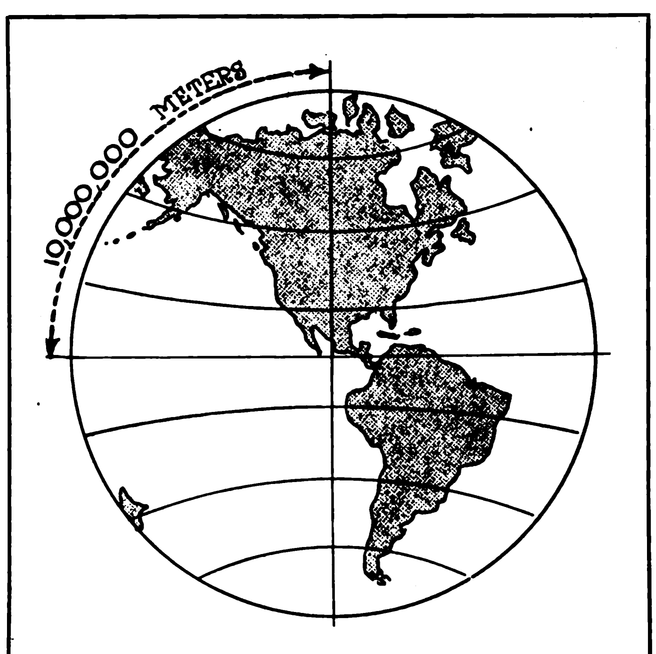
Anglo-Saxon System Has Progressed But Little in the Last Millennium, Whereas the Metric Is a More Recent Product and Is Better Adapted to Modern Conditions

Part I

FORTY-SIX years ago the United States government legalized the use of the metric system of weights and measures in this country. Today we are still struggling along with the incongruous English system of pounds, feet, and square and cubic units even though we acknowledge it to be inferior to the other system. We say that 12 inches make a foot, that 3 feet make a yard and go on laboring under this arbitrary arrangement when our French friends take the meter as their standard length unit, and say that the next larger measure is 10 times greater and that the next smaller is 10 times less.

Much discussion and argument, both by statesmen and by engineers and tradesmen, has been carried on for and against the metric system. **That it would be a distinct advantage to us if the metric system were in general use most authorities agree, but the great loss to our industries and manufacturers which the change would incur is the one insurmountable obstacle.**

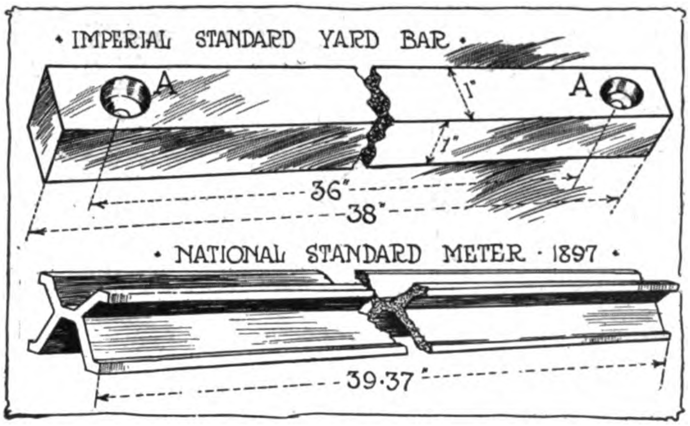
Automobile engineers are almost unanimous in agreeing that it would be a great saving and advantage to them once it was in use in place of the English system, but their machinery and equipment is all designed for the latter, and, quite naturally, none of them wishes to make the change, because it is a matter of dollars and cents. Their workmen are all educated to the foot, inch and yard system, and it would take considerable time to get them accustomed to any other method of determining the size of any piece. Draughtsmen are accustomed to figuring in inches and in incongruous fractions of the inch, and they would require some time to be able to think in any other units. These men are all on the commercial side of the question.



The quarter meridian of the earth was taken as the length from which the standard French unit or meter was determined as one ten-millionth part

The scientist will almost invariably argue in favor of the metric system, because it is logical and because to him its use in place of the English system does not involve any commercial consideration. He can buy his instruments graduated in centimeters, millimeters, grams and the like just as cheaply as he can purchase those apportioned in feet, inches, pounds and so on. Change from one system to another with him does not involve the scrapping of expensive equipment. He says that the metric system is the only logical one to use, and he has every point in his favor, except the one of the immense cost of the change.

And so here we have both sides of the question. On the one hand we see the scientific fraternity all fighting to get our government to adopt as compulsory a system of weights and measures which is based on solid and rational principles, and on the other the great army of manufacturers, merchants and tradesmen in general, who, from commercial considerations, do not wish to change. And they have won every fight against the com-



The standard prototype meter and yard, both of which are carefully preserved. The wells A-A in the yard bar are sunk half an inch, and at the bottom of each well a gold stud is inserted on which the defining line of the yard is engraved

pulsory use of the metric system, because the change would mean millions of dollars to them. Certain it is that, if the system is ever adopted, it must be done very gradually, so that there will be ample time for readjustment of this most important consideration to any people—that of weights and measures.

Few of us in these busy times stop to consider what an important part in our civilization the subject of weights and measures plays. Indeed, it is as old as language itself and evidences of its influence upon trade and conditions are to be traced back to the earliest days of the human race. Primitive man counted his possessions in terms with which he was familiar and according to the standards of his time. It was natural for him to consider distances in terms of his simple objects. He took the length of his foot or the width of his hand or the length of his finger as a basis of length comparison and it was but natural that these dimensions of the body should furnish the basis for his measurements. Perhaps such articles as gourds, egg shells and the like formed the foundation for his measurements of volume, while for weights he used seeds. These were rough standards, arbitrarily selected, and had no logical basis for their foundation. Yet today, in our own enlightened times, we make use of just such arbitrary standards and use them for a basis for some of our ultra-scientific and engineering considerations.

It is interesting to trace the science of metrology back to its early times and to see how little the English standards have developed in the last 1000 years. Most metrologists credit the origin of systems of weights and measures to Babylon and Egypt, which countries evidently derived their systems from a common source. The pyramid of Ghizeh, which dates back to about 4000 B. C., has been considered by authorities to contain various writings and other archæological records bearing upon some of the earliest methods of apportioning land and for fixing various standards of weights and measures.

In Greek and Roman Records

Greece was among the first to have weights and measures systems, of which we have accurate records. Rome naturally observed the same standards and between the two there seems to have been a close connection. It is certain as to where the early Anglo-Saxons derived their systems, but early they attempted to make them standard by various laws of more or less merit. In the Domesday Book, which was published in 1086, the Saxon yard was mentioned as a unit of measurement and soon afterwards, during the reign of Henry I, who ruled from 1100 to 1135, it is stated that the legal yard had a length equal to that of the ruler's arm. Richard I enacted laws providing for standards of length made of iron, and for measures of capacity the brims of which were lined with this metal also. The Magna Charta did much to establish uniformity by stating that there should be one measure of wine, one of ale, one of corn, and so on.

So on down through the reigns of the various English monarchs laws were enacted and standards constructed bringing the different measures down to the present. From time to time the statutes were changed to conform with the then-considered correct method of apportioning lengths, weights and volumes. We find many acts passed to carry out the intent of the fundamental standardization principle as laid down in the Magna Charta of 1215. From the time of the Saxon Kings, the unit of monetary weight was the pound, yet there was no law in actual force until 1266 specifically laying down the relations between weights and measures. This law of the Assize of Bread and Ale stated that "By the consent of the whole realm of England, the measure of our Lord the king was made, viz., an English penny called a sterling, round and without any clipping, shall weigh thirty-two wheatcorns in the midst of the ear; and twenty pence do make an ounce, and twelve ounces a pound, and eight pounds do make a gallon of wine, and eight gallons of wine do make a bushel, which is the eighth part of a quarter." This is the definition of the old Tower pound and it was the earliest form of the present British sterling pound.

With such arbitrary beginnings, it is no wonder the system which we know to-day is the intricate and irrational one that it is. There is no logical basis for the taking of 36 inches as a yard, nor for the progressing from 1 inch to a foot by 12 units.

The metric system, while it had an early beginning, is much younger than the English system and it has a sound foundation on which to rest. History of the metric system, which is founded on the decimal notation, dates back to about 1670, when one Gabriel Mouton of Lyons, France, proposed a comprehensive decimal system having as a basis the length of an arc of 1 minute of a great circle of the earth. Somewhat later, in 1720, a plan was proposed by Cassini, recommending the adoption of a unit equal to 1-6000 part of a minute of an arc of a great circle, which unit had a length of about half that proposed by Mouton. Du Fay, in 1747, brought forward a plan which involved the length of the second's pendulum as a unit. This was subsequently elaborated and continued by La Condamine, who took into consideration the variation in length of the pendulum at different altitudes in determining his standard unit. Several others at that time advocated in France the use of the pendulum unit instead of the proposed fraction of the arc of the meridian, since they believed that the former could be more readily determined.

Present System Adopted 1790

All through the eighteenth century, schemes based on these units were proposed for the improvements of the systems of weights and measures then in vogue. It appears that the French Government appreciated the necessity for some such uniformity throughout the country, but one after the other the schemes were considered and discarded, largely through fear of the immense amount of antagonism and confusion which their adoption would create.

It was not until 1790 that a plan which was the real instrument for causing the ultimate adoption of the present metric system was finally adopted by the National Assembly of France. This scheme had as its backer Talleyrand, the Bishop of Autun, who proposed as a fundamental unit the length of a second's pendulum at 45 degrees latitude, and as a unit of weight that of a cube of water the height of which should be one-twelfth the pendulum's length. After consideration by the Committee on Agriculture and Commerce, the proposal was accepted and sanctioned by Louis XVI in 1790. After settling upon the principle of decimal division the next important step was the selection of a unit. In 1791 three suitable units were under consideration. These were the length of the second's pendulum, the quadrant of a great circle of the equator, and the quadrant of a great circle of the meridian. After great care and deliberation, it was finally decided that the unit should be based upon the quadrant of the meridian, since, while it was not as easy a measurement as the pendulum length, it at the same time had a nearer relation to the accepted means of measurement of length. It was also considered that the length of a quarter meridian could be determined much easier than could that of a similar section of the equator.

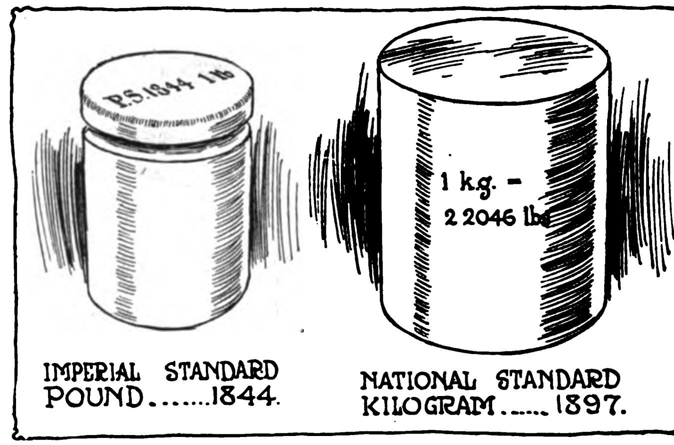
It was decided that after the arc had been measured by trigonometric methods, 1-10,000,000 part of this arc should be taken as the fundamental unit. The work was carried on in earnest by a committee of the National Academy. The actual meter, the name which was given to this fundamental unit and which is derived from the Greek word, *metron*, meaning, *a measure*, was finally determined in 1799 by the Commission and has an actual length of 39.37 inches.

From this time on until its adoption as compulsory in France the metric unit had a rather varied and stormy career. Of course, after the scientific determination of the unit, or meter, it only remained to have the system recognized and generally adopted throughout the country. Political conditions in France tended to delay the general acceptance of the new system. In 1,800 a decree was issued which stated that the decimal system would be put into effect the following year and a special nomenclature was proposed giving the various metric units French names. In 1812 the metric movement received a serious setback by an edict of Napoleon which established a system of measures termed *Usuelle* in place of the metric system as established in 1800, but which made use of the principles of the decimal system. Napoleon's law prohibited the use of any other save the *Usuelle* system. After its operation for a quarter of a century, the latter method of determining weights and measures was abolished by an act passed by the Chamber of Peers and the Chamber of Deputies in 1837. This decree provided that after January 1, 1840, all weights and measures should be of the decimal metric system and that any persons possessing any but these decimal weights and measures were to be punishable according to an article of the penal code.

Metric System Established

This act was the beginning of the metric system of weights and measures as now used in France. It has become firmly established and not only is it the compulsory and legal system in France, but also in the following countries: Argentina, Austria-Hungary, Belgium, Brazil, Chile, Germany, Greece, Italy, Mexico, Netherlands, Norway, Peru, Portugal, Roumania, Servia, Switzerland, Spain and Sweden. Its use is legalized in Egypt, Great Britain, Japan, Russia, Turkey and the United States.

The United States Government, after hearing considerable debate for and against the adoption of the system as the compulsory one in this country, in 1866 finally legalized its use.



Relative size of kilogram and pound. These are the exact shapes of these standards

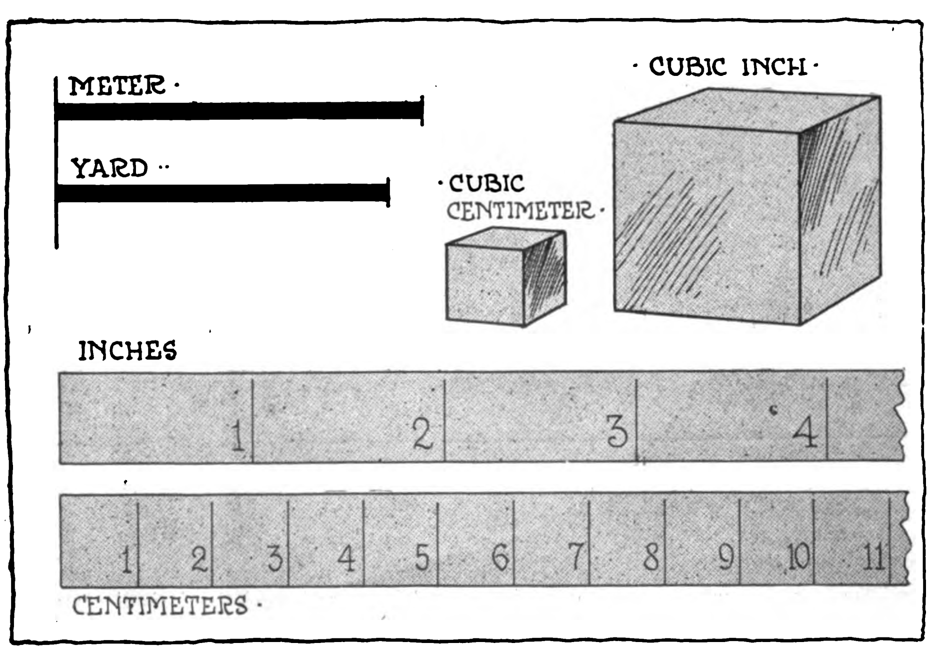
Congress on July 27 of that year approved, authorized and directed the Secretary of the Treasury to furnish each state one set of the standard weights and measures of the metric system, and with this start its use has grown considerably in this country and a large part of the public is continually urging its general adoption.

Recommended By Congress

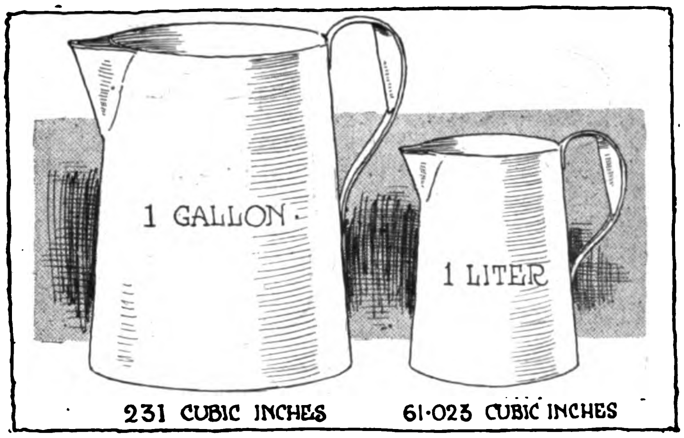
The progress of the system was brought out by the fact that Congress, in establishing a standard for measuring sheet iron and steel in 1893, expressed its standards in both the metric units and the common English units. One year later, Congress established the units of electrical measure, which are the international standards and based upon the metric system. In 1896 two reports were prepared by the House Committee on Coinage, Weights and Measures which recommended the French system for adoption. This recommendation was unanimously recommended for adoption, but did not pass a third reading. In 1901, 1902, 1903 and 1905 similar bills were proposed tending to have this country adopt as its legal standards for compulsory use the metric units. The Littaurer bill, however, which was formulated in 1905, provided only that the metric system be used in the governmental transactions.

Thus it will be seen that the question is a live one. For years the solons of England and America have wrestled with the problem of getting the people to realize the great advantage of such a decimal system once it is firmly established. It is from the engineers and manufacturing interests that the system receives its least support. Commercial considerations are their only reasons for opposing the system, which they know to be the logical one, and the adoption of which in this country would mean many dollars to them. They cannot see how the advantages to be gained from the use of these easier methods of length and quantity determinations would compensate for the great cost which the change would incur.

Scientists recognize the great advantage to be gained, but they do not consider the problem from the commercial standpoint. Lord Kelvin, the great British physicist and philosopher, was a leading exponent of the decimal system. He said, in one of his speeches, "I believe I am not overstating the truth when I say that half the time occupied by clerks and draughtsmen in engineers' and surveyors' offices—I am sure at least half of it—is work entailed



Relative sizes of the English and metric units. All save the meter and the yard are full size



Relative size of a liter and a gallon. The gallon equals nearly 4 liters

upon them by the inconvenience of the present farrago of weights and measures. The introduction of the French metrical system will produce an enormous saving in business offices of all kinds—engineering, commercial and retail shops.

"Nothing can be more convenient than the French metrical system for every kind of business and science. There is no case, large or small, in respect to measurement where the system is not satisfactory."

A brief explanation of the metric system is not out of place here. It is founded directly upon the decimal notation. The unit, as has been shown, is the meter. The base ratio is ten, and the subdivisions of the unit are either ten, one hundred, one thousand, times smaller than it. Correspondingly, the units above the meter are either ten, one hundred, one thousand, ten thousand, and so on, times greater. Thus if it is desired to change from one unit to another it is only necessary to change the number of ciphers, or the decimal point.

The table of decimal units will serve to show more clearly the progression from one unit to another by a ratio of 10:

10,000 meters	= 1 myriameter
1,000 meters	= 1 kilometer
100 meters	= 1 hectometer
10 meters	= 1 decameter
1 meter	= 1 meter
.1 meter	= 1 decimeter
.01 meter	= 1 centimeter
.001 meter	= 1 millimeter

The multiple prefixes employed are from the Greek and they apply to the multiples of the meter, while the submultiples are from the Latin. Thus, the Greek *deca* means ten, while the prefix *deci*, meaning one-tenth, comes from the Latin *decem*, meaning ten.

Volume and Surface Units From Length Units

The table given above is for lineal measurement only. The units for volume and surface are derived from length units, however. Thus, the unit of square measure, or surface is the square meter, from which the multiples and submultiples are obtained and are called square centimeters, square kilometers, and so on. Similarly, the primary volumetric unit is a cubic meter, from which are derived the cubic decimeter, the cubic millimeter, etc. The ratios of increase or decrease from the primary unit, however, are 100 for the square measure and 1,000 for the cubic. This follows from the fact that since the unit of length increases by the ration of ten, the unit of surface, which is derived from it must increase by the square of ten, or by 100. In like manner, the cubic unit must increase by the cube of 10, or 1,000. Thus the surface table becomes:

1 square kilometer	= 1,000,000 square meters
1 square hectometer	= 10,000 square meters
1 square decameter	= 100 square meters
1 square meter	= 1 square meter
1 square decimeter	= .01 square meter
1 square centimeter	= .0001 square meter
1 square millimeter	= .000001 square meter

Likewise for the volume table. The primary unit for the measurement of capacity is the liter, while that for mass is the gram. The progression from these units both for increase and decrease is done in the same way as outlined for the units of measurement, volume and so on. The prefixes are the same. To facilitate the transformation from units of volume and capacity, the originators of the metric system took the liter to be equal to a cubic centimeter. This, however, has been declared to be slightly inaccurate, and, for scientific purposes, the International Committee defined the liter as the volume occupied by a mass of 1 kilogram of pure water at its maximum density and under normal atmospheric pressure. This was adopted in 1901 in the Paris general conference. While the actual unit of mass is the gram, it is so small as to be rather impractical for average mass determinations, and, for this reason, the practical unit is taken as the kilogram. In 1901 also the general conference defined it as the basis for mass determinations by stating that "The mass of the international kilogram is taken as unity for the international system of weights and measures."

Lord Belhaven's Suggestion

Tables for the conversion of units from the metric to the English system and *vice versa* are found in handbooks dealing with mathematical or engineering subjects, so that we are today able with considerable labor to translate into our own units any measures or weights which are given to us in the French system. We find that

1 inch = 25.4 millimeters.

which indeed is an awkward figure with which to deal. Half an inch will obviously equal 12.7 millimeters, while 1-4 inch will equal 6.35 millimeters, and so on. A very useful suggestion was made by the Rt. Hon. Lord Belhaven and Stenton, who suggested that, for the conversion of measurements which did not require extreme accuracy, it would be more convenient to assume the inch equal to 25.6 millimeters. This figure would then give us a table as follows, which is seen to be very easy to determine, and which is sufficiently accurate for all ordinary measurements:

25.6 millimeters	= 1 inch
12.8 millimeters	= 1-2 inch
6.4 millimeters	= 1-4 inch
3.2 millimeters	= 1-8 inch
1.6 millimeter	= 1-16 inch
0.8 millimeter	= 1-32 inch
0.4 millimeter	= 1-64 inch.

In next week's issue of THE AUTOMOBILE *the opinions of the leading American automobile engineers on the relative values of Metric and English methods of measurement are given. The scientific superiority of the former is not denied by any one of them, but every expert admits that the sudden introduction of the French system would be well nigh impossible, owing to the tremendous investments now represented by tools adapted to operate on the English system and workmen accustomed to use them. Suggestions are made by some of the foremost engineers as to how a gradual introduction of the decimal system could be brought about.*

Legal News of the Week

Westinghouse and Bergdoll Differences Adjusted—Testing Mississippi Law—Republic Sues G. & J.—To Argue Dyer Suit

Efforts to Improve Pennsylvania's System of Licensing Chauffeurs—Suit Against Atlas Engine

Philadelphia, Aug. 19—A mutually satisfactory settlement of the legal proceedings recently instituted by the Westinghouse Machine Company, of Pittsburgh, Pa., against the Louis J. Bergdoll Motor Company, has been effected.

The litigation by the Westinghouse Machine Company was based on the terms of a contract entered into 2 years ago by which that concern was to build for the Bergdoll company 1,000 gasoline motors, to be delivered at certain specified quantities and times. After about three-fifths of the motors contracted for had been built a hitch occurred through the alleged failure of the Westinghouse company to make prompt deliveries of the balance, the Bergdoll company contending that by the delay in receiving the motors a consequent loss in automobile sales ensued, owing to inability to supply finished cars, and the latter company refused to accept or make payment for the balance of about 400 motors. The Westinghouse company brought suit to recover payment on the undelivered balance.

In the Court of Common Pleas No. 4, where the suit was heard, Judge Audenried awarded judgment for $104,000 to the Westinghouse company, which decision was promptly appealed. By the terms of the settlement the original contract will be adhered to, the motors to be delivered to the Bergdoll company as required.

Will Argue Dyer Patent Suit

Argument of the legal proposition involved in the motion of attorney Jay N. Emley, representing the Palmer and Singer Manufacturing Company to reopen the order granted to the Enterprize Automobile Company for a decree *pro confesso* for infringement of the Dyer patents, will be heard by Judge Holt, of the United States District Court late last week.

Under the order of court a confessed decree was granted against the defendant in July and subsequently the defendant went into court and entered objection to the action taken, petitioning for another chance to carry on the case.

The position of the Enterprize company is that the various stipulations for delay in the court proceedings have applied only to postponement of the time to answer the complaint and not to the extension of time for pleading or demurring.

Good News for Taxi Creditors

Columbus, O., Aug. 19—Receiver McDowell, of the Columbus Taxicab & Service Company, of Columbus, O., in a partial report made to the court recently, showed that the concern is making a profit under his management and promises to pay off all of the debts of the company.

Republic Rubber Sues G. & J.

Indianapolis, Ind., Aug. 19—The Republic Rubber Company, of Youngstown, O., has brought suit in the federal court in this city against the G. & J. Tire Company, alleging infringement of patents and asking an accounting. It is charged that the G. & J. company has infringed on patents for the improvement of tires, granted in 1908 to Tod J. Mell, of Youngstown, O. While the G. & J. Tire Company has its factory and offices in this city, it is incorporated under the laws of New Jersey.

[The Mell patent upon which the action is based is the same instrument upon which the Republic company proceeded against Morgan & Wright last year. United States Circuit Judge Noyes in writing the opinion of the United States Circuit Court of Appeals for the Second Circuit held that the patent was invalid, having been anticipated by the Healy British patent. That opinion, however, does not prevent the complainant from proceeding against alleged infringers in another circuit. Among the reasons for such action may be the discovery of new facts in support of the patent. Prior actions in the United States District Court had been favorably decided toward the patent by Judge Hazel who sustained it generally and held that the defendants in the suit had infringed. Manufacture of the alleged infringing tires was not checked by the decree as the defense filed a bond and continued. The final score as between the parties stands at one decision each, the latter taking precedence of the former.]

Fighting Mississippi's License Law

Jackson, Miss., Aug. 19—With all the care used in staging a play, Mississippi's state license law has been broken. All details for the "crime" were arranged beforehand by the judge, the attorneys for each side and the man who agreed to be the victim. Representative men were stationed at agreed points as witnesses. After a last review of just what would be done, the court and the attorneys stepped to one side to let the martyr chug forth. H. C. Laurence, manager of the South State Street Garage, is the volunteer who broke the law. He toured the principal streets of the capital with his untagged car and on returning to the appointed place the forewarned policeman stepped out and made the arrest. As per agreement, a criminal charge was made and a hearing was granted immediately that the appeal to the Supreme Court, as had been planned, could be asked and allowed. Mr. Laurence was then given his release without bond.

This case is the outgrowth of the action of the last session of the state Legislature when a law was passed providing for the assessment of a scale of charges based on the horsepower of the car.

May Amend Licensing System

Philadelphia, Aug. 19—Efforts are being made to have Mayor Blankenburg and Director of Public Safety Porter use their influence in having enacted remedial state legislation looking toward the abatement of the abuses claimed to have grown up under the present loose system of licensing chauffeurs. The assertion is made that under the present system of indiscriminate issuing of licenses there is no effective way by which the police can know the records of irresponsible persons whose reckless driving is a constant menace to the safety of the public.

Among the remedies suggested for enactment into law are legislation having for its object a thorough investigation of the applicant's character, with particular reference to his sobriety, a more thorough supervision of licensed chauffeurs and a closer tab kept of the records of chauffeurs to whom licenses are granted.

Indianapolis, Ind., Aug. 19—Suit has been brought in the circuit court by the Minnehaha National Bank of Sioux Falls, N. D., against the Atlas Engine Works, of Indianapolis, which is in the hands of a receiver. The action, also directed against Hugh H. Hanna, president of the Atlas works and the United States Fidelity and Guaranty Company, is to collect a judgment for $2696, upheld by the Indiana Appellate Court last April. The surety company gave an appeal bond for the Atlas company in the sum of $3,500.

Motor Trucks Prove Worth as Army Supply Train

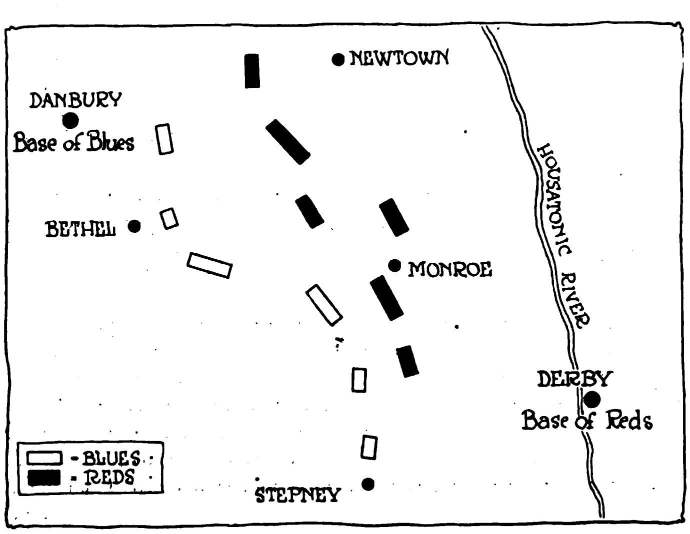
Maneuvers in Connecticut Under Bad Road Conditions Sound Taps for Mule—Mock War Operations Indicate Small Truck Is Better Than 5-Ton Vehicle Where Bridges Are Weak and Hill Trails Tortuous

THE good old army mule has heard the mournful sound of Taps. The army of the United States stands at the dawning of a new day—the day of motor transportation. During the military maneuvers in Connecticut last week, the automobile proved its case under conditions that more closely approximate actual war service than any that have gone before in the history of the country.

Approximately half of the work of supplying and providing for the fighting forces on both sides, the umpires, non-combatants and others connected with the maneuvers, roughly estimated at 20,000 men for 10 days, was done by means of automobiles.

They overwhelmed the mule wherever traction could be found; they covered distances that were outside the realm of possibility for the ancient beast; carried loads beyond the capacity of muledom and then went back and did it over again.

They proved that never again shall a mule train carry supplies from a main supply base to field depots. They indicated that in the near future the mission of the mule as a means of transport from the field depots to the fighting line shall end and that he will be displaced by the small swift motor wagon with a carrying capacity of about 2 tons.



Distance: Danbury to Stepney, 21 miles; Derby to Newtown, 16 miles

They showed impressive qualities to the regular officers who were in charge of transportation and convinced all but a few ultra-conservatives that the mule already had passed along to his reward.

A striking feature of the situation is shown in the experience of the Blue army, although its conclusions apply equally to the Reds or any other fighting force anywhere. The total amount of quartermasters' and commissaries' freight amounted to 961 tons. This was composed about half and half of rations and forage. Of course, the forage was destined for the calvary and artillery horses in large measure, but there were 220 mules that had to be maintained and every pound of hay and grain destined for their use had to be carried in some way. With the elimination of the mule and the decline of the cavalry arm of the military service, the forage supply becomes a small matter for future consideration, representing the keep of the artillery horses.

Traction First Road Quality

Of course, the road is a part of the automobile. In such hills as staged the scene of the campaign, cross-country work was out of the question as far as the motor truck was concerned, but this fact should be carefully borne in mind: it was also beyond the capacity of any mule that ever lived.

It is conceivable that in a flat country mules could go across the fields and so could the trucks, but the experience in Connecticut proved that mule-drawn wagons are on a par with motor trucks when it comes to traversing high ridges—for neither could do it.

A concrete example of the effect of the showing made by the trucks is contained in the remark made by the driver of an army mule team to the representative of THE AUTOMOBILE while riding to the front with a load of hay. The man watched a file of trucks pass with their loads and then turned and said: "Say where can a fellow learn how to drive one of them things?"

The motor equipment was picked up anywhere and everywhere. A few of the automobiles are owned by New York and Massachusetts, but the total number so owned was only five or six at the outside. The rest were rented, donated or commandeered on a time basis. Some of the owners were not much delighted with the arrangement when they say how tremendously their trucks were being pushed. The equipment included many of the well-known types and makes, as appears in the tabulations herewith.

The service of the trucks was largely that of transferring supplies from the base to the field depots and from the field depots to the line of battle or encampment. The Blue army, with a longer line to cover, delivered an average of 43.1 miles per truck per day according to the best figures available. The Red army figures were slightly below this average because of the larger motor equipment and the shorter line to be served.

Blue Army Haul 21 Miles

The Blue base was at Danbury during the crucial period of the campaign. From there the quartermaster's department served four field depots behind the line. These were located roughly at intervals of 5 miles in a line almost south from Danbury, the most southerly being in the rear of Stepney. The chief depot for forage was at Bethel, 5 miles southeast of Danbury and a branch of the railroad took care of the bulk of the hay, grain and wood destined for the fighting units in the field to the east and northeast.

From these four depots and also directly from the base supplies of all kinds were conveyed by field trains to the camps of the military organizations. The average distance from the base to the field depots on the Blue side was 12 1-2 miles and from the depots to the front 7 1-2 miles. This was arranged so that the mule teams could cover it, as the plans of the campaign were made on the basis of the mule and not the automobile truck.

On the Red side the base, or one of them, was at Derby and the distribution was from Newtown on the north to Monroe and Stepney on the south. The average haul to the field depots was 7 1-2 miles and to the front from the depots 5 1-2 miles.

The equipment of the Blues included twenty-three trucks and that of the Reds was about thirty at its maximum strength. On the Red side the available records were fragmentary, but among the vehicles in service were nine Whites, ranging from 5 tons capacity to 1,500-pound wagons; four Packards of 5- and 3-ton sizes; one G. M. C. of 5 tons; two Saurers of 4 1-2 tons; several Peerless trucks; Mais, two; Pierce-Arrow, several; Simplex, Stoddard-Dayton, Alco and perhaps others at various times.

Five of the White trucks are owned by the military arms of the states of New York and Massachusetts, the others were furnished by factory branches or hired from private owners. The same may be said for all the rest of the equipment.

The biggest truck used was a 10-ton Pierce-Arrow, which made the trip from the factory at Buffalo in 4 days' running. This truck had to be unloaded many times on account of weak bridges and its service was limited in the Connecticut hills because of its weight.

Transportation, as it applied to the quartermaster's department of the Blue army, involved the problem of moving 961 tons of freight. Results are always required of the quartermaster and the results attained by the officers entrusted with that post by the Blue army were largely reached by the use of the automobile truck.

MOTOR EQUIPMENT OF BLUE ARMY

White 3-ton truck delivering commissary supplies to New York Blue brigade near Bethel—Part of the load has been left with regiment shown in rear

Baggage trucks only required traction

How the Massachusetts Reds received their daily rations
Big Saurer proved too heavy for conditions of highways

In fact, the troops of this army were short of mule-drawn equipment, according to the army regulations and the deficiency was cared for by trucks, propelled by gasoline power. There were twenty-three of them with the army, according to a careful canvass of the situation, but only four were directly connected with headquarters.

Service of Trucks Satisfactory

Broadly speaking, the services rendered by the trucks was satisfactory. They were mostly chosen at random, and were picked up wherever available. Nineteen of the twenty-three were assigned to the various military organizations as field trains. One of them was equipped as an ambulance. Still another served both armies at different times, thus leaving the actual number of trucks connected with the distribution of rations, baggage, forage and wood as seventeen.

The plan of supplying and providing for an army in the field was explained in THE AUTOMOBILE by Captain-Quartermaster Barker, of the United States Army, in charge of the supply depot for the Blues at Danbury, Conn.

There are two main divisions of the distribution. First, there is a general supply depot, located at some distance in the rear of an army. From this supply depot supply trains are run to various points in the rear of the fighting organizations. The supplies are transferred to the field trains of the fighting units which convey them to the quartermasters and commissaries of the regiments, troops or batteries. The total haul from the central supply depot to the line of battle must be less than 25 miles if mules are to serve for drawing power and if such perishable freight as fresh beef, for instance, is to be a portion of the loads. This limit is definitely placed by reason of the fact that a four-mule team, drawing a wagon loaded with 3,000 pounds of freight, can make only 2 1-2 miles an hour for a maximum of 10 hours a day. The army regulations contemplate the use of the mule exclusively for this service.

Last appearance of the good old army mule

The central supply depot is located as close to a railroad line as the circumstances will permit. The haul to meet the field trains of the regiments is usually laid out over country roads, but the route of the field trains to the battle line or the encampment may be over any course that will give traction. Almost always roads are available for such purposes, but sometimes the field trains have to go cross-country.

Functions of Supply Train

The result to be attained is a continuous supply of food, ammunition, forage, etc., in one direction and accommodations for wounded men and unavailable material in the other.

The actual experience of the Blue Army was about as follows: During the latter days of the campaign, the main supply depot was established at Danbury on a branch line of the New York, New Haven & Hartford Railroad, having connections with the sources of supply. The fighting line was established along the Housatonic River and as it retired westward the hauls became shorter and shorter until the left wing of the army rested upon the supply base. The railroad extended to Bethel, and the road was used in place of the ordinary supply train in a wide sense. The four trucks assigned to the quartermaster were auxiliary to the railroad. The main distributing point for forage was Bethel and the trucks were utilized for the longer hauls to the field trains of the regiments further to the right of line.

They were used almost continuously and averaged 48.7 miles a day, including the time two of them were stuck in the ditch, 3 miles south of Bethel during Tuesday night. This mishap was the result of unskillful handling, pure and simple. There was no other element in the situation. The drivers allowed their engines to run dry and one of the G. M. C. 3 1-2-ton trucks was laid out as a result. The other suffered to some degree from the same cause, but it was a skid from the road that could have been prevented by an experienced chauffeur that put it out of service temporarily. When the first car had cooled off, the 5-ton G. M. C., which was lightly loaded, pulled it and the skidded car from the ditch. Neither was materially damaged.

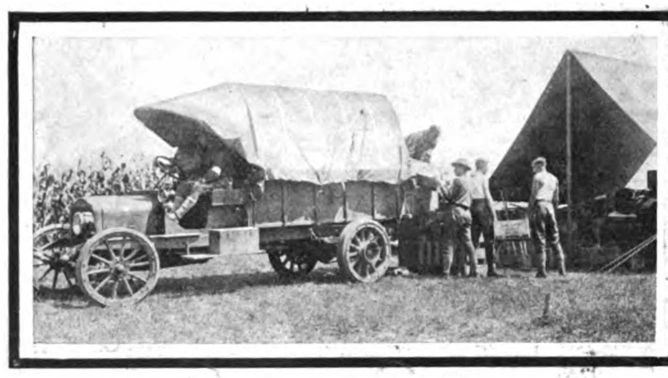
On Thursday the haul from Danbury to the field train of the regiment at the right of line was fully 20 miles by road, but the trucks covered the ground as required carrying an overload ranging up to 25 per cent. This, of course, does not apply to the 5-ton vehicle, which was always underloaded when its itinerary included any of the numerous weak bridges with which the country abounds. It was equipped with block tires on its driving wheels and except for its size which seemed excessive under the specific operating conditions performed well.

The service was tremendously hard on tires and it is certain that the tire equipment of every truck engaged suffered at least 200 per cent. as compared with the normal wear of the same mileage under normal conditions. The gasoline consumption of the quartermaster's trucks was about 3 1-2 miles to the gallon on the general average. The average mileage made by the quartette in 10 days was 487 and the total wagon mileage delivered was 1,948, based upon the performance of 8 days of the maneuvers.

No Cross-Country Work Attempted

There was no cross-country work attempted by any truck connected with the army, except where the cars left the roads to enter fields for the purpose of delivering freight. The road conditions on the general average were strenuous. The grades ranged up to 45 per cent. and there were nine distinct ridges of hills where the degree of inclination was in excess of 20 per cent. There were eighty-two bridges and culverts on the lines of communication in the rear of the Blues. Some of these were so weak and rickety that they gave way beneath the heavier trucks. An overloaded Sternberg went through a bridge near Stepney; a Packard with 4 tons of freight broke down a culvert at Redding Ridge, and another Packard in seeking to make a detour around a shaky bridge structure was mired down in a swamp and stayed there for several days. This latter car was assigned to the Provisional Artillery regiment.

The Second New York Brigade had for its field train seven automobile trucks. The cavalry and artillery were served to some extent by this equipment as well as two trucks specially assigned to that work. The New Jersey brigade had five trucks and there were four others assigned to the engineers, hospitals, etc. The remainder of the transportation was represented by



Delivering rations to Blue company commissary

mule and horse-drawn wagons, this type of transportation being used exclusively by the United States regulars. All told, the Blues had twenty-three trucks and fifty-five teams. This is about half the amount that would have been required by the same number of organizations on the basis of full war strength, reckoning also a full 50 per cent. allowance for the use of the railroad between the main base and the field bases.

Reckoning the average truck used by the Blue army at about 3 tons carrying capacity and estimating the general average daily mileage at 43.1, half of which would be under load, the truck equipment alone would seem to have had sufficient capacity to handle all the freight. But the transfer at the field depots and duplication of service cut down the actual figures to approximately three-quarters of the total service performed.

How the Trucks Carried Beef

As an instance of the work of the trucks the following may be cited: On Thursday it was necessary to transfer 3,000 pounds of beef from Danbury to the field supply depot behind Stepney. The meat was loaded upon one of the 3 1-2-ton G. M. C. trucks at Danbury and with sufficient other freight to make up 4 tons was delivered 21 miles from the main depot in a run of 3 hours. There, the load was transferred to a 3-ton Alco and was delivered to the commissaries of two regiments 4 miles to the eastward in less than 1 hour. The country about Stepney is mostly up and down and just south of Bethel there is a hill that would make the best mule that ever lived wonder why he had selected the army as a field of industry. This hill exceeds 20 per cent. inclination for 400 yards and has spots that are above 30 per cent.

It required 2 hours to load this truck and 3 1-2 hours to make the transfer to the Alco. It took the Alco 3 1-2 hours to deliver the last of the load to the commissaries. The excessive loading

New York troops had best motor equipment—This group of pictures shows three phases of military service, loading, loaded and unloading

Five makes and styles of trucks, mule-wagons and pack animal starting from a camp ground behind a column of Blue Infantry

G. M. C. 5-ton truck with a fair load of forage

and unloading time used was typical of the whole experience and may be charged in a measure to the varied character of the loads carried as well as to unskillful loading.

To summarize the experience:

Time running from base to field depot	3	hours
Time running from depot to front	1	hour
Loading time at base	2	hours
Transferring load	3½	hours
Time to last delivery	2½	hours
Total	12	hours

If mule teams had been used for the service three teams would be required in each relay and the result would have been as follows:

Loading time at base	3	hours
Transferring	5	hours
Delivery	2½	hours
Running time from base	8⅝	hours
Running time to front	1⅝	hours
Total	20½	hours

In estimating the loading and unloading time, the labor of the team crews alone is contemplated.

The motor trucks immediately proceeded to other service after completing this trip, but if mules had been used they would have been all through for the day, at least after a 21-mile pull over such hills.

The pleasure cars attached to the army completely displaced the horse courier. They averaged 90 miles a day and besides being used to transport the aides of the commanders, they served in the quartermaster's department to carry all sorts of miscellaneous loads. On account of the sharp rock to be found practically everywhere on the maneuver field, tire trouble was the common lot. On a single trip behind the Blue line, nine cars were observed making tire repairs along the road. The cars averaged rather less than 6 miles to the gallon of gasoline.

Extreme figures of service, as far as reported, were an average of 72 miles a day by the 3-ton Packard assigned to the Forty-seventh New York and a maximum of 82 miles made by an Alco 3-ton truck. Among the pleasure cars, the Matheson scored 200 miles in one period of 24 hours.

As a general thing the officers were pleased with the showing of the motor equipment and it was freely predicted that the day of the mule had passed.

Details of the experience of the Reds showed similar conditions, a trifle less strenuous.

Some Lessons of the Campaign

THE performance of the automobiles connected with the two armies was the most pressing subject of thought, if not discussion, among the Regular Army officers assigned to the campaign.

Their conclusions, guardedly expressed, are that the new element introduced into American military science will force a complete readjustment of war plans to conform with it.

No more unpromising field for the motor truck could be found than the hilly country chosen for the maneuvers. Horse and mule equipment was purposely left inadequate so that a severe test of the automobile under adverse surroundings might be made.

The conclusions of a majority of the officers, including those who had to deal directly with the trucks, are that the truck has come to stay; that it is still imperfect; that it will certainly displace the mule for handling supply trains to field depots.

The radius of action of the truck is from 20 miles up to 50 miles, making a single round trip of from 40 miles to 100 miles in a day. This difference depends upon road conditions and the necessities of the particular case.

Under present road conditions and particularly with reference to the strength of bridges, big trucks are unavailable. When

Automobile trucks loading commissary at Bethel

The baggage was often loaded into trucks in less than 10 minutes—The trucks had no difficulty in holding their places in column

roads and bridges have been improved, the limit of size will increase.

The present 5-ton truck is too heavy for use on the Connecticut bridges.

The overloaded 3-ton truck is at practically the same disadvantage.

The proper size for general army use should be less than 3 tons capacity. The 2-ton truck and the 1 1-2-ton truck and the 1,500-pound wagon did yeoman service.

Great speed is not necessary in army service. The mule's radius of action is not more than 12 1-2 miles maximum and his speed is 2 1-2 miles an hour. The average 3-ton truck extended its radius of usefulness to over 21 miles and made from 9 to 12 miles an hour.

The mule can be worked a maximum of 10 hours a day; the truck can be worked a maximum of 24 hours a day.

The mule must rest and feed; the truck can be gone over with a pair of spanners and a can of lubricant while it is being loaded.

The mule team can haul a 3,000-pound load 12 1-2 miles and return with the empty wagon in 1 day; the truck can haul 6,000 pounds over the same route twice in a day without undue strain on the mechanism.

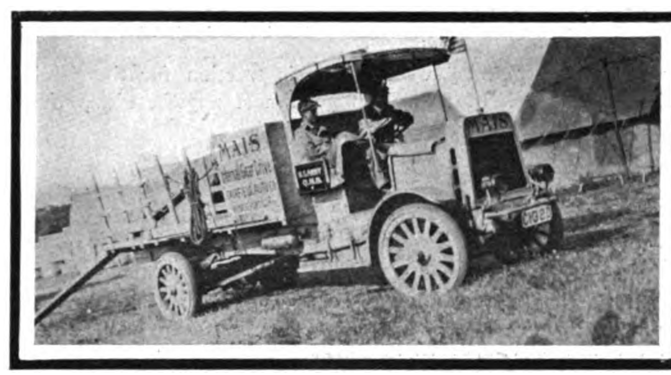
Truck Equals Four Mule Teams

Therefore, the truck can do the work of four mule teams under ordinary conditions and if both equipments work at pressure, the truck can do the work of eight teams.

In hauling perishable freight over long distances, the truck can do satisfactory work beyond the radius of action of the mule.

The mishaps encountered by the trucks during the maneuvers were due in large part to unskillful handling, lack of knowledge of the roads and to their size.

There were 11 White trucks of this type engaged



Mais trucks were employed on the Red side

Solid tires, dual on the drivers, gave the best service, although the pneumatics used by some of the smaller wagons gave a good account of themselves. One truck was equipped with block tires. One had pneumatics filled with composition rubber.

One truck was laid out because of tire trouble, a small Gramm machine which commenced service with a worn left rear tire. This truck was much overloaded and the tire gave out after 6 days of grinding on the rocks.

The tire cost of the campaign will never be known with accuracy because the tires in service were in various conditions at the time the campaign opened. But it is known that the overloading, overworking and overspeeding that was done all around will make itself apparent a little later in premature replacements.

The conclusions of those in position to observe the performances of the trucks are as follows:

The installation of automobiles will cut down the amount of forage and freight to be handled by the quartermaster's department by almost 30 per cent. through the elimination of provision for the mules.

When the cavalry arm is decreased in size, this item may be reduced by 50 per cent.

Trucks must have some kind of a road to operate upon. The better the road, the more satisfactory the service. The only cross-country work possible for the truck under the conditions in Connecticut was to leave the road a short distance to deliver its freight. Even this was fraught with considerable difficulty. Therefore, the conclusion reached is that while the truck has demonstrated that the mule must go as a means of transport from the base to the field depot, the mule will have another chance to show its fitness in the field trains.

This does not mean that the mule has shown superior quality in the field trains, but simply that the trucks available for that

New York troops had the only automobile ambulance

Forwarding hospital used two trucks of this type

kind of service could not go across country quite as certainly as the animals.

Trucks specially designed for this service may answer the question, but it is problematical whether the need of such a type is sufficiently important to call for much attention. It is self-evident that no automobile can be made that can follow a mule loaded with a pack through a pathless thicket or on a deer-trail across the side of a canyon.

In ordinary country where there is traction for the driving wheels, the truck of today can go almost anywhere any other wheeled vehicle can show the way.

What the Experts Suggest

Every truck in army use should be fitted with a set of ratchet sprags to prevent it slipping backward. An Alco truck in the campaign slipped back into a stone wall and broke its gasoline tank. The use of such a device might have saved one G. M. C. and one Packard truck from mishaps that put them out of commission temporarily.

After a rain, especially in the hills, traction is precarious. When the automobile trucks of the armies were wriggling around on the hills after the rain of Tuesday, several of them slid into ditches and could not get out without outside assistance. It is suggested that some means for locking the differential, by bolt or otherwise, be adopted generally so that a ditched truck with one wheel on tractional surface can help itself back to the road by its own power.

The trucks also should have a very low gear for use in such going, or worse, as that met with in the war.

Some suggestions were also made as to the advisability of using a truck with the drive on all four wheels and steering by both sets of wheels. This was the idea of some of the officers who were seeking to find the type of gasoline car that might displace the mule in the field trains.

Another suggestion that was probably the result of experience with poor traction after the rain was that a drum, about 10 inches in diameter, should be placed on one of the driving hubs, to be used in emergencies for extricating the truck from ditches, broken bridges or swampy land, but particularly the former. With two turns around the hub drum, a stout rope, one end of which can be fastened to some immovable object and the other held taut by a man, will probably prove of much service in case of lost traction, the engine of the automobile furnishing the power by which the car may be replaced upon firm going.

The most severe criticism of the truck in military service was delivered by a few of the older and more conservative officers. The head of the Blue army's transportation at headquarters had four trucks of various makes under his personal direction. They were all of 5 tons capacity and as a result proved too much for roads and bridges. He said that he wished he had a full equipment of mules in place of the trucks.

As has been stated, results are the main thing to be attained in army transportation and it is obvious that mules are better than 5-ton trucks if the mules can deliver their freight and the 5-ton trucks can not. If 2-ton trucks had been installed in place of the big fellows that broke the bridges, the chances are that the opinion of the Blue army's transportation head might been modified.

To Adopt N. A. A. M. Truck Standards

There are numerous indications that the commercial motor vehicle standards recommended this year by the N. A. A. M. will be freely adopted by manufacturers, both members and non-members of the association. Already some of the leading companies have given the word that the new models shall conform to the speed ratings, and frame widths and lengths recommended, and information is now at hand that twenty-two companies have adopted the standard truck warranty approved by the association June 5, or have expressed their intention of doing so, and will incorporate it in their new catalogues to be prepared this fall.

The warranty has been the subject of careful study on the part of practically all the makers since it was published and it is evident that it meets with general approval, as many manufacturers have expressed the hope that it will be adopted universally without change. Only two criticisms have so far been offered—one being that for electric vehicles the reference to ignition apparatus, gas tanks and generators is superfluous, which objection has been overcome simply by omitting these words; and the other the limitation of the warranty to 90 days.

The latter point has developed an interesting feature that illustrates plainly how the work of standardization can give stability to the industry. Up to the present it has been the practice of different makers to warrant their vehicles for different periods—some for 90 days, some for 6 months, others for 1 year and several for longer periods, up to 7 years. "We have made it a practice," says one manufacturer, "to warrant against defects in material and workmanship for 1 year and would prefer to stand back of our output in the broadest possible manner, as we are using, and expect to use, only the best of material and workmanship in the construction of our trucks. If, however, a large majority of the association feel that a 90-day warranty is better for all concerned, we will join in the matter.

The general manager of another well-known company says: "At the present time our guarantee reads for 1 year, but we believe this is entirely too long and that the 90-day guarantee is all right. We are not members of the N. A. A. M., but we shall be only too glad to co-operate with it in establishing a standard guarantee covering motor trucks."

The reason why a 1-year guarantee is too long is well illustrated by the experience of a company in the South, which is related as follows by the general manager:

"Last year we took up the manufacture of 1 1-2, 3 and 5-ton trucks and were forced, on account of Northern competition, to give 1 year's guarantee on all trucks sold. This has proven so unsatisfactory that we have practically suspended the manufacture of trucks."

Car Painting for the Tyro

Knowledge of Value to the Owner Who Contemplates the Renovation of His Automobile

Constituents and Proper Proportioning of Paints and Varnishes—How to Do the Work Well and Cheaply

TO BE qualified to get the best service from the paint and finish upon his car the owner should first of all be informed concerning the ingredients which compose the structure of pigment and varnish.

It may not be essential to his welfare, or to his pecuniary advantage, to know how to apply the various coatings, or to manipulate the manifold processes which underlie all this devious work of developing the finished structure, but to be informed in detail of the composition of the materials joined together on the car is great gain.

Getting it fixed in a general way in his mind, the car owner will be enabled to enforce a system of caretaking in every way calculated to prolong the life of the finish.

The first or preliminary coat is, in the main, composed of raw linseed oil, to which is joined a light body of some filling pigment—white lead, lampblack, yellow ochre, Venetian or Indian red. Raw linseed oil has been vouched for as the life of the paint, so that in the priming the oil is the essential thing and the pigment the non-essential.

Essentially, too, this coat should be well worked and brushed into the wood or metal so that a uniform distribution of material and the proper penetration are assured.

Less Oil in Paints for Metals

The metal surface, sheet steel or aluminum, as may be, requires a primer containing, as a matter of necessity, a smaller proportion of oil. Metal will not absorb and take care of as much oil as wood, hence the priming coat will need to contain proportionately less oil and proportionately more thinning and drying material when designed for metal.

After the priming coat comes a pigment regulated to go firm and secure over the priming. This coat may be made up of white lead and some coloring pigment thinned in three parts raw linseed oil and five parts turpentine. In speaking of turpentine we mean, of course, pure turpentine, the unadulterated product of the living pine. This is the thinner *par excellence.* It thins the paint or color and assists the painter to spread the pigment over the surface. Having accomplished this, it evaporates and leaves the pigment in the full possession of all native and original properties.

Adulterated turpentine, along with many of the turpentine substitutes, gives both the painter and the car owner trouble in various ways. Turpentine adulterated with some one of the various forms of petroleum imparts to the paint or the color an uncertain drying property, this lack of uniformity working harm to the durability of the paint structure. Thus trouble of a serious nature is visited directly upon the car owner.

Turpentine substitutes are often fearfully and wonderfully made, some of their component parts being grease and acids chemically acted upon and converted into a thinner, in connection with a fluid body which, while having many turpentine characteristics, is lacking in those properties indispensable to a thinner of the right kind.

Not infrequently the car finish goes to premature decline without apparent cause. If the chemical history of all things entering into the paint structure could be known, many of the early deaths might be traced straight back to spurious or substitute turpentines. Wherefore, concerning the use of turpentine the car owner may well write into his painting specifications a demand for the pure article.

Raw linseed oil is likewise a paint medium upon which the car owner in company with the painter should look with grave concern. Raw linseed oil is scarce, and the temptation to extend the volume by using an oil that is in no way related to linseed is correspondingly great. Adulterated raw linseed oil is difficult to detect except through the poorer paint service obtained from its use. About the best means of protection to adopt, all things considered, is that afforded by buying direct from a concern entirely above the business of dealing in or handling the impure oil.

With two coats of priming and filling-up material for the body surface, the next step takes us to the roughstuff. This is a coarse filler mixed with equal quantities of coach japan and rubbing varnish, and thinned with turpentine to the proper brushing consistency. Four or five, and even six coats of this filling-up pigment is put on at the rate, preferably, of one coat per day. After several days this foundation of roughstuff is rubbed down to a smooth and level condition with blocks of rubbing brick, otherwise known as artificial pumicestone. A good deal of skill and thought must necessarily go into this work, for right at this stage the ideal surface to finish upon is actually made possible. If the surface in rubbing is scratched and gouged no amount of varnish and no amount of skill in putting the varnish on will make up for the defects. If the surface be poorly rubbed, the ultimate finish will be poor. While varnish is a beautifier and a protector of the surface, it is likewise a graphic delineator of all surface imperfections. All of which explains the wherefore of making every lick count for good in rubbing the roughstuff.

Following this smoothing and leveling-up process the surface is lightly sandpapered and dusted off and two coats of color applied. In some cases one coat of color is deemed sufficient, a coat of varnish-color being flowed over the single coat of color. It all depends, or chiefly depends, upon the color and what the requirements of the work are. In the event of using some of the lake pigments, all of which are very transparent, the requirements are one coat of ground color, one coat of the lake mixed and applied as a flat color, and then one coat, or two, if the surface conditions demand it, of the lake mixed with varnish.

When dry, the gloss is beaten off with a soft sponge wet and dipped in pumicestone flour, and a coat of rubbing varnish containing a bit of the glaze or lake color is flowed on. In due time this coat is rubbed, and a second coat of rubbing varnish is put on. For first-grade work perhaps another coat of rubbing varnish is used. If striping or ornamental lines are employed they should be put on before flowing on the last coat of rubbing varnish. Comparatively little ornamentation is now done on the car, but this little is done exceedingly fine, as a rule.

The last coat of rubbing varnish, when dry, is rubbed very carefully, then washed up and the body-finish varnish applied. Within the last year or two an automobile line of varnishes has been perfected which dry very quickly in the course of a night in some cases.

No Water on Berlin's Streets

For some time a special soap-and-oil emulsion has been used for sprinkling the streets of Berlin. It is mixed with water in the proportion of 1 to 100, and one sprinkling every 4 to 5 weeks secures freedom from dust, to a certain degree, even on the streets with the densest traffic. As no sprinkling is done in winter, six sprinklings per year is the rule, and the cost of this method, which is continued and therefore seems to be satisfactory, is only 1-7 of what the cost of the old system of sprinkling with plain water would be. When the oil used is rich in asphaltum a certain saving is effected, because in that case the streets are found in better condition at the beginning of the following season and require less sprinkling.—From *Automobil-Betrieb. medio* July.

In the Export Field

Opportunities for Foreign Sales of American Automobiles Set Forth in Special Consular Reports

Canada and Great Britain Our Chief Outside Markets, Followed by France, Mexico and Italy

FOREIGN Markets for Motor Vehicles is the title of a compilation of special consular reports just issued by the Bureau of Manufactures of the Department of Commerce and Labor, covering the field up to the end of 1911. The book is designed to be of assistance to American automobile manufacturers and is of such a character that makers of motorcycles and of automobile accessories may also gain an idea of the opportunities for business in foreign lands. The number and values of the automobiles and parts exported to and imported from the various countries during 1909, 1910 and 1911 are given in tabular form. The book, which comprises 143 pages, takes up the western hemisphere first and then proceeds to give the trade conditions in the different countries in Europe, Asia, Africa and Australasia. At the end of the book is a list of the catalogues, pamphlets, etc., on file in the Bureau of Manufactures which may be borrowed by American automobile manufacturers interested in the export trade, together with a list of 163 reports received from consular officers which it was found impracticable to publish. A very brief digest of the book, taking up the countries in order, is as follows:

Canada is the chief market for American automobiles, purchasing in the fiscal year of 1911 almost 40 per cent. of American automobile exports. The sale of American cars has increased swiftly but steadily and promises to continue. Machines in most general use are of medium size. The main centers of automobile activity are the large cities, such as Ottawa, Quebec, Montreal, Toronto, etc., but the rapidly developing western districts are fast absorbing American automobiles. A number of American factories have established Canadian branches which are turning out cars in such numbers that the demand in the Dominion is not only fairly well supplied, but there is also a sufficient surplus of machines to permit of exporting in considerable quantities. The various officials reporting from Canada, however, estimate the number of families possessing sufficient means for the purchase and upkeep of automobiles to be considerably in excess of those at present owning motor vehicles.

Mexico Has No Car Factories

No automobiles are made in Mexico, every machine used being imported. The City of Mexico is wealthy. It is the distributing center of the republic and the buying center for the principal mining districts. All the streets are asphalted and most of the roads leading out of the city are macadamized. The American colony in Mexico City numbers about 10,000 persons, most of whom are well-to-do. Considering these general conditions, it is easy to see that there is a good market for automobiles, which, however, is already well supplied and extensively worked. There are more American cars in use than European, the medium-grade car predominating. Practically the same conditions obtain in Aguascalientes, Chihuahua, Durango, Guadalajara, Monterey and other Mexican cities. An excellent field for the American car are the haciendas, the proprietors of which often have to travel long distances. These proprietors are wealthy as a class and attractive literature printed in Spanish sent to them might result in many direct sales.

In Central America there are very few good highways and consequently comparatively few automobiles, most of these being of doubtful value. Local agents cover the countries and there is small opportunity for sales.

In the West Indies, except Cuba and the Dominican Republic, practically the same conditions are found as in Central America. The annual sale of automobiles in Cuba amounts to a little over 100 cars, about the same number being sold in the Dominican Republic.

Argentina leads the countries of South America as a market for automobiles, imports of cars into that country reaching 2,461 in 1911, most of these coming from France, while the United States sent comparatively few. There is much wealth in Buenos Aires and the country at large and American manufacturers are just beginning to cultivate the market. Compared with the methods used in the United States, the selling of automobiles in Argentina is not vigorously pushed.

Brazil offers an excellent market for American automobiles, there being 6,000 to 8,000 people in the Federal District alone who can afford to own motor cars. There is a large demand for high-grade machines, the purchasers desiring hill-climbing ability regardless of price, while cheap or low-grade cars find a poor market. Rio de Janeiro is the central selling point.

One-half of the 150 people in British Guiana who might afford an automobile are physicians or government officials. At present, pleasure automobiles in that country number thirty-seven and the average annual sale is not over fifteen cars.

Ecuador has twenty-two motor cars, eleven of which are of one American make. There are less than 300 miles of roads in the country suitable for automobile use.

The wild, rugged conditions to be found in Paraguay render the building of automobile roads out of the question for years to come and there has been no attempt to introduce motor cars into that country.

Road conditions also hamper the market for automobiles in Peru. Nevertheless, the sale of cars is increasing, although slowly. American cars are displacing the French in popularity.

Demand for Our Cars in Uruguay

The prejudice against American cars in Uruguay, so strong 3 years ago that sales were practically impossible, has been destroyed to such an extent that for 2 years the dealers have found it difficult to supply enough cars. At present, there is one automobile to every 2,000 inhabitants of Uruguay. Sales are being made at the rate of 100 cars a year, the fairly high-grade cars being most in demand.

The absence of suitable roads in Venezuela and the high cost of gasoline (65 cents a gallon) interfere with the wide use of automobiles, but there is room for more American agencies in Caracas. In opening an agency, however, it should be borne in mind that it is difficult to find active natives who could properly demonstrate a machine.

Austria-Hungary has excellent conditions for automobiling but is amply supplied as far as large high-priced cars go. However, inexpensive American cars of graceful appearance and ample power would find an excellent market in that country.

France offers only a fair market to the American manufacturer, largely on account of the preference for European cars, especially those of French make. Those American cars gaining a footing in France are mostly of the small, inexpensive variety.

The sale of American automobiles in Germany has been greatly restricted in the past, only about 100 machines having been sent there in the last year from the United States. The German purchaser prefers German machines as a rule, and, if this is not the case, hesitates to purchase an American car because of the lack of adequately-stocked repair shops with all spare parts and because the finish of the body is not often to his liking.

Owing to the large number of high-grade cars manufactured in Italy, American builders of this type of vehicle have not had much opportunity of invading that country. Makers of small, inexpensive runabouts and touring cars are finding Italy a very fair market, however, while there is a limited field for motor trucks.

While the United Kingdom is an extensive manufacturer of automobiles, and is near France, Germany and Italy, where the production is also large, that country is the second-best customer of the United States in the automobile trade, being surpassed only by Canada. The prevailing opinion in regard to American cars in the United Kingdom seems to be that they are becoming increasingly popular because of their low price, although the public is not inclined to think them as durable as the English makes. The United Kingdom is fairly well covered as a market, but there is a good opening for light cars under 16 horsepower, as they enjoy lower tax rate. In Scotland, the low-hung cars have the preference on account of the narrow Highland roads with their sharp turns, while in Ireland low-priced cars are popular.

Russia has not many cars because of the poor road conditions throughout the country, but there is a demand for light cars for business use about the cities, while moderate-priced, light-weight American cars should find a ready sale in many districts.

As in other European countries, the chief outlook for the sale of American automobiles in Spain is for the low-priced cars, of light but durable construction. The only way to market cars in Spain with any degree of success is to send the cars there and demonstrate them to prospective purchasers. So far, little energy has been shown in the sale of automobiles in Spain.

Afraid That Our Cars Lack Strength

In the Netherlands and Belgium, American makers would have to meet and overcome a feeling that their cars are not strong and durable enough before they could expect to make much headway. Actual demonstration is the best method of marketing.

Switzerland does not offer a promising market for American cars because of the prejudice against them based on the argument that they are not suitable for Swiss roads.

Competition is keen in Sweden and American cars are coming more and more into vogue.

American manufacturers have not demonstrated their cars in Norway as energetically as their European competitors. Otherwise, many American cars could quickly be sold in that country.

Denmark offers an excellent opportunity for the sale of delivery cars and motor trucks.

The future of the automobile trade in Turkey is very promising. The same is the case in Roumania, but Greece and Servia offer comparatively poor markets.

In China there is practically no market as the roads are bad and the natives care little for automobiles.

The market in the Dutch East Indies is well worked and offers comparatively little opportunity.

India's imports of American automobiles are rapidly increasing and that country offers a fair market which might possibly be developed to a considerable extent.

Easily Obtained Parts a Necessity

Japan offers a fairly good market for small cars, although the road and climatic conditions tend to restrict the number of automobiles in use.

Siam and Siberia offer fairly good markets, which, however, have not been worked to any great extent.

Algeria may offer a permanent market for certain classes of American automobiles, their introduction having been a pronounced success. Egypt presents practically no opportunities.

South Africa offers an excellent market, particularly for the low-priced and medium-priced car. American manufacturers have not developed this market and kept in touch with it as they should have done. At present, the manufacturers will have to overcome the prevailing prejudice against American cars based on the claim of lack of durability.

Imports of American machines in Australia have shown a phenomenal increase in the past few years, but the market, although vigorously worked, may be further developed, all prejudices against American cars having been overcome. Practically the same conditions are found in Tasmania.

From nearly all the reports it would seem that the main essential for the development of a foreign market is the establishment of a branch or agency well supplied with spare parts and with facilities for making all sorts of repairs. Many of the consuls state that the people in their territory are not satisfied with the body finish of American cars, while others complain of faulty packing.

EXPORTS OF AUTOMOBILES AND PARTS FROM THE UNITED STATES IN 1909, 1910 AND 1911 AS GIVEN IN THE BOOK JUST ISSUED BY THE DEPARTMENT OF COMMERCE AND LABOR

Exported to—	AUTOMOBILES						PARTS

Selling Cars in Australia

The Antipodean Demands Good Treatment From the Agent and Insists on Plenty of Repair Parts

Small and Medium-Price Automobiles, Costing Up to $1600, Will Find a Market in the Island Continent

SYDNEY, AUSTRALIA, Aug. 5—There is a good field in Australia for the American motor car exporter to do a profitable business, but it must be done on lines different from those previously adopted. In the past the American exporter who wanted an agent for his cars generally sought the leading agent in each state, or, to put it in other words, the agent who has been doing the greatest business in cars of other countries, and these were in every case the leading cars of Europe. The evil results of this method has been in most cases to make the American line a secondary consideration. The agent who has been making a pet line of some European car has taken up an American car agency simply to fill the bill for a cheap car, and is in the habit of telling his customers that the American car is all right for light work, but advises the customers (if he can afford it) to go in for the higher grade European car for any solid work he desires to put the car. The result of this has been the education of the public to the belief that American cars are inferior in quality to those of other countries, and it has also been the means of many deserving cars having but a small market. Therefore the American exporter who proposes to do good business in Australia must secure an agent who will push his car in preference to any other.

Another mistake many exporters make is that they place their cars in the hands of agents who already have five or six different agencies, and although the agent is doing a good business for himself the return for the different makers is but small, taking it individually.

The high-grade and high-priced American cars have no sale at all, and in this respect their makers have themselves to blame, for they have allowed the makers of cheap cars to come here first and advertise their product as America's best, and as the public seems to get most of its motor education from advertisements, they have placed American cars as second grade. This superstition is going to be hard to remove. If the high-grade maker wants a market here, he will have to get an agent who will educate the people to believe that a good American car is as good in quality as any European car, and, with its high clearance and other rough-country features, is a most suitable car for our use.

Durability, Not Speed, the Requisite

In this country, the advertising of some speed record offers very little inducement for buyers to purchase, but records for durability, quality and the stocking of spare parts, do tempt people to buy.

As for public taste in this country, it must be said we follow the English style, especially as this is a British country. Numbers of motor buyers write home to England to their friends for the latest ideas, and apart from recommending English cars, English ideas are also driven into the minds of the buyer. The leading idea of all, seems to be the detachable wire wheel, which has a strong demand. The first high grade American maker who fits a detachable wheel will get a good market here among the better class of motorists.

Practical self-starters fitted to cars will also help to sell. The body work of good cars needs be of the latest design, and must be well finished, preferably of the style used in England. It might be mentioned there is a duty of $120 on touring bodies, which is sufficient protection to enable local body builders to make our "up-to-date style" of bodies here at about what it costs to import, and in this respect the European maker scores a point by exporting chassis only.

As there are no frosts in this country to speak of, air cooling has few points of advantage over water cooling, and in the matter of the latter type the thermo-syphon system is gaining favor.

In high-class cars finish counts a lot; that is to say, the finish of the chassis. Rough castings and the "gas pipe" appearance, as it is termed here, does not appeal to the public and cars with a rough finished chassis will never defeat the European car among the wealthier class.

Getting down to specifications: High clearance, well-sprung cars, and good hill climbers are the order of the day, and as fuel is costly, economical carbureters count a lot.

There is an immense field for light delivery wagons here, something to carry from about 1,000 pounds to a ton, which is lightly built yet strong, light on tires, fuel, etc. The retail firms are slow to take on light deliveries as they have not seen the kind to suit their requirements.

Large Cars Not Very Popular

Returning to the matter of agents, much depends as to how the agent is going to treat his customer after he has purchased, and upon the sort of repair shop he keeps. Another thing the maker wants to make sure of, and that is whether the agent will last in time of depression. We are at the present time enjoying prosperity, owing to good rainfalls; but if drought came, it is a matter of the survival of the fittest, for we all really depend upon the wool clip and the wheat yield for our prosperity. This year we have had a 2 months' stretch of no rain, and this means that the banks are slow to advance money; fortunately, however, the prospects of a drought have entirely disappeared, and city business is flourishing once more. The American maker who desires a good business here must secure an agent who can stand a drought, or even a bad season, for past history has shown that when an agency changes hands the line seems to fade away.

Getting down to the popular sizes of cars which will be in demand for the future, I will say that the big car of 40 horsepower and over will have a very limited sale. There are no millionaires in this country, and wealthy people are somewhat scarce, and of these, very few will entertain extravagant motor cars. The question of upkeep of large cars is most important in this country; for instance fuel is so scarce that gasolene is never used; naphtha and benzine are substituted and these cost in the cities 34 cents a gallon.

Tires are also expensive; most tires are imported and in addition to the usual freight, landing, and commission charges, there is a duty of 25 per cent., all which make tires about 50 per cent. dearer than in countries of their origin, so it can be understood that the expense of upkeep of large cars will render their sale very limited.

Touring cars up to 30 horsepower will do well in either four or six cylinders, and if good workmanship and finish are put into the car the price will not stop the sale, especially when the prejudice against American cars is removed. At the present time no American cars costing over $1,600 are being sold in the Commonwealth, but several costlier cars are now being imported privately, and people are beginning to realize that good cars are made in America. The cheaper class of American car sells well, however, as few, if any, European car makers can compete with the American small car builder.

The maker looking for a market for his car here will find Sydney full of American cars, but the other five big cities have not taken seriously to American machines as yet. The field there is well open, and only requires proper working for a successful trade. The exporter must remember we only have a population of four and one-half millions in the whole of Australia, including Tasmania.

Experiments with Various Types of Motor-Propelled Agricultural Tools Has Developed the Fact That Heavy Machines Do Not Pay—Lighter, More Elastic Implements Are Needed—Uniform Lubrication of Motor Cylinders

EVENTUAL Motor Tools for the Farm.—Experiments with agricultural motor machinery have served to convince Europe of the immense difficulties which are to be overcome in this field. It has been practically decided that the large, heavy and costly steam or motor plows never will return an interest on the investment which they represent—at least not where land values are high—unless used mainly for such work as subsoil plowing, ditching and the planing of meadows or rough-surfaced fields; work which may be carried on without close reference to seasons and weather and which does not require to be repeated year after year; in other words, work which would sort under civil engineering rather than under routine agriculture. The standard agricultural motor tool must be of an entirely different nature. The agricultural milling machine has been tried in many forms. It was based on the idea of the industrial milling machine for wood and metal working operations, which is that of working with cutting edges rotated at high velocity and intended to cut loose only a very small portion of the material at each cut. Difficulties in applying this principle to the milling of the soil arose everywhere. At the shop, the milling machine is stationary and its work is taken to it; in the field the machine must move, it must follow the undulations of the soil. The surface to be worked is immense and must be attacked by a tool of large dimensions. Whether this tool is long and turns rapidly or short and turns more slowly, its weight must always be considerable, so long as it is rigid, necessitating a powerful motor to work it, a heavy vehicle for carrying it. Such was the construction of the steam disk plows and similar machines and, though some weight reduction has been effected by substituting gasoline motors, such are still the characteristics of the more recent soil millers with rigid blades, as the Koszegi, the Quellenec and other ones. An apparatus of this kind cannot be light. If the rotary mass on which the blades are carried around at a speed of 150 to 200 revolutions per minute is suddenly stopped in its course by an obstacle there is produced a violent mechanical shock, an enormous accumulation of energy at the point of contact, a shock which reacts from the traveling blades attacking the control shaft, the pinions, chains, gears, the flywheel, the motor and the chassis.

Since, in fact, in this class of machines, rigidity has been found to be the fundamental vice which engenders all the subsequent defects from which these machines have suffered—great weight, high price, unsuitability for many forms of work—it was eminently logical to seek to replace the rigid soil-stirring tools with elastic ones, as has now been done. By taking this step the lack of homogeneity in soils was for the first time taken into consideration. The logic which has brought us to look upon the paws of fossorial animals as the best possible prototype for the tool sought to be incorporated in the mechanism of agricultural machines also finds itself confirmed in these considerations. It seems that the final solution must lie in this direction.—*Bulletin de la Société d'Encouragement pour l'Industrie Nationale*, March.

Compound Regulation of Cylinder Oiling.—The amount of lubricant splashed upon pistons, sleeve and cylinder walls in the Minerva-Knight motor—is not only regulated by the speed of the motor, but is also co-ordinated with the amount of gasoline taken from the carbureter, the aim being to make it approximately proportionate to the heat and power development of the motor. The construction serving this purpose is indicated in Fig. 1, which represents a vertical section in the central transverse plane of one of the four cylinders, through the lower half of the crankcase. B is the connecting-rod, V the crankshaft, M the crankpin, D a scoop secured to the connection-rod knuckle and G an oilboat which can be tipped more or less by means of the shaft A to which it is secured, thereby making the scoop D dip more or less deeply into its contents. The shaft A runs the length of the crankcase, at one side of it, as shown, and at its rear end, which projects to the outside of the case, a crank is attached which is moved whenever the gas admission is regulated by means of the accelerator pedal. A lug H under the middle of the oilboat limits its downward movement and thereby establishes a minimum or oil datum, below which the regulation depends upon the motor speed alone. The short end of the oilboat is formed as a cup and into this oil supply for the boat is received from the tube T, which is connected with the oil pump. The latter is located at the middle portion of one side of the casing where the aluminum casting is bulged especially to afford a housing for it. It is driven from the sleeve-actuating shaft of the motor and draws from the oil well R which constitutes the lowest portion of the crankcasing in the manner of construction now customary. Besides driving the oil to the four oilboats the pump drives a small stream to a sight glass device on the dashboard, making a little red indicator dance to show that the mechanism is working. The oil in the well may for that matter be kept so high as to submerge the oilboats, and, by this provision, if the oil pump for any reason gets out of order the means are handy for converting the oiling system into one of ordinary splash feed.—From *La Vie Automobile*, August 3.

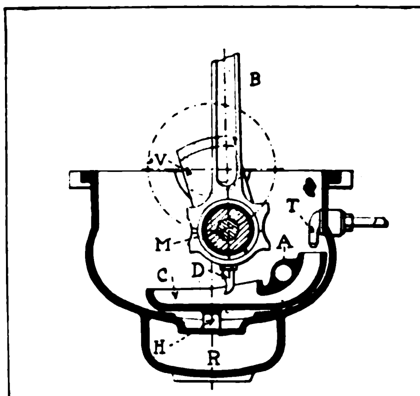

Fig. 1—Diagram of Minerva-Knight oiling system

IT IS CLAIMED by the *Revue de L'Automobile* that paper can be made incombustible by means of an immersion in a very strong solution of alum and that the result is still better if the immersion is repeated after the first coating is dry.

System in Retail Sales of Gasoline

How the Garageman Can Keep Track of Every Transaction—Carelessness of Employees Checked

Scheme is Compact, Simple and Effective—Lubricating Oil, Grease and Graphite Included

GASOLINE sales by a garage may mean profit or loss to the establishment, depending on whether the large quantities of this fuel are handled with little or great waste. To determine the degree of loss and to reduce it to a minimum, it is necessary for a garageman to keep a close eye on his gasoline sales. There are three courses open to a garageman in the way of handling gasoline and lubricants; he can keep a rough memorandum of every sale of fuel or oil. he can obtain and file a receipt from the chauffeur for every purchase of these materials or he can have these records prepared in duplicate and send one to the owner of the car for which these materials were bought. Furthermore, the garage operator may either record the receipt of gasoline every day and total the amounts at the end of the month and deduct therefrom the total of sales; or he may do this work from day to day, and, as it proceeds, see where he stands at any time. The greater the amount of business done by a garage, the more obvious is the necessity of an elaborate system to keep record of its development. Carelessness, which in a small garage may incur a loss of $10 or $20, will result in a debit ten times as high in a proportionately larger establishment, unless an efficient system is installed to prevent such abuses.

The essential features of gasoline-recording systems used by a number of large and medium-sized garages in New York City are considered in connection with the accompanying illustrations. The capacities of these garages range from thirty to 300 automobiles, and the most perfect systems are used by the largest establishments.

Gasoline received by the garage from the oil companies is, in all cases, entered in a book. At the end of each month these entries are totaled and the sum of gasoline sales are deducted

Form 1—Monthly continual gasoline inventory sheet

from the amount thus found. The same process is used in the making of the monthly inventory for oils and other lubricants.

The forms used in connection with gasoline and oil sales vary greatly as regards the details of their design. Some are ordinary receipt blanks with nothing but the name of the company printed on them; others have spaces specially marked for gasoline, motor oil, transmission grease, and some also for such material as waste. Some of the forms are made out single, others in duplicate, and in the latter case one copy of the gasoline receipt is sent to the owner of the car or reserved for him if he should demand it in the future. All forms either remain in their original books or binders, in numerical order, until the end of the month, or they are filed under the names of the customers whose purchases they record.

Cash Register Type of Recording

One of the simplest forms used in the sale of gasoline and oil is form 2. It is an ordinary type of blank suited for a continuous-band recording machine of the National cash register type, in which the operator writes out the name of the buyer, the date of the sale and the material sold, also the price. The form is signed by the owner or chauffeur, depending on who receives the gasoline or oil, and also by the man who delivers it to the buyer. The form here illustrated is given to the latter, while the garage retains a carbon copy of the hand-written information on a plain, white band of paper which runs under the printed strip of forms. This form is satisfactory for the opera-

Form 5—Gasoline and lubricants blank of large garage. Form 6—Gasoline-and-oil card for out-of-town cars. Form 7—Blank used by the same company for its regular customers

tion of an establishment doing not too large a business in fuel and oil, as every detail of the sale has to be recorded by hand.

An advance over this type of blank is form 3, which contains the date, name of buyer and figures referring to gallons of gasoline or quarts of oil. This reduces the work of the person recording the sales to a considerable extent. The forms are numbered consecutively and come in pads, a tan-colored duplicate following every white original. This form is also signed by the person selling and the one receiving the goods.

Form 8 is designed for the recording of gasoline only and is a correspondingly simple blank. The blanks are numbered consecutively and come in duplicate in book form. The original of the slip is given to the buyer, while the carbon copy remains in the original book as a basis for the monthly compilation of the bills. Exactly the same design except for the substitution of the words oil (grease)—either of which is struck out when the slip is filled—is used in the handling of lubricants.

Special Blanks of Varying Details

The next simplest type is probably that shown as Form 7. It enumerates the most important materials, in the same way as the preceding forms, but also contains a space for whatever sundries the garageman sells to his customer. These forms come in duplicate. The original is white and is given to the buyer, while the yellow copy remains in the book. These forms are not numbered.

Another type of blank which specifies with greater detail the various classes of lubricants handled by the garage is form 5, which is made out singly. The copy here shown is printed on pink paper and bears a number, the forms being issued in series of consecutive numbers. As in the case of other forms, the chauffeur or owner receiving gasoline or oil signs for it.

A special type of blank is form 6, which contains spaces for gasoline and oil in addition to storage, etc. The company using it does considerable business in storing and serving the cars of the guests of several elegant hotels; it is the same company as the one issuing form 7. These machines are left in the garage for several days, sometimes for but a day, and therefore they do not appear on the regular customers' book, but when a car is brought to the garage, form 6 is filled out with the date, name of owner, make and license number of car and orders as to what is to be done with it. This form is filled out without a duplicate, as, if the latter were lost and the car claimed by someone willing to pay the storage and other dues on the car would have to be delivered to that claimant. All the charges appearing on the card, form 5, are billed to the customer when the car is delivered to him.

One of the most practical forms in use is form 4. It consists of a soft pasteboard perforated along its middle line and printed the same way on each half. The figures printed for the marking of gasoline and oil are arranged symmetrically with reference to the perforated line, so that, by bending the card along that line and punching a certain number, this is simultaneously punched out of both cards. Three sides of each half card are printed with figures referring to gasoline and the fourth side is reserved for oil. The latter figures are printed red to contrast with the black print of the gasoline-recording figures.

Aside from these small sales blanks, larger forms are used, which serve for bookkeeping and billing purposes. One of these designs is shown as form 8, which is used by a company recording gasoline and oil by a plain blank similar to form 2. Form 8 is a monthly sheet on which all materials bought by a customer are enumerated. The quantities of gasoline, other lubricants, supplies and sundries are entered on this sheet, which is 17 by 14

Form 9—Simple type of gasoline slip made out in duplicate

inches, together with their prices, so that the original sheet serves as a bill to the customer, while the duplicate is retained by the garageman.

The monthly, itemized statement, form 10, is somewhat similar to the preceding blank, but differs from it mainly by having the dates of the month printed on it for a daily recording of gasoline, oil and grease sold to the customer to whose purchases the page is devoted. In addition to these records, the form affords spaces for other supplies, the date of their sale, charges and credits to the customer, and his eventual balance at the end of the month. This form is also made out in duplicate, the carbon copy remaining in the original book, while the copy here shown is detached by tearing a perforation. This sheet is continued day by day, so that at the last day of the month it remains but to enter one day, post the items and send the bill to the customer.

Form 11 is a very ingenious type of blank which is used by the same company as form 5. Form 11 is a tan-colored envelope, 5 by 7 1-4 inches, in which all small gasoline, oil, supply and other memoranda are kept until the end of the month. Then they are added and the totals of the various classes of items entered in the proper places on the front of the envelope, from which they are copied on the monthly bill sent to the customer. After the bills have been sent out, all envelopes of 1 month are filed away alphabetically by the names of car owners and held on file for future reference during the next half year.

Standing Inventory of Gasoline

The company using term 6 has devised another blank proving a standing inventory of the gasoline stock. This is necessary, because the garage using this form does a very considerable business in gasoline and, therefore, has to keep very close tab on the quantities received and sold. The form serving for the gasoline inventory, form 1, is 8 by 10 inches, printed on white paper and designed with one line of space for every day of the month. The gasoline stock of the company is measured at 8 a. m. and at 8 p. m., and additions to the stock are entered between these times, giving the exact time of receipt and the quantity of fuel taken in. The differences in stock must be accounted for by sales slips, form 6, or stock requisitions, when gasoline is used by any of the employees for inside work in the garage.

Thus, by the use of a gasoline-and-oil sales form, a customer's monthly record form and a continual inventory form, a garage, no matter how large, can easily keep record of every gallon of gasoline and oil, every can of grease and graphite. The sales forms are made out by the man tending to the gasoline pump, the monthly record and the inventory by an office worker. This makes the whole system compact, simple and effective in that it permits the garageman to see, at any time he chooses to find out, what state his gasoline business is in and where it is necessary to exert increased care in watching the employees. Furthermore, the preparation of a monthly profit-and-loss account for the garage is an easy matter when all the minor items are taken care of by the use of a subsidiary system devoted to the recording of gasoline and lubricant deals.

Harking Back a Decade

FROM *The Automobile and Motor Review*, August 23, 1902: Consul-General Bellew, at Yokohama, Japan, reports that so far thirteen automobiles have been imported into that country, but that most of them still remain in the hands of the importers, who use them for advertising purposes. Automobiles are not classified under the Japanese tariff and they are admitted as carriages, paying duty of 25 per cent. ad valorem.

The 1902 Toledo touring car has a motor with three cylinders ranged vertically with its cranks equally spaced on the shaft, giving three power impulses for every two revolutions.

The commonest and most natural mistake of the novice who tinkers with his vaporizer is to give the engine too much gasoline. Most modern vaporizers, particularly those of the float-feed type, are provided with a drip outlet in the mixing chamber making it impossible to flood the latter, but occasionally a vaporizer is found which, when fed with more gasoline than the air passing through can take up, will allow the liquid to accumulate.

J. W. Packard, president of the Ohio Automobile Company, has designed a 12-horsepower car for his own use. The car has hollow steel axles running on 7-8-inch balls. The wheelbase is 84 inches. Eight of the principal bearings are oiled automatically.

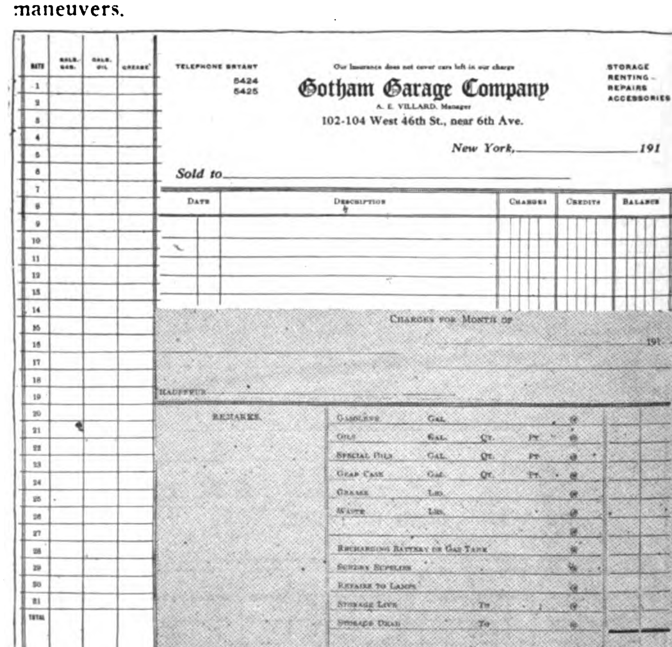
A. W. King, one of the pioneers in the manufacturing industry, has retired from the Automobile Company of America, and will shortly bring out a new type of motor vehicle.

The Pierce motorette entered in the recent endurance run of the Automobile Club of America, negotiated the 100 miles on 4 gallons of gasoline without making a penalized stop. Sixteen other contestants finished the run with clean scores.

The National Association of Automobile Manufacturers has adopted a standard guarantee to be used by all its members. The main feature of the guarantee is the clause providing for a 60-day limit to its effect.

Charles L. Fair, of San Francisco, and his wife were killed near Pacy-sur-Eure, France, when Mr. Fair's car skidded and ran into a tree. Mr. Fair was brother-in-law to W. K. Vanderbilt, Jr.

The automobile belonging to Major Eben Hill, of Brigadier-General Frost's staff, has proved very useful during the past week about the state military rendezvous of the Connecticut National Guard at Niantic. It proved so speedy that some of the staff officers failed to get into the saddle at all during the week of maneuvers.



Form 10—Monthly record and bill for gasoline, oil and materials used by each patron. Form 11—Envelope serving as basis for monthly compilation

Otho Electric Starter

Description of a Device Operated by the Automobile Motor Which Generates Current for Ignition, Lighting and Starting

AN ingenious starting and lighting system, which is unique in that it involves a motor with a stationary armature, field and commutator, has been brought out by the Otho Motor Company, of Boston, Mass. The only moving part of the motor generator is the flywheel of the automobile motor, a fact which stamps this starter as something distinctly new. The results accomplished by the starter are similar to those of other systems involving a motor generator and a storage battery. After starting the motor the device becomes a generator which stores up the current in an accumulator from where it is taken to light the lamps, furnish current for ignition purposes if desired and after the motor has been stopped to restart the motor. In the adaptation of the device, however, a marked degree of ingenuity has been used and a distinctly new method of construction evolved.

A comprehensive idea of the device is given in Fig. 1, which shows a part section through the installation. As may be seen, a special form of flywheel is required. The only moving parts of the device, the four brushes and pole pieces are carried on the flywheel. They are indicated in the illustrations, Figs. 2 and 3. The moving parts are firmly fixed on a solid foundation formed by the rear of the crankcase. This framework carries all the wiring so that there is not a moving wire in the whole arrangement. In addition to this it carries the commutator as seen in Fig. 4. The flywheel is formed in such a manner that it can be slipped over the stationary frame, allowing the pole pieces to take up their proper positions in relation to the stationary field and aramture.

Description of the Device

Armature winding consists of thirteen coils of No. 12 wire; laminations are placed between the coils and moulded in an insulating cement forming the stationary armature and field ring. There is one field winding consisting of 10 pounds of No. 12 wire. The battery outfit needed is six cells of Exide-lead storage batteries. These weigh about 10 pounds to the cell. Only Exide batteries can be used with this system. Using the full voltage of this storage battery, which will be slightly in excess of 6, the starter will operate at 35 amperes. The storage battery will start to be charged at about 200 revolutions per minute of the crankshaft, or at an approximate speed of 10 miles an hour. The motor-generator takes up the functions of a generator as soon as the motor starts to fire, but it does not start to charge the battery until the speed reaches that just designated. A centrifugal switch throws in the battery when this speed is reached and keeps it in until the speed mounts up to 35 miles an hour on the regular adjustment. Above 35 miles an hour the battery is cut out. The latter speed is adjustable, however.

The fact that the battery is disconnected from the motor-generator at lower speeds than 10 miles an hour will prevent the possibility of the batteries discharging through the motor when the car is standing idle should the switch be left in.

Simple wiring and a simple method of switching is used in the present form of the starter. To start the motor the gear-shift lever is moved over to a special notch; this throws in the switch and starts the motor-generator, which now performs the functions of a motor and starts the engine. The wiring is very simple also, as may be noted from a study of Fig. 4, which shows the two wires leading to the storage battery. A ground wire is the only additional wire necessary.

In fitting the starter to a motor any type of clutch may be used. The sectional view, Fig. 1, shows the device installed in a flywheel with a multiple disk clutch. The flywheel will be of a slightly greater diameter than is generally required in order that the extra fittings may be installed. The motor is sufficiently powerful to turn the engine at 75 revolutions a minute until the battery current is exhausted, although a long application of this power will never be necessary. There is no reduction gearing.

Properly Patching a Punctured Inner Tube—Information on Induction Coils—Schemes to Increase Power—How to Test for Leaks in Gas Tanks—Questions in Ball-Bearing Design—Job of Dentistry on Worn Brake Ratchet Teeth

Steps in Patching an Inner Tube

EDITOR THE AUTOMOBILE:—I have a 30-horsepower touring car and wish to know as to how to keep my tires in good condition. What I would like to know specifically is how many extra inner tubes I should have and what I should do to keep these so that they are always available. I would like to know the best method of applying patches to a tire, as I have tried it and always had the patch come off after a short time. There is evidently some step that I do not carry out in the application of the patch or I am sure that I would get better results than I am having now.

New York City. C. C. COPPER.

—In the first place, if you are doing any extensive touring, five inner tubes besides the four on the car would not be too many to carry. If you just use the car around the neighborhood, three will be sufficient. The main point to remember is to keep these tubes in good repair so that you will always have them to rely upon should you get a succession of punctures. The possibilities are that on a 50-mile trip three successive punctures may be sustained, while again a trip of 1,000 miles may be taken with none at all.

After the trip take the punctured tubes to the workbench and cure them of all leaks. It would be well for the car owner who does his own repairing of inner tubes to have a vulcanizing outfit. There are many small ones on the market which give entire satisfaction and which are very easily handled. If a vulcanizer is used, the method of procedure will be as follows: Carefully and thoroughly sandpaper the tube in the proximity to the leak, Fig. 1, removing all signs of dirt. When the tube is white and clean rub the surface of the rubber with a little gasoline. Cut the patch to the desired shape so that it will fit over the puncture and soften it by saturating it with gasoline. The patch will become gummy and can be kneaded in the fingers. The patch is then applied to the puncture and vulcanized. The method of application of the vulcanizer will depend upon the type used.

When a vulcanizer is not used the tube and the patch are prepared in the same manner as has been described. After the patch is ready to be applied to the tube put a thin coat of cement on the tube and another on the patch. Allow these to become thoroughly dry. Then apply another thin coat of cement to both the tube and the patch. When this is nearly dry apply the patch to the tube, being sure that the hole in the tube is as near the center of the patch as possible. The patch being placed upon the tube, it is necessary to exert considerable pressure to make a good, firm job. A clamp, such as shown in Fig. 3, can be applied to advantage.

Wants the S.A.E. Rating Formula

Editor THE AUTOMOBILE:—Will you kindly publish a formula for the S. A. E. rating?

Woodsfield, O. CLYDE TROUTMAN.

—This formula and its derivation were published in THE AUTOMOBILE of August 1, on page 231.

Induction Coil Information Wanted

Editor THE AUTOMOBILE:—What is the voltage delivered at the spark plugs using six cells dry battery and vibrator coil?

2. Does one make coil produce a hotter spark than another on the same number of cells? If so, give the make.

3. Are there any four-cylinder, four-cycle automatic intake valve motors made? What cars use them?

4. Will a set of six dry cells burn out a coil if left connected up? If so, how long will it take?

5. How will a motor act if it uses a burnt coil?

Lebo, Kan. J. H. DRESSLER.

—(1) This voltage is not exactly known. A current of 20,000 volts will jump a gap of 1 inch at atmospheric pressure. This is taken as a basis and estimates have been made using this as a criterion. The generally accepted opinion is that the potential of the current ranges between 8,000 and 10,000 volts, while the amperage of the current is negligible at the plugs.

(2) One coil will produce a hotter spark than another if it has more secondary windings, if it more carefully designed and if the secondary windings are laid closer to the primary. This is the case regardless of the make of coil. When you pay more for a coil you get a coil that has better quality insulation. When the highest grades of insulation are used on the secondary windings of the induction coil the effect is that the laminations of wire are closer to each other because the insulation is thinner. It must be understood that the efficiency of the induction coil

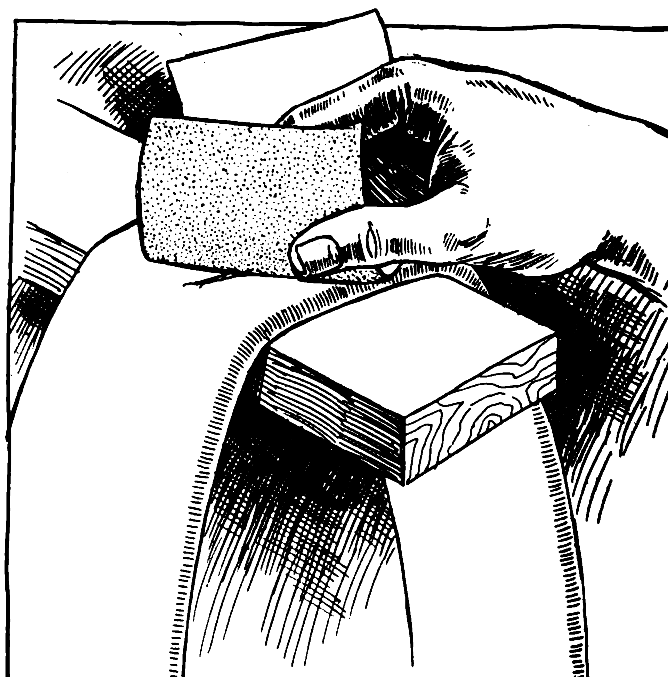

Fig. 1—Sandpapering tube—first step in vulcanizing

depends to a great extent on the number of secondary windings for a given size coil. The closer these are to the primary winding the better for the reason that the induction field is more intense the closer to the primary winding and therefore it may be stated as a fact that the thinner the insulation on the secondary wires the more efficient will be a given size coil so long as there is no leakage of current through the insulation.

(3) There are no more automatic intake valve motors made, all having been discarded in favor of the mechanically operated.

(4) As a general rule it may be stated that the batteries would be run down before the coil would be burned out.

Information on Racing Motor Gasoline

Editor The Automobile:—Will you kindly give the following information:

1. What is the best gravity of gasoline for racing, and would it be satisfactory for average running in the average car? Why?

2. Can you give me a formula for a compound which when applied to brakes will prevent them from squeaking, but will not interfere with their efficiency?

3. If an ordinary single-unit spark coil were inserted in the plus wire from the battery or magneto of a Ford car, as in Fig. 2, so that the current would flow through the primary winding only, and then four vibrators of the regular four-unit coil were

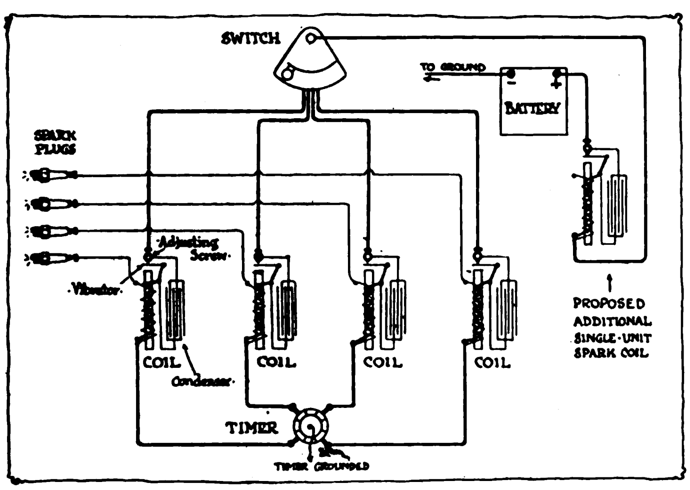

Fig. 2—Diagram showing single-unit coil inserted in positive wire from battery to magneto

short-circuited, would not the use of the single vibrator of the inserted single-unit coil give as good or better results than are obtained by the use of the four-unit coil and the four vibrators by giving perfect synchronism and by reducing the number of troublesome vibrators? If such were done, would it be better to short-circuit the secondary winding or not? Do you think the scheme would work with any satisfaction? If batteries alone were used, would this scheme consume more or less current than the original system?

4. If an extra plug were inserted over the exhaust valves of on Overland 1912 4 by 4 1-2 motor would there be any gain of power? Would the Splitdorf magneto employed on these engines generate sufficient voltage to operate the two plugs, when placed in series?

Oakland, Md. A. Jouce Riker.

—(1) The ordinary automobile naphtha or gasoline of a grade varying from .60 to .69 is used to the greatest extent in races. In former years racing drivers were under the impression that a high test fuel was the best, but soon found out that it did not have the power of the fuels of lower test, although it was easier to start the motor with these fuels. The demand for gasoline of a high test has now practically disappeared since the drivers have become educated to the point that the lower tests contained the greater number of heat units. Improvement in carbureters has also been responsible to a great extent for the use of the more

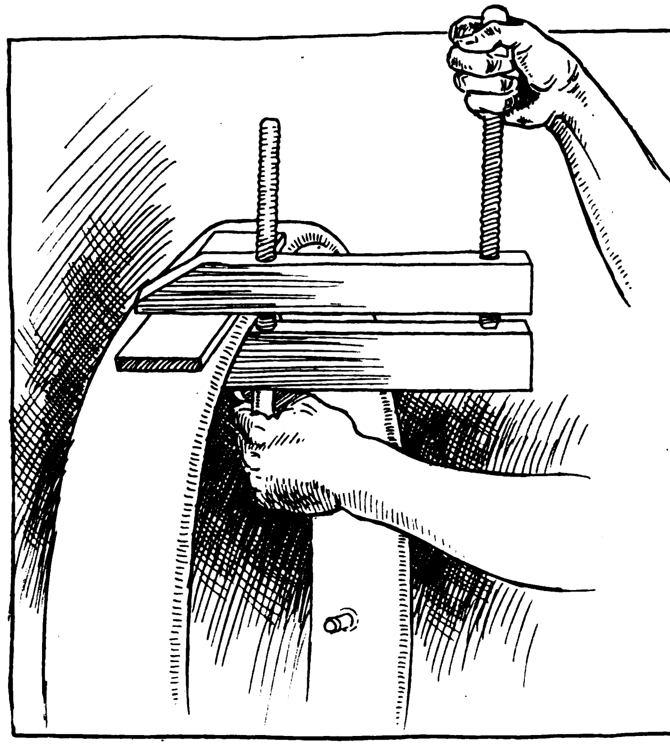

Fig. 3—Clamping patch on tube to insure adherence

powerful fuels, as the difficulties of starting are now not nearly as great as they were. Gasoline from one part of the country will have a different test than from another part, so that allowance will have to be made for this when stating the best quality for use in a racing car. In the Atlantic Coast States 66 gasoline is very good for racing. The best Ohio gasoline from Lima crude is from 58 to 60 test, and Texas and California crude produces a gasoline which is best at 56. In Maryland it may be said that the best is as stated, 66.

(2) The fault of a squeaky brake is in the fabric that is used as a lining. The best cure is to remove the fabric that you now have on the brakes and replace it with new material. The fault may be in the composition of the fabric or it may be that the fabric has been improperly placed on the shoe. It will occasionally happen that the fabric becomes torn and the wrinkle causes a squeak.

(3) In using a single vibrator from battery or magneto it will be necessary to short-circuit all four coil vibrators, using a common master vibrator in connection with the four-unit coils which would give a perfect synchronism, but you would be subject to the trouble that arises from running a master vibrator continuously in that the contact points burn out and cause defective spark timing. If you should short-circuit the secondary winding it would be impossible to get current at the plugs. As to current consumed, if the battery were used alone, there would be no more current consumed than with the original system providing the coils were kept properly adjusted.

(4) There would probably be a slight increase in power if you used a double set of spark-plugs and arranged them so that they would fire simultaneously, but this must be done with a double distributer magneto. There can be no good results expected from two plugs connected in series, as the second plug will introduce complications that make it very unsatisfactory in action. The result of such an arrangement would probably be a very weak spark in both plugs. The Splitdorf people state that this magneto would not and could not be expected to work well when connected to plugs in series.

Presto Tank Is Exhausted Rapidly

Editor The Automobile:—I do not seem to be able to get the service out of my Presto tanks that I did when I first got my car. I do not drive at night any more than I used to and yet

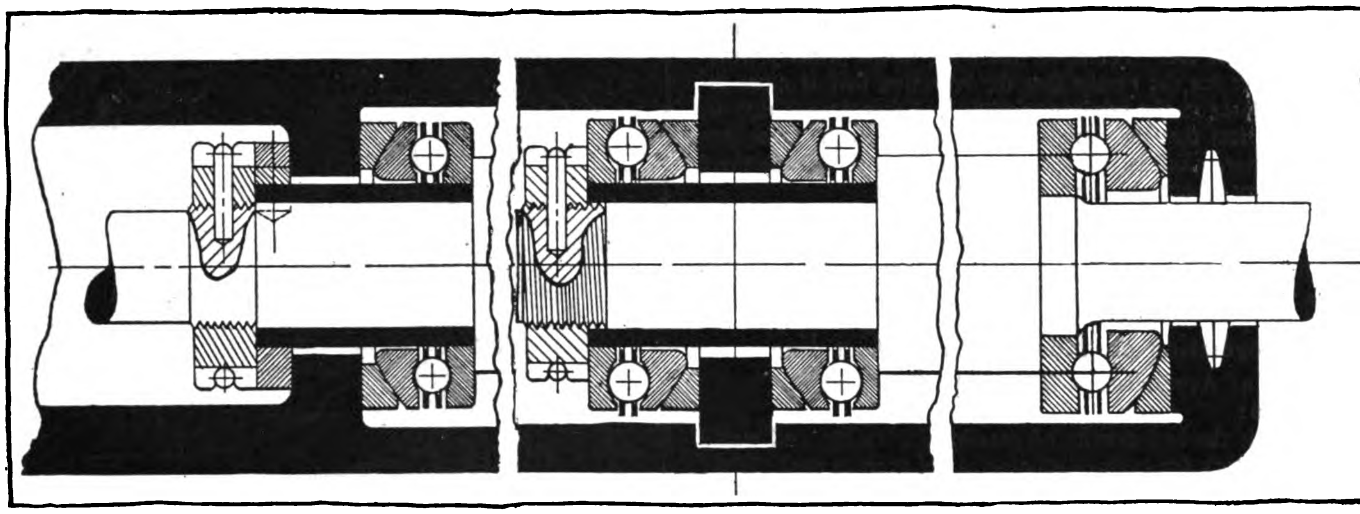

Fig. 3—Three types of ball bearings designed to take thrust in either or both directions

while I formerly got a whole season's use out of my tank I now find that the best I can do is a month. I am using tanks of the same capacity that I always did. It naturally must be due to a leak, but I do not know how to look for it. I have been advised to try by smelling, but I have sniffed along that pipe line as many as a dozen times without discovering anything that seemed as if it might be a leak. Will you please tell me what to do?

Bridgeport, Conn. C. D. WILLIAMS.

—THE AUTOMOBILE has just received a communication from Carl G. Fisher, president of the Prest-O-Lite Company. He gives the following information:

"Leaking pipe lines are a frequent but perfectly needless source of waste. The trouble lies almost always in the carelessness of the user. Complaints of short measure and excessive gas consumption are always traceable to leaks. The peculiar feature of this is that if the owner will spend but a few moments in testing the tubing from the tank to the lamp, the waste will be eliminated, and in many cases the life of each tank of gas will be doubled.

"First disconnect the rubber tubing at the lamps, and pinch or clamp the ends tightly. Go over every inch of the rubber and brass tubing and each connection with heavy soapsuds, seeing that every portion is thoroughly covered with it. Then turn on the gas. A leak at any place will be shown at once by the formation of a bubble. If it is formed at a connection, this should be tightened at once. If the bubble appears on any portion of the tubing (either rubber or brass) it is a sign that the tubing should be replaced or repaired. Rubber is a very treacherous substance and hardens and cracks very easily after exposure to air, heat and sunshine—yet some gas tank users are clinging to rubber tubing that they have used for a year or more.

"The places where the rubber is joined to the brass tubing should be watched carefully as they are a prolific source of leaks. Wherever the brass tubing is run through the frame or mud apron it should be protected from wear. Very often leaks are found at such spots. The rubber tubing, however, is the worst offender and a few cents spent in putting in new rubber connections will often pay for itself many times over in the gas saved. When all of the tubing and joints have been tested and connected to the lamps, the lamps themselves should be tried for leaks. Put soapsuds around the base of the tip and on the stem which holds the tip and on the rubber tube joints at the lamps. Then turn on the gas and light the lamps. If bubbles appear at the joint in the stem inside the lamp, this stem should be unscrewed and the threads covered with white lead.

"Every automobile owner should make this simple test, whether he suspects a loss of gas from leaks or not—and it should be done three or four times a year at least. Every Prest-O-Lite tank is charged to full capacity and fully tested at our charging plants, and wherever a user seems to be emptying his tanks too rapidly in nearly every case pipe-line leaks will be found responsible."

Route from Boston to Altoona

Editor THE AUTOMOBILE:—Will you kindly outline the shortest and most practicable automobile route from Boston, Mass., to Altoona, Pa., giving me distances, etc.?

Lawrence, Mass. J. RODNEY BALL.

—The best route to follow from Boston to Altoona, Pa., is by way of Boston, New Haven, New York City, Harrisburg and Altoona. Going from Boston direct to Providence, a distance of about 45 miles, to New Haven which is about 126 miles from Providence, and then on to New York City, 73 miles further, you will have the shortest route, covering about half the journey. From New York City, cross over to New Jersey by way of the Forty-second street ferry to Weehawken. By following route 41 of the Blue Book to Easton, you will find excellent roads. The distance is about 87 miles. From Easton you pass through Nazareth, Bethlehem, over the Lehigh river into Allentown, and thence into Reading, covering about 57 1-2 miles. Here you will turn west on Penn street with trolley across iron bridge under railroad and straight through village of Sinking Springs. From there on to Harrisburg, you pass through Myerstown, Lebanon, Palmyra, Hummelstown and then into Harrisburg, covering about 54 miles. From here to Altoona the roads are fair, covering about 138 miles. Starting out from Harrisburg, turn north on Second street past Soldier's Monument. Passing through Dauphin and thence on to Mifflintown, the roads are very rough, but from there on through Huntingdon, Alexandria, Birmingham, Tyrone, and into Altoona, they are excellent.

Advocates Left Steer, Center Control

Editor THE AUTOMOBILE:—Referring to your editorial in the August 1st AUTOMOBILE regarding the advantages and disadvantages of left-hand steer, the writer would call your attention to one point evidently overlooked:

You state that the driver sitting on the right side can gauge his relation to the ditch much more readily than one sitting on the left, but overlooked the fact that the driver on the left can watch an approaching vehicle much more readily.

The writer drove right-side steer cars for 5 or 6 years and this year is driving a high-powered car with left-side steer and center control. He finds the left-side steer far superior in all particulars, especially in being able to see how close the wheel of an approaching vehicle is to his own wheel when passing. Possibly in a country where the roads are lined with deep ditches, the necessity for watching the ditch might be greater than that of watching the passing vehicle, but in the writer's opinion the danger from careless and reckless drivers is much greater.

Were not the first American cars copies of foreign cars built with the right-side steer to accommodate the car to the foreign rules of the road where all vehicles pass on the left?

Do not most of the arguments favoring right-side steer come from those having had no experience with driving on the left side and from manufacturers whose policy it is to make no changes unless compelled to? Are not most of the largest manufacturers of high-priced cars today resting on their reputation and selling out-of-date machines to save the expense necessary to add these later improvements? Do not the purchasers of high-priced cars seldom do their own driving and for that reason remain careless as to features of construction of advantage to the driver? ABBOTT WIDDICOMB.

—If you will look on page 210 of THE AUTOMOBILE for August 1, 1912, you will find that the point you mention is cited there under advantages of left-hand steer and is illustrated at the top of the opposite page. As you say, this constitutes a great advantage in favor of the left steer.

Question of Ball Bearing Design

Editor THE AUTOMOBILE:—Are ball bearings that are used to take thrust in one direction only of substantially different design from those which take thrust in opposite directions? If so, please explain the different mountings.

Boston, Mass. E. D. FITZGERALD.

—There is a distinct difference in the ball bearings that are called upon to take loads in either direction and those which are only required to stand a stress from one side. The loads referred to are thrust loads and not radial loads. There are three distinct types of bearings which are distinguished by the different kinds of thrust load they are compelled to bear. The three types, as made by the Timken company, are shown in Fig. 3. The first of these shows a bearing which is designed for take thrust in one direction only. As may be seen from a study of this illustration, if the thrust should cease or should come in the opposite direction, the cage containing the bearings would be apt to drop slightly out of place and when the thrust was resumed the balls would become pinched between the plates. When there is a chance that there will be a cessation of the load so that the plates would separate, a nut, such as that shown in the second bearing, is necessary.

The second type of bearing is one in which a slight thrust in the opposite direction has to be sustained. A plain disk is inserted as shown for the purpose of taking up the load in this direction.

The third bearing is similar to the first in many respects. In fact, it is really two of the first type of bearings turned end for end so that the thrust in either direction is equally well taken care of. In giving these types of mountings the Timken company cautions the user not to allow an undue amount of thrust to be set up by an initial adjustment of the nut behind the one bearing. The setting-up process should not be carried to too great an extent, as a ball bearing is so designed that the friction is not perceptible to the touch except when the bearing is seriously overloaded. Aligning washers are also essential with the thrust bearings wherever the shaft axis can for any reason change position. As distortions may occur during service, the aligning washers are strongly recommended in all cases. Special stress is laid on the alignment of the shafts by all bearing manufacturers, who agree that while distortions may not occur during ordinary work there are very apt to be times when an extraordinary occasion will cause a serious disalignment unless there are special provisions made to brace the shaft. Of course, the extent of the injurious results consequent upon a disalignment of the shafts depends almost entirely on the degree of distortion of the plane of thrust.

Has Solution of Blow-Out Problem

Editor THE AUTOMOBILE:—Responsive to your request for other automobilists to explain Mr. Worseldine's tire trouble, I submit the following explanation:

Since a straight-side type of tire is generally held on a rim by the tension wires in the bead, it follows that after 1,000 miles or thereabout of use they slightly lose their tension. When this takes place it is evident that the casing either creeps a little or else tends to lap itself at some point on its periphery, depending on the elongation of the bead. The result is that it pinches the tubes and causes it to blow out immediately, or else while standing still, involving thereby the factor of the owner's luck. Having the flap in the tire makes little or no difference in my opinion.

I have had this trouble in a much more exaggerated form. A crooked dealer once sold me some clincher tires (soft-bead type) for use with quick detachable rims. While they were new they were all right, but after about 1,000 miles they would expand, often as much as 4 inches, and blow out the tube.

The remedy I suggest is Q. D. tires.

Chicago, Ill. L. O. SCHOPP.

Emergency Brake Lever Won't Hold

Editor THE AUTOMOBILE:—I wish to give a little experience I have just had happed to me, with the idea that it may help some of your other subscribers and prevent them having the same trouble that I had a little over a week ago. I left my car standing on a hill just above a railroad station on a prominent street in the upper part of New York City. I thought the car was perfectly safe where I left it, but it happened that the ratchet which held the emergency brake lever was worn nearly flat, and as a result the lever did not stay in place but slipped out, allowing the car to roll down the hill and out onto the track. Only the timely action of some workmen saved the car from being smashed to pieces by an oncoming train. I have since examined other cars to see if they were deficient in this respect and have found several that were. I made a couple of sketches showing the ratchet as it was on my car and another as it should be. These are reproduced in Figs. 4 and 5, and I would state that I believe it would pay the owner of a car to go over his machine with a file, touching up such points as these. On many of the smaller makes of cars these ratchets are not nearly as deep as they should be in the first place, so that it does not take long for them to wear away. In a short time they become so inefficient that they are likely to fail just as mine did.

New York City. J. T. TODD.

Cadillac for 1913

Increased Length of Stroke Most Marked Change in Motor—Efforts to Obtain Silent Operation

Carbureter Has But One Adjustment—Combined Electric Ignition, Lighting and Starting System Improved

CADILLAC cars for 1913 are in seven body styles, all of which are mounted on the one chassis as heretofore. Although a number of mechanical changes have been made —principally in the motor—the general Cadillac design features still hold.

The motor, while presenting all of the standard Cadillac features, such as separate copper water-jackets, separate cylinder heads of the L-type and five-bearing crankshaft, has a greatly increased stroke over that of 1912. This dimension has been increased from 4 1-2 inches to 5 3-4 inches. The cylinder bore remains at 4 1-2 inches, giving a stroke-bore ratio of 1.28, and putting the Cadillac motor unquestionably in the long-stroke class. The horsepower is increased 18 to 25 per cent. depending on the speed, the greatest percentage of increase being evidenced at speeds ranging from 12 to 35 miles an hour. This is due, of course, principally to the lengthening of the stroke. The S. A. E. horsepower rating for a motor of this bore is 32.4, but the rating which is given the car by the makers, and which is actually developed on block tests is from 40 to 50 horsepower.

Details of Motor Construction

The four cylinders are cast single, as shown in Figs. 1 and 2. The construction is shown clearly in the sectional view of one of the cylinders, Fig. 8. This cylinder design is peculiar to the Cadillac motor and has been used for a number of years. The cylinder heads H_1, Fig. 8, which contain the valve chambers are attached to the cylinders by right and left threaded nipples N_1. The water jackets W_1, which surround the cylinders are of spun copper and are so clamped in position, as shown in Fig. 8, as to preclude any possibility of water leak, it is claimed. The idea of the Cadillac designers in using this peculiar construction is that with an even thickness of cylinder walls and of water jacket, space is afforded around all the cylinders. It also makes it possible to replace any part of any cylinder without disturbing the rest.

The main bearings and lower connecting-rod bearings have all been increased in diameter and in length, which along with the five-bearing crankshaft make an extremely rigid construction, and serve to reduce whipping stresses and motor vibration. The camshaft has also been enlarged from a diameter of 3-4 inch to 1 3-16 inch, and it is mounted on three bearings instead of five as formerly. This three-bearing mounting is made possible because of the larger size and consequent greater strength of the camshaft. The cams are integral with the shaft.

The sizes of the various motor bearings are listed:

Crankshaft—Five bearings. Rear: Diameter, 2 inches; length, 4 inches. Remaining four: Diameter, 2 inches; length, 2 7-8 inches.

Camshaft—Three bearings. Diameter, 1 3-16 inch.

Wrist Pin Bearings—Length, 3 inches; diameter 3-4 inch.

Silent Operation a Feature

The crankshaft and generator shaft on the motor are driven from the crankshaft by silent chains which replace the meshed gears and tend to increase the motor's silence. The chain drive arrangement is shown clearly in Figs. 9 and 10. The valves are all inclosed separately by a special form of housings as shown at V, Fig. 6. The inlet and exhaust valves have been increased from their former diameter of 1 3-4 inch to 2 1-8 inches. All valves are interchangeable and are operated by the single camshaft on the right side of the motor. The valve tappets do not bear directly upon the cams, the lower end of each cam block being provided with a roller, which is constantly in contact with the cam.

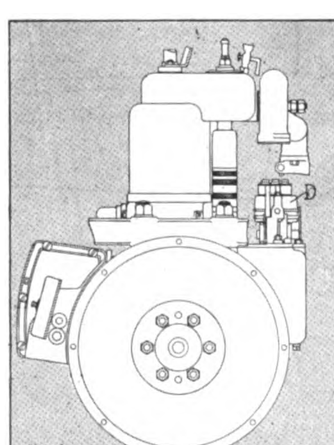

Fig. 3—Rear view of Cadillac 1913 motor

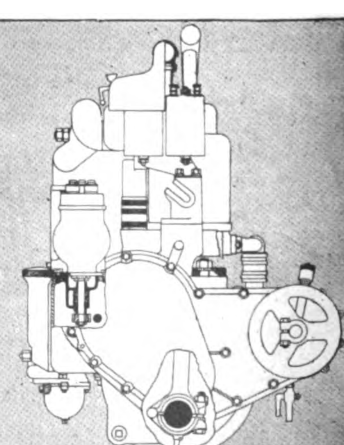

Fig. 4—Front of motor, showing hinged connecting-rod end

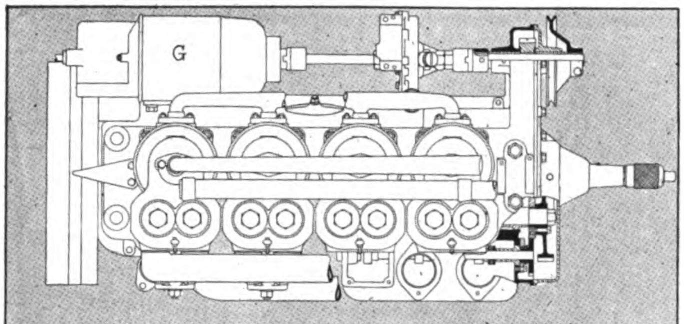

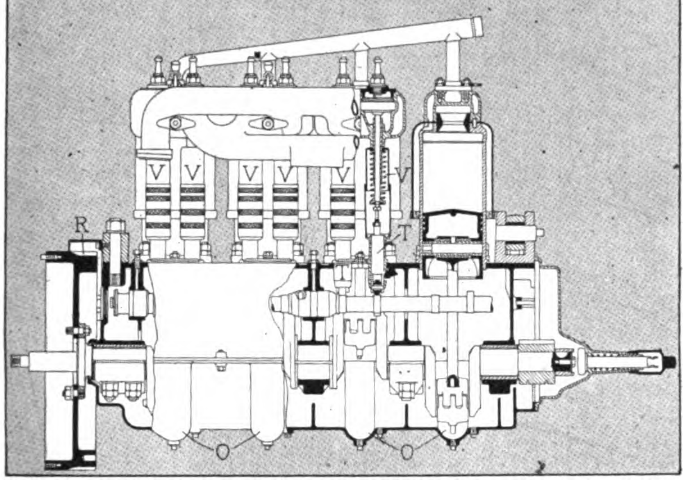

Fig. 5—Top view of the Cadillac engine, showing position of generator G

Fig. 6—Right side sectional view of motor, showing manner of inclosing valve springs and cylinder construction

The lubrication of the motor remains unchanged and is of the automatic splash type, the oil supply being maintained by a mechanical force-feed lubricator. There is a sight feed on the dash. The oil pan part of the crankcase is divided into four compartments into which the lower ends of the connecting-rods dip. The oil reservoir is at the right side of the motor, being a part of the base. In this reservoir to which the oil finally passes there is a double-acting force pump which forces the lubricant up through the sight feed on the dash and thence to the crankcase compartments. The sloping troughs on the sides of these compartments distribute the oil from one trough to another and maintain a constant level in all of them. These individual oil troughs for the lower connecting-rod ends are shown at O in Fig. 6. They are provided with drain plugs to remove all the lubricant for cleaning or other purposes.

The Cadillac carbureter for 1913 has only one adjustment, that being for the air supply. The gasoline adjustment is fixed. There is, however, an auxiliary air adjustment on the steering column. To assist in vaporization, the carbureter is water-jacketed, which is an especial advantage in cold weather.

Improved Delco System Used

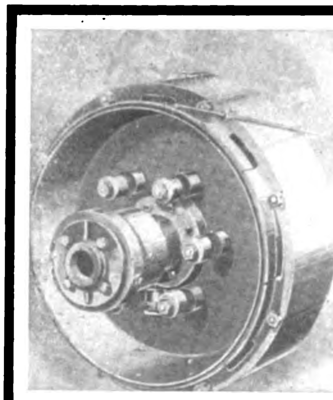
The cooling system is continued as on former models, the radiator being a Cadillac design consisting of 147 seamless copper tubes which pass vertically through 145 horizontal copper plates. Cooling is assisted in the conventional way by the use of a belt-driven fan at the forward end of the motor. The fan belt tension is regulated by adjusting the center distance of the fan pulleys.

The electrical system of the Cadillac is of the Delco type, somewhat improved from its form as applied to the 1912 model. This system combines all the electric functions of ignition, lighting and starting. The generator, which is temporarily converted into a motor when required to start the car, is on the rear left side of the motor at G, Figs. 2 and 5. The Delco system has been explained on numerous occasions in the THE AUTOMOBILE and will be only briefly taken up here. For starting the engine, the closing of a switch within the driver's reach temporarily transforms the generator into a motor. Pushing forward on the clutch pedal causes a gear of the electric motor to mesh with teeth cut in the outer rim of the flywheel as shown at R, Figs. 10 and 6. The electric motor then turns the flywheel and the crankshaft until the engine takes up its regular cycle of operation, after which the clutch pedal is released, disengaging the gears. The starting switch is then cut off and the generator operates as a generator and is driven by gears from the engine, furnishing current for ignition, for lighting and for charging the storage battery.

Ignition and Lighting Improvements

The ignition system consists of two complete, independent circuits and there are two sets of spark-plugs. In addition to the generator, there is a set of dry cells for emergency use and for furnishing ignition current when the storage battery energy is being used for driving the temporary motor which starts the gasoline motor. After the engine is running the dry cell current is cut out and the generator current switched on by means of a switch under the driver's control. In connection with the dry cell current a Delco distributer, shown at D, Fig. 1, is employed. Current for lighting head, side and tail lamps is furnished by the storage battery when the motor is idling or not running, while after it is up to speed the generator current becomes sufficient to provide for the lamps. Any excess current produced is passed to the storage battery. This current distribution is all provided for by automatic control switches. The storage battery has a capacity of 130 ampere-hours, and as soon as that capacity is reached the charging automatically ceases. Up to 280 to 300 revolutions a minute the ignition current comes from the storage battery but above that speed it is sent automatically direct to the spark-plugs from the generator.

By using two windings and two commutators on the generator armature, one for use when the electrical unit is driven as a generator and the other when used as a motor, it is possible to operate the motor-generator on 6 volts. This permits of the doing away with the formerly-used control switch and ampere-hour meter. The voltage regulator determines the rate of charge to the storage battery and the voltage to the lamps. It provides for the charging of the storage battery at a rate depending upon the condition of the battery. That is, a fully discharged battery is charged at a high rate, and vice versa. On the new model the gearing between the electric motor and the flywheel is made about 25 to 1, instead of 20 to 1 as heretofore. This change increases the cranking speed of the motor and the duration of cranking time. Another improvement in the system is in the spark timing which is automatically controlled by a ring governor, making it unnecessary to constantly regulate the spark lever on the steering wheel quadrant. The wires to the side lights are run through



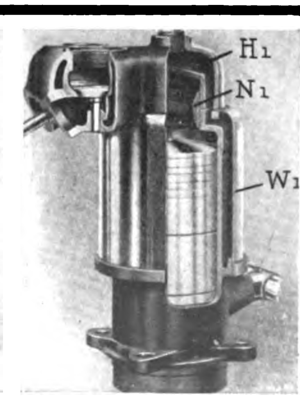


Fig. 7—The Cadillac cone clutch with spring ring in the flywheel

Fig. 8—Showing cylinder construction. Cylinder-heads and water-jackets are separate

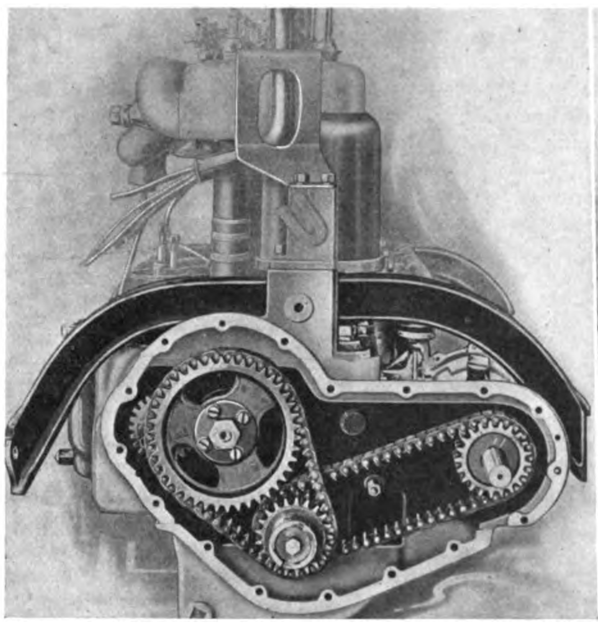

Fig. 9—Front view of Cadillac motor, showing silent-chain driven pump and cam shafts

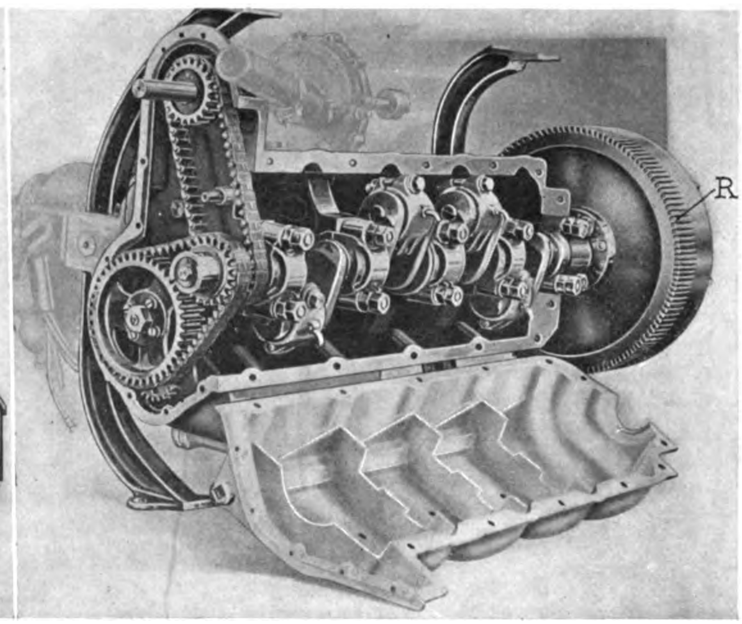

Fig. 10—Bottom of motor, illustrating 5-bearing crankshaft and oil compartments

the brackets which hold these lamps and are therefore invisible. This is a new feature. Fuses have also been placed on all lights and a Yale lock has been put on the ignition switch.

In considering the remaining features of the car, the clutch is next in order. It is of the cone type and leather faced, and has a special spring ring in the flywheel. This ring with which the cone engages is split at eight points of its periphery and part of each section is sprung inward. The idea of this arrangement is to make the clutch take hold gradually and to eliminate all the shock and jar which results from the clutch taking hold fiercely when starting the car.

The transmission is of the selective, three-speed, sliding-gear type with direct drive on high. Gears, transmission shaft and clutch shaft are of chrome nickel steel. The gear teeth are beveled in the conventional way. A view of the gearset is shown in Fig. 11. The main transmission shaft, the jackshaft and the clutch shaft revolve on a total of five annular ball bearings. The drive from the gear-box to the rear axle is by means of a heat-treated, carbon steel shaft, fitted with two universal joints. These are provided with hardened and ground bushings and pins. The joints are inclosed in spherical housings and run in oil baths. The forward universal is telescopic and is so constructed as to be self-centering. The torsion member is V-shaped and tubular. The rear axle is of Timken floating type with bearings of the same make, throughout. The driving pinion and bevel gear are of a special carbon steel. The front axle is drop-forged of I-beam section and has drop-forged yokes, spring perches, tie-rod ends and steering spindles. The front wheel spindles of the new chassis are fitted with Timken bearings at the top.

Brake and Chassis Specifications

The brakes are of the conventional type, bolted to the rear wheel spokes, drums with diameter of 17 inches and a width of 2 1-2 inches. Wheels are of artillery type and fitted with demountable rims. They carry 36 by 4 1-2-inch tires, whereas last season the tires were of the 36 by 4-inch size.

The frame is of pressed-steel channel, double-dropped a total of 2 1-2 inches. The frame width in front is 30 inches and 33 inches at the rear. The entire frame has been dropped 1 inch, giving the car 1-2 inch more action by lowering the front axle 1 1-2 inches more than last season.

The spring suspension is of the standard platform type in the rear while the front springs are half-elliptic. The rear side springs have been made 4 inches longer than on the previous model. The present spring sizes follow:

Front—Length, 36 inches, width, 2 inches.

Rear Sides—Length, 48 inches; width, 2 inches.

Rear Cross—Length, 39 1-2 inches; width, 2 inches.

The steering gear is shown in Fig. 12. It is of Cadillac worm and worm-gear sector type. It is adjustable and is provided with ball thrust bearings. The steering wheel has a diameter of 18 inches and has its rim corrugated. The spark and throttle levers have the usual location on the quadrant above the wheel.

A new feature this year is the placing of the emergency brake inside the car, making it possible to use the right front door.

On the new model the wheelbase has been increased 4 inches from 116 inches to 120 inches, while the tread is 56 inches. This serves to make the body more roomy and adds to the comfort of the passengers.

All open bodies are of sheet-steel construction, while the closed bodies have aluminum sides. A cowl appears on all the new open bodies instead of the dash, while the fenders follow the lines of the wheels. In all respects the new bodies are most attractive in appearance and the upholstery is of such a character as to make easy-riding a feature. The standard equipment for 1913 will include mohair top and side curtains, windshield and speedometer. These were not given as part of the regular equipment last year. A full complement of tools and accessories for all contingencies is found on 1913's Cadillac.

La France Hauls Big Load

Pulls 11 Tons Up an 8 Per Cent. Grade 100 Yards Long at a Rate of 5 Miles an Hour

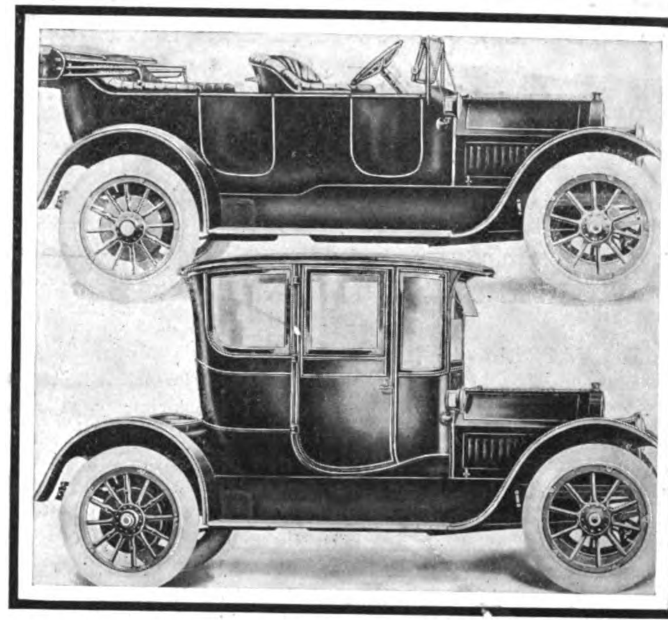
IN a demonstration of the 5-ton American-La France truck, manufactured by the American-La France Engine Company, Elmira, N. Y., which was given at Bergen, N. J., last Friday, this truck, which is equipped with a 40-horsepower, four-cylinder engine, hauled a total load of over 11 tons up an 8 per cent. 100-yard hill at a rate of 5 miles an hour. The truck has a wheelbase of 143 inches and an overall length of 227 inches, and a loading space of 154 square feet. It is equipped with a Manly hydraulic-drive system, which takes the place of clutch, transmission and differential.

For the demonstration the truck was loaded with about 11,200 pounds of bricks and a trailer was attached to it, which carried 11,550 pounds. This load was first transported over a level road about 1 mile in length at an average speed of 11 miles an hour, after which the train was driven up the hill. The train was stopped several times in the middle of the hill and was started again without any trouble.

Manly Transmission a Feature

The principal feature of the La France truck is the Manly hydraulic transmission. It consists of a five-cylinder piston pump, in which the cylinders are arranged in star manner around the driveshaft, which is directly coupled to the crankshaft of the automobile motor, and two similar devices on the jackshaft which are driven by the pressure of the oil entering them from the five-cylinder pump, thus acting as water motors which drive the sections of the rear axle by means of chains. The five piston plungers of the pump bear on a bushing which incloses an eccentric of the pump-drive shaft. The eccentricity of the bushing may be altered by an ingenious mechanism controlled by the driver so that the stroke of the pumps may thereby be changed, resulting in a corresponding change of the quantity of oil transported by the pump and an inversely proportionate change of pressure exerted by the pump on the oil forced into the motors on the jackshaft. When the control lever, which is attached to the steering post, is thrown forward, the stroke of the pump is lengthened and the speed of the whole system is increased, while a backward movement of the lever reduces the stroke, and eventually causes the eccentric to become concentric with the pump shaft and the pump stroke to become nil. This locks the oil in its passage and makes the motors act as brakes on the rear wheels. While the use of this drive makes the clutch superfluous, a device is used which serves its purpose. This is a by-pass valve, controlled by a pedal on the driver's seat, which interrupts the passageway from the pump to the liquid motors and causes all the oil to be circulated directly from the outlet back into the inlet of the pump.

American-La France truck and trailer, hauling a load of 11 tons of bricks over a Jersey hill at 5 miles an hour



New Cadillac body styles: Fig. 13—The touring car type. Fig. 14—The new coupe model

The accompanying illustration shows the 5-ton truck and trailer with the oil motors on the jackshaft. The absence of the propeller shaft is also noticeable, a pipe which branches from the pump to the two motors taking its place. The return of the oil to the pump is through two pipes laid directly under the loading platform.

Taxicabs for English Maneuvers

From the 1st of August until the middle of September there will be 500 fewer taxicabs in commission in the streets of London than usual. The War Office has commissioned these vehicles for use during the autumn maneuvers. The bodies of the taxicabs are removed, after which transport wagon bodies are fitted to the engines. The general scarcity of qualified cavalry horses in the British army is responsible for the innovation. At the same time it all goes to illustrate the impromptu efficiency of the motor vehicle in a case of emergency.

From Paris to Lyons is 320 miles. It is over this course that a successful trial has just been made with a "winged motor car." The car, designed by M. Bertrand de Lesseps, was driven by a revolving wing. In appearance the vehicle is not unlike an ordinary automobile, save that it is shaped like the prow of a ship in front. The wing is small, thick and strong, and revolves within a protecting cage. The engine, of 40 horsepower, rotates the wing by means of a shaft and chain transmission. No other mechanism is in evidence, the wheels of the car being free except in the matter of foot brakes. A single lever controlling the clutch is beside the driver, this lever also controlling the forward and reverse movement of the wing. The latter can be reversed at a moment's notice, thus affording an additional brake. The car weighs 1,300 pounds and attained a speed of 62 miles per hour with the wing making 2,100 revolutions each minute. The inventor is convinced of the car's practicability and hopes to capitalize his invention in the near future.

OWING to a mistake in calculation, the population per car in the state of California as given in the statistical story in the issue of THE AUTOMOBILE for July 25 was 300, whereas that state should have headed the list with one automobile for every thirty of the population.

Mais Truck Reorganized

Incorporated With $1,000,000 Capital—New Company Is Largely Composed of Stockholders in Old Company

Mortgage of $10,000 on the Plant—Stockholders in Old Concern to Receive Nothing

INDIANAPOLIS, IND., Aug. 21—The Mais Motor Truck Company has been reorganized and incorporated with $1,000,000 capital by the purchasers of the property at receiver's sale. Frank H. Wheeler, of Wheeler and Schebler, who will hold one-half of the stock, is the new president. Walter M. Pearce, Rushville, Ind., is vice-president, while Alvin S. Lockard, Indianapolis, is secretary and treasurer. William H. Brown, former president, will continue with the new company. The officers and Jacob V. Stimson, Huntingburg, Ind., and Harry G. Francis, Rushville, will constitute the board of directors.

The new management is composed largely of stockholders in the old company. Stockholders of the old concern will realize nothing on their shares. The new company has assumed a mortgage of $10,000 on the plant beside paying $71,000 for the assets.

Only one bid was submitted for the purchase of the company and the property was sold by the receiver, Franklin Vonnegut, to Frank H. Wheeler, of Indianapolis, and Walter N. Pearce, and N. G. Francis, of Rushville. The purchase price is $71,000 and the sale, of course, is subject to the approval of the court, which is in vacation.

Mr. Wheeler declined to give any details as to the future of the company until the sale is approved by the court. Mr. Francis and Mr. Pearce are stockholders in the old company. Mr. Wheeler will control about 50 per cent. of the stock.

Besides getting the plant and equipment, the purchaser will get about $12,000 in accounts and $10,000 in notes receivable. One-third of the sale price is to be paid in cash; one-third in 12 months and the remaining one-third in 18 months.

The receiver filed the following inventory in court: Finished stock, including two shop cars and parts in assembly, $26,759.32; automobile parts, now in process of machining, $6,327.89; automobile parts in the rough, consisting of rough castings and all unfinished parts, $19,481.55; bar steel, brass and steel tubing, $7,887.17; machinery, $55,236.82; factory equipment and supplies, including all belts, pulleys, motors, starting boxes, etc., $10,778.53; office equipment $2,784.05; paints, oil, etc., $460.56; patterns, manufacturing cost, $7,804.36; jigs and tools, manufacturing cost, $13,439.67 and real estate and buildings, $30,000. Total, $180,959.92.

The receiver expects to have approximately $85,000 to divide among the creditors. The liabilities of the company are said to amount to approximately $250,000.

Swinehart Declares Dividend

AKRON, O., Aug. 19—The Swinehart Rubber Company has declared a quarterly dividend of 1 1-2 per cent., which means the reduction of the regular dividend from 8 to 6 per cent. In a letter sent out with the dividend checks the statement was made that the company deemed it advisable to reduce the dividend and build up a larger working capital.

Rubber Trade Doubts Pool Rumors

No pressure to sell was apparent in the crude rubber market recently and the buying, while steady has been in jobbing quantities only. Little credence is placed in the reports of another giant scheme of valorization and the position is taken by many of the consumers that even should the plan be adopted, it is likely to have no more success than the one which was attempted last year.

The 1911 idea was financed under the auspices of one of the Brazilian states and bonds were issued to buy about 15,000,000 pounds at an average of $1.10 a pound. This rubber was retired from the market and the price advanced to $1.70. At that figure trade became stagnant and every attempt to liquidate the valorized stock found a sinking market with no buying force in it anywhere. The holders of the valorized stock became panicky at last and the whole mass of rubber was sold at about $1.18 a pound average. On the face of affairs the pool made a gross profit of $1,200,000 but as a matter of fact, brokerage, interest, commission, freights, storage and other items of cost brought the money level of the product to $2.60 per pound which netted the holders a stunning loss of over $18,000,000.

With the experience of the state-promoted pool in mind, the rubber trade does not figure that the present rumors of valorization are founded on much of a fact basis. Current prices are based upon about $1.19 1-2 per pound for up-river fine.

Bergdoll Agrees to Take Motors

PHILADELPHIA, Aug. 19—The legal hostilities between the Louis J. Bergdoll Motor Company, of this city and the Westinghouse Machine. Company, of Pittsburgh, were finally adjusted and

Automobile Securities Quotations

Goodrich common was the strong feature of the market for automobile securities during the past week. The stock advanced 5 points on impressive investment buying caused by excellent preliminary reports of extended business. Firestone was another strong feature among the tire makers. There was some realizing on recent purchases of Studebaker common and the market yielded a point as the result of such trades. General Motors was steady and United States Motor was fractionally lower on profit-taking sales. Reports from the manufacturing and accessory industries were all rosy. One of the most significant basic features of the market was the quiet strength of Rubber Goods. An outline of the reorganization plan for United States Motor will probably be announced early next week. Rumors as to changes in the personnel of the company have been circulated for a week but lack color of official sanction. Chairman W. E. Strong has announced that the 1912 business is closed and that so far the 1913 situation is satisfactory.

settled when full satisfaction was entered on the records of court of Common Pleas No. 4.

In May, of 1910 the Westinghouse company contracted to build for the Bergdoll company 1,000 gasoline motors to be delivered at the rate of not less than 100 per month. After receiving and paying for 600 of the 1,000 motors the Bergdoll company declined to receive or pay for the balance, alleging as its reason, failure on the part of the Westinghouse company to make deliveries as agreed, and consequent losses in sales of automobiles in the construction of which the motors in question were to be used. As a result the Westinghouse company brought the above action.

By the terms of settlement the balance of the motors are to be shipped to the Bergdoll company as its needs require.

Atlas Plant Closed Temporarily

SPRINGFIELD, MASS., Aug. 19—The Atlas Motor Car Company has practically closed its plant temporarily because of its inability to secure motors for its product. Plans are under way for a directors' meeting at which the capital stock will be increased from $250,000 to $350,000 and an arrangement made to build the motors at the plant. The question of a reorganization will also be discussed. The company has orders approximating $200,000 on its books and these would be largely increased if the company had not been handicapped just at this time in getting motors.

Market Changes for the Week

The most important feature of the week's market was the advance in the price of Bessemer and open-hearth steel. Each advanced $1.00 on Monday, as a result of the pressure for shipments. Copper experienced a fractional loss in price on Thursday, remaining unchanged throughout the week. Tin was also a prominent feature of the metal market this week, due to active speculative operations, advancing the price 75 cents per 100 pounds. Fine up-river Para rubber rose 2 cents a pound during the week, closing at $1.19. Lead advanced 5 cents on Tuesday, being much firmer in tone, closing at $4.55.

Oil and lubricants remained at their old prices, with the exception of cottonseed oil and linseed oil, the former varying in price throughout the week, closing with a loss in price of 3 cents. Linseed oil closed at 68 cents, experiencing a loss of 2 cents, due to lack of interest of the consumers. Gasoline remained unchanged. Antimony advanced 1-2 cent a pound on Thursday, closing at 7 5-8 cents per pound. The variations for the week follow:

Material	Wed.	Thurs.	Fri.	Sat.	Mon.	Tues.	Week's Change

Insurance Men Plan Boost

Point to Rise of Automobile Accidents From 3 to 22 Per Cent. of Causalty Total as Reason for Increase

Overlook Basic Cause for Excessive Losses Which Result From Present High Rates

HARTFORD, CONN., Aug. 17—Bertrand A. Page, vice-president of the Travelers' Insurance Company, of Hartford, Conn., has just returned from the convention of the International Association of Casualty and Surety Underwriters, held at Fortress Munroe, where he read a paper on the question of motor accident insurance. He pointed out that because the losses due to automobile accidents amounted in 1911 to almost 22 per cent. of the total accident insurance men are becoming very much alarmed. He showed that in 5 years prior to 1906 automobile losses amounted to less than 3 per cent. of all losses, rising rapidly since then. To meet this the insurance men are considering higher rates or less liberal policies. Among other things he said:

Ten years ago, roughly estimated, there were less than 100,000 pleasure automobiles in the United States and Canada. To-day there are at least 900,000 in use. While the auto claims have been steadily on the increase, there has been no appreciable diminution in horse and vehicle accidents. The average amount paid for claims under this heading for the 5 years, 1902 to 1906 inclusive, was 10.4 per cent. of the total losses. In the year 1911 we find horse and vehicle accidents constituting 6.6 per cent. of the total in amount of claims, and automobile accidents 21.8 per cent. of the total.

Indemnity claims from auto accidents May, 1906, to April 1, 1912, in the amount paid were in excess of the death losses during the same period; 548 claims were paid last year for cranking accidents alone. Of the 1335 auto claims in 1911 1317 were for indemnity losses.

It is our experience that the greater number of claims do not come from the reckless use of an automobile, and from the nature of the accidents they might occur to anyone however cautious and conservative. When the automobile first came into popular use it was assumed that an extra rate to cover the hazard was not expedient, because the proper use of an automobile is one of the customary diversions of outdoor life. We do not contend that it is any more hazardous to run an automobile now than it was ten years ago, but we do contend that because of its use being almost universal, the exposure is one which must be considered in connection with insurance of the select and preferred classes. That the average automobile owner personally operating and caring for same should pay an extra rate is evident from the figures heretofore quoted. There are those who cannot safely be insured at less than extra special hazardous.

We charge a chauffeur $10 per $1000—yet his position depends on his care in operating the car. He is experienced and does the right thing instinctively. He has nothing to divert his mind. His interest is not in scenery nor the beautiful ladies who adorn the tonneau. He has not spent the evening at the club, and if he wished to hold his position he learns early that there is a strict prohibition, applicable to chauffeurs only, against the mixing of alcohol and gasolene, even in small quantities.

It cannot be said that exposure is only an incidental one, such as hunting, fishing and other sports. The insured is at it daily or nightly from eight to twelve months in the year. We can assume the hunting hazard for two weeks to a month each year, but if our insured makes hunting his business we advance his rate from $5 to $15 per $1000.

Much has been said about the necessity for higher rates or a less liberal policy contract. With automobile accidents constituting in the year 1911 about 22 per cent. of the claims in amount and over 10 per cent. in number, it would appear that the remedy for the situation lies in the securing of an adequate rate in connection with the insurance of those who use automobiles daily. It is unfair to charge the non-user for the claims incurred by his more exposed neighbor.

Ten years ago there was practically no such thing as an automobile accident. Last year, claims from select, preferred and ordinary class risks were increased by automobile accidents 28 per cent., and this does not take into account horse and vehicle accidents caused by automobiles, nor injuries to pedestrians and persons on bicycles, motorcycles, etc., who were run over or into by autos. During the past few years, the automobile has been the big factor in increasing claim loss ratios, although unwarranted liberalizations in the policy contract have not been without their effect.

Carl Fisher Buys Into Esterline

INDIANAPOLIS, IND., Aug. 19—Carl G. Fisher and James A. Allison of the Prest-O-Lite Company, this city, have bought $100,000 of the capital stock of The Esterline Company, West Lafayette. The plant will be moved to the new horseless city, near the Indianapolis Motor Speedway.

The Esterline Company manufactures a graphic registering meter and various electrical specialties, including an adaption of the Berden system of electric lighting for motor cars. The company has an authorized capitalization of $200,000 and employs 200 men.

Canadian Ohio Stock Out

Company Puts $90,000 Worth of 7 Per Cent. Cumulative Preferred on the Market

Factory Will Be Established at Colborne, Ont.—Working Agreement With American Ohio Company

TORONTO, Aug. 19—The Canadian Ohio Motor Car Company for public investment $90,000 worth of 7 per cent. cumulative preferred stock at $100 per share, carrying a bonus of 25 per cent. common stock.

The manufacturing plant will be established at Colborne, Ont., where the company has been granted a valuable site and exemption from taxes for a period of 10 years.

The operating agreement between the Ohio Motor Car Company and the Canadian Ohio Motor Car Company is of material advantage to the Canadian company, inasmuch as it provides that the Canadian company shall have the exclusive right to manufacture and sell the "Ohio" car, and to the use and benefit of all patents, blue prints, tools, dies and general engineering, together with free service of the draughting department of the American company, and to receive the benefit of all experimental work both now and in the future, of the American company.

Canadian Foreign Trade Lively

MONTREAL, Aug. 19—It has been known for some time past that the Montreal office of the New Zealand Shipping Company has been placing a number of Canadian made automobiles in Australia and New Zealand, but few will be prepared to hear the dimensions to which this trade has grown. During the year ending May 1, 1,292 Canadian automobiles had been sent by New Zealand liners, and it is hoped to forward at least 1,800 during the ensuing year. The total number already shipped from the opening of the summer navigation season to date is 629.

The Shell company, of Canada, advises that a large cargo of gasoline was shipped on board the steamer *Electra* which sailed from Singapore for Montreal on August 5. The shipment comprises 1,500,000 gallons of gasoline and is expected to arrive in the harbor before the end of September. It will be discharged at the Racine pier.

Fall Motor Festival in Chicago

CHICAGO, Aug. 19—Plans have been made by the Chicago Automobile Trade Association for its annual fall festival, which has been scheduled for the week of September 14-21. In reality this is to be a street show, with Michigan avenue lighted at night, all the stores decorated and the 1913 models on view. As attractions there will be parades and other affairs which will bring out the prospects. The opening night there is to be a parade of commercial vehicles, which will include those machines which have taken part in the Chicago Motor Club's demonstration, which has been scheduled for September 10-13.

Gotham Protests High Gasoline

High local gasoline prices have brought about a storm of protest from New York garage proprietors who claim that the metropolitan district is being subjected to adverse discrimination on the part of the oil companies. According to leaders in the business, the price of gasoline sold to automobilists in New Jersey, Connecticut and up-state is around 18 cents a gallon while they are obliged to sell at 20 and 25 cents a gallon in order to break even on their gasoline business.

They state that the local government will be obliged to charge 30 cents if there is to be any material profit in the business. The point is made that the garage operators realizing that gasoline at an exorbitant level will tend to check the use of the automobile are heartily in favor of a readjustment of prices so as to foster wider use of the car.

A meeting has been called early in September when the whole matter will be threshed out from the viewpoint of the garageman and the user.

The Standard Oil Company denies any discrimination against New York and states that the level of prices established in New York applies equally to all the metropolitan territory. This price is 16 cents a gallon in wholesale lots and 21 cents a gallon delivered to garages in steel barrels in lots of 200 gallons or more.

The reason for the difference in prices is said to be founded upon the overhead charges of the local trade including the expensive equipment necessary for handling gasoline under the local ordinance, higher rentals and the price of labor here as against the cost of running a country garage.

N. A. A. M. Clears Show Issue

Some confusion in the minds of the trade may have arisen through the unwarranted use of the term National Show Circuit, as applied to the local show circuit, some of preparations for which have been handled by the National Association of Automobile Manufacturers.

The facts in the case, according to official announcement of the N. A. A. M. are that the only national shows to receive sanction are those to be held in New York and Chicago. At all others, manufacturer as such are barred from participation.

But, a circuit of dates for local shows which shall be handled and entered only by the local trade and for which manufacturers are authorized to loan a chassis or show car and to be represented by salesmen, if desired has been arranged as follows:

Cleveland, January 6-11.
Philadelphia, January 20-25.
Detroit, January 27, February 1.
Minneapolis, Feb. 10-15.
Kansas City, February 17-22.
Pittsburgh, March 3-8.
Boston, March 8-15.
Buffalo, March 17-22.

The dates February 24, March 1 will be assigned in a short time.

Vancouver Show in Full Swing

VANCOUVER, B. C., Aug. 15—The Vancouver second annual automobile show held under the auspices of the British Columbia Auto and Motor Trades Association and Premier McBride, is now in full swing, and is one of the finest automobile displays ever seen in Western Canada.

The exhibit embraces cars of every description—commercial and pleasure, gasoline, steam and electric, as well as a wide range of all motor accessories.

A little over 2 years ago there were twenty motor trucks in this city, and at present there are over 200.

There are in this city about 1,700 power-driven machines, including motorcycles and business trucks.

BUFFALO, N. Y., Aug. 20—The pathfinding crew for the third annual reliability run of the Buffalo Automobile Club to be made September 11-14 completed its labors Friday night in the Studebaker 30 car, which was sent from Detroit for the work of mapping out the course to be taken on the annual run. In the 4 days consumed for the completion of the course to be taken, 838 miles were traversed, the pathfinder returning to Buffalo every evening. An average of 210 miles daily was made by the pathfinder.

The winner of the reliability tour will be awarded sweepkstakes trophy for the ensuing year.

Peugeot Enters at Elgin

Grand Prize Winner and Two Other Cars of That Make Scheduled to Compete

Boillot, Goux and Zuccarelli, Grand Prize Pilots, Probably Will Be the Drivers Chosen

CHICAGO, Aug. 21—The Peugeot car which won the French Grand Prix will contest for racing honors in America, with its first appearance in the Elgin road races of August 30-31, in which it will be entered in the Elgin National Watch Company trophy race and the free-for-all. From Elgin the team will proceed to Milwaukee for the Grand Prix and Vanderbilt cup races.

A cablegram received by Paul Lacroix, American representative of the Peugeot, announced Monday that the three cars that raced in the French Grand Prix were already on the water, accompanied by three drivers, with the intention of taking part in in the American road races. It is anticipated that they will reach New York Saturday and be shipped immediately to Chicago, reaching Elgin on Tuesday, where they will be given a couple of days for practice. Just who the drivers are is not known, but it is anticipated that they are Boillot, winner of the Grand Prix, Goux and Zuccarelli.

Following this cablegram E. C. Patterson, of Chicago, and R. J. Collier, of New York, who started the movement to import the Peugeots, agreeing to be sponsors for them in the American races, made four entries in the Elgin road races—each being represented in two races on the second day. The third car also will be entered by Mr. Patterson as soon as he is notified by Mr. Lacroix that this can be done. These entries are made provisional on the cars getting here in time, which seems most likely now. If the cars race at Elgin, both Mr. Patterson and Mr. Collier will enter them at Milwaukee also.

Many Expert Drivers Entered

The French dressing given the races adds greatly to the International flavor of the contests which are being promoted by the Chicago Automobile Club, and the Elgin Automobile Road Racing Association, for already nominated are the Fiat of Italy, and the Benz and Mercedes, of Germany, while the American representation consists of the Knox, National, Stutz, Mercer, Mason, Falcar and Herreshoff.

The roll-call of drivers engaged shows a rare lot, consisting of the French trio, Teddy Tetzlaff, Erwin Bergdoll, Ralph Mulford, David Bruce-Brown, Hughie Hughes, Spencer Wishart, Harry Endicott, Len Zengel, Billy Knipper, Charley Merz, Gil Anderson, George Clark, Neil Whalen, W. G. Wordingham and several others. In the case of Bruce-Brown, his entry hinges on his closing a deal with E. E. Hewlett of Los Angeles for the same Fiat which he drove at Savannah last fall. Bruce-Brown's car which he drove in the French Grand Prix was not shipped from Italy until today, so that there is no chance of it getting here in time. As Hewlett has all three of his cars at Elgin now there seems to be no doubt as to his coming to terms with the two-time winner of the American Grand Prix.

Course Preparations

Work on the course is progressing rapidly and unless it rains the rest of the week, which is unlikely, it will be in shape by Saturday. Practice, however, will not start until Monday. Several of the camps already have been established, the Fiat, Mercer and Mason being here already.

Wm. K. Vanderbilt, Jr.'s personal representative, E. G. Williams, inspected the course being prepared for the four big motor classics to be run under auspices of the Milwaukee Automobile Dealers' Association on September 17, 20 and 21, and returned to New York on last Saturday full of enthusiasm and highly gratified over the selection of the roads and the progress of the work of reconstruction.

"It is fine," was the expression of Mr. Williams after being hauled over the 8.2 mile course. "It is much better than the Greenfield course you Milwaukeeans first thought of using for the big races. Those two 3-mile straightaways will add a touch of the real sport of motor racing, and I think some new marks will be hung up if the course proves as fast as it looks today. One of the best features of the roads you have selected is that high speed can be maintained throughout its length, for your turns are wider than the rule and of such shape and dimensions that drivers will not have to slow down to the extent that they do on less safer turns on other courses."

The work of surfacing the roads with a 70 per cent. asphaltum composition, with screenings, began on Monday morning. A. B. Chamberlain, of New York, who has the contract for oiling the course, arrived on Saturday and has already organized his crews. The first oil has been applied on the Town Line road, the upper or north leg of the course, but the bulk of the work will await a thorough drying of the surface, following heavy and continuous rains.

Rain Hindered Road Work

During last week there were showers on all but 1 day, and this has interfered slightly with the progress of the road work. However, before the contract was taken, allowances were made for exactly such conditions, and the completion of the work will not be delayed 1 day unless some serious situation should arise which cannot be discerned at this time. One week from Saturday the course will be ready for the space-eaters. The drivers already entered for Milwaukee who will be seen at Elgin, will beat it from the Illinois course to Milwaukee and find the course ready for preliminary practice when they arrive.

It is likely that no definite idea of how many cars and drivers will run in the four events at Milwaukee until the Monday following the Elgin meet. It is known, however, that sixty cars have already been nominated, meaning that each field will average fifteen cars. The light car classes, the Pabst Blue Ribbon and Wisconsin Challenge trophy events, are being well filled, the extra large cash purses and the beautiful cups being an inducement.

Fall Races for San Antonio

SAN ANTONIO, TEX., Aug. 19—At a recent meeting of the board of directors of the chamber of commerce of this city it was decided that an automobile race meet shall be held here October 24, 26, 27, as a feature of the annual Harvest Jubilee. Prizes aggregating $3,000 will be offered. Dr. W. A. Hering, of the San Antonio Automobile Club, was selected chairman of the committee which will look after the matter of arranging for the proposed races. Extensive repairs and improvements will be made to the local track and everything possible will be done to insure the success of the event.

GREENVILLE, MISS., Aug. 20—Heavy rains contributed to the failure of the Memphis Auto Trade Association's endurance test. Of the twenty cars that entered only five reached Greenville, the others returning after the heavy rains began. Two Cadillacs, an Overland, a Studebaker-Flanders and a Hudson pulled through the mud to this city. The Overland was damaged by going through a bridge, but despite the serious damage, repairs were made by the driver at the site of the accident.

ST. LOUIS, MO., July 8—The Automobile Club of St. Louis will soon have all preparations made for the annual reliability run of the organization, which this year is to take place in September. The exact dates have not been settled upon as yet. The route will very likely be to Glasgow, in the center of the state *via* the Cross-State Highway and back by a different route. This has not been decided definitely either.

Fourth annual tour of the Minnesota State Automobile Association entering the city of Minneapolis on the return from Winnipeg, Man.

Marmon Wins Badger

Is Now Permanent Holder of the Journal Trophy—Eight Cars Running at Close of Event

Records of the Runabouts So Close That Decision Is Left to the National Contest Board

MINNEAPOLIS, MINN., Aug. 16—With the Marmon entry, No. 1, victor in the touring car class and winner permanently of the Journal trophy, the fourth annual tour of the Minnesota State Automobile Association, its first international tour and most eventful run of its history, ended Thursday noon.

Eight cars remained in the running at the close. The Cutting and MacFarlan did not appear at the start, the Staver withdrew at the end of the second day and continued as official car. The pilot, pacemaker and press car stayed through. One of the non-contestant cars, that of President H. J. Clark, was abandoned in the mud at the end of the first half of the third day's run. The other non-contestant, Dr. H. G. Blanchard, of Waseca, Minn, ran through, although breaking three springs and an axle and having some tire trouble.

Owing to the closeness of the records of the Hupmobile and the Studebaker car driven by W. H. Soules, the decision as to the award of the *Daily News* trophy for the runabout class has been left to the national contest board. The unofficial points are twenty-two for the Hupmobile and twenty-one for the Flanders.

SCORE OF CARS FINISHING MINNESOTA TOUR

DAY. No. Name.	1	2	3	4	5	6	7	Total
1—Marmon	0	0	0	0	0	0	0—	0
*2—Hupmobile	5	0	7	0	3	4	3—	22
*3—Studebaker	9	0	0	12	0	0	0—	21
5—Cadillac	0	0	35	148	272	0	0—	455
7—Mitchell	0	0	3	0	0	191	3—	197
8—Paige-Detroit	9	21	114	65	12	23	0—	244
9—War.-Detroit	0	0	15	276	27	2	0—	320
11—Reo	0	37	3	7	3	15	0—	65

*Scores unofficial, have been referred to National Contest Board for decision.

The second half of the 7-day run was much easier on cars and drivers than the up-trip. A large part of the distance in North Dakota was over the Meridian road, which is in fair condition. The route from Winnipeg to the border at Emerson was on the east side of the river and far superior to the north-bound road, which was one of the worst found in the first three days of the endurance run. At Emerson a short trip was made west to Pembina, where the cars were cleared at the United States customs house.

While it was discovered that the north route through the middle part of the state and the White Earth reservation is not yet ready for persons who want easy touring, a perfectly feasible road was discovered returning to Minneapolis. A great part of the road is posted, the whole length of the Meridian road having two signs at each corner and slow signs on bad turns. This made the work easy for the pilot as well as the pacemaker. At intervals, a short cut had been made by the pathfinder, usually along the right of way of a railroad, which always resulted in a disagreeable run, owing to the recent rains in the district. Most of the mire holes encountered were on these detour roads, owing to the fact that the railroad, being high, acts as a dike and causes the water to stand on the gumbo soil.

Wilkin County Has Best Roads

The first dust encountered was in the sandy soil the last day as the route neared Minneapolis. Fine roads exist in the vicinity of Fergus Falls and Alexandria, favorite touring spots. Wilkin county, however, between McCauleyville and Breckenridge and between Breckenridge and Foxhome appears to have the lead for the Automobile Club of Minneapolis good roads bronze statue, hitherto in possession of Renville county, won in 1910. The reason for the award will be that the roads are consistently smooth and with good connections at culverts and bridges. Absence of chuck holes also moved the chairman of tht good roads committee, Louis Koch, to decide for Wilkin. Douglas county, in the famous park region of the state, has excellent and well dragged roads, but the occasional chuck holes worked in favor of Wilkin.

The return route from Winnipeg, being the older one, is more traveled than the western road. The scenery on the return trip is perhaps more beautiful, yet to the tourist the eastern route through the Indian reservation, who likes wild and untouched nature will appeal strongly. It transpired on the trip that the offer of the club trophy had resulted in much road work by the traversed counties and in an advance in road making methods due to the publicity of standard road building rules.

Automobile dealers on the tour were encouraged to believe there is to be a good market in their line for the 1912-1913 season, owing to the tremendous crops already harvested and being threshed, and to the interest taken at all controls in the merits of the various cars entered.

Two cars went through without mechanical trouble, the Marmon with perfect score, the Cadillac used cars with many penalties, but mainly for broken spring work.

The developments of the tour as to the stability of the various cars are found in the accompanying table.

The tire record shows as follows: No. 1, four Goodrich tires, no trouble; No. 2, Goodyear tires, two blow-outs, nine punctures, all rear tires; No. 3, Studebaker, two Firestone in front, two Morgan & Wright in rear, three inners in front tires; No. 5, two Millers in rear, two blow-outs, one Goodyear and one Hartford front, no trouble; No. 7, same Kelly Racine used on pathfinder trip, all blew out, altogether three blow-outs and eight punctures; No. 8, Kelly Racine, one puncture, one blow-out; No. 9, Kelly Racine, one blow-out, two rear punctures; No. 11, Goodyear, six punctures, three blow-outs; No. 12, Goodyear (old), one puncture and one blow-out, came in on Michelins; Brictson press car, Pierce-Arrow, four Goodrich tires covered with Brictson treads, same air as in the 1911 Glidden, no trouble. Paige pilot, Kelly Racine tires, no changes; pacemaker, Stoddard-Knight, Hartford and one Goodrich, two blow-outs and four punctures.

Dallas to Have a Speedway

Dallas, Tex., Aug. 19—Ed. A. Vaughan, a prominent local business man, is promoting the construction of a motor speedway to cost $250,000. The corporation, which will be known as the Dallas Motor Speedway Company, is well advanced toward organization. It is the purpose of the company to construct a 2-mile speedway on the Miller farm in Oak Cliff, a suburb of Dallas. The plans and specifications for the course, grandstand and other features of the enterprise have been prepared. The grandstand will have a capacity of 20,000 people and in addition to this there will be bleachers with a seating capacity of 10,000 people. The entire race course will be in view from the grandstand and bleachers at one time. The site for the proposed speedway is ideal. Mr. Vaughan says it is intended to have the speedway finished and ready for formal opening next May during the monster meeting of the Shriners.

200-Mile Sunday Race at Columbus

Columbus, O., Aug. 19—Entries are coming in satisfactorily for the 200-mile automobile race to be run off on Sunday, Aug. 25, at the Columbus Driving Park under the auspices of the Columbus Automobile Club. Assurances are given that there will be at least ten entries and possibly more. Among the number will be several Cino cars, a Columbus Firestone and others.

The committee in charge of the event will make every effort to keep the dust down upon the track and to that end have purchased 15 tons of calcium chloride which will be spread upon the track before the race is started.

Burman Stars at Albany

Breaks New York State Record for Mile on Two-Lap Track, Covering the Distance in 1:12 4-5

Retains the Remy Brassard and the W. B. Trophy Besides Winning $50 Cash Prize

ALBANY, N. Y., Aug. 19—At the first official automobile meet ever held in Albany, Bob Burman in his Blitzen Benz car raced 1 mile in 1:12 4-5 on the two-lap track at Parr's Island here Saturday afternoon before 5,000 spectators, clipping 4 1-5 seconds from the previous record for a mile in New York State on a two-lap track, the previous record having been made at Binghamton 2 years ago. Burman was victor in five out of seven events, the first event being only for Albany drivers of high-powered cars and the final race being a non-stock, special event, free-for-all handicap, in which Burman, in Cutting, was defeated handily by Harry Kyle, driving his White car. However, Burman retained the Remy Brassard and W. B. Trophy, each valued at $2,500, winning two of three heats for Remy Brassard and easily beating Harry Kyle in fifth event for the W. B. Trophy. In addition, Burman captured a $50 cash prize by beating H. Kyle, in his White, in the third event, making 3 miles in 4:9 3-8. Summaries:

News From Foreign Lands

Argentine Is a Great Automobile Country —Switzerland Prejudiced—New Dutch Substitute for Rubber

Motor-Driven Agricultural Implements of All Sorts Receiving Much Attention in France

BUENOS AIRES, ARGENTINA, Aug. 16—The Argentine Republic is keeping pace with other nations in her interest in and adaptation and use of the motor car. Buenos Aires is the center of activity in the rapidly-growing practice of making use of the motor vehicle in all of the phases of traffic where the automobile agreeably fits in—private pleasure cars, public conveyances, especially taxis, char-a-bancs to carry twenty passengers, post-office vans, commercial trucks, fire engines and accompanying apparatus, military and hospital ambulances, and the doctor's runabout.

Years before the motor vehicle was brought into use the public officials had seen to it that not alone the streets of Buenos Aires, but of the rural districts in general, were put into a travelable condition. The force of this statement must be apparent when it is known that there are 7,290,862.79 square meters of pavement in Buenos Aires alone. From these figures it will be seen that practically every street in the city is paved. So far as the country roads are concerned, their upkeep involves the latest methods, the steam roller and crushed stone entering conspicuously into the building of the public thoroughfares.

All motor-driven vehicles used in the republic are licensed in Buenos Aires, the rates for licenses varying from what in United States money equals $11 to $41 yearly. Every driver of a public taxi is required to carry a notebook containing a photograph of himself, together with traffic regulations affixed to its pages. The speed limit within all cities is 10 miles per hour. The law compels every owner or driver of a hackney carriage or taxi used for public service to be open, after the victoria pattern vehicle, this demand being made on the ground of hygienic necessities. Garages are not only numerous, but splendidly equipped and equal in efficiency to the best in any other part of the world.

The police, especially the mounted contingency, have supreme control in regulating street traffic.

All motor vehicles entering Argentina are required to pay a customs duty of 10 per cent. of value.

Of the 47,617 vehicles of all sorts in Buenos Aires 2,601 comprise private automobiles of all the best makes, the United States being well represented, 1,005 taxicabs and 140 motor trucks. Then there are the fire-engines and motor vehicles in other branches of public service. Of course, the automobiles in use in other sections of the republic bring the total number up much higher than indicated by the figures above. The people of that country demand the very best grade of automobiles and there is no other nation in which the possibilities of trade in high-class cars is greater. The cars must be demonstrated to their entire satisfaction. Besides, as is the case in other Latin countries, there are certain practices of credit to be observed. Custom has demanded it for generations, and it is the manufacturer who honors and pays heed to this rule who gets the business in Argentina. Another indispensable necessity is the practice of keeping a complete set of repair parts.

Down to the present time there is no factory in Argentina where the automobile is produced in its entirety. There are, however, quite a number of assembling plants, where imported parts are put together.

The fire department of Buenos Aires is essentially motor-supplied. The brigade is governed with military discipline and is dependent on the central police brigade and the minister of the interior. The brigade is 1,000 strong, having a complete complement of officers corresponding to a line regiment, with a colonel in command. A fully equipped station, involving motor fire-engines and every modern improvement, is installed in each police division. The cost of upkeep of the city fire brigade is $4,000,000 in Argentina (paper) money, equivalent to $1,760,000 of United States money, yearly. There is a similar automobile fire brigade, but smaller, maintained in each province of the republic.

In no other country in the world has the introduction of the automobile produced a greater revolution in traffic than in this aggressively modern Republic of Argentine.

Switzerland Still Unprogressive

Switzerland's heart is still in the wrong place, so far as its attitude toward motorists and motor cars is concerned. The car of the tourist is excluded from the most picturesque and romantic Cantons, even such as the Canton of Schwyz. Nor may the car traverse the glorious Grisons; nor over the lovely road from Landquart to Chur; the St. Gothard and Simplon passes; the lofty valley of the Engadine; the vicinity of the Maloja Lakes; the magnificent Axenstrasse high above the superlative Lake of Lucerne; St. Moritz; Davos; Pontresina; nor the Bernina, Maloja or Splügen passes. Not even the combined efforts of the Federal Government and the Swiss Automobile Club can succeed in overcoming the obstinacy of the Swiss people. And all because they declare that the dust kicked up by motor cars running over the roads would float over the fields, settle upon the grass and thus upset the digestive powers of the cattle. Evidently the Swiss are a people who do not hold that every cow is doomed to eat the conventional peck of dust during the period of her lifetime.

Rubber Substitute in Holland

A factory is under construction at Ymuiden, Holland, it is reported, where a rubber substitute invented by a Mr. Van der Heyden will be manufactured. The ingredients to be used are fresh fish meat and 15 per cent. of natural rubber which are mixed and treated by a secret process. Besides having all the desirable properties of natural rubber the new product is said to be insensible to the action of heat and benzine. It is also very cheap, as albumen is gained as a by-product and the wastes may be used for fertilizing purposes.

Motorizing Dublin's Fire Brigade

Captain Purcell, chief officer of the Dublin Fire Brigade, has set out on a mission of economy, by means of which he hopes to revolutionize the fire-fighting system of the United Kingdom. His plans fall nothing short of motorizing every brigade, and at the same time preventing the present existing patterns of horse-drawn fire engines from being consigned to the scrap-pile. Captain Purcell's scheme is to strip off the pole and whiffletrees from the engine and attach a motor tractor in place of horses.

Not alone are some of the Dublin engines already undergoing this stage of evolution, but the brigade is being supplied with four-cylinder, 50-horsepower engines of the internal combustion type, having dual ignition, and forced lubrication to all bearings. The transit gear is stopped on arriving at a fire, and a lever is moved by means of which the pump is coupled up to and driven by the same engine. This pump is of the centrifugal pattern, manufactured in gun-metal, and, when connected up to the hydrants, considerably augments the pressure available in the water mains. In order to create an instantaneous vacuum, a special air pump is provided, when it is found necessary to lift water by suction from an open reservoir. The capacity of this pump, while making its normal speed of 1,750 revolutions per minute, is 350 gallons every 69 seconds, forcing the water to a height of 300 feet, while maintaining a pressure on the hose delivery of 120 pounds to the square inch. At a lower pressure it will deliver even a greater quantity.

Each engine has accommodations for carrying ten men, in addition to .26 gallon of fuel in lockers—tools, standpipes, smaller appliances, 2,000 feet of delivery hose, and 32 feet of 5-inch suction hose. The method of steering the motor comprises an apparatus by which the front wheels pivot in the center of the hubs, thus relieving the gear from shocks and transmitting them to the axle direct. The tires, broad and flat, are of the solid rubber sectional block type, built to encounter snow or soft ground with no danger of skidding.

Not alone is Dublin's fire brigade equipped with the new motor fire engines, but many of the suburban towns, like Ball's Bridge, Blackrock and Kingstown are provided with up-to-date motor fire-fighting apparatus.

Automobiles in Yucatan

According to tax records, there are today 103 licensed private automobiles in Merida, 6 of which are electric. Commercial vehicles have not been introduced, and it is not likely that they would find ready acceptance, in view of the cheaper mode of transportation by cart. The most popular types of car are the 5-passenger touring car and the runabout, of 20 to 30-horsepower, four cylinders, and a gear ratio of 3.5 or 4.2 to 1. No particular attention seems to be paid to the finish. A chauffeur's license costs 75 cents and an automobile license for any size car costs $5 monthly. There are four garages in Merida, but they do not carry on hand a large supply of repair parts. The local market seems to have been well looked after, but it is probable that there will be further opportunity for sales when conditions improve. American cars have given good satisfaction, as is shown by the fact that in the last 3 years importations of automobiles from the United States amounted to $43,990, as compared with $19,002 from France.

French Agricultural Motor Tests

WASHINGTON, D. C., Aug. 19—Bartley F. Yost, consular assistant at Paris, reports to his department that the subject of motor power for agricultural implements is receiving more and more attention in France. The third annual contest of the Automobile Club of France, in which prizes are offered to farmers having attained the greatest success in the use of motors, will be opened this year in a dozen different departments. Farmers who wish to take part in these contests, according to Mr. Yost, are required to furnish information as to the area of their tillable soil, nature of crops produced, number and kinds of animals used in their work, designation and origin of motors used in their work, name of the manufacturer of the motor, nature of combustible used, force in horsepower, kinds of implements and machinery propelled, date of installation of motor, and results obtained.

American concerns interested in the results of these tests should apply to the president de la Commission agricole de l'Automobile Club de France, 8 Place de la Concorde, Paris.

American Automobiles in Ceylon

WASHINGTON, D. C., Aug. 19—Charles K. Moser, United States consul to Colombo, in reporting on the trade and industries of Ceylon, says, under the heading, "Automobile Trade-Gasoline Imports:"

"During 1910-11 193 motor cars were imported, of which 9 came from the United States. During the last six months of 1911, 118 motor cars were imported, of which the share of the United States, according to the official figures, was 17. Probably half as many more cars of American make were brought into the island from other countries. It is expected that during 1912 from 100 to 150 motor cars will be imported, and there is a good market here for American cars that can carry out cata-

Calendar of Coming Events

What the Months Ahead Have in Store for the Automobilist—Shows, Conventions, Race Meets, Etc.

American and Foreign Fixtures of Importance Set Down in Chronological Order

Shows, Conventions, Etc.

Aug. 24-Sept. 9....Toronto, Can., Display of Automobiles, etc., at Canadian National Exhibition, Transportation Building.
Sept. 5-15.........San Jose, Cal., Automobile Show, San Jose Automobile Dealers' Association.
Sept. 14-21........Chicago, Ill., Annual Fall Festival and Show, Chicago Automobile Trade Association.
Sept. 17-20........Denver, Col., Convention International Association of Fire Engineers.
Sept. 23-Oct. 3.....New York City, Rubber Show, Grand Central Palace.
Dec. 7-22 ....Paris, France, Paris Automobile Show, Grand Palais.
Jan. 4-11..........Cleveland, O., Annual Automobile Show.
Jan. 11-25, 1913...New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25.........Philadelphia, Pa., Annual Automobile Show.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show.
Feb. 10-15.........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 24-March 1...St. Louis, Mo., Annual Automobile Show.
March 3-8.........Pittsburgh, Pa., Annual Automobile Show.
March 8-15........Boston, Mass., Annual Automobile Show.

Sept. 2............Indianapolis, Ind., Speedway Meet.
Sept. 2............Winnipeg, Man., Track Meet.
Sept. 3-6..........Chicago, Ill., Commercial Vehicle Reliability Run, Chicago Motor Club.
Sept. 11-14........Buffalo, N. Y., Third Annual Reliability Tour, Automobile Club of Buffalo.
Sept. 17...........Milwaukee, Wis., Grand Prize Race.
Sept. 20...........Milwaukee, Wis., Wisconsin Challenge and Pabst Trophy Races.
Sept. 21...........Milwaukee, Wis., Vanderbilt Cup Race.
Sept. ....Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-11..........Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 12............Salem, N. H., Track Meet, Rockingham Park.
Nov. 6.............Shreveport, La., Track Meet, Shreveport Automobile Club.

Foreign.

Sept. 26-Oct. 6....Bourges, France, Agricultural Motor Car Exposition.
Nov. 8-16.........London, England, Olympia Automobile Show.
Jan. 11-22.........Brussels, Belgium, Annual Belgian Automobile Show, Centenary Palace.

logue promises. The great complaint one hears against American motor cars is that they are lightly and carelessly built and that they do not stand up.

"The steady increase in the market for motor cars is reflected in the imports of gasoline. In 1909, 66,203 gallons were imported; in 1910, 136,646 gallons; in 1911, 206,028 gallons, valued at $83,533. Of this amount only 800 gallons were American gasoline, and yet American gasoline is admittedly far superior to Borneo gasoline and is sold to local consumers at from $0.06 to $0.10 per gallon cheaper. A local dealer gives two reasons for this: The prejudice which exists in this community against most American products, and the fact that the Borneo gasoline was first in the market and is now sold to wholesalers and consumers under a contract by which they are bound not to use any other."

GLASGOW has done away with every horse-drawn fire-engine in the city, with a single exception. Her fire brigade is now equipped with sixteen motor fire vehicles. The last instalment comprised eight turbine pumps and one motor car.

FRANCE now has in use 85,000 motor cars, her last year's production having been 40,000; Germany, in use, 50,000; production, 15,000; Italy, in use, 15,000; production, 5,000.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

The Designing Program

THERE are some cars that are designated one-engineer machines; there are others that are engineering-corps machines; these two classes of cars are very different products.

The first class is the outcome of the brains of one man, together with whatever good he abstracts from the products of other makers. If he is not too individually obstinate, to avail himself of such opportunities.

The second class is the product of several engineers, some of whom may be chief engineers and the others engineers who have been called into consultation on different points that arise in conjunction with the bearing problems of the machine, the ignition problems, the self-starter questions, carburetion, axle design and the many other departments that call for special engineering knowledge.

History reveals in the short span of American automobile history many examples of the one-engineer machine and there is a common factor in nearly all, namely, that the course has been an expensive one to the maker and is generally a course that has had to be reformed because of financial exigencies. The one-engineer car is really almost impossible to conceive, particularly when that engineer looks upon himself as a magneto expert, an efficiency factor in the carbureter problems, a quantity to be reckoned with in bearings and their manufacture, the last word in suspension, the Alpha and Omega in gearbox design as well as the oracle of a score of other departments of engineering in automobile manufacture.

The last 10 years of automobile history show how expensive the one-engineer principle has been to a few makers, where the one man was responsible for everything from the rear axle to a new lubrication system for the motor, at the same time serving as factory superintendent and advisory head for every department in the factory. A new model brought out under such individual pressure is launched on the stormy seas of its career and scarcely has it cleared the harbor than the rocks have grated on the keel. The rear axle has developed a noisy differential, it has developed a weak bearing, it has developed weak studs in the differential, it has developed an oil leak which eventually reaches the brakes and it has developed not a few other structural weaknesses.

The gearbox of this one-engineer car has shown similar defects and the cost of correcting them after the model has been launched becomes enormous. It may be that the clutch brake has not had adequate adjustment provisions; accessibility has been unnecessarily sacrificed between the motor and gearbox, the brakes have not been increased commensurately with higher motor power due to larger valves, lighter reciprocating masses or improved ignition. The one engineer could not do it all. The final result has been expense from first to last, expense coupled with a reduced reputation, expense coupled with overworked maintenance departments and expense coupled with a club placed in the hands of every rival maker.

With an engineering-corps organization such troubles are largely eliminated, they being met face to face in the early evolution of the design and corrected before placed on the 1913 market. One of the best-known American automobile engineers was quite free recently in telling about the different consulting engineers whom he engaged to wrestle with him in the problems of his new model. He engaged the best to eliminate the bearing noises in the gearbox; he engaged others to work out the weaknesses of the self-starting outfit; he engaged others to solve the problem of proper motor size with reference to car weight and speed; he engaged a transmission expert to aid in the selection of gear ratios between motor and rear wheels for the different speeds; he engaged others who were expert in body work, with the hope of reducing body squeaks to the minimum; and this engaging of or consulting with experts could be described still further, but sufficient examples have been cited to show the wisdom of the engineering-corps cars as well as to indicate how it is economy to develop a new model along such broad-gauge lines.

A company bringing out a car under the engineering-corps system is assured of the kinks being eliminated before the model has been passed upon; it is assured that the whims of individual engineers will not find a place in the car total without having been laid threadbare before the other engineers who were called into consultation or were on the regular engineering staff. It is assured that some discarded feature of design will not be continued because one engineer desires that it should be so; it will be assured that some valuable new factor will not be left off the design because one engineer had some whim against its adoption; in a word, the car will be an engineering construction and not a composition of the whims of one man. The car will be a rational unit rather than a motor with entirely unsuited chassis parts, or as it has been in some cases a new type of carbureter with the remainder of the car subservient to this one part. The business factory must insist on the engineering-corps method of production. It is the only safe one, it is the only one that will keep abreast of the times and produce for the company that share of the industry's profits which its organization merits. The manufacturer who, led by a false sense of economy, tries to make larger profits by conducting his works on a one-man basis, is bound to court failure in the long run if he keep up his policy, and a big loss even if he drops it after having at length learned his lesson. Competition is growing keener every day, and the sooner he will see his way to fall in line with the trend, the surer will be his success.

Henry F. Donaldson, S. A. E. President, Dead

Had Been An Important Figure in the Automobile Industry for Over a Decade—After Wide Experience in Journalistic Work, He Became Prominent in the Motor Publication Field—For Several Years Editor of "The Automobile"

HENRY F. DONALDSON, president of the Society of Automobile Engineers, died suddenly at his home, 508 West One Hundred and Forty-ninth street, New York, on Tuesday, August 13. Mr. Donaldson had been an important figure in the automobile industry for 10 years and his sudden death came as a shock and a sorrow to his multitude of friends and business and personal associates.

Henry F. Donaldson

Mr. Donaldson's progress in the industry was rapid and steady and he was at the summit when death's summons reached him. He was a man of broad sympathies and warm-blooded friendships. As a star reporter 20 years ago it was not below his dignity to extend a helping hand to the struggling cubs and for that reason, among others, his name is held in respect throughout that mysterious realm known as the Fourth Estate.

As an engineer he was well founded by careful preparation at one of the great Glasgow universities where he took the classical course as well as that in marine engineering and was an honor man in his class. As a writer and editor, he graduated from the mill of metropolitan journalism and carried his wide knowledge of technique into his automobile work.

He was of Scotch-Irish descent, like many thousands of others who have made their mark in journalism. His first work was in a Glasgow shipyard, where he rose to a position of authority in a short time. Despite his powerful physique of late years, he was a delicate youth and the exposure and irregularity of his work in Glasgow undermined his physical stamina, causing him to seek health in the United States. About 1888 he worked as a reporter in Chicago and when the Chicago *Times* was reorganized he was employed on the local staff, handling many of the leading stories. Later he worked on other Chicago newspapers and eventually heard the call to New York. His daily work in the metropolis was largely on the New York *Times*, where he was employed until about 1895. He was one of the founders and chief editor of *Marine Engineering*, the leading marine engineering publication of the world. About 1900 he sold his interest in the paper to his partner and in 1902 was appointed editor of The Automobile.

After being engaged for that work, Mr. Donaldson was sent on an extensive foreign and American tour to inspect the status of the industry, assuming the editorial chair in the fall. He continued as editor of The Automobile for several years. He was one of the pioneers to recognize the tremendous importance of the automobile truck as a factor in commercial life and was one of the founders of the *Commercial Vehicle*.

When the reorganization took place last year, Mr. Donaldson sold his interest in the publication and went into partnership with Joseph Tracy as consulting automobile engineer.

He had always been interested in the organization work of the Society of Automobile Engineers and assisted in every way possible. The work was recognized by the society and Mr. Donaldson was honored by election as its president last January. He was a leading spirit in getting up the European trip of the society last fall and aided in making that trip a big success. He was largely accountable for the recent summer excursion of the society, when the sessions of the organization were held on board a lake steamship, which proceeded from Detroit to the head of Lake Huron and return.

Mr. Donaldson was 45 years old. He leaves a widow, but no children.

The Council of the Society of Automobile Engineers has passed the following resolution on the death of President Henry F. Donaldson:

RESOLVED, that the Society of Automobile Engineers, through its Council, greatly deplores the death of its President, Mr. Henry F. Donaldson, whose capable and energetic work for the Society during the past year is widely recognized and who was respected and beloved by all of his associates for those brilliant attainments of mind and sterling qualities of manhood that raised him above the ordinary level of mankind, making him a natural leader and an unwavering advocate of that which was right and noble and generous; and be it further

RESOLVED, that the Society extends its deepest sympathy to his immediate family and other relatives in their grief over their great and irreparable loss.

Annual convention of Mitchell distributors at the Mitchell-Lewis factory, Racine, Wis., where they inspected the 1913 models

DETROIT Demountable's Yearly Meeting—The Detroit Demountable Rim Company held its annual meeting at Detroit, Mich., last week, when new officers were elected. The company has been manufacturing rims for but one year and has sold about 100,000 sets of various types of rims.

Buick Ships 1913 Models—The Buick Motor Company, Flint, Mich., has made its first shipment of assembled cars of the 1913 model. A carload went to San Francisco, the first city to receive next year's line of cars. Shipments will be made from day to day to the agencies farthest from Flint in order that the distant points may be served at the same time as the closer ones. To-day 3,000 men are on the payroll, the production is 90 days ahead of last year and the shipments are 60 days ahead of time.

Cole Representatives Confer—Cole representatives from all parts of the globe spent a day recently familiarizing themselves with the Cole product at the plant, Indianapolis, Ind.

Rowan Joins Clark-Carter—F. S. Rowan has assumed the position of advertising manager of the Clark-Carter Automobile Company, Jackson, Mich., manufacturer of Cutting cars.

Eisemann's Factory Sales Branch—The Eisemann Magneto Company has opened a factory sales branch in Indianapolis, Ind. The branch has a complete repair shop and service station.

Ward with American—J. M. Ward, secretary of the Indiana Automobile Manufacturers' Association, has been appointed assistant sales manager of the American Motor Company, Indianapolis, Ind.

Callan to Explain Law—Hon. Albert S. Callan, author of the present New York State automobile law, is to speak at the West Side Y. M. C. A. August 29; at 8.15 p. m., on the New York State Automobile Law.

Add Supply Department—The New York Coach and Auto Lamp Company, New York City, manufacturer of automobile lamps, has added an automobile supply department to do wholesale jobbing in accessories of all kinds.

India's Pioneer Automobile Man—Kavashah D. Wadia of Bombay, India, is in America for a week's stay. He is the pioneer automobile man of India. While here he will probably take up the matter of introducing more American cars in India. He will stop at the Prince George, New York City.

Moore with Gramm-Bernstein—W. H. Moore has given up his position as sales manager of the Gramm Motor Truck Company, Lima, O., to take the position of general sales manager of the Gramm-Bernstein Company, of that city.

Adds Automobile Supply Department—The New York Coach & Automobile Lamp Company, New York City, has added an automobile supply department where wholesale jobbing will be done in automobile accessories of all kinds.

Kraatz with Beaver Company—F. O. Kraatz has been employed by the Beaver Manufacturing Company, Milwaukee, Wis., to act as outside man for the purchasing department. He will assist in securing prompt shipments of raw materials.

Indianapolis Company Opens Salesroom—The Indianapolis Motor Car Company, Indianapolis, Ind., has opened a new salesroom where it will handle the Flanders electric and Everitt. It will continue the truck salesroom and garage as heretofore.

Fosdick with Hupp Company—An important addition to the forces of the Hupp Motor Car Company is announced in the appointment of Harry Fosdick as assistant general manager with particular reference to the supervising of agencies and sales distribution.

Splitdorf Service Station Complete—After September 1 the premises at 18-20 West Sixty-third street, New York City, will be the New York headquarters for the whole line of Spiltdorf ignition devices. Oscar J. Rohde will be in charge of the new Splitdorf headquarters.

Makes 90 Miles Speed Limit—The old town of Westmoreland, near Huntington, W. Va., has made a revolutionary step and fixed the speed limits within its borders at 90 miles an hour, as is announced on huge signboards. The reason for this ordinance is that lower speed limits are apt to be ignored.

Sudrow Sales Manager Marion—F. G. W. Sudrow has been appointed sales manager for the Marion Motor Car Company.

Williams with Swinehart—The Swinehart Tire & Rubber Company has secured A. E. Williams as advertising manager. He was formerly with the Firestone Tire & Rubber Company.

Change in Pope Hartford Agency—The Pope Hartford Company has made a change in its agency at Worcester, Mass., giving it to C. D. Brewster, of Marlboro, and Eugene L. Caton, of Worcester.

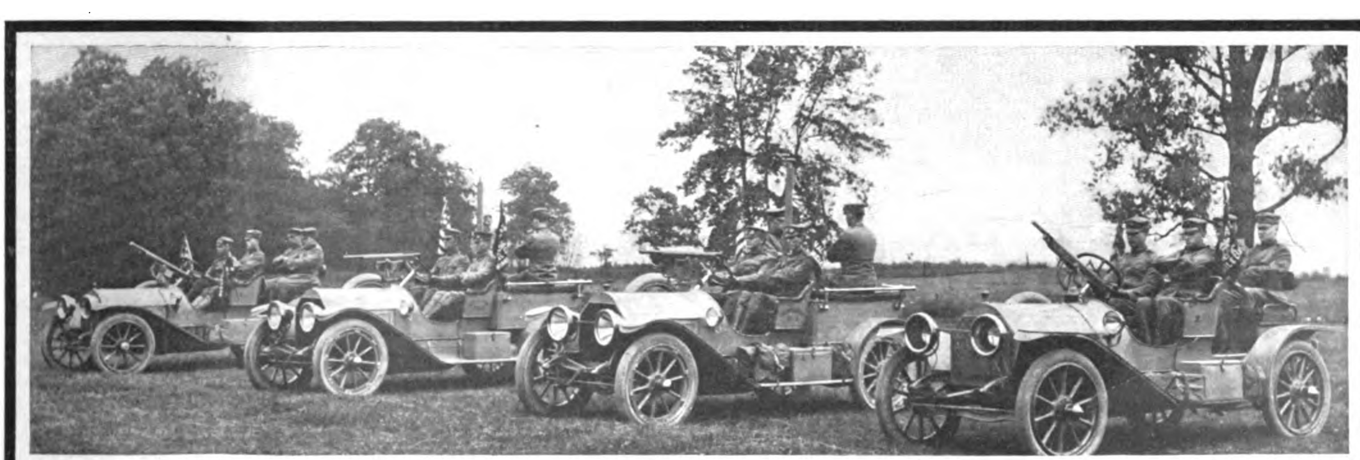
Paige Goes to Boston—M. R. Paige, sales manager of the Moline Wagon Company, Moline, Ill., has gone to Boston, Mass., to join the Boston branch of the Velie, taking charge of the commercial department.

Goodyear Branch Moves—The Goodyear Tire & Rubber Company's branch has been removed from 1026 Connecticut avenue to 1016 Fourteenth street, Washington, D. C., where a three-story brick and stone building has been erected by the company.

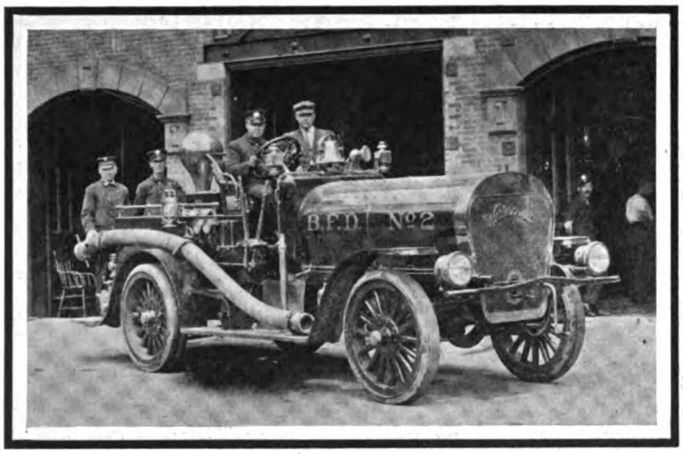
Marathon Agency Expands—The Marathon Sales Company, Baltimore, Md., which handles the Marathon cars, has opened showrooms at 1117 Hunter alley. The service station will be continued at 10 Morton street.

Mitchell Service Building Enlarged—The Mitchell Automobile Company, Milwaukee, Wis., has reopened its service building and sales headquarters. Two stories have been added and the equipment of the plant doubled. N. R. New is manager at Milwaukee.

Guatemala Buys Cars—The Government of the Guatemalan republic recently bought four Cadillac automobiles for the use of its army. The cars, which are shown on this page, were equipped with a field piece each, and two of the four were also fitted with wireless equipment. Mr. Camacho instructed a number of soldiers in the operation of the cars, a class for this purpose being organized in the Guatemalan military academy. After 4 months' tuition, the soldiers proved efficient chauffeurs, although there are practically no roads outside of Guatemala City, the capital of the republic, where all the instruction was given.



Four Cadillac cars fitted with field guns purchased by the Government of the Republic of Guatemala for army use



Watrous pumping engine in use at Bridgeport, Conn.

Wishart to Drive Mercer—Spencer E. Wishart has been added to the Mercer racing team. He will drive a Mercer raceabout in the series of contests to be held in middle West.

Fitzsimons Leaves Thomas—George Fitzsimons has resigned his position as sales manager of the E. R. Thomas Motor Car Company, Buffalo, N. Y., to take effect September 1.

Change in Cole Agency—The firm of Setzer & Beach, Bridgeport, Conn., has been dissolved. The new organization, under the name of Bernard Setzer, will continue to handle the Cole.

Taylor with Philadelphia Garage—William T. Taylor, formerly local branch manager of the Warren, has been appointed sales manager of the Boulevard Garage & Sales Company, Philadelphia, Pa.

Stuart Joins Hatch Forces—Arthur J. Stuart, formerly connected with the Kissel Kar Company, has been appointed sales manager of the Mason B. Hatch Company, Main and Northampton streets, Buffalo, N. Y.

Potomac Company to Move—The Potomac Motor Car Company, Washington, D. C., has leased 1226 Connecticut avenue N. W. for a term of years, and after exclusive improvements will remove from its present quarters.

Baker Abandons Yearly Models—The Baker Motor Vehicle Company, Cleveland, O., has abandoned the idea of the yearly announcement of new models. That they have found it a better policy to simply give continuously to the purchaser the benefit of the best and latest improvements.

Buffalo Company Reorganizes—At a reorganization of the Positive Clutch & Pulley Company, Buffalo, N. Y., manufacturers of patented power transmission appliances, Ulysses L. Caudell was elected president; Thomas A. Chisholm, vice-president and Geoffrey T. Clarkson secretary-treasurer.

Leech Oakland Philadelphia Manager—Edward K. Leech will assume the management of the Philadelphia, Pa., branch of the Oakland Motor Company, Pontiac, Mich., to be established here September 1. Mr. Leech came from the *Commercial Car Journal*, Philadelphia, Pa., where he was general manager.

Ewing Resigns from Nyberg—Oscar R. Nyberg has resigned from the Nyberg automobile Works, Anderson, Ind., as head of the publicity and advertising department, to return east to complete his course in the Harvard Law School. C. A. Lawrence, city editor of the Anderson Morning Herald, will succeed him.

Philadelphia Trolley Company's Complaint—The Fairmount Park Transportation Company, Philadelphia, Pa., has lodged a complaint against the sightseeing automobiles, claiming that the use of the roads through the park for business is a violation of a rule of the commission barring business vehicles from the park drives.

Bridgeport Buys Pump Automobile—The city of Bridgeport, due to the demands of the Board of Fire Commissioners, has purchased a new $10,000 Watrous gasoline pumping engine. This will be stationed in the thickly populated section east of the Pequonnock. The engine is rated at 126 horsepower and is capable of driving the machine at a speed of 40 miles an hour.

North Shore Express Line—The People's Express Company, operating a fleet of motor trucks along the North Shore of Massachusetts from Boston to Newburyport and Amesbury, has found the business so profitable that an order has just been placed with the Myer Abrams Company of Boston for three 3-ton and one heavy-duty 5-ton Lauth-Juergens vehicles for additional service.

May Have Bus Line—A big transportation company of New York that has been studying the park resorts of New England has made overtures to the officials of Riverside park, Springfield, Mass., for permission to run a bus line from Springfield to the park next season. The transportation company promises a 20-minute run with five big machines, the route to follow the river road in Agawam. The street cars are so crowded now that it is impossible often to get seats or even standing room on the electric cars.

Automobile Incorporations

AUTOMOBILES AND PARTS

AKRON, O.—Ideal Commercial Car Company; capital, $200,000; to manufacture motor cars, engines trucks, etc. Incorporators: H. C. Gates, A. Tschantz, A. J. Dettoff, M. Stump, E. E. Quirk.

BOSTON, MASS.—Republican Motor Company of Massachusetts; capital, $1,000; to manufacture automobiles. Incorporators: Norman J. MacGaffin, E. M. Churchill.

BOSTON, MASS.—Motor Monitor Company; capital, $20,000; to manufacture engines. Incorporators: Howard P. Soule, Gardner W. Chase, Richard S. True, Jr.

COLUMBUS, IND.—Columbus Automobile Parts Company; capital, $45,000; to manufacture motor parts. Incorporators: F. H. Penfield, Fletcher Goodwell, Benjamin S. Dean, J. J. Handley.

HAMILTON, O.—Ideal Steel Wheel Company; capital, $500,000; to manufacture and deal in spring wheels for automobiles. Incorporators: J. E. Strietelmeier, A. F. Parker, D. E. Kiegan, Walter C. Taylor, James B. O'Donnell.

INDIANAPOLIS, IND.—Hydraulic Transmission Company; capital, $200,000; to manufacture a hydraulic clutch for automobiles. Incorporators: W. K. Millholland, Paul Millholland, Ernest Millholland.

LOUISVILLE, KY.—Edwards Motor Car Company; capital, $750,000; to manufacture motor trucks.

LOUISVILLE, KY.—Commercial Automobile Company; capital, $1,500. Incorporators: J. N. Gibbons, W. B. Williams, E. N. Williams.

MADISON, WIS.—Power-Stevens Fan Devices Company; capital, $150,000; to manufacture fans for cooling motors, and for vacuum cleaners, ventilating devices. Incorporators: Joseph C. Schubert, J. J. Power, John E. McWilliams, Leroy W. Stevens.

MIDDLETOWN, N. Y.—Industrial Motor Car Company; capital, $350,000; to manufacture motor vehicles. Incorporators: William Courtland, Cuthbert Jewell, M. Crawford.

NEW YORK CITY.—Hurlburt Motor Truck Company; capital, $150,000. Incorporators: Joseph P. Carroll, William B. Carswell, F. D. Peale.

NEW YORK CITY—New York Electric Vehicle Association, Inc.; capital, $50,000; motor vehicle business, especially electrics. Incorporators: George Tiernan, Frank H. Parcells, Robert G. Reblefsen.

RICHMOND HILL, N. Y.—Dillman-Helin Motor Company; capital, $20,000 to manufacture motors, etc. Incorporators: William C. Dillman, Richard Dillman, Fero Helin.

SOUTH BEND, IND.—South Bend Automobile Body Company; capital, $20,000; to manufacture automobile bodies. Incorporators: S. W. Nicholson, J. C. Paxson, V. E. Paxson.

THOMASVILLE, GA.—Logan Automobile Exchange; capital, $15,000. Incorporators: W. A. Logan, E. E. Mack, Roscoe Luke.

TORONTO, ONT.—Central Garage & Supply Company, Ltd.; capital, $150,000; to manufacture automobiles, engines, etc. Incorporators: Robert B. Haley, Ernest S. Benyon, Roydon J. Haley.

WORCESTER, MASS.—Morgan Truck Company; capital, $300,000. Incorporators: Charles B. Foster, Evan F. Jones, C. H. Derby, J. R. George, John E. Bradley, C. B. Foster, L. P. Clark.

GARAGES AND ACCESSORIES

AKRON, O.—Dutch Rubber Company; capital, $1,250,000; to manufacture rubber articles and automobile tires. Incorporators: E. L. Schnee, C. R. Grant, I. A. Grant, F. E. Sherman.

AKRON, O.—Marathon Tire & Rubber Company; capital, $10,000; to deal in automobile tires and other rubber goods. Incorporators: Ellis R. Diehm, C. C. Owens, Sterling Newell, Donald McBride, H. J. Crawford.

AKRON, O.—Mutual Oil & Supply Company; capital, $10,000; to handle Cleveland Automobile Oils, etc. Incorporator: M. L. Stuer.

BELAIR, MD.—Harford Garage; capital, $3,000. Incorporators: Joseph S. Archer, Richard Dallam, Philip H. Close.

BOSTON, MASS.—Cambridge Station Garage; capital, $6,000. Incorporators: John J. Guiney, Frank W. Roberts, David J. Murphy.

BROOKLYN, N. Y.—Revilo Automobile Company; capital, $5,000. Incorporators: Philip Roth, Donato Cella, Frank Dunn.

New Schacht Truck—The Schacht Motor Car Company, Cincinnati, O., will soon put on the market a new 1-ton worm drive truck equipped with pneumatic tires.

Fitch Garford Manager.—Herbert G. Fitch, of the Willys-Overland Company, Toledo, O., has been made general manager of the Garford branch of the company.

To Handle Marvel—Frank P. McLellan has been appointed Indiana representative for the Marvel Carburetor Company, which is moving from Indianapolis, Ind., to Flint, Mich.

Electric Ambulance for Dumb Animals—The Pennsylvania Society for the Prevention of Cruelty to Animals has installed an electrically driven horse ambulance to minister to the wants of abused and suffering dumb animals.

Marvel Moves to Flint—Arrangements are being completed to move the plant of the Marvel Carburetor Company from Indianapolis, Ind., to Flint, Mich. The stock has been sold to a number of automobile manufacturers by the local stockholders.

Hamilton Is Manager—Roberts & Sherburne, who have taken on the American for Boston, Mass., have placed G. W. Hamilton in charge as manager of the agency. George Brown, who went to Boston from the American factory at Indianapolis, is manager of the service department.

Automobile Incorporations

Buffalo, N. Y.—William Guillott Manufacturing Company, Buffalo; capital, $10,000; to manufacture stamped metal goods for the automobile trade. Incorporators: William Guillott, A. S. Guillott, Edward W. Reynolds.

Buffalo, N. Y.—Studebaker Sales Company; capital, $25,000; to engage in selling automobiles. Incorporators: Arthur Haile, Bradley H. Phillips, E. C. Schlenker.

Cleveland, O.—South End Garage Company; capital, $5,000; to operate a garage and general repair shop. Incorporators: A. Haskin, H. Lewis Mock, H. Sadugar, J. E. McNemar, J. Goldstein.

Columbus, O.—Southern Taxicab Company; capital, $10,000; to conduct a taxicab service. Incorporators: James J. Keating, James A. Allen, Thomas Decker, Jack Williams, A. P. Carmichael.

Columbus, O.—Pomeroy Automobile and Garage Company; capital, $25,000. Incorporator: A. R. Clifton.

Columbus, O.—Engle & Vincent Automobile Company; capital, $15,000; to deal in automobiles and accessories. Incorporators: Charles H. Engle, G. A. Marquardt, Frank L. Vincent, Charles W. Engle, John K. Henry.

Davenport, Ia.—Meinert & Rogers; to conduct a taxicab and automobile repair business. Incorporators: E. C. Meinert, W. E. Rogers.

Detroit, Mich.—Michigan Motor Specialties Company; capital, $75,000; to manufacture automobile accessories and electrical specialties. Incorporators: N. M. Beck, C. W. Beck, Charles Wright, Jr.

Geneva, N. Y.—D. M. Dorman Company; capital, $10,000; to engage in automobile business. Incorporators: D. M. Dorman, Charles C. Runyan, Louis J. Licht.

Jacksonville, Fla.—Miller Automobile Company; capital, $10,000. Incorporators: H. Clay Stanford, C. D. Hyatt, J. J. Griffin.

Lexington, Ky.—Commercial Automobile Company; capital, $11,500. Incorporators: J. N. Gibbons, W. R. Williams, E. N. Williams.

Louisville, Ky.—Auto-Print Company; capital, $20,000. Incorporators: W. T. Givan, B. S. Wasmer, A. H. Bowman.

Nashville, Tenn.—Seaton Wheel Company; capital, $130,000; to manufacture automobile wheels. Incorporator: John T. Landis.

Newark, N. J.—Sullivan Automobile Company; capital, $25,000. Incorporators: Jas. Sullivan, Chas. Bagole, William N. Franzel.

New Castle, Pa.—Lawrence Automobile Company; capital, $40,000. Incorporators: L. C. John, George Greer, Roy Jamison.

New York City.—Rubberine Tire Filling and Sales Company; capital, $500,000; to manufacture rubber and substitutes for rubber. Incorporators: James D. Bridges, J. Curtis Clarke, George H. Davis.

New York City—Cukor Safety Crank Company; capital, $40,000. Incorporators: Bela Cukor, Isadore Eustaedter, Hyman J. Rosenbaum.

New York City—McGraw Tire & Rubber Company; capital, $100,000; to manufacture automobile tires and rubber goods. Incorporator: Raymond Collins.

New York City—Tredvent Tire Company; capital, $100,000; to manufacture automobile tires, etc. Incorporators: Nathan A. Sterling, David A. Sterling. Samuel Bing, Morris Rachmil, Louis Cantor.

New York City—Pioneer Motor Car Company; capital, $10,000. Incorporators: Henry J. Richardson, Northrop R. Holmes, George N. Nay.

New York City—Blitzen Company; capital, $1,000; to deal in automobile specialties. Incorporators: William C. Decker, James B. Mackie, Fred B. Scofield.

Oconto Falls, Wis.—Munsert-Carlson Automobile Company; capital, $5,000; to conduct a garage and deal in motor cars. Incorporators: W. J. Minsert, C. W. Carlson.

Ottawa, Can.—Hull & Ottawa Garage Company; capital, $40,000.

Sherbrooke, Can.—Canada Lifting Jack Company; capital, $20,000; to manufacture automobile jacks.

St. Louis Mo.—Swap-Benyon Automobile Repair Company; capital, $2,100. Incorporators: T. W. Swap, Charles A. Madill, Albert Banyon.

Toledo, O.—Heavy Tonnage Transportation Company; capital, $150,000; rapid transit of merchandise in motor trucks. Incorporators: Wm. J. Seitz, E. A. Mallory, Jacob Brecheisen, Clarence B. Hadden.

C. Y. Knight and Paul Daimler examining an American car

Cincinnati May Not Have Show—Cincinnati may have no automobile show next year. The Dealers' Association, which annually promotes these exhibitions, is not in favor of holding any more. They say that it practically puts business at a standstill for months, prospective buyers standing them off until the show.

Warren with Abbott—Joseph D. Warren, formerly with the Metzger Motor Car Company, has become New England manager of the Abbott Detroit, and he is negotiating now with some Bostonians to take over the Boston agency that has been at a standstill since the death of Willard M. Jenkins a few months ago.

Many Canadian Cars Exported—During the year ending April 30 the New Zealand Shipping Company of Montreal, Que., shipped 1,292 Canadian made automobiles to Australia and New Zealand, while this year they expect to ship to those countries 1,800 machines, 629 having been shipped already during the present season.

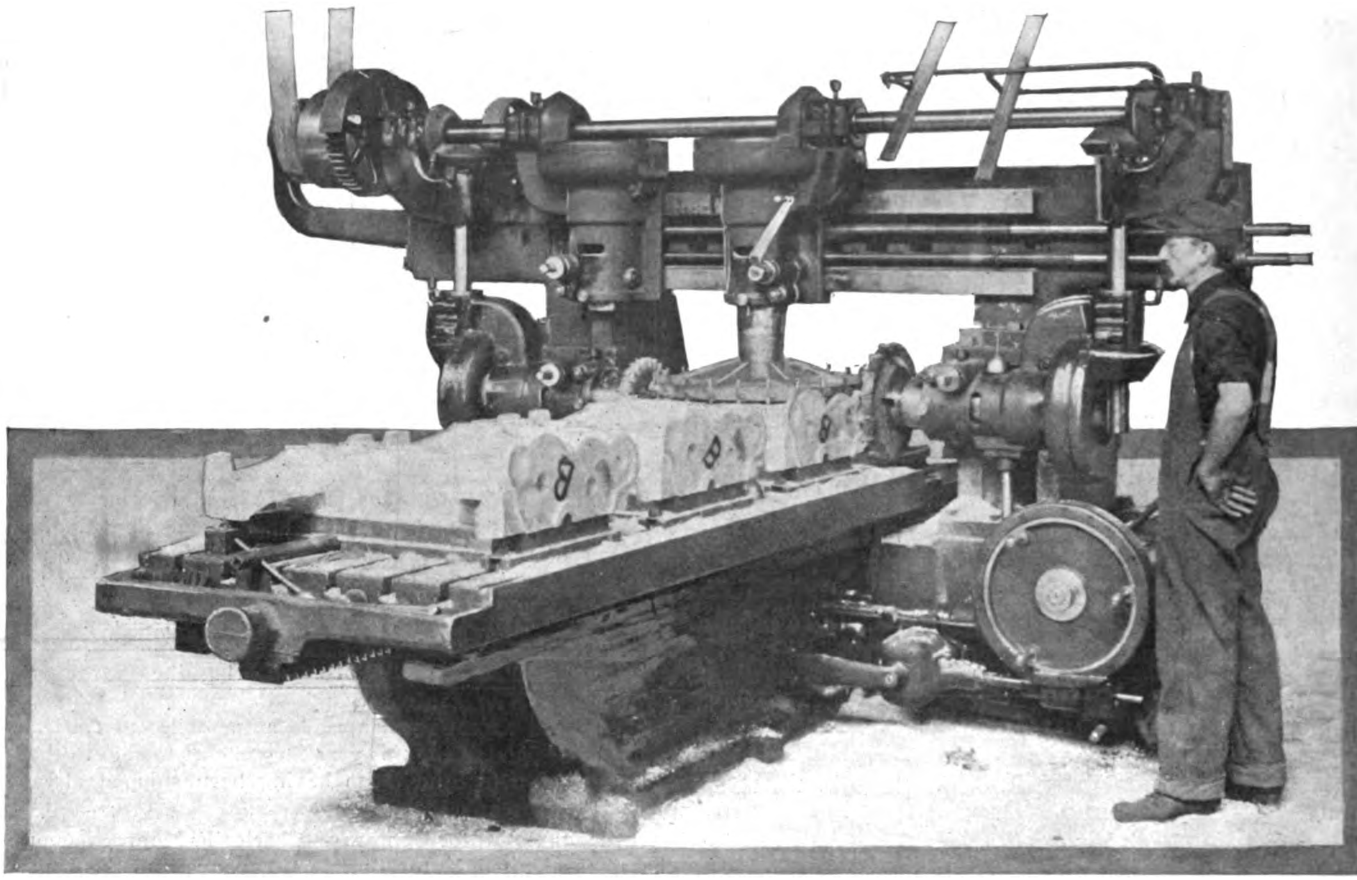
Buys Buffalo Motor Company—Charles F. Monroe has purchased the United Motor Buffalo Company from the United States Motor Company. Mr. Monroe, who was manager of the Buffalo company, will continue the distributing of the United States Motor Company products for the northern part of New York and Western Pennsylvania.

Knight and Daimler Confer—Charles Y. Knight, inventor of the sleeve valve motor, recently took an American car with his engine over to Europe, where it was inspected by Mr. Bush, chief inspector of the Daimler Company. The accompanying photograph shows Paul Daimler, head of the Mercedes factory, and Charles Y. Knight, studying and examining the construction of an American car.

Brayton Elected President—W. B. Brayton, of Cleveland, O., has been elected president of the Regal Motor Sales Company, the new Buffalo, N. Y., branch of the Regal Motor Car Company, Detroit, Mich. Mr. Brayton will act as sales manager only of the Buffalo district, while C. A. Hamilton, general manager of the new sales concern, will devote his entire time to Western New York business.

New Marmon Delivery Car—The Nordyke & Marmon Company, Indianapolis, Ind., will add a light truck to its pleasure car line. The motor will have a 4-inch stroke and there will be an automatic governor limiting the speed to 20 miles an hour. The truck will have a capacity of from 1,200 to 1,500 pounds. A distinctive feature will be the use of dual rear wheels, such as are used on the heaviest type of trucks. Pneumatic tires 32 by 4 are used on the new truck and the wheel base is 120 inches.

Factory Miscellany



Ingersoll crankcase milling machine used in the plant of the Haynes Automobile Company, Kokomo, Ind.

The above is a view of the big Ingersoll crankcase milling machine used in the manufacture of Haynes cars. The machine is in use at the Kokomo, Ind., factory of the Haynes Automobile Company, and, as may be seen from the illustration, is capable of handling three crankcases on the sliding table. There are three milling cutters in operation at the same time on three sides of the crankcase, and when this operation is complete the aluminum casting is ready to be transferred to the assembling department.

GOODRICH to Build Office—Building Inspector Goodwin, Akron, O., has approved plans prepared by the B. F. Goodrich Company for the erection of a large addition to the office building. It is the plan of the officials of the company to combine the office forces of the Goodrich and the Diamond companies, so a larger office building will be necessary. The estimated cost of the addition will be $100,000. When completed the structure will be 228 feet long and five stories high. The lower floors of the addition will be used for the general offices while the fifth floor will be reserved for the offices of the officials of the corporation. The work of construction will be started at once.

Firestone Plans Growth—Plans have been made to increase the capacity of the plant of the Firestone Tire & Rubber Company, Akron, O., at least 25 per cent. The Firestone company will also build a fireproof employment office to cost $13,000. Another large factory building is to be added to the present group.

Milwaukee County's Share—Milwaukee county, Wis., will receive the sum of $17,420.82 as returns on the payment of automobile registration fees to the state during the fiscal year of 1911-12. The registration law provides that after the secretary of state pays the expenses of administration of the registration division the remainder shall be distributed pro rata among the counties. The counties must use the returns for good roads purposes.

Toronto Plant Progressing—The plant of the Toronto Rubber Company, Toronto, O., will be completed about September 15, when it will be placed in operation. All of the repair work and improvements on the plant, which was formerly occupied by the American China Company, will be completed by that time and the machinery installed. It is the intention to employ about seventy-five men at the start. The company will manufacture all kinds of rubber articles, including automobile tires and other accessories.

To Make Hydraulic Clutch—An automobile clutch operated on the hydraulic principle will be manufactured by the Hydraulic Transmission Company, which has been organized in Indianapolis, Ind., by W. K. Millholland, Paul Millholland and Ernest Millholland, who conduct the W. K. Millholland Machine Company. The Millholland company is a contractor and manufacturer of automobile parts and will be closely allied with the new concern, which is incorporated with an authorized capitalization of $200,000.

Perfex Company Enlarges Plant—J. R. Fouch, vice-president of the Perfex Company, Los Angeles, manufacturers of the Perfex car, makes announcement that the Los Angeles plant will be greatly enlarged.

Milwaukee Rubber Company Moves—The Milwaukee Rubber Works, Milwaukee, Wis., has taken large quarters at 1928-1930 Vliet street. The company manufactures inner-liners and other tire and rubber specialties.

New Body Factory—The R. J. Irvin Manufacturing Company, Indianapolis, Ind., which makes automobile bodies and tops, has awarded the contract for the erection of a two-story factory building in Indianapolis which will cost about $50,000.

Cutting's Four-story Addition—Clark-Carter Automobile Company, Jackson, Mich., manufacturer of Cutting motor cars, has nearly completed its large and extensive four-story addition to the present plant. The company expects to occupy it by August 15.

Chevrolet Buys Plant—The Chevrolet Motor Company has purchased the plant of the Imperial Wheel Works, Flint, Mich., and will open it about September 1. The Chevrolet company is one of the organizations owned by the Republic Motor Company recently capitalized in Delaware for $65,000,000.

Top Company Moves—The Iroquois Auto Top Company, Utica, N. Y., has removed its factory from the Whiffen Block to the Cox Building. The firm has received large contracts from automobile plants in Detroit and other Western cities and increasing business necessitated the removal to larger quarters.

Racine Rubber to Grow—The Racine Rubber Company, formerly the Kelly-Racine Rubber Company, Racine, Wis., is adding a large list of new equipment which will greatly increase its plant's capacity. The company is confining its business to the manufacture of pneumatic tires for automobiles and motorcycles and has had a most profitable year.

Imperial's Increased Facilities—The Imperial Automobile Company, Jackson, Mich., has purchased the Jackson plant of the Buick Motor Car Company. This gives the Imperial two finely equipped factories, the new plant having a capacity of 8,000 cars a year, bringing the total output of the company to over 10,000 machines a year.

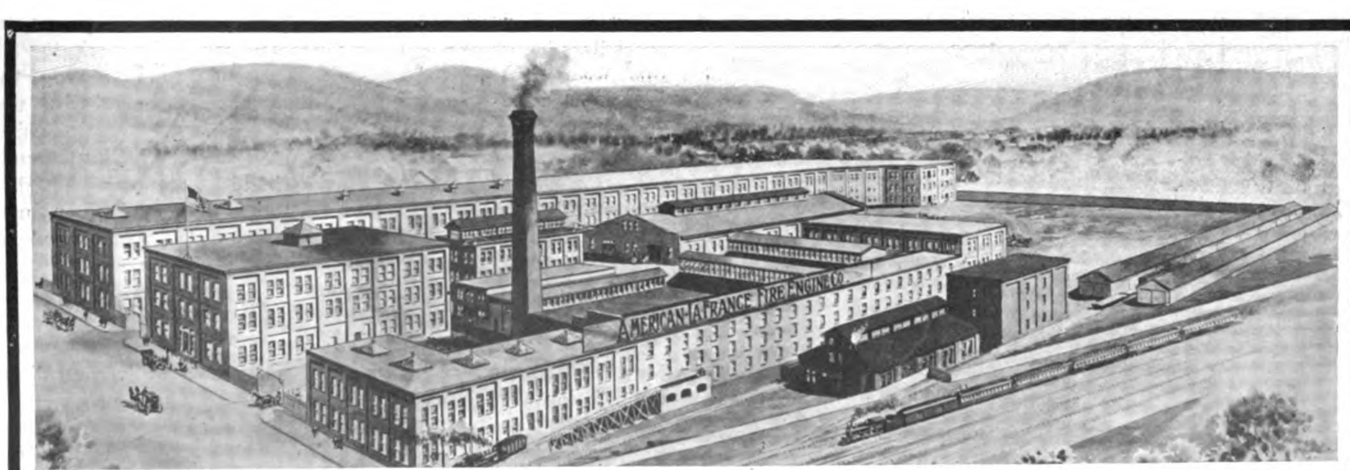
To Make Windshields Only—Manager Edward F. Adams, of the Columbus Auto Parts & Machine Company, Columbus, O., announces that in the future the concern will confine itself to the manufacture of windshields instead of covering a general line of manufacturing. Within a short time the company will put out a 1913 model windshield which will have a rain vision and a ventilator.

To Build Pleasure Cars—The Buffalo Electric Vehicle Company, the new Buffalo, N. Y., million-dollar automobile industry, has secured a lease on the building which was formerly occupied by the Denniston Company, makers of bodies for motor cars, which concern recently went into bankruptcy, and within a few days will open their pleasure car factory in that building. The branch office and showroom also will occupy this building, while the salesrooms and executive offices will be located at 200-246 West Utica street, in that city.

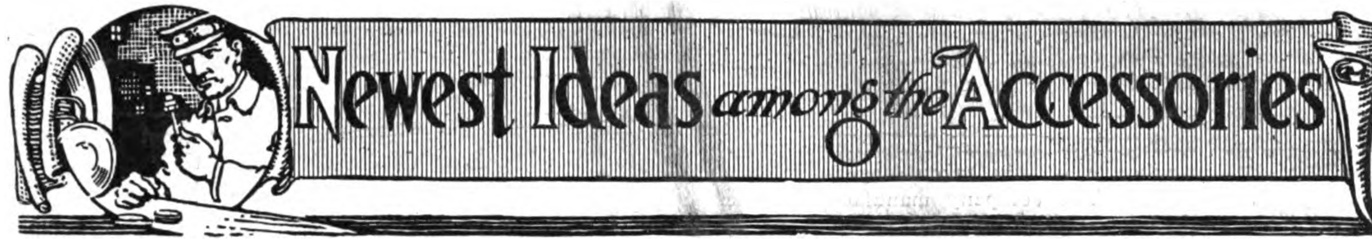
Bosch Magneto Not to Move—Chief Engineer Albert Klein, of the Bosch Magneto Company's plant at Springfield, Mass., has told the committee of 100 of that city that the Bosch company will not move to another location, at least for the present, but that until it is definitely settled whether or not the meat-rendering companies located near the Bosch plant, and against which many complaints have been made, are to move, the Bosch company will not make any plans to extend its factory buildings. The company is building a restaurant for its employees now and if the rendering companies were ousted it is probable that the magneto company would build additional extensions to its big manufacturing plant.

Goodyear Installs Fountains—By the installation of fifty-three fountains, through which is constantly bubbling a supply of fresh spring water, the Goodyear Tire & Rubber Company, Akron, O., has solved the problem of the summer drinking water supply for 5,000 workmen both from a sanitary standpoint and that of efficiency. A contract has been let to install a circulating system of galvanized iron piping to all parts of the factory and at convenient spots throughout the plant fountains will be located. The piping will be covered with cork to a thickness of over a half inch to insure a reasonable amount of coolness for the water, but if this is not satisfactory a refrigerator plant will be erected, through which the water will run.

New Departure Plant Busy—The New Departure Manufacturing Company, at Bristol, Conn., is working its big plant 127 hours a week in all departments and 152 hours a week in some departments with day and night shifts of skilled mechanics. This remarkable condition is assured for months to come by actual contracts for 1912 and 1913 delivery. Further increased business has been provided for by factory additions now in process of construction. These additions will give nearly 75,000 square feet of floor space, which will be available late in the fall of the present year. Three outside machine building plants and the company's own extensive manufacturing machine shop are busy on special mechanical equipment for the new buildings and is being rushed to put all departments in an efficient condition.



View of the Elmira, N. Y., factory of the American-La France Engine Company, manufacturers of heavy-duty motor trucks



Wauto Pail; Red-Head Plug; Measuring Tapes; Tri-Radiant Burner; Acorn Tire-Gauge Air Cock; Portable Grinder for Tourists' Tools; Spark-Plug Testing Device; Alcohol Headlight; Blowout Patch

Fig. 1—Wauto pail

AMONG the latest additions to the accessory market is the Wauto tourists' pail, manufactured by the Wauto Pail Company, Broadway and Columbus Circle, New York City. The pail, Fig. 1, is made of a heavy sort of canvas sewed with a double seam all around, and no hinges, pins or rivets are used in the making of the pail. The pail is very light and may be carried flat in any suitable compartment of the tonneau, making it very suitable for camping and similar uses.

Red-Head Platinum Point Plug

Emil Grossman Company, 250 West Fifty-fourth street, New York City, announces a new spark-plug design, which is especially constructed for use with high-tension ignition systems. The plug, Fig. 2, is very similar in shape to other Red Heads, but differs from them in three principal points: The positive electrode is coated with a platinum cap 1-32-inch thick and as deep, which covers the sparking point proper and insures it against fusing even under the heat of a very strong spark; a terminal cap of special form, Fig. 3, is used, which is equally adapted for the use of ring, slip or snap cable connections; the shell is heavily nickel-coated and highly finished, mainly to give the plug a different appearance from other designs made by the same company. A further innovation is the box in which the plug is furnished; this is shaped as a torpedo, and in its base carries a wooden block threaded to fit the plug shell and hold it securely in place before it is taken out for use.

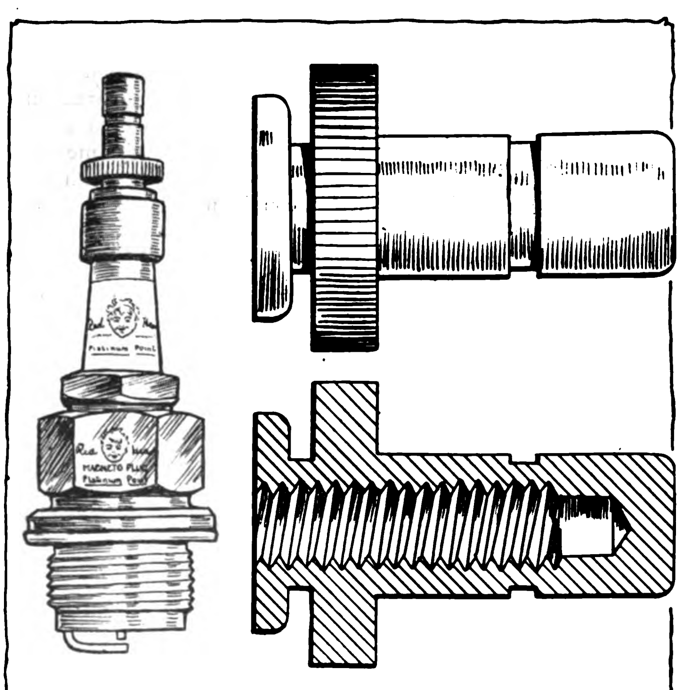


Fig. 2—New design of Red-Head spark-plug. Fig. 3—Enlarged view of Red-Head special terminal cap

Tri-Radiant Acetylene Burner

In order to utilize the whole surface of a headlight reflector, the Lenhart Burner Manufacturing Company, 246 North Delaware avenue, Philadelphia, Pa., has designed a triple acetylene burner, the Tri-Radiant, which provides three individual flames, all of which are spaced the same distance from the reflector. The acetylene enters the burner, Fig. 4, through the bottom of the bored stem and at the point where the burner branches out to the two sides a valve is provided to open or shut off the flow of gas to each of the side burners. This feature permits of regulating the amount of acetylene used according to the operating conditions.

Luther Portable Tool Grinder

Tourists desiring to carry a small and handy tool grinder with them while traveling will find the Luther device, Fig 5, an instrument well adapted to their needs. This tool is operated by hand, using a long crank which is geared to the grinding wheel at a ratio of 1 to 20. The wheel is of Dimo-Grit, a very hard material, and is hollowed out to accommodate four pinions which bring about the gear reduction specified above. The wheel has a diameter of 5 1-2 inches and, with all the other parts of the apparatus, may be packed in a box 5 3-4 inches square. The tool rest and clamp which are furnished with the grinder permit of attaching it to the car quickly and in any suitable position.

Novel Steel Measuring Tapes

A complete line of measuring tapes is manufactured by the Lufkin Rule Company, Saginaw, Mich. Some of these devices use linen tapes, others steel, and the housings in which they are inclosed are either of leather or brass. In Fig. 6, a type specially adapted to engineer's uses is shown. The steel tape of this design is 1-4-inch wide and is wound around a spool by means of a folding, winding handle attached to the spool on the front of the casing. The latter is made of brass and nicely finished with nickel plating. The outside of the tape passes through the eye of a steel frame to which a handle is attached, but this frame is detachable. The tape is marked in tenths of an inch on one side and in twelfths on the other and is supplied in lengths of from 33 to 300 feet.

Acorn Tire-Gauge Air Cock

Stevens & Company, 375 Broadway, New York, manufacture the Acorn air cock, Fig. 7, which is used while controlling the inflation of a tire with a Stevens gauge. The air cock is attached to the end of the hose through which the compressed air is led into the tire. The top of the cock is screw-threaded internally to fit any external 1-8-inch thread; the tire gauge is threaded into this passage and when the cock is opened and the air passes through it, it also presses on the gauge and there indicates the degree of inflation. When the desired pressure has been reached, the cock is shut off and removed. If no gauge is used in the inflation work, the thread may be closed by a standard 1-8-inch plug.

Hardy Plug Testing Device

Spark-plugs which miss fire may be easily located by the R. E. Hardy Spark Plug Company's tester, Fig 8, made at Austin avenue and May street, Chicago, Ill. It consists of two contact pieces which are separated by a small spark-gap and to which is fitted an insulator handle. In testing the plug which is suspected as misfiring, one of the contacts is placed against the binding post and the other against the plug shell, and in case there is no spark between the two electrodes, a spark will jump the inclosed gap of the tester. The use of this device is very comfortable, as the spark-plugs need not be disturbed in any way while being tested.

Butylite Alcohol Headlight

An entirely new line of automobile headlights has been evolved by the Butylite Automobile Headlights Company, New York City, which use alcohol as a fuel and therefore does away with electric or acetylene generator, tanks or other means of carrying or producing a light-generating medium. The fuel is carried in a small vessel under the lamp and is forced to the burner by the pressure of air which has been pumped into the container by a small hand pump. One filling of the vessel is sufficient to keep the lamp burning for 20 hours, the alcohol being vaporized and burned in a small, thick Welsbach mantle which is claimed by the maker to be shock proof.

Essex Rubber Blowout Patch

The Westchester Appliance Company, 8 West Sixty-second street, New York City, distributes the Essex rubber blowout patch. This patch is made of seven plies of sea island cotton, frictioned together with a fine grade of rubber. It goes between inner tube and casing, and is so shaped that it may be folded around the bead of the casing. The patch is made in five sizes for application to 3, 3 1-2, 4, 4 1-2 and 5-inch tires.

Accelerator for Ford Cars

Owners of Ford model T cars will be interested in a simple outfit made by the Lincoln Machine Shops, Lincoln, Ill., which provides an accelerator pedal for this type of automobile. This equipment comprises a triangular plate to the end of which a bell crank lever is attached, a small connection from the bell-crank lever to the hand throttle rod, a cable connection from the lever to an accelerator pedal on the footboard and a spring which returns the bell-crank lever to the closed-throttle position. The triangular plate is attached by bolting under the two-cylinder head bolts of the last two cylinders, and the connection between bell-crank and throttle rod is so made that when the bell-crank lever

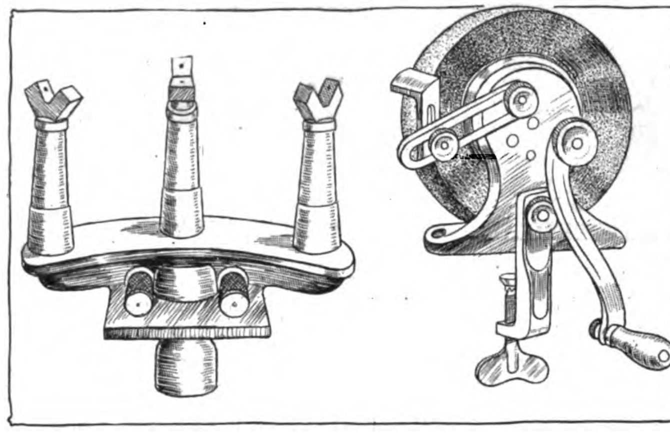

Fig. 4—Tri-Radiant acetylene burner. Fig. 5—Dimo-Grit tool grinder for touring use

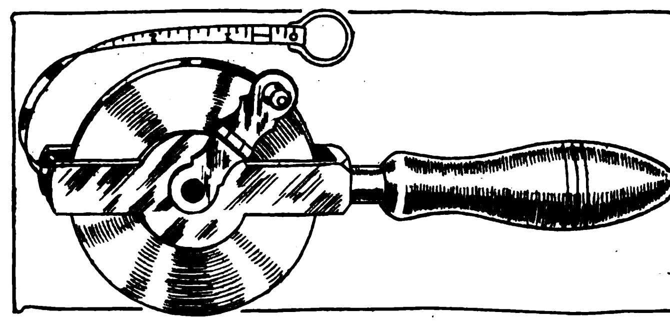

Fig. 6—Lufkin Steel measuring tape for engineers' use

is turned, as the operator depresses the accelerator pedal on the floorboard, the throttle rod is twisted and the carbureter throttle opened.

Stellite Composition Metal

Elwood Haynes, the original designer of the Haynes car, 305 N. Washington street, Kokomo, Ind., has succeeded in compounding a new metal which is of extraordinary hardness and thereby fit to take the place of steel, while it is not subject to rust, being oxidized only at red heat and then but slightly. The material stands between steel and silver in whiteness and brilliancy. Its elastic limit is 85,000 pounds and its tensile strength 110,000 pounds. The co-efficient of expansion is almost as low as glass, and the metal is chemically inert, being attacked only to a slight degree by dilute muriatic or sulphuric acid, but not by sublimate, alkali solutions, etc. As the metal is an alloy, its elements may be mixed in various quantities, and the range of hardness obtainable in this way is between high carbon steel and rock crystal.

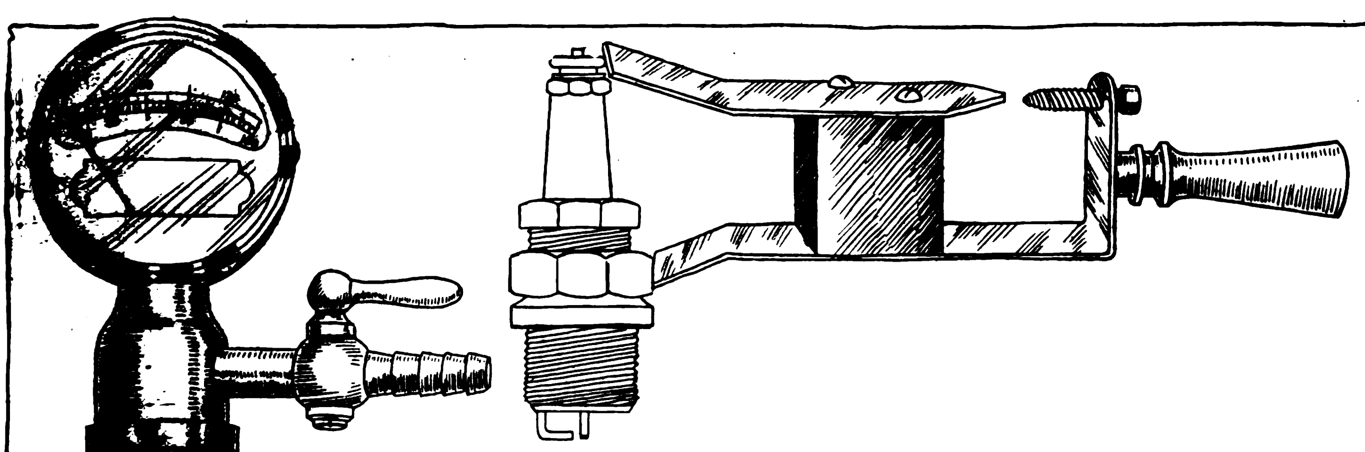

Fig. 7—Acorn air cock used while controlling inflation of tire with Stevens gauge. Fig. 8—Hardy device for testing spark-plugs

INTERNAL-Combustion Motor—In which the feeding of fuel from a reservoir is accomplished through a cam-operated valve.

The patent relates to an engine construction, Fig. 3, consisting of a working cylinder, frame and crankshaft C, which latter drives a camshaft C1 by means of gearing. The fuel used by the engine is fed from a receptacle F through a passageway M, and its flow is controlled by a valve V. The latter is carried by a rod R which, at its lower end, carries a cam follower. A cylindrical sleeve S is in position on the camshaft and rotates therewith, and there is a cam tapering down to the sleeve and a cam which extends a little beyond the other end of the sleeve. These two cams actuate the rod and valve so that fuel is passed intermittently from the receptacle F to the interior of the cylinder.

No. 1,034,732—to James H. Pierce, Bay City, Mich. Granted August 6, 1912; filed September 18, 1911.

Flexible Shaft Connection—In which driving and driven member are connected, at a varying distance, by a sleeve.

The subject-matter of this patent, a flexible connection for shafts, as shown in Fig. 1. The device consists of a sleeve with an opening which is non-circular in transverse section and into which a driving and a driven member project. Each of these two members fits the sleeve closely at all points of the engaging surfaces, and sections are so formed in the sleeve as to permit relative tipping movement of some parts. The sleeve is pivoted at one to a lateral extension of a rotating shaft.

No. 1,034,453—to Lindley D. Hubbell, Hartford, Conn. Granted August 6, 1912; filed July 24, 1906.

Vehicle Cushioning Device—Comprising two hollow sections which are in telescoping, airtight engagement.

This patent describes a construction, Fig. 4, which consists of two relatively movable sections, an upper one V and a lower one L. The upper section is so shaped as to form a longitudinally extending chamber between its portion O and I. This chamber is adapted to receive the lower section L, but is wider than the thickness of that section, so that a certain lateral play is insured between V and L. The inner portion I of the section V is considerably longer than O, and its outside is shaped with two annular grooves, one above and one below the level of the lower edge of O. Likewise, O has an annular groove on its inside and near its edge, and packing rings R in these three grooves provide an airtight engagement of the sections V and L.

No. 1,035,022—to Laurence L. Leasure, Winfield, Kan. Granted August 6, 1912; filed September 13, 1911.

Internal-Combustion Motor Valve—Being a gear designed to actuate the inlet and exhaust valves of a cylinder.

The motor valve design here described is shown in Fig. 2. It consists of a cage which has an outer wall O provided with ports, an inner cylinder wall W and a hollow guide structure S supporting a valve stem S1, the end of which carries a valve V1. Within the inner cage wall a sleeve valve V is mounted. This is formed with a flange F capable of seating simultaneously upon the ends of the walls O and W. In the hollow valve guide a coiled spring controls the normal position of the stem S1 and the valve V1, and another spring is coiled around the guide structure serving the same purpose in the case of valve V. Bar connections to the camshaft of the engine are so constructed that, upon moving a bar in one direction, one valve is operated, while moving it in the other direction the other valve is moved.

No. 1,034,708—to William Henry, Philadelphia, Pa. Granted August 6, 1912; filed September 18, 1907.

Transmission Gearing for Automobiles—Comprising two rotors, the engagement of which is controlled by a movable transmission shaft.

This patent relates to a transmission comprising a transmission shaft of such length and texture as to permit of slight flexure and so supported as not to interfere with the flexure of the shaft. A friction rotor is carried by this shaft, bearing normally against a driving rotor. Means are provided to spring the transmission shaft so that the driving and driven rotors are separated.

No. 1,032,350—to Gustave Dumont, Neuilly-sur-Seine, France. Granted July 9, 1912; filed February 15, 1909.

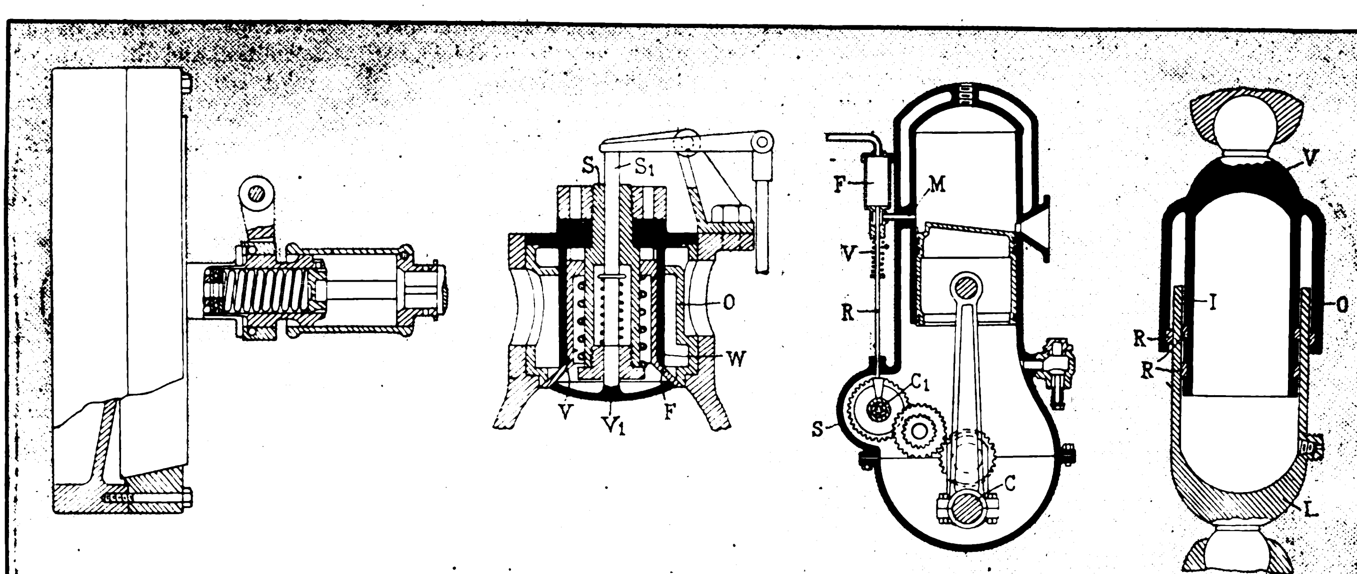

Fig. 1—Hubbell flexible connection. Fig. 2—Henry valve. Fig. 3—Pierce motor. Fig. 4—Leasure cushioning device.

The Automobile

Metric or English Measurements?

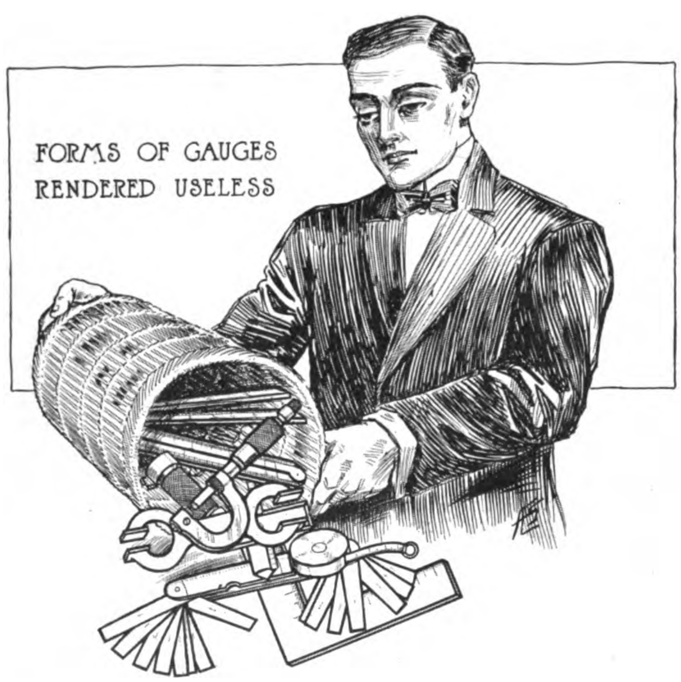
Prominent Engineers Representing Some of the Best-Known American Automobile Manufacturing Concerns Express Their Views as to Possibility of Adopting the Metric System

Majority of Engineers Believe That, While System Would Be Advantageous if Adopted, the Enormous Expense Involved Prevents—A Minority Are of the Conviction That Change Could Be Made

Part II

LAST week The Automobile explained at some length the metric system, discussing its history and that of the English system. It was pointed out that the great obstacle in the way of the general adoption of the far more useful and logical metric scheme was the great resistance offered to it by the engineering and commercial fraternity, due to the large expense which the change would incur. This cost would be largely through the necessity for scrapping much valuable machinery, which is based upon the foot and inch system, through the necessity of educating the American workmen to a new system with which they are not familiar and the consequent mistakes which they would make at the start; through the necessity of changing much design which has been worked out with English units and the great amount of work which draughtsmen and designers would have to do to bring about such a change.

This week we publish the views of a number of eminent American automobile engineers on the subject, which is a live one with us as a nation to-day. The letters herewith are not all against the general adoption of the metric system by the automobile industry—some come out squarely for it. Others are of the opinion that, once installed, it would be a great benefit to them, both as regards their foreign trade with such countries as have it as a standard system and on account of the time it would save in their engineering departments. Yet many of these men who favor it as a system believe that the cost of its introduction is prohibitive. Others are of the opinion that if all manufacturers would agree after a certain date to use the metric system the system in use at present would soon become obsolete.

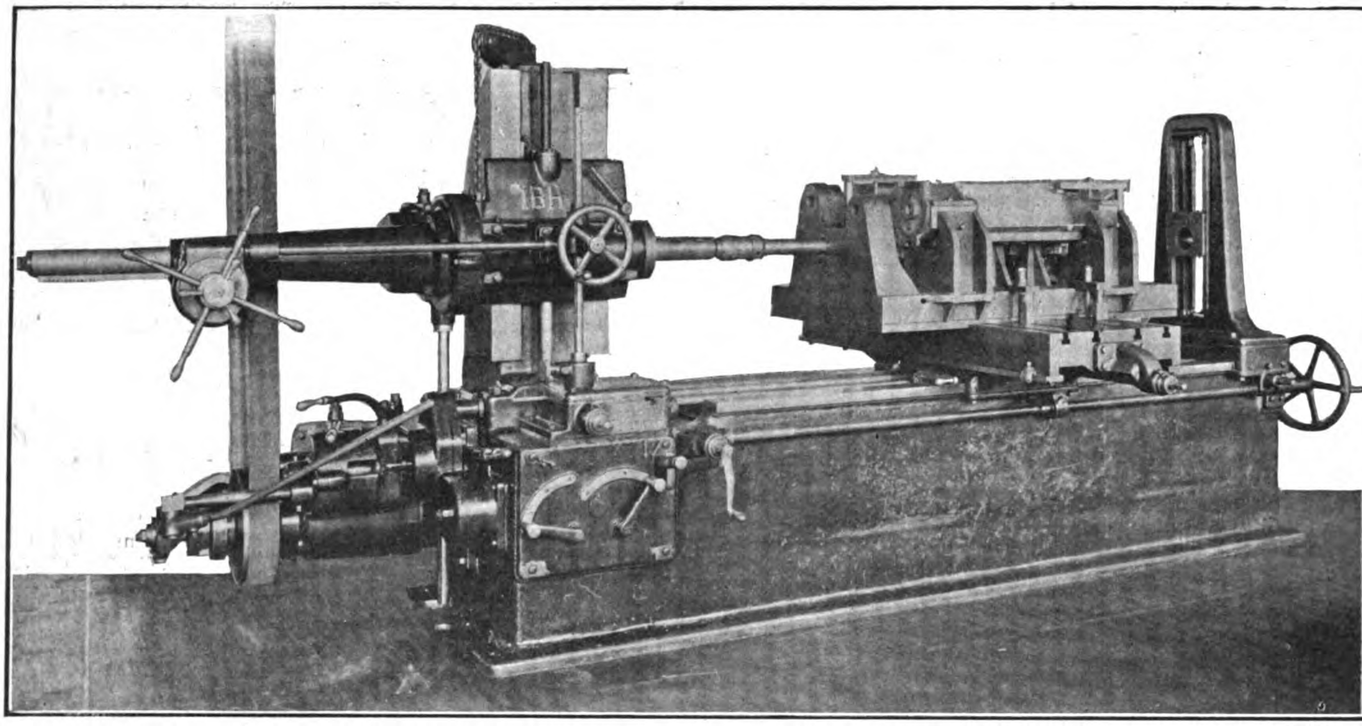


Our micrometers, gauges and measuring instruments would be useless

It is the opinion of many that should one branch of manufacturing, such as the automobile industry, attempt to arbitrarily adopt as its standard a system which was not generally accepted by all branches, there would be no end of difficulty in getting material on a measurement basis which was at odds with that in general use.

One engineer gives it as his belief that the American car manufacturer will not be handicapped in the export market on account of the variance or difference in measuring systems, even though he acknowledges it to be true that the international nature of the automobile demands a universal scheme of measurement. His letter is given below:

"There is not the least question but what the adoption generally of the metric system would prove convenient in more ways than one. It is true that the international nature



Boring mill and jig used on Stearns-Knight crankcases. Change of setting scale would involve replacement of speed-gear trains

of the automobile demands a universal scheme of measurements. The American automobile manufacturer will not, in my estimation, be handicapped in the export market on account of the variance or conflict in measuring systems. The reason for this belief is that both measuring systems are so well and universally known as to make them easy of comparison and interchangeability in figures at any point in the civilized world.

"Here in America the automobile manufacturer would have to contend with several different things in attempting to adopt the metric system. If the American automobile manufacturers were to adopt the metric system this step on their part would be retroactive on allied industries, meaning all companies now supplying mechanical parts necessary in making up automobiles. These allied industries, while in some instances dealing entirely in automobile products, are still, for the most part, supplying other industries.

"To have, therefore, a successful application of the metric system to our designing and manufacturing, it would be almost necessary to prevail upon different manufacturing industries, railroads and the United States Government to join hands in the movement.

"The changes necessary in manufacturing would be more noticeable, perhaps, in the jigs and fixtures than in the machinery itself, but I do not feel able to say just how great the changes necessary would be."

He, too, believes that for successful adoption of the French system all must join in the movement with the government.

Engineers Favor Metric System

That engineers see the possibilities of, and drawbacks to, the decimal system is evident from the way in which they have met the issue. We are pleased to present their views:

M. H. Roberts, Chief Engineer of the American Locomotive Company, states: "The engineering department of this company favors the use of metric measurements, but finds it a handicap because so few American manufacturers have adopted the metric system. On account of the difficulty of securing material when it is ordered in metric dimensions we were forced during the past year to change our truck drawings from metric to English measurements.

"The use of the metric system is largely a matter of public opinion and if it should come into general use it would be found to be very convenient, but its retention by the manufacturers who have already adopted it in this country depends upon a much more common use of the system than exists at the present time."

Charles Boyden, of the American Motors Company, favors the change. He says in part: "Our engineering staff is strongly in favor of the adoption of the metric system as applied to automobiles. The reasons for this are quite obvious.

"It certainly will, in the writer's opinion, take considerable time to effect a change of this kind, inasmuch as it would necessitate change in all machinery, tools, jigs, etc., and the expense would, indeed, be enormous."

Dual System a Temporary Result

V. E. Lacey, of the Cunningham Company, thinks that the change would have to be abrupt, as may be seen in the following: "The most serious obstacle in the way of the adoption of the metric system seems to be this one element of cost. Another difficulty of course is that all factories would be required for some years to come to maintain both equipments in their factories so as to be able to supply repairs for machines manufactured under the old system.

"As to how this transition should be made is a very serious question, but it is the writer's opinion that in automobile work it would have to be made abruptly; that is, to jump direct from the old system into the metric, adopting every phase of the new system at the same time. It is the writer's opinion that this would cause less confusion than by adopting the system piecemeal.

"As to changes in factory machinery, it seems to the writer this would be very great. Every machine turning out metric parts such as threads, gears and the like, would have to be arranged for the purpose. This would mean that new machinery would have to be purchased for the purpose. The old machinery would have to remain in service for some considerable time to take care of past work."

T. A. Peck, of the Empire Company, favors the change strongly. He says: "We have no comment to make except that in our opinion the adoption of the metric system of measurement is as badly needed here in America as the American decimal system of coinage is needed in the old world."

H. Nyberg, President of the Nybert Company, thinks this country is in need of the metric system. He states: "To-day America is rapidly becoming the greatest manufacturing country in the world. She should do everything in her power to develop and increase her industries in legitimate ways. Americans use one system of measurement when most of the civilized world uses another. This puts our salesmen at a disadvantage, for they must translate the measurement on their machines into the foreigner's system in order to make him understand, which entails a loss of time, a loss of money and untold annoyance.

"This might be justified if our system were better than the metric, but it is not. Our British forefathers took the length of an English king's foot as one unit, and the distance between two joints on his forefinger as another, which shows that it has no basis of reason upon which to rest. Moreover, our units do not increase in logical order, but by 12 and 3 and so on.

"No such objections can be made to the metric system. It has but one unit, and then increases and decreases by decimals, thus harmonizing with our number system. The metric system is logical and orderly, and it is my earnest wish that not only American automobile manufacturers would adopt it but also that Congress would make it the standard system of measurements throughout our country."

Missionary Work a Difficulty

F. N. Nutt, Chief Engineer of the Haynes Company, has little doubt but what the metric system would be satisfactory. His views are as follows: "There is no doubt but what the metric system if universally adopted would be all right, but the missionary work and trouble to be encountered by the above adoption would be annoying. The rising generation should be educated to one or both systems and the present day manufacturer would have to shoulder numerous mistakes and delays in trying to educate the present day mechanic. In order to adopt the metric system present factory machinery and tools would have to be changed, gear centers and gear calculations would have to be worked over, as well as gear reduction on lathes and other shop tools in order to cut threads according to the metric system. Each and every mechanic would have to buy new scales and other measuring instruments."

C. P. Brockwar, of the Inter-State Company, believes the change should be made, but he is in no hurry, as may be seen by his remarks, which follow: "Regarding the adoption of metric system in automobile factories, will say that we have no doubt about its benefits, but we believe it will be some time before this change can be made.

"We do not feel that we would care to pioneer in a campaign of this kind, as it will undoubtedly mean a great deal of expense, change of machinery and tools. We do not believe that the American car owners would be pleased with a change of this kind, unless change would be general with all manufacturers, which would be impossible.

"We believe that a gradual change can be made through the automobile engineers by standardizing on one or more parts at a time, to be made to the metric system."

H. G. Farr, Chief Engineer of the Knox Company, believes that the change will take place in the future. He says: "I believe that this is going to come sometime and would much prefer it if we had no past history to contend with.

"Of course, you understand that it would mean a complete re-start from everything, drawings, patterns and jigs, to adopt this system, involving a tremendous expense and about three years' time to make the change. The change in factory machinery he does not believe would be so important other than in jigs and fixtures, with the possible exception of all threading machinery, which of course would have to be changed to the metric pitches.

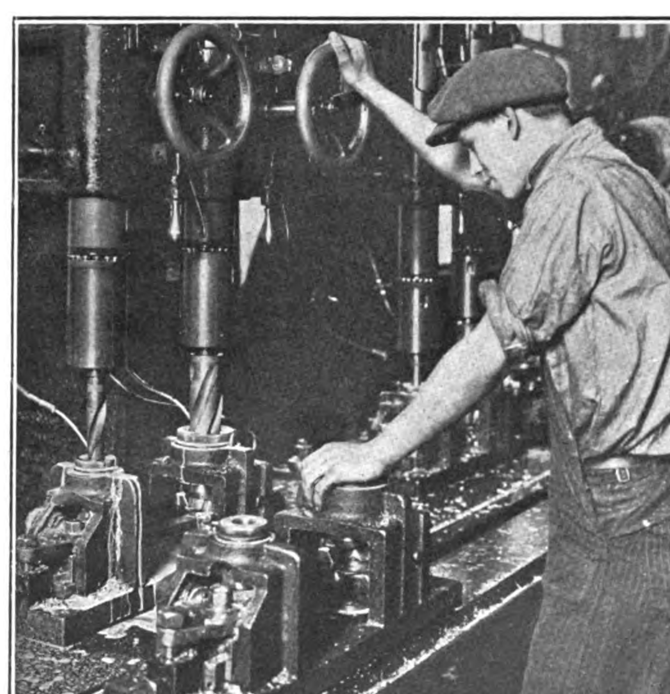
"We do not believe that it would be of any particular benefit to take the metric equivalents of English sizes throughout an automobile and say that you had adopted the metric system. It would not be adopting it, it would be simply English dimensions in metric figures and would involve a great amount of decimal millimeter dimensions which would mean more work."

Thinks Decimal System Superior

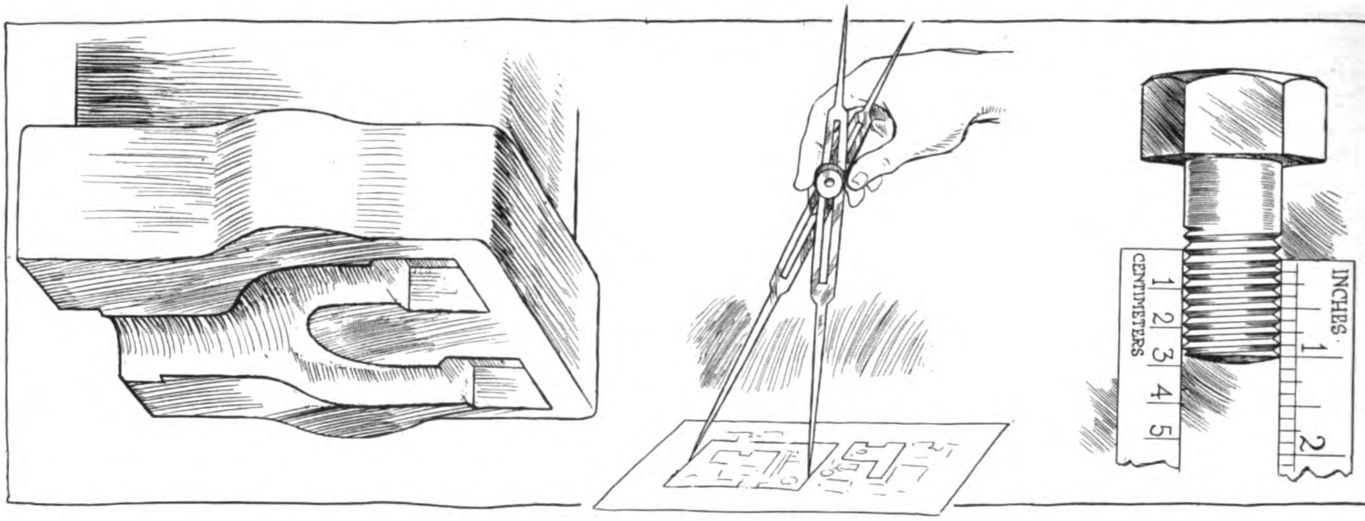
H. J. Edwards, of the Edwards Motor Car Company, sees necessity of fixing a certain date for the change. He states in part: "In my opinion the decimal system of measurement has the same advantages over the English system of yards, feet and inches as the decimal system of coinage has over the English system of pounds, shillings and pence. In the Daimler factory they are using the metric system of measurement entirely, and from what I learned in the shops they did not have very much difficulty when they installed it. I should like to see the decimal system of measurement inaugurated in this country, not only in automobile practice but universally. It is just as easy to talk kilometers, meters and millimeters as it is to talk miles, yards, feet and inches, and with a very little practice it is quite easy to carry in your own mind what these dimensions represent without having to resort to changing them to miles, etc.

"So far as automobile practice is concerned, the only way I can see at present in starting the movement would be that any manufacturer commencing the design of a new model after a certain date would use the metric system. The present system would then gradually become obsolete by elimination. It would be much easier for a company manufacturing all, or the greater portion, of their parts to do this than one who buys their parts and assembles their cars, unless the rule of inauguration would apply not only to automobile concerns, but also to the parts people as well. It is true, it might create considerable confusion for a while, but I am confident that in the end it would be worth while."

Wm. G. Wall, Chief Engineer of the National Company, believes the majority of factories would be willing to make



Drill used on Chalmers connecting-rods. Change would affect drill diameters as well as gear relations, etc.



The introduction of metric standard would necessitate the discarding of English dies, gauges, screw threads and other factory accessories

the change, saying: "I believe that, regardless of the expense and trouble occasioned by the changing from our present system to the metric system, the majority of automobile factories would be willing to do this, provided some agreement could be made whereby the entire industry would within a certain number of years discontinue the present system and take up the metric system exclusively.

"The necessary first steps in beginning a campaign of this kind would be the interesting of the Society of Automobile Engineers and the Automobile Board of Trade in this. If both of these organizations would sanction such a change it could probably be carried through. With either one of these organizations against it, however, it would be almost impossible to change to the metric system in this country."

George T. Handutt, Consulting Engineer of the United States Motor Company, believes the automobile industry too small to swing other forces into line. Part of his statement is: "We do not question for one moment the desirability of metric measures for manufacturing purposes, but we believe that the automobile industry is too small a factor in the industries of the United States to attempt to force the issue, because it has not full control of the situation.

"Let us assume for the moment that the automobile factories acting in concert agreed to adopt the metric measure and incorporate it into their product.

"The first thing would be the enormous loss of equipment in the form of reamers, dies, punches, gear sets and the redesigning of special machinery. This loss in the larger companies might easily exceed one million dollars.

"In the second place the entire working force would have to be instructed in the use of the new measure. Mistakes would be frequent and the delay in producing the product would be serious.

Conversion Would Cause Delay

"Thirdly, additional delay would be entailed and more mistakes by the use of conversion tables from English to metric measure, which would of necessity be used until the period of transition was completed, representing another large loss. Tools and machinery would have to be largely special at first and for a time at least cost a great deal more.

"Finally, many factories which do not come under our control would create further expense; for instance, the size of rods, tubing and stock of various kinds which is now supplied according to inch measure could no longer be selected by these dimensions, but with reference to the nearest metric dimensions, entailing a large amount of machining and waste of material.

"It is a conservative estimate that it would cost large companies not less than two million dollars to make the change.

"Set off against this expenditure and justifying it are convenience and speed of manufacturing which will undoubtedly eventuate in the ultimate. The progress would be by slow degrees and it would be many years before the automobile industry could begin to realize on this investment.

"It is the writer's belief that metric measures can only be introduced into this country by first legalizing them by an act of Congress to the exclusion of all other measures, and set an example by transacting all government business on the metric basis.

"No one industry of which I am aware is capable of forcing the rest of the country into line, and the interdependence of one industry upon another is so great that enormous expenditure without adequate return is entailed in every instance.

Government Adoption Necessary

"The adoption of the metric system in laboratories and places of such character where commercial consideration does not enter is a comparatively easy matter. But in commerce where money is not spent for any consideration except immediate and adequate return the adoption of the metric system is utterly impossible by individual effort, practically impossible by the concerted efforts of an entire industry, however large, and only a matter of very slow probability where it is made a national issue. In France and Germany it was only successfully introduced after government upheaval."

H. C. Stutz, President of the Stutz Company, believes in letting well enough alone. He says: "I am of the opinion that the S. A. E. standard and the A. L. A. M. standard is a mighty good proposition.

"It has grown very successful and has just gotten our screw machine people and tool makers in line, and to adopt some other system and discard the one we have at present does not look as though it was good judgment on an engineer's part."

J. G. Sterling, Chief Engineer of the F. B. Stearns Company, thinks that the benefits would not justify the trouble in making the change. Part of his statement follows: "Replying to your communication of August 6 asking our opinion in connection with the adoption of the metric system will say that my personal inclination would be toward the universal adoption of this system as early as possible, but I do not believe that the benefits to be gained by changing to the metric system as applied to lineal dimensions alone would justify the trouble and inconvenience that would necessarily arise from its adoption at the present time."

G. R. Wadsworth, of the Peerless engineering staff, states that the loss of money in making the change would be too much. He says: "Changing from the present system to the metric practically means scrapping a great deal of machinery, gauges and other expensive apparatus as well as redesigning all these units. The loss to be encountered is more than American manufacturers care to undertake at this time, or possibly at any time."

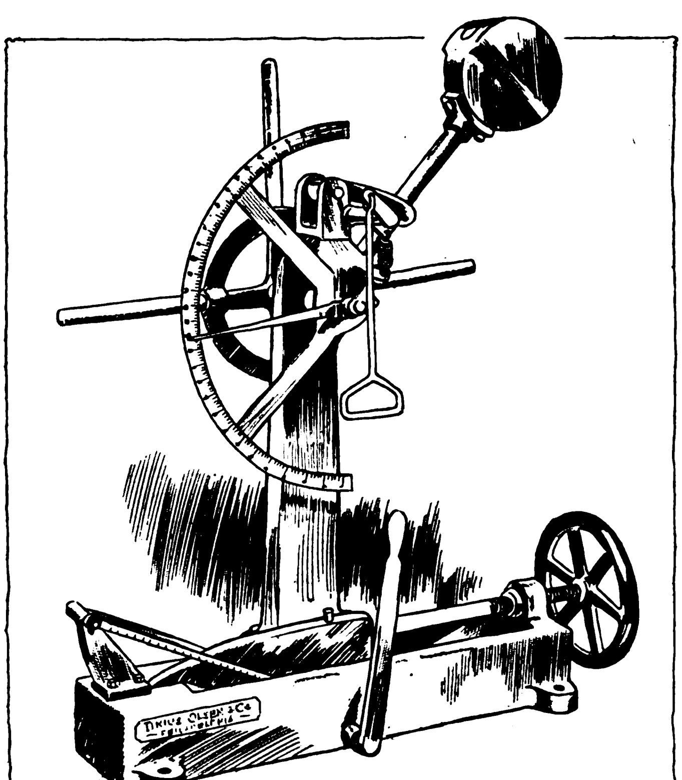
C. B. Rose, Chief Engineer of the Velie Company, does not think that the change could be made by the ordinary manufacturer, as may be seen from the following statements made by him: "Due to existing conditions a considerable length of time would be consumed in putting this system into effect. I believe that the proper way to do this, providing it should be decided to do so, would be to gradually change on all new work going through the factories. That is, if a new design was brought out at any time incorporate the metric system of measurements in this design rather than endeavor to change over on present design.

Benefits Only for Export Trade

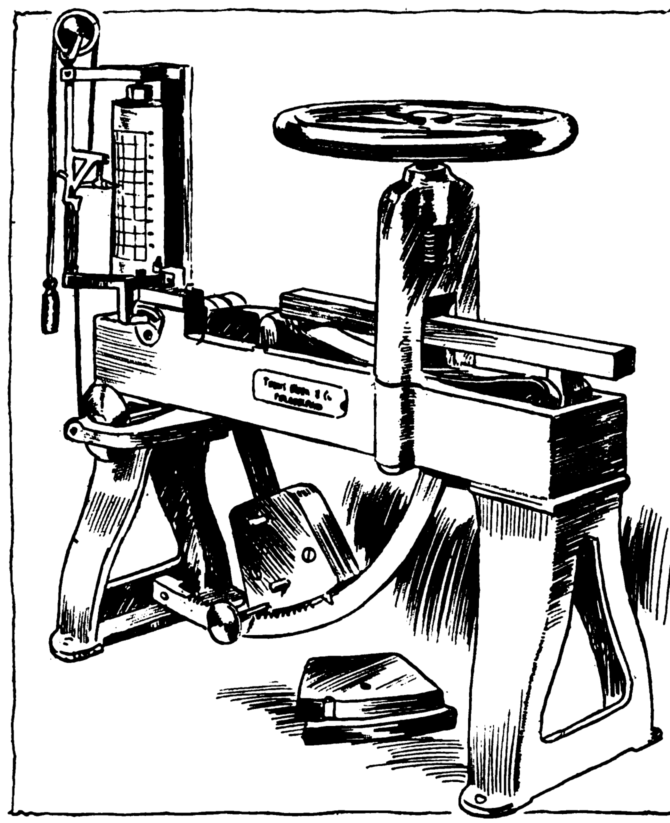
W. H. Callier, General Manager of the Marathon Motor Works, sees benefits only for export trade if change was made. He says: "A few years ago the adoption of the metric system was thoroughly discussed by the American Society of Mechanical Engineers, of which the writer is a member. The objections made by the society to the adoption of the metric system at that time, we believe, hold good in the construction of automobiles. We do not see how the adoption of this system would be of any benefit to our cars other than those exported."

P. W. Klinger, a Speedwell engineer, says: "My personal feeling is that the metric system would be a very desirable one if used universally. One of the largest objections we can see to it would be first, the very large number of changes which would be necessary in machine tools and equipment and all measuring apparatus, and secondly, the endless amount of confusion which would necessarily take place in the transition period from the old to the new method of gauging.

"For the automobile world it would seem that the S. A. E. should, after due deliberation, decide upon a period of time



Impact testing machine adapted for metric and English units



Transverse tester for cast bars graduated for English measurements

in which the change should be made, say two or three years, during which time all new drawings produced could be worked on the new standard with the old figures given as a check up to the expiration of the transition period."

W. H. Vandervoort, of the Moline Company, thinks the change would be a foolhardy undertaking. He says: "The first question I would naturally ask is, 'What are the advantages when our present system is so thoroughly installed?' The great mistake made by the engineers of this country was that they did not adopt the metric system as to the desirability of the system, but when you stop to consider what it would mean to adopt it at the present time I feel that it would be a foolhardy undertaking.

"Think of the widespread campaign of education that would have to be started in order to get our workmen to a point where they could intelligently handle this system. It would be many, many years before the English system could be entirely discarded, and during that time of necessity both systems would have to be used in all factories, or at least so long as their was possibility for call for repairs for product that had been delivered."

G. G. Behr, of the Hudson Motor Car Company, doubts if any real benefit would arise from the change. He says: "I have talked this over with the heads of the various departments of our company who would be interested in such a change and from our standpoint a change of this sort would not seem advisable for various reasons. To begin with, it would take years to work it out properly, during which time there would, undoubtedly, be considerable confusion. It would, no doubt, to a great extent interfere with the operation of our service and repair departments and in view of the fact that practically all of our parts are built by outside concerns we would, no doubt, experience great difficulty in getting them into line.

"Taking all these points into consideration, it is a question in my mind whether or not any real benefit would be derived by changing to the metric system, owing to the numerous difficulties which we would undoubtedly encounter if such a change were attempted."

Where the Trucks Are

National Association of Automobile Manufacturers Presents Tables Showing Distribution

Geography, Population, Paved Streets and Roads Are Considered as Relative Factors in the Problem

ONE of the most remarkable compilations ever made since the beginning of the automobile industry is the following series of three tabulations and explanatory notes and conclusions sent out by the National Association of Automobile Manufacturers covering the geographical distribution of automobile trucks and its relation to population and improved streets and roads.

Due credit is given by the association for the painstaking effort used by *The Commercial Vehicle* in collecting the data upon which the tabulations are based, but the association elaborated upon the tables and introduced a mass of data upon which the conclusions drawn in the accompanying article had their foundation.

Scrutiny of the tables shows that there are certain spots in the United States where population and roads would seem to warrant a wider use of the commercial car where the showing is not favorable. These sections deserve the attention of manufacturers. Other states and districts have a considerable excess of motor equipment which may be accounted for on the hypothesis of unusual local conditions. In Oregon for instance the horticultural and mining industries in connection with the wide use of trucks in the city of Portland bring the state to a rank above Connecticut in the number in use. Where such conditions exist it might be possible to utilize that fact to advantage.

New York's showing is interesting. The Empire State ranks first in number of trucks, total population, and in the number of residents who live in cities of and above 25,000. It is also first in the number of miles of paved streets in the cities.

But in the matter of improved country roads it is behind Indiana and Ohio. If this condition proves anything, it shows that street pavement is a more important element in truck use than the improvement of country roads; thus indicating that the truck at present is a creature of the city. This, however, is not borne out by a digest of all the figures. Good roads and streets are required for advantageous operation, but they have to be considered together in order to justify an intelligent opinion or conclusion.

The other side of the proposition is shown in California where the percentage of paved streets is 50 and of improved roads 17.87, while New York is 54 and 16.13 per cent., respectively. The percentages of paved streets in both states is not dissimilar, considering the fact that the city of New York is included in the tabulation. The improved country roads are proportionately more numerous in California than in New York and the ratio of automobile trucks per 1,000 of population is greater in California than New York. Considered on the basis of city streets this ought to be reversed, but the difference is made up in the excess of good country roads; thus proving that both elements are required in reaching the correct conclusion.

The states south of the Ohio River, particularly Kentucky and to a lesser degree Tennessee, where the percentage of improved country roads to total roads is higher than their respective ranks in population, show a marked deficiency in the normal number of trucks. There is an immense amount of work in Kentucky and Tennessee that could be shifted to the automobile truck and on the poor showing in each state it would seem that a market for more trucks might be cultivated.

Such efforts as that, however, call for combative marketing.

TABLE 1—SHOWING RELATION OF DISTRIBUTION OF MOTOR TRUCKS TO POPULATION AND GOOD ROADS.

State.	Number of Commercial Motor Vehicles in Use in 1912.	Population of State in 1910.	Population per Square Mile.	Population in Cities of 25,000 and Upwards.	Miles of Improved Country Roads in 1909.	Miles of Paved Streets in Cities of 30,000 and Up in 1907.
New York	7,892	9,113,000	191	6,355,280	12,787	2,952
Pennsylvania	2,664	7,665,000	171	3,015,161	3,365	2,154
Illinois	2,551	5,638,000	101	2,624,656	8,914	1,947
California	2,198	2,377,000	15	1,095,120	8,587	1,066
Massachusetts	2,045	3,366,000	419	2,155,475	8,463	1,912
Ohio	1,171	4,767,000	117	1,784,210	24,106	1,643
Michigan	1,146	2,810,000	49	939,929	6,900	687
New Jersey	1,080	2,537,000	338	1,368,927	3,377	687
Indiana	970	2,700,000	75	479,071	24,955	482
Minnesota	970	2,076,000	26	594,618	5,417	326
Missouri	832	3,293,000	48	1,080,087	4,755	1,119
Iowa	730	2,225,000	40	330,092	2,505	253

The districts where an excess of trucks is indicated embrace localities where the use of trucks is common and their worth has been demonstrated. It would appear as if the marketing of more trucks in those localities would work out by following the line of least resistance.

Take the farming state of South Dakota, for example. The state has several big railroads, but it is so large that they appear rather inadequate. It has no big cities and ranks thirty-sixth in population. It is a state of seasons. When the harvests are made there is intense activity to get to market. The state ranks twenty-ninth in the number of automobile trucks and only 1-2 mile in every 100 of its highways has been improved.

After a prolonged dry spell such as generally follows the harvest, the roads are passable for trucks and the pressure of freight originating on the farms calls into service every available means of transportation. These facts account for the excess of trucks in South Dakota under all the conditions. When road improvement is extended the demand for trucks should be much larger in such territory as that represented by that state.

Close study of the three tables will disclose scores of interesting facts about truck distribution as the data is sufficiently detailed to allow of some close approximations of actual facts.

Following is the complete article:

The controlling factors in the geographical distribution of motor trucks are somewhat complex. Interesting results have been obtained in an effort to trace some of the principal factors, as shown in the accompanying tables.

It has been said that the motor truck is essentially a good roads proposition and consequently an attempt was first made to show a direct relation between the number of commercial motor vehicles in each of the

States and the total mileage of good roads in the States. The result indicated that some other factor had a greater influence on distribution. It was assumed that this must be population, and therefore the total population of the States and the population of each State per square mile were compared with the number of trucks in each State. The result was better this time, but still not up to expectations. Hence the conclusion was reached that, as large cities are known to be the centers of motor trucking, there must be a closer relation between the number of trucks in a State and the number of people living in large cities in the State.

This was found to be the case, but an ever closer relation is shown between the number of trucks and the number of miles of paved streets in such cities, so that the final conclusion is that the use of trucks is dependent in greatest degree upon the number of people living in large cities and the condition of the streets in such cities. It is evident, however, that there are still other influences having important effects, such as the temperament and occupations of the people and the degree of prosperity of the communities.

Referring to Table 1, the figures relating to the vehicles in use were compiled by *The Commercial Vehicle* from three principal sources of information—production as reported directly by manufacturers to March 1, 1912, State and city registrations of motor vehicles, and reports of trucks in use in the principal cities by reliable observers and well-informed persons. These figures show a total of nearly 30,000 commercial vehicles in use, which correspond fairly closely with the results of the statistical investigation into production and sale made by the National Association, and are believed to be the most reliable figures available showing the distribution of trucks by States.

The population figures and percentages were taken from the United States Census report for 1910. The mileages of improved roads and the percentage of improved roads to total miles of roads in the various States are from a report for the year 1909 by the United States Office of Public Roads and relates solely to country roads that have been graded, drained and hard surfaced or treated with some preparation. The mileages of paved streets in cities of 30,000 population and upward are from the Census report of 1907, the figures for 1909 being now in course of preparation and not yet available.

Examination of Table 1 shows that, while New York State, which heads the list with 7,892 trucks, has the largest total poulation, the largest population in cities of 25,000 and up, and also the largest mileage of paved streets in cities of 30,000 and up, it has an average of only 191 persons per square mile as compared with 508 in Rhode Island, 419 in Massachusetts and 338 in New Jersey, and has only 12,787 miles of improved country roads against 24,955 miles in Indiana, 24,106 in Ohio and more than 10,000 miles each in Wisconsin and Kentucky. On the other hand, California, which ranks fourth with 2,198 trucks, stands twelfth as regards total population, with 2,377,000, and numbers only 15 persons per square mile, but nearly one-half its population lives in cities of 25,000 or more. and it stands seventh in miles of improved country roads and miles of paved city streets. Again, Texas, with a population of 3,897,000 and 4,896 miles of good roads, is credited with only 382 trucks, whereas on these two factors alone it should have more than Missouri, with her 832 trucks. But, on examination it will be seen that only 473,375 of her great population live in cities of any size and that there are only 358 miles of paved streets in those cities, while practically one-third of Missouri's people live in cities and the cities have 1,119 miles of paved streets.

In order to render such comparison easier, Table 2 has been prepared. This shows the rank or standing of each State in each of the factors mentioned, and it is necessary only to follow across the line after each State to determine whether it has its full quota of trucks in proportion to population and good roads and streets. Examination will show, as already stated, that the most direct relation is found between the rank in actual number of trucks and the rank in population in cities and the paved streets in the cities; that is, between columns one, four and six.

Thus, it appears that those States having a normal quota of trucks, or in which the distribution is about uniform with city population and street paving, are New York, Pennsylvania, Illinois, Massachusetts, Ohio, Michigan, Connecticut, Rhode Island, Texas, Georgia, Maine, South Carolina, Montana, New Mexico, Nevada, Washington and Delaware.

Those States having an excess of trucks above normal are California, Indiana, Nebraska, Utah, Iowa, Oregon, Kansas, Arkansas and Florida.

Those having deficiencies are New Jersey, Missouri, Washington, Maryland, Kentucky, Virginia, West Virginia, Tennessee, Alabama, New Hampshire, Louisiana and Oklahoma.

Evidently, local conditions affect the situation in most of the abnormal States. Take Tennessee, for example. It has less than two-thirds as many trucks as it should have to be on a basis with the normal States. This may be accountable for on the ground of comparative backwardness in industrial and commercial progress or because the field has not been cultivated sufficiently by the truck manufacturers' agents. Louisiana is another instance, due perhaps to temperamental and industrial factors. Where blanks occur in the fourth and sixth columns they indicate that there are no cities in those States having 25,000 population in 1910.

The percentages in Table 3 show almost the same results as the relative standing in the States on the basis of actual numbers in Table 2. In explanation of this table, California has 92½ per cent. of one motor truck to each 1,000 inhabitants, giving it the largest number of trucks to population. Forty-seven per cent. of her people live in cities of 25,000 and up, giving her fifth place in this respect. Of her total road mileage, nearly 18 per cent. has been improved, and just half of the street mileage in cities of 30,000 and up had been paved up to the year 1907. Louisiana has an average of less than one truck to 37,000 inhabitants, as compared with nearly one truck to 1,000 in California.

TABLE 2—SHOWING STANDING OF STATES IN NUMBER OF MOTOR TRUCKS, POPULATION AND MILES OF GOOD ROAD

Trade News of the Week

Petition In Involuntary Bankruptcy Is Filed Against King Motor Car Company—Liabilities Are $304,000

Rubber Market Lively—Standard Oil Explains Recent Continued Rise of Gasoline Prices

MERCHANDISE creditors of the King Motor Car Company, of Detroit, held a meeting in that city last week, elected a creditors' committee consisting of Messrs. Mallory, Oglesby and Hayes and seriously considered the matter of the company's finances.

Sidney S. Meyers, of New York, was selected as counsel for the creditors' committee and after viewing the situation from the standpoint of the creditors, Mr. Meyers advised immediate bankruptcy proceedings.

A petition in involuntary bankruptcy was drawn up under the direction of Mr. Meyers and was placed in the hands of Detroit legal representatives for formal filing in the United States District Court.

The investigation of the creditors, according to Mr. Meyers, disclosed the fact that the total claims against the company amount to about $304,000. Of this amount $100,000 is represented by the claim of Artemus Ward, of the advertising company Ward and Gow, and said to include loans of money as well as merchandise claims.

The assets of the company are rated as material of a book value of $150,000 and accounts receivable of $15,000. The material consists of parts of automobiles, but the stock on hand is not sufficient to make up complete cars unless certain deficiencies are supplied. The creditors estimated that it would be necessary to advance from $175,000 to $200,000 in order to make up 250 cars. This course was not favored and upon the recommendation of Mr. Meyers, steps were taken to institute bankruptcy proceedings.

In addition to the list of assets the company also has a lease upon the buildings which constitute its present plant.

DETROIT, MICH., Aug. 28—A petition in involuntary bankruptcy has been filed in the United States District Court, Eastern District of Michigan, against the King Motor Car Company. The petitioning creditor is the Harvey Manufacturing Company and the claim in suit amounts to about $1,100.

Rubber Easier in Lively Market

The bulge of crude rubber prices which carried the market up to a basis of $1.25 per pound for up-river fine was reduced after the commencement of the fortnightly auction in London. The prices obtained at the plantation sale were only slightly lower than those current 2 weeks ago but the total offerings were 725 tons, of which about 300 were sold on the block. A better local demand was apparent in the market with some buying that appeared to be for manufacturers.

Old Contracts Disturb Gasoline

Owing to the series of advances that have been noted in the market for gasoline during the past 8 months, prices have been badly demoralized in various sections of the country. Reports have been received that approximately the same grade of gasoline is available in Ohio and several adjacent states in the Middle West at 13 cents a gallon as can be obtained in New Jersey at 18 cents, New England in spots at 17 cents and New York City at 25 cents.

The Standard Oil Company of New York declares that it buys gasoline in Cleveland at the refinery at 17 cents a gallon and that the retail price of gasoline of the same grade in New York City is 19 3-4 cents a gallon f.o.b. New York in wooden barrels of 50 gallons capacity. Parenthetically, the Standard Oil Company explains that the grade of gasoline known as 68-70 degrees forms very little of the total amount sold and used for automobile fuel. The grade used for automobile fuel is known as motor or stove gasoline and the degree is not given.

The wholesale price of gasoline quoted by the Standard Oil and Texas companies in New York and f.o.b. New York for shipment elsewhere in steel barrels, the barrels to be returned immediately upon delivery is 16 cents a gallon.

The apparent paradox contained in the figures is explained as follows: Last year in July and before garagemen and big users and dealers in gasoline entered into contracts with the manufacturers of gasoline, the Standard Oil Company, Texas Company and others, at the level current at that time. Some of these contracts are still in effect with thousands of gallons of gasoline still to be received by the contracting purchasers at the same price that was in effect in July, 1911. In turn, some of these garagemen contracted with customers to supply them with gasoline at a certain figure and despite the repeated advances they have kept on selling at the original price not only to the customers with whom they have contracts, but also to their trade generally.

When their contracts expire, they will have to be renewed at the contract price that is current at the time of the renewal.

"Overlooking a chance to make hay while the sun shines," is the way headquarters of the big oil companies view the action of the garagemen.

When asked as to the significance of the epigram, an official of one of the companies said that in view of the big jump in the market price of gasoline, the customers who made contracts at low figures should have had a nice fat profit at the expense of the sellers instead of handing over the profit to their general trade, thus demoralizing prices and causing confidence to waver.

As to the permanence of the present level, or a gradual appreciation in prices, the opinion prevails that high prices have

Automobile Securities Quotations

Automobile securities had another quiet week in the markets. Goodrich issues have been listed on the New York Stock Exchange and the common has been strong for a week. General Motors continues to gain slowly but steadily. U. S. Motor has been active within a narrow range.

come to stay and that the maximum price has not been reached.

"The facts in the case," said a Standard Oil official, "are that the emphatic demand of the hour is for gasoline. We can sell all we can get. The other petroleum products do not keep pace with gasoline as to demand. The solution of the problem lies in the discovery of some means by which the other petroleum products can be utilized as automobile fuel. The present investigation of the carbureter question is being followed by this company with much care and attention."

The situation in a nutshell is that the rate of 16 cents a gallon may be regarded as basic. The variations from that level are the results of local conditions, but as a general thing the rate in any given locality is about 12 1-2 cents plus the freight or transportation charge from the refinery to any given field. The price of 17 cents paid by the Standard Oil Company of New York at the Cleveland refinery includes the freight charges and contemplates 68-70 degree gasoline. This might account for the considerable difference in price noted.

Peil Is Mitchell Sales Manager

RACINE, WIS., Aug. 26—Leo A. Peil, president and general manager of the Mitchell Automobile Company, a large distributor for the Mitchell-Lewis Motor Car Company, of Racine, Wis., has been appointed general sales manager of the Mitchell-Lewis company to succeed William L. Day, who has resigned to accept the position of general manager of the General Motors Truck Company, Pontiac, Mich. Mr. Peil assumes his new duties on September 1.

Fiat Announces $500 Cut in List

Horizontal reductions of $500, applying to types 56, 55 and 54 which are the 50-horsepower six, the 55-horsepower four and the 35-horsepower, four-cylinder cars have been announced by the Fiat Automobile Company. The standard prices now established are $5,000, $4,500 and $4,000 for the three models respectively.

Market Changes for the Week

Small gains in tin and lead were the only developments in the metal market, these being strong. Copper was quiet. Steel continued at its old prices. Oils and lubricants also remained unchanged throughout the week, and the same applies to gasoline which still sells at 21 cents a gallon in 200-gallon lots in spite of promises for a small rise.

Aristos-Disco Suit Filed

Eastern Distributors for the Gas Starter Company Demand $325,000 Damages —Seven Causes of Action

Breach of Contract Alleged in Action Brought in Federal District Court at Detroit

WORD was received in New York Tuesday by E. B. McDuffee, president of the Aristos Company of New York, that suit has been filed in the United States District Court for the Eastern District of Michigan on behalf of the Aristos Company demanding damages of $325,000 from the Ignition Starter Company, alleging breach of contract.

According to a copy of the bill of complaint the suit is based upon seven causes of action. The bill alleges that the Aristos company has been the Eastern distributor for the Disco starter. That as such it purchased upwards of 4,000 starters for more than $50,000 and it complains that the contract conditions under which the starters were purchased were violated by the defendant company in numerous particulars for which damages of $100,000 is demanded. For violation of an alleged agreement not to advertise the Disco in the Eastern section of the country except with reference to the Aristos Company as Eastern distributors, $10,000. Lack of service, $75,000. Various elements of damage and loss caused by the alleged actions of the defendant company, $94,000, and for other reasons, $21,000.

The suit is a law action and the usual course of such proceedings is to reach an issue on the pleadings within 6 months and a hearing soon thereafter.

DETROIT, MICH., Aug. 28—Suit has been entered in the United States District Court by the Aristos Company, a Delaware corporation, against the Ignition Starter Company, makers of the Disco starter, asking $325,000 damages for breach of contract.

Esterline Company Forming Plans

INDIANAPOLIS, IND., Aug. 26—Announcement was made a few days ago of the purchase of one-half of the capital stock of the Esterline company, LaFayette, Ind., by Carl Fisher and J. G. Allison, owners of the Prest-O-Lite Company and the Indianapolis Motor Speedway. The capital stock of the company is $250,000. The plant at present located at LaFayette, will be moved to Indianapolis, and will locate at Speedway.

The Esterline company, it is announced, has already booked orders for the Berdon electric lighting equipment aggregating more than $1,000,000.

One of the most important lines to be manufactured is a new electric lamp for motor vehicles.

Swinehart to Issue Stock

AKRON, O., Aug. 28—Stockholders in the Swinehart Tire & Rubber Company have been offered a right to subscribe for 23 per cent. of their holdings in the new stock issue recently authorized by the company at par. The business of the company has outgrown its working capital and the increase in the issue of stock is to provide such. The subscription is subject to ratification at the annual meeting September 25.

Vinot Factory for Montreal

MONTREAL, Aug. 26—The Montreal Automobile Carriage Company has been formed for the purpose of building all sorts of cars. The Vinot Car Company, of Canada, has contracted for all the Vinot cars to be built by the Automobile Carriage Company and skilled mechanics are coming from the French factories.

Elgin Has 34 Entries

Great Road Races Promise to Surpass Record for Course—Many Celebrities Listed Among the Drivers

Well Balanced Fields Named to Go in Each of the Contests Scheduled for This Week

CHICAGO, Aug. 27—Meeting with far greater success than even its most enthusiastic supporters anticipated, the Chicago Automobile Club stands ready to run the third annual Elgin road races next Friday and Saturday and offers a program that is of greater brilliancy than anything of this kind ever developed in the Middle West. Whereas a couple of weeks back it looked as if the club would be lucky if it brought together twenty entries, today when the final count was made and the drawing for numbers took place, it developed that there were thirty-four entries on the books, not counting the four Peugeots which had been declared following the receipt of a telegram from Importer Lacroix to the effect that the French cars had been shipped for an American engagement. It now looks as if this was a false alarm, at least so far as Elgin is concerned. While the Peugeots remain on the list they will be booked only in case they get here in time to race.

The thirty-four entries in hand represent a larger field than started last year when stock car racing held the center of the stage. The thirty-four are divided so that three will start in the small car race for which F. W. Jencks, general manager of the Elgin Automobile Road Racing Association, is offering the trophy; six are booked for competition in the race for the Aurora trophy for cars of from 231-300 inches; while four are to start for the Illinois cup for 301-450 cars. This makes thirteen cars for the first day and inasmuch as all three races are run simultaneously it will make a big field. On the second day there will be fifteen cars running, twelve in the Elgin National Watch company trophy race for cars 600 inches and under and nine in the free-for-all. There are three of the free-for-all cars that are not in the Elgin.

Twelve different makes of cars are represented in the 2 days of racing, out of which number three—still not counting the four Peugeots—are of foreign extraction, the Fiat, of Italy, and Benz and Mercedes, of Germany. American makes represented include the Knox, Stutz, Mercer, National, Rayfield, Mason, Falcar, Ford and Herreshoff. This will be the first appearance in the racing field of the Rayfield, a six-cylinder car made in Springfield, Ill. New also is the Mason which is entered in the Aurora cup and the Elgin trophy races. This Mason is a slightly larger one than the Mason which Harry Endicott drove so successfully at the Galveston beach meet.

A list of drivers includes nearly all of the celebrities, those booked being Teddy Tetzlaff, Ralph Mulford, David Bruce-Brown, Ralph DePalma, Erwin Bergdoll, Spencer Wishart, Hughie Hughes, and Caleb Bragg. In the case of Bruce-Brown there still remains some doubt, for while the American Grand Prix winner was the first entrant, his plans have been somewhat upset by the non-arrival of his Fiat car from Italy. He is expected here not later than Wednesday, when an attempt will be made to have him drive one of the Fiats which Teddy Tetzlaff brought here from Los Angeles. Caleb Bragg has been nominated by E. C. Patterson, of Chicago, the sportsman who endeavored to import the French Peugeots. Failing to get a definite reply from the Frenchmen, Patterson, on Saturday, nominated Bragg, but as yet he does not know whether Bragg will drive a Fiat or a Belgium Metallurgique which he is reported to be preparing for Milwaukee.

With such a choice collection of cars and drivers, the Chicago Automobile Club has the stage all set for the big show. The course is in good shape and well oiled, soldiers have been secured to guard the course, a great interest aroused among the motorists of the Middle West and a prize list which includes $6,500 in cash has been offered. Threfore, the local promoters who have had only 7 weeks in which to handle the meet, feel confident that success awaits there efforts Friday and Saturday. The entry list is given on page 42.

Georgia Town Runs Trade Tour

ATLANTA, GA., Aug. 26—The possibilities of the automobile as a trade builder for the merchants of towns and small cities has been demonstrated by the little town of LaGrange, Ga. This city held the first of two boosting tours recently, covering three counties north of it. It will soon hold a second traveling southward.

The first trip covered 70 miles and more than forty business men of the little town made the circuit. Good crowds were present at all their stops. No attempt was made to do any business, but LaGrange was boosted as a trading point.

Other Georgia towns are planning to duplicate this experiment.

Club to Climb at Davenport

MOLINE, ILL., Aug. 26—The Davenport Automobile Club, which includes in its membership Moline and Rock Island automobilists, will hold a hill climb at Moline on Labor Day. Eight events have been carded, including a free-for-all for amateur drivers, the cars entered to carry full factory equipment. For this event the Josephson silver cup will be the first prize. Entries are

Left, Bergdoll in his big Benz. Center, left to right, Drivers Pullen, Hughes, Endicott and Tetzlaff, with Mechanician Hill in background. Right, Mulford in his Knox Six

limited strictly to members of the Davenport Automobile Club.

The events are for cars costing $1,000 and under; cars costing $1,000 to $1,800; cars costing $1,800 and up; cars costing $2,000 and under, carrying four passengers; cars costing $2,000 and over, carrying four passengers; age handicap; free-for-all; free-for-all for Josephson cup, amateur drivers, cars must carry full factory equipment.

Milwaukee Club Holds Evening Tour

MILWAUKEE, WIS., Aug. 25—The Milwaukee Automobile Club conducted its first annual Harvest Moon tour on Saturday evening, August 24, from its clubhouse at Milwaukee to Oconomowoc, the famous summer resort, and return. Sixty-seven cars participated. The start was at 5 o'clock and dinner was taken at Lalumier hotel on Oconomowoc lake at 7 o'clock. The return trip was begun at 8.30 o'clock, and the route was via Waukesha, where a party of twenty cars from the Waukesha Motor Club was picked up and taken to the Milwaukee clubhouse for a buffet luncheon and informal dance.

M. C. A. Revises Contest Rules

DETROIT, MICH., Aug. 24—Recommended changes in the rules to govern automobile contests for the coming year were formulated and presented to the General Rules Committee of the Manufacturers' Contest Association at its mid-summer meeting held recently. The proposed changes are few in number and not radical, but the exact significance of them cannot be established until the tentative list is acted upon by the Contest Board of the American Automobile Association.

A general poll of the situation was taken in advance of the meeting and queries as to changes in the code were presented to 130 manufacturers in and out of the organization. Sentiment was about evenly divided between the advisability of holding strict stock contests and non-stock contests.

CARS AND DRIVERS ENTERED IN THE ELGIN RACES, SHOWING THE BORE AND STROKE OF THE ENGINES

Wishart Breaks Records

Lowers Mark for 200 Miles and Several Intermediate Distances on Columbus 1-Mile Circular Dirt Track

Official Rules Covering Next Year's Grand Prize Race Published by the Automobile Club of France

COLUMBUS, O., Aug. 26—Records were shattered at the second annual 200-mile race given at the Columbus Driving Park August 25, under the auspices of the Columbus, Ohio, Automobile Club. The records for 75 miles, 100 miles, 150 miles and 200 miles on a circular dirt track were broken before a crowd estimated at about 35,000. The race was successful in every way and there were no accidents of any kind to mar the pleasure of the afternoon.

Spencer Wishart, in a Mercer, finished first in 3 hours, 28 minutes and 4 1-2 seconds, as against a previous record on the same kind of track of 3 hours and 45 minutes. The others finishing inside the money were Howard Wilcox, in a Cino, time 3:35:10; Johnny Jenkins in a Cino, time, 3:35:30 and Neil Whalen, in a National, time, 3:36:49. Ben Lawwell, in a Westcott, was also in at the finish but was not in the money.

Wishart drove steadily throughout and did not push his engine for the first 50 miles. After some jockeying, Wishart took the lead and held it with the exception of a few laps around the 50-mile period. At 65 miles, the Mercer led and was never retired from that position. It was after negotiating 103 miles that Wishart came into the pit for the first time and then three tires were changed. At that time he was four laps to the good and left the pit still in first place. At 129 miles Wishart again went to the pit for tires and water and at 180 miles the third stop was made, this time for oil. All told, he lost 10 1-2 minutes in the three stops.

The records broken were: 75 miles by Wishart, in his Mercer, 1 hour, 19 minutes and 38 seconds as against the record of Strang, at Columbus, O, July 3, 1909, in 1 hour 19 minutes and 39 seconds. 100 miles by Wishart, in his Mercer in 1 hour 40 minutes and 51 seconds as against Burman, at the Columbus, O., track, July 3, 1909, in 1:41:00 2-5. He made the 150 miles in 2:34:05, which won for him the Virginia Hotel cup.

The money and prizes distributed were: Wishart, in Mercer, $1,000 and Chamber of Commerce trophy. Wilcox, in Cino, $500 and Hartman Hotel trophy. Jenkins, in Cino, $300 and North Side Chamber of Commerce trophy. Whalen, in National, $200 and Williams & Schlereth trophy; 50-mile lead, Cino, Jenkins, Gordon Trophy, time, 1:02:41; 100-mile lead, Mercer, Wishart, Central Ohio Oil Company cup, time, 1:40:51; 150-mile lead, Mercer, Wishart, Hotel Virginia cup, time, 2:34:05. A summary of the prize winners and their respective times follows:

Car	Driver	Time
Mercer	Wishart	3:28:4½
Cino	Wilcox	3:35
Cino	Jenkins	3:35:30
National	Whalen	3:36:49

French Race Rules Published

PARIS, Aug. 16—In its official rules just published for next year's Grand Prix race, the Automobile Club of France has determined an allowance of 20 liters of gasoline per 100 kilometers (being at the rate of 14.1 miles to the gallon) and fixed a minimum weight limit of 1,763 pounds and a maximum of 2,425 pounds, without gasoline, oil, water, tools or spares. The total distance of the race, which will be a 1-day event, will be about 560 miles, the course to be about 30 miles round and as near as possible to the city of Paris.

Minute precautions have been taken in the drawing up of the rules to provide against cheating. In addition to a fine of $2,000 and disqualification of the driver, his team mates and the firm proved guilty of an attempt to dodge the rules, the committee has decided that it will supply the gasoline tank, the piping and all unions. The tank, which will be 39 inches in length and of a diameter to be determined when the total distance of the race has been decided on, must be placed across the frame to the rear of the two seats, it must not be encased or covered in any way, and the car must carry all spare tires and wheels across the frame to the rear of the tank. The whole of the fuel to be used in the race will be put into the tank before the start; thus if the distance is 560 miles, the amount of gasoline aboard will be about 40 gallons. The gasoline allowance will be made at a temperature of 15 degs. C., with rectification for any variation in temperature from this standard.

When the tanks have been filled on the day before the race, the filler cap will be sealed, all connections on the gas line will be sealed, and a control put on the carbureter, the car then being placed under military guard until the moment of the race.

Permission is given the competitors to indicate the brand of gasoline they desire to use in the race, a list of ten different makes being quoted from which a choice can be made. The particular brand selected will be bought from the retailers in the ordinary sealed cans and only opened in the presence of the competitors.

The construction of the tanks will be such that it will be impossible to put gasoline in without detection.

Under the rules any manufacturer can enter six cars at a fee of $800 per car, entries to be received by October 31 and to attain a minimum of forty for the race to be held. In view of the possibility of too large a number of starters, the right is retained to reduce the number per firm, starting with the firms having the maximum number of cars entered, by the drawing of lots, or by the running of an elimination race, as may be considered advisable. From October 31 to March 1, 1913, entries will be received at double fees.

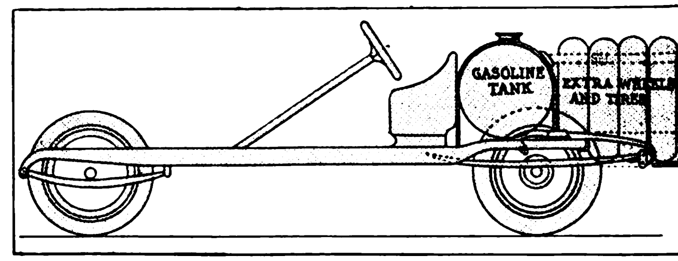
Alco Truck in Home Stretch

KELTON, UTAH, Aug. 26—The Transcontinental Alco truck has reached here, with a distance traveled of 3,150 miles and a record of thirteen state lines crossed. Less than 800 miles now remain of the journey from the factory of Charles W. Young & Company, Philadelphia, to the Carlson-Currier Company at Petaluma, Cal.

In contrast to the floods, washouts and other obstacles to travel that were met in Wyoming good road conditions have been experienced by the truck in Utah.

In reaching Kelton, the crew, on account of superior conditions for traveling, chose to make a wide detour to the north and drove across the Utah-Idaho state line just above Snowville.

MINNEAPOLIS, MINN., Aug. 27—The Contest Board of the Minnesota State Automobile Association announced today the disqualification of Studebaker No. 3, a contestant in the runabout class for the *Daily News* Cup in the recently run fourth annual reliability tour which finished at Winnipeg. The cause of the disqualification was that the car left the course, running around Foxholm, Minn., on the fourth day of the contest.



Position of fuel tank and spare wheels and tires prescribed by rules for 1913 French Grand Prix

Painting and Upholstering

High Grade of Workmanship Exacted By Automobile Owners and Users Elevates These Trades to Arts

Not Only Must General Effect Be Pleasing But Detail Must Be Carefully Executed Throughout

OF ALL the trades connected with the making of the automobile, none is more important and essential than those of painting and upholstering. Other trades are mechanical; these are charged with the elements of art.

The motor maker, the body fashioner, the designer, the worker in wood or metal, and the cunning artificers in various other lines create the car to do its appointed work, but without the creative, artistic and executive talent of the painter and upholsterer the prospective buyer would be as a stranger unto the salesman's inexhaustible vocabulary.

Neither the painter nor the upholsterer is a mechanical necessity. Both contribute to the comfort of the car owner; one to both the physical and mental, the other to the mental. Both, to accomplish the higher order of results now exacted by automobile owners and users, must be experienced and expert in all the intricacies of their crafts.

With the upholsterer, design, style, finish, material, color, form and finish, together with the luxurious effects which all these things are expected by the car owner to give to the vehicle, are chief items of his stock in trade. Not only must the general effect be all that anything in art can well be, but in detail also the work must, to meet modern requirements, be complete throughout.

Car Buyers Growing Critical

Within the past 2 years, car buyers have found it to their interest to be critically exacting in their choice of upholstering for their cars. Good upholstering or trimming serves no useful purpose, aside from a mere temporary effect, unless it is durable.

Durability of the upholstering depends perhaps about equally upon the workmanship and upon the quality of the goods used. The cushion and back springs, and the materials immediately connected with these in bringing up the form and foundation for the finer fabrics, are essentially important and the car owner may rightly insist upon these being of the best. Like the painter, the upholsterer or trimmer is concerned with the foundation building. With a defective under-structure the whole building, however fitly joined together upon its outer trappings, is in ever-present danger of going to pieces.

The maintenance of form, expansion, compression, with here a little and there a little of that deftness of touch which is at once the unmistakable mark of a superior workmanship, are necessary factors in the make-up of a good and durable job of car trimming.

Some of the foundation materials may be summarized as follows: Springs, sheeting, webbing, duck, buckram, thread, hair, etc.

For high-class work, which, after all, is ultimately the cheapest, the best curled hair, with sheet cover padding and springs of the finest elasticity, worked into an adjustment that means the most satisfying comfort, are indispensible.

With the outer adornments of the upholstery—the cloth, and silks, and satins, and lace, and cord, and leather, tufts, buttons, tassels, carpets—everybody having to do with the car is concerned. These things, of course, are variously priced, according to quality, but, as before stated, quality rather than the price should be the governing factor. Generally speaking, in the choice of cloth the car owner or buyer should select as the fabric most durable, goods of moderately long wool, soft and firm to the touch, not too compactly woven, clear in thread, and warp and woof, of cheap and shoddy filling, pliable, elastic and suggestive of luxury.

For automobiles of the best class, hand-woven laces continue to be in favor despite the expense attached to their use. Cushion fronts, doors and pillars display the wide laces, while the narrow fabrics are used, as required, principally in connection with the wide samples. In automobile upholstering, as in the painting, very much depends upon the choice of colors—their capacity to undergo service without fading. Naturally in the finest fabrics the color is fast and uniform.

For automobile work, the cloth should be dull finished—that is, without gloss. This is produced under the process of cold pressing, whereas hot pressing produces the gloss finish. Either finish may be made up from the same piece of goods.

The dyeing of the cloth has much to do, we are told by those in authority, with the quality, supposing the quality of the fabrics to be uniformly good previous to this treatment. There are at least two processes of dyeing, namely: Wool dye, which provides for the wool being dyed prior to being woven, and piece dye, which provides for dyeing the cloth in the piece as it comes from the loom.

In leathers, choice colors may be had for automobile work. Many rare and beautiful colors are wrought in leather, the split-hide leather, it is said, taken from the best hides, being most largely used for car upholstering. The finish, feel and appearance of fine leather, colored to harmonize and soften down the entire tone of the interior work, confers upon the upholstering a sense of comfort, of luxury, of indescribable restfulness quite unsurpassed by anything else that art or the ingenuity of man can put into the car.

Besides the cover fabrics, the cloth or leather, there are the interior furnishings, which belong to and are a part of the trimming of the car. You may choose to call them accessories, but they practically all belong to the trimmers' department of work for arrangement and display.

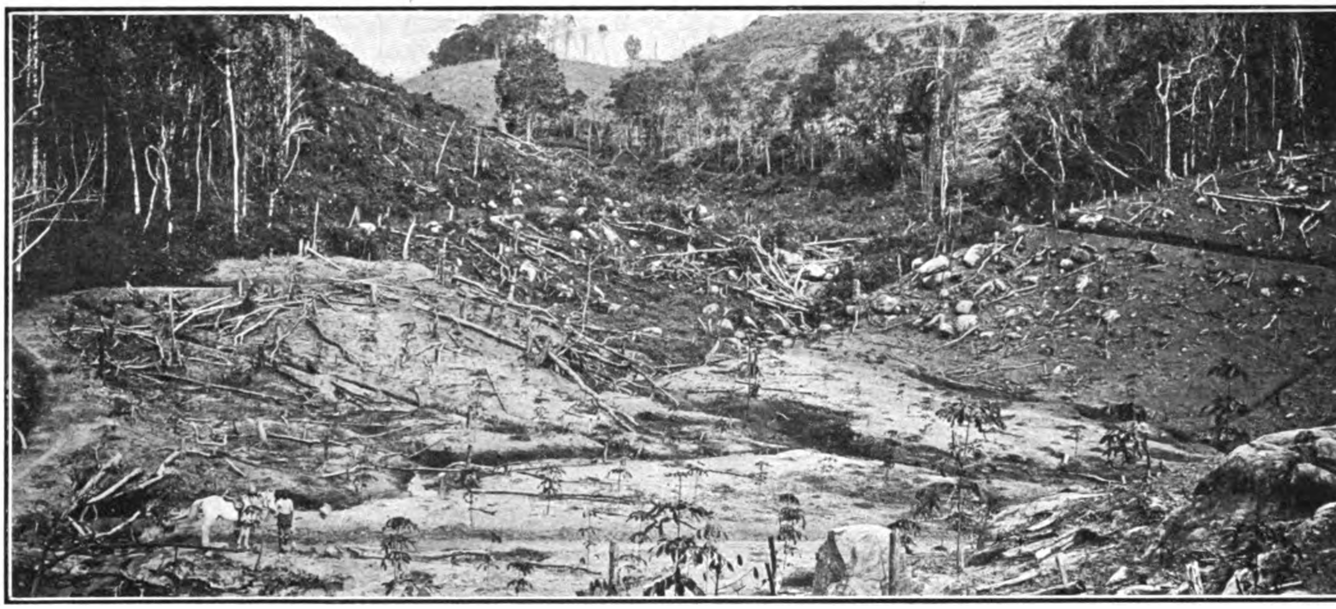
For the larger type of car, limousines, etc., there are hat-racks, parcel-nets, dome lights, corner lights, megaphones, coat-hooks, bouquet- and umbrella-holders, and a fairly wonderful list of other sundries which must enter into the completion of the car if it is to approach in detail work, and in the hundred and one little things making for the delight and convenience of the user, the beautifully finished and furnished cars from over the sea.

So, too, in the painting. While the American finisher gives to the car a quality of work unsurpassed, the American painter in his choice and combination of colors, and his manner of displaying them, fails somewhat by comparison with the work of the incomparable French colorists. However, we are this year being treated to a quality of color work which promises very soon to equal, or even surpass, anything accomplished by foreign touch artists.

Surface Work Highly Perfected

Surface work, rounding out and perfecting every detail of the under foundation is a department of work which in this country has been brought to a high state of perfection. If the French painter leads his American brother in color methods, the latter leads the world in surface creations and in the fine art of finishing.

While all these things are of immediate concern to the car owner the durability of the colors, the wearing properties of the varnish, and the results wrought out by a combination of the two are of still greater importance. The dark, fine blues and greens and maroons which seemingly harmonize with practically every popular upholstering and trimming material are, for the most part, durable colors requiring only the adequate protection of plenty of good varnish to maintain them in a high order of excellence through a long term of service.



How a newly-planted rubber orchard in Ceylon is laid out—Here the trees are only 12 feet apart, a mooted subject among the experts

Plantation Rubber a Factor in Industry

Production Increasing Rapidly, Thus Counteracting the Demand on Para Grades—Some Interesting Details Outlined by Experts with Regard to Advanced Methods in Use Among the Planters of Ceylon and the Far East

PLANTATION rubber in 1912 will reach a production 100 per cent. in excess of the production of cultivated rubber in 1911, according to the estimates of experts engaged in that branch of the industry and verified by the rubber auction reports from London and the other great marts where plantation rubber is handled. The amount of plantations offered in London is gaining with each fortnightly auction as compared with the offerings of last year.

As applied to the automobile industry, the production of plantation rubber is of prime importance and also has a secondary bearing that is an immense influence. There is a closely guarded question as to whether tire makers use any considerable amount of plantations in the manufacture of their wares. Some of them deny it; others will not make a definite statement with regard to the matter, while still others tacitly admit that plantation rubber has sufficient quality for their purposes without saying that their companies use it.

The general claim is made by tire makers that pure, hard-cure, up-river Para is used exclusively for tire making in their particular establishments. In proof of their claims it may be stated that the tire makers do buy and use vast quantities of Para and considerable supplies of that grade and variety of rubber may be seen in their storage warehouses in its original form.

To Equal Para in Quantity in 1915

But, whether or not plantation rubber is used to any material extent in tire making, the fact remains that every ton of merchantable plantation rubber manufactured and marketed has a distinct bearing upon the tire industry, inasmuch as it relieves the pressure of demand from the Para grades, because even if plantation rubber is not utilized for tires, it is usable for many other purposes that have always required Para in the past, and will be used for many other purposes in the future that would have accentuated the demand for Para when they became developed.

In the first 7 months of 1912 10,000 tons of plantations were auctioned in London, which is the principal trade point for that class of merchandise. In the corresponding period of 1911 the total was a round 6,000 tons. As the shipments are becoming larger each month, the rate of increase over last year steadily rising, makes it more than probable that the number of tons marketed in London will be at least double those of 1911. The total amount for the year is estimated in that market at approximately 20,000 tons.

Increase of 100 Per Cent. Expected

Next year with the new plantations coming into commercial productivity and with the increased production of the present plantations, a total yield of over 40,000 tons is predicted. As to figures further in the future, at best they are estimates, but the opinion of the experts is that the yield will increase to the total capacity of the available labor to handle.

It has been predicted that by 1915 the total yield of plantations will more than equal that of the Para districts and the rest depends upon the quality and quantity of available labor and the introduction of advanced economic methods in cultivating, collecting and manufacturing.

The plantation rubber industry is about 36 years old, having been born shortly after H. A. Wickham, a British scientist of high rank, had smuggled a boatload of seed of the Hevea Brasiliensis out of the Amazon country. The removal of Hevea seed proved a surprise to the Brazilian government. In fact, it was not within the legal contemplation of that state that such a situation should eventuate.

The cargo of seeds numbered many thousands, but after the delays that attended their transportation by devious routes to

Ceylon, only a few hundred of them were sufficiently preserved to germinate. There were some live germs in the seeds, however, and the result of Mr. Wickham's enterprise proved to be a nice little patch of infant rubber trees, numbering about 100 trees all told.

From that start the great plantation rubber industry of Ceylon, Malaysia, Oceania and the East Indies generally has developed. The initial plantation was so small that it required many years before it was possible to plant large areas on a commercial scale and still longer to bring the plantations to a point where the yield of rubber was large enough to be called a factor in the industry as a whole.

That day has now dawned and from this year plantation rubber must be reckoned as one of the chief elements in the industry.

The history of its development marks a tremendous step in the automobile industry. Ten years ago there was only a small fraction of the total production of rubber that was used by the automobile tire makers. Today it represents thousands of tons, more than half of the Para yield, and yet the price of crude rubber is not equivalently higher when the augmented demand is considered.

All the Ceylon plantations are from seedling Hevea Brasiliensis, which originated from the Wickham seed. Generally speaking, the yield per tree, 8 years old and 18 inches in circumference 3 feet above the ground and ranging from that size and age upward to the largest trees now in bearing, may be reckoned at about 6 pounds per season. The new plantations and those that have not had the most advanced type of care and administration will average less than that rate of yield and the older and better cared for plantations will yield more than that rate. Mr. Wickham takes the position that the trees should be planted not less than 33 feet apart and run not more than fifty trees to the acre. Kelway Bamber and other experts figure that 150 trees per acre is not excessive, and a few of the extremists on the other side place their figures as high as 500 or more.

According to Mr. Wickham's contention the trees require a large area of ground so that their roots may spread out in all directions, giving the tree a strong support and by reason of the lack of crowding below the surface to avoid the chance of having the tree become debilitated and liable to fungus infection on account of its lack of strength. He also demonstrated that tree for tree plantations conducted along the lines he indicated yielded a much larger amount of latex than those where close planting was the rule.

Wickham Points Out Essentials

Mr. Wickham divides the plantation rubber problem into three heads and places these heads as follows:

First.—That the Hevea tree has, and is still, being altogether too closely planted for a tree—a forest tree—of its natural order and habit.

Second.—The system designated generally as clean-weeding considers land from which the humus of the surface being burnt off, what remains of the surface soil is exposed to the bake of the sun and the beat of the rain and may be seen any day being carried bodily away in the drains of the nearest water-course—a loss never to be replaced.

Third.—Incision versus excision in the manner of tapping the trees for latex.

Under the first head he argues that the powers of growth must be arrested if insufficient room for the roots is allowed. He claims that the whole idea of the plantation is based upon some plan for avoiding that very difficulty by making adequate space provision for the rubber trees.

Under natural conditions in the jungle there is always a tense struggle for existence between the jungle and forest growths. This is somewhat compensated because the various elements in the competition are of different botanical orders and draw upon different food constituents. Much material also is returned to the ground in the form of humus for future food supply. But in the case of the plantation, the trees, all of one species, demand the same food elements and a fierce competition is concentrated on soil that is often denuded of humus. In tropical soil germs of morbid or fungoid growth are always present. These are usually innocuous unless the tree's power of resistance has been lowered. There is nothing that will lower the power of a tree or a man like starvation and make it or him liable to the germ of disease. If, however, the vitality of the subject be kept on a high plane by food and care, the chances for deterioration are minimized.

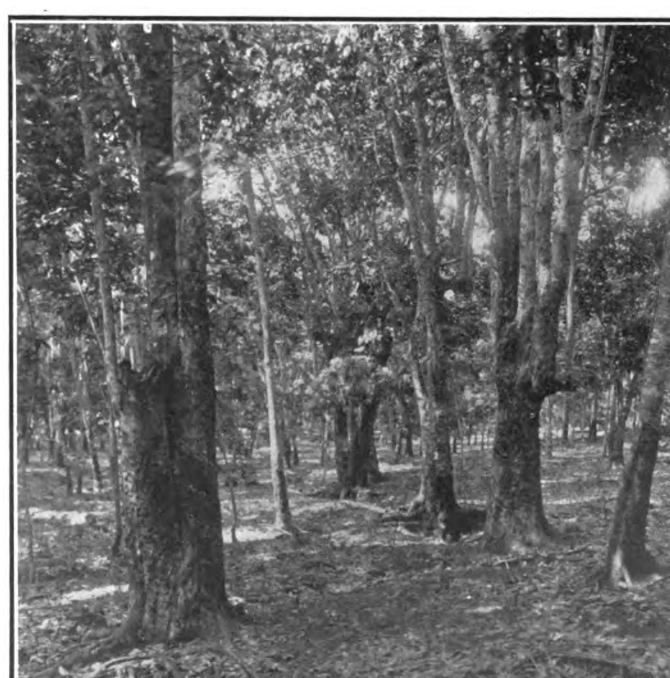
On the subject of clean-weeding Mr. Wickham says that if the surface is burned off and the soil washed away or baked around the roots, the tree must suffer at once. The Hevea loves to have its head in the sunlight and its roots in a cool, free, covered soil. Quoting from Dr. Ewart Mr. Wickham said:

"The use of fire to clear ground in preparation for cultivation is common among primitive races who practice a more or less rudimentary kind of agriculture, but with the advances of science fire plays less and less part in its doings. Even in a garden the less the amount of rubbish that is burned instead of being rotted in, the less amount of manure is needed to be carted in to keep up fertility. Eactly the same thing applies on a larger scale and even greater extent to agriculture."

Favors Incision Method of Tapping

With regard to the question of incision versus excision, Mr. Wickham holds that the former system will eventually be found to be the better method of tapping.

Kelway Bamber agreed with much that Mr. Wickham had presented. He stated that his experience in Ceylon pointed to 150 trees to the acre as being not too many, particularly in the early period of the plantation. He cites the fact that the rapid growth of the trees placed in such close proximity to one another gives rapid and adequate protection to the surface soil, shielding the earth from the rays of the sun and the force of the rain. Undoubtedly the wider planting, such as contemplates from forty to forty-eight trees to the acre, will give trees in time that will prove larger and more productive than those planted close together, but, he maintains that the plan of planting 150 trees or thereabouts has given better financial results than the other system so far in the industry.



Oldest rubber plantation in the world, which was started 36 years ago

Fish-bone method of tapping, showing feeder channels

Fish-bone method, showing vertical cutting and feeders

Speaking broadly of the plantation situation, Mr. Bamber said:

"Luckily for Ceylon the proportion of poor yielding trees is slight, but when found all such trees should be removed to prevent crossing with the better varieties. For the first 2 or 3 years, especially in soil requiring much drainage, the greater proportion of Hevea trees show a distinct gray bark, which darkens and becomes more corky from the base upwards after that period. After the third year the bark of the better types of trees increases in thickness considerably. When rubber first began to be planted on a large scale it was usually estimated that no returns would be obtained under 5 or 6 years, but it has been found in many instances that the trees were of sufficient girth to commence tapping in or after the fourth year and that with careful work no harm to the tree resulted, but should the trees at this early stage be over-tapped serious harm might follow.

"A favorite system, first tried on the Lanadron Estate, was to commence with a basal V tapping, embracing half the circumference of the tree and 15 inches from the ground and with another V, 12 to 15 inches above it, if the girth of the tree permitted. This is now frequently employed, with various modifications as to the proportion of the bark tapped, and while in many cases it gives satisfactory yields, it affords a means of gradually training the coolies to do good work before the bulk of the trees come into bearing.

Spiral Bleeding System Passing Away

"The spiral form of tapping has now almost gone out of practice, especially since Professor Fitting's able brochure was published. Latterly also the old system of pricking and paring is disappearing, as it has been found that better yields are obtained by paring only and with less injury to the trees. The evidence is, however, not conclusive and some of the finest work has been done by the combined tools followed by excellent healing of the bark.

"Professor Fitting demonstrated by his experiments that the supply of plant food for the stem, etc., was interfered with to a large extent by the spiral or half-spiral and similar methods of tapping and recommended that opposite quarters only should be tapped to minimize this effect, a suggestion that is being freely adopted."

Going into the details of advanced tapping methods, Mr. Bamber takes the position that with young trees it is better to tap only one-third of the circumference at a time. He states that if opposite quarters are used, the length of the cuts will not be sufficient to insure a good flow of latex. He cautions extreme care in tapping so that the bark of a certain section will last the required number of months. Twenty cuts to the inch is considered as a fair average. If one-third of the bark is tapped during the first year on an 18-inch tree, at 3 feet from the ground, at the end of the year the tree should measure from 23 to 24 inches in girth. The process of tapping is believed to be a fostering influence to promote the girth of the tree.

Tapping Increases Girth of Trees

When a tree has reached a girth of from 23 to 24 inches it is considered large enough to be subjected to tapping on opposite quarters if desired.

In tapping by the paring methods only, it must be remembered that the bulk of the latex tubes are situated close to the soft formative substance from which the growth of the tree is supplied, called cambium. Thus the blade of the tapping tool must go fairly deep if the latex is to be extracted. The slightest fraction too little in the incision will result in disproportionately small annual yields.

Formerly it was considered that no renewed bark should be touched under 4 years, but now it has been found that a good flow can be obtained after the second year from the bark that had been tapped previously. If the bark is not renewed within 2 years it may be taken as proof of the fact that tapping has been too rapid for the vigorous growth of the tree.

The new incision method of tapping is described by Mr. Bamber as follows: "It consists of cutting shallow vertical channels down the bark from 6 feet to the ground, incising these at 1 inch intervals. The latex is collected at the base of the tree in the usual way. Two channels are cut the first day on opposite sides of the tree and incised with a special blade from top to bottom at intervals of an inch. The second day after two more channels are cut 3-4 inch to the right of the two already made, and similar incisions are made as in the course of the others. On alternate days this process is continued until the whole circumference of the tree has been channeled and incised at 3-4-inch intervals. The tree is then rested for 6 weeks and the incision and channeling process is repeated on alternate days in the same channels but with the incisions 1-4 inch below the previous cuts. After each complete round the tree is rested for 6 weeks so that the trees are tapped an average of 72 days in a year, in six periods of 12 days each.

The yield from this process is about on a par with other systems, but it is open to certain objections as well as much support. The process increases the proportion of scrap rubber by reason of the difficulty in catching all the latex as it flows down the channels, but this loss may be prevented by care and promptness in collecting the scrap.

In favor of the system it is urged that the process of incision is more readily adaptable to bark growth than the other systems of tapping and that theoretically at least the system gives a longer yielding life to the tree.

The experiments were tried to learn whether bark renewed from below only gave as much latex as the bark after the total removal of the bark. It was known that where bark was cut away daily the renewed bark gives more latex than the original. The outcome of the experiments is still uncertain and will be for at least a year, but present appearances all point to an affirmative answer.

Manufacturers First Seek Uniformity

One of the drawbacks to plantation rubber so far as a material element in manufacturing is the fact that it is not uniform in quality. Even the product of the same plantation varies somewhat from the viewpoint of the manufacturer. The position of the manufacturer is that where he makes a certain line of goods requiring identical qualities in the material used throughout a manufacturing year, he can never be certain that a certain grade of plantation rubber will be absolutely uniform today and 6 months from now.

This is explained by the producers on the theory that they are not closely enough in touch with the manufacturers. They produce the rubber according to their best information as to the requirements of the market and the manufacturer purchasing in the market sometimes finds that the quality of the same grade of rubber varies sufficiently to force him to change his manufacturing processes or secure a supply of rubber that tallies with his original supply upon which the processes were based.

For instance, he may find traces of acetic acid or alum in one lot that were not present in the original or former shipments and the presence of such chemicals may render the rubber unfit for his particular purposes. Francis Martin, a manufacturing chemist, recommended that the producers eliminate all traces of coagulating mediums and water from their products before marketing. This would have the effect of making it unnecessary to wash and dry the product before use and would serve to enhance its value.

Would Pay More for Even Grades

Some of the makers who consume large amounts of plantation rubber feel very strongly on the subject of uniformity. Even quality is made a secondary consideration with them. Opinions have been expressed by men who are real factors in the trade that an advance of 15 cents a pound for certain grades would be gladly paid by the manufacturers if they could be assured that the rubber of a certain grade would be always of uniform characteristics.

The rubber producers are striving in every way to bring about this result and some of the leaders assert that they would willingly take 2 cents a pound less for their product if they could be assured that it was uniform.

Vulcanization is regarded as the supreme test and a movement is now under way to install small vulcanizing plants on several of the big Ceylon plantations so that actual working tests of the grades of rubber can be made right on the ground. The manufacturer has only a general idea of what is going to happen when he employs a new grade of rubber and he finds his proof of the pudding in the results attained. According to the scientists, vulcanization is the surest way of classifying rubber so that if the manufacturer knows that a certain grade will vulcanize according to certain methods and the product will serve to gain a certain result, he can purchase freely to the benefit of everybody concerned.

THE AUTOMOBILE is indebted for much of the information contained in the foregoing to A. Staines Manders, organizing manager of the International Rubber Exposition, which will be held at the Grand Central Palace September 23 to October 3.

Racing Speed Does No Harm to Perfect Road—French Demountable Wire Wheel—The Fiat Fire Pump—Load Suspension a Factor in Tire Wear—Cottin-Desgouttes Construction Features—Cheap Scavenger for Cast Steel

CAR Speed and Road Conservation—In its report on the recent *grand prix* race over the Dieppe course in France, the committee on sports of the Automobile Club of France takes note of the condition of the roads as observed before and after the racing cars had passed over them twenty times. This part of the report reads in substance as follows:

Despite the length of the contest and the number of vehicles engaged, the road in a general way suffered very little. On the straight stretches it was in perfect condition. In the places where the drivers could urge their motors, some detrition of the surface was observed, and it is possible to maintain that this result should not be ascribed to the speed but rather to sliding of the wheels on the ground, this sliding being due to misproportion between the relatively small weight of the cars and their excessive powers. The road in this case served as a brake band, absorbing the surplus power which was not utilized for propulsion.

The Dieppe race is a new demonstration of the fact that on a perfectly compacted road surface speed, weight or power, when held within the already widely extended limits characteristic of racing cars, are not factors in the destruction of roads; on the contrary, the weight, which causes adhesion to the road, should be in such a ratio to the power available at the motor shaft that the sliding of the driving wheels becomes impossible, and this for the protection of the tires as well as of the road. Anti-skid tires with suitable projections on their tread, in as much as they improve the adhesion certainly check the sliding of wheel and reduce the wear of the road. It is to be noted in this connection that the majority of the vehicles were equipped with anti-skid tires on the first day and that on the second day the few smooth tires which formed the exception from this rule were replaced with anti-skid tires.

It is known that accelerations and retardations are especially harmful to roads and tires. In this respect it was noticed that in front of the grand stand the road remained in perfect condition, although starting and braking were frequent at this point. The inference is that great progress must have been accomplished in the flexibility of motors as well as in clutches and brakes.

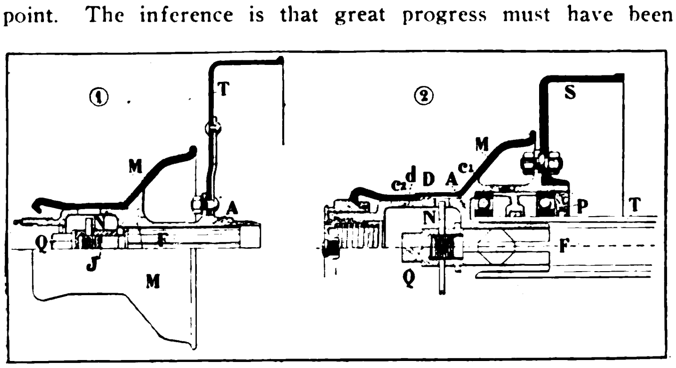

Fig. 1—Mounting of the fixed hubs in R.A.F. demountable wire wheels on different wheel-driving shafts—(1) on a non-floating type of shaft—(2) on a full-floating type of shaft

The vehicles in most cases hugged the road closely, and the well-studied load distribution methods, spring suspensions and spring moderators certainly contributed to this result, so favorable for roads and tires. It must be stated, however, that at the foot of hills, at the spots where gear was changed for the climb, considerable road detrition was observed. The speed change showed its effects; which argues in favor of progressive gear change.

At the turns the heaviest vehicles skid at the rear at the moment when the straight direction is resumed, and the lighter vehicles skid with all four wheels. This fact was verified at the hairpin turn (*la Fourche*) where the road was plowed up. The banking of the turn which is so valuable for the security of the vehicle, seems ineffective for conserving the road surface. It may be considered settled that the whole width of the road should be tarred at turns and also that repairs with crushed stone should be made over the whole width at these places and should be given time to settle. The fact that the stone replacements on the roads of the race were not recent combined with favorable showers to conserve their good condition.—From *Bulletin Officiel,* July.

Wire Wheel Construction—The demountable wire wheel, which is known as the R.A.F. and made in France embodies certain details of design and appearance which distinguish it from the well-known Rudge-Whitworth wheels made in England. The differences relate mostly to the method of mounting the wheels on the axles and are shown in the accompanying illustrations, Fig. 1 (1 and 2) and Fig. 2 (1, 2 and 3). The wheels themselves comprise the steel rim, the triple rows of spokes and the pressed steel hub, the latter, M in Fig. 1, being formed with two conical faces, $c1$ and $c2$, by pressure against which the wheels are held in their planes when mounted. The pressure is exerted by means of the mechanism of an auxiliary hub which is in all cases permanently—though removably—mounted upon the wheel spindle. It is the auxiliary hub which carries the ball-bearings and, in the case of the rear wheels, the brake drums. It rotates on the spindle in front wheels and with the spindle in driving wheels. Fig. 1 (1) shows the mounting of the auxiliary hub on the end of a wheel shaft which drives the wheel under load stress, while Fig. 1 (2) shows the mounting on a wheel shaft of the full-floating type, in which the load is supported on the tubular axle surrounding the wheel-driving shaft. Fig. 2 (1) shows the mounting of the auxiliary hub in a front wheel. Externally these hubs, Fig. 2 (2), all look alike, and the caps which lock them to the pressed-steel wheel-hubs by means of the internal locking barrels shown in Fig. 2 (3) are all of the same design, externally and internally. The auxiliary or, as it might be called, the fixed hub is formed with a conical surface E which serves as abutment for the conical part $c1$ of the wheel hub, and the latter is pressed up against this conical face by means of the screw cap L, Fig. 2 (1), which is threaded upon the outer end of the fixed hub, while the exact centering of the wheel is secured by the smooth cylindrical portion G of the fixed hub to which there corresponds a similar internal smooth cylindrical portion in the wheel hub. The toothed zone D on the fixed hub similarly corresponds to an internally toothed belt in the wheel hub and their engagement prevents rotation of the wheel on the fixed hub. In order to provide a secure lock for the screw cap, the fixed hub contains the barrel or plug D, Fig. 2 (3). This barrel which is pushed outwardly by a strong spring B, Fig. 2, (1) and (3), is provided with two toothed belts of which one goes into engagement with a corresponding toothed belt in the interior of the fixed hub, unifying these two parts, while the other engages an interior toothed belt cut in the interior of the screw cap L. This combination constitutes, then, a very secure lock with the assistance of the outward pressure of the spring B which amounts to about 50 kilograms. And to hold the barrel in place, preventing the spring from throwing it out, a groove K in the fixed hub receives a split ring C, Fig. 2 (3), which abuts against the toothed portion of the barrel.

A special tool has been devised for facilitating the mounting and dismounting of this wheel. It consists in a spanner fitting over the screw cap, with which is combined a yoke with prongs which may be adjusted to enter the groove in the cap, so as to fix the tool laterally, and with a screw device for pressing the barrel inward against the resistance of the spring while the screw cap is being released by the turning of the spanner. Another special tool serves for extracting the fixed hub whenever this operation may be desirable for examining ball-bearings or brakes.—From *La Vie Automobile*, July 27.

Fiat Fire Engine—The rear end of a fire engine chassis as built by the Fiat company of Italy is shown in Fig. 3. It is driven and operated for fire extinguishing purposes by a 45 horsepower gasoline motor, and the complete vehicle with 17 men on board and equipped with ladders and a reel can be driven on level ground at a speed of 25 kilometers per hour and is capable of climbing grades of up to 16 degrees. The chassis alone weighs about 2100 kilograms. According to a statement in *Zeitschrift des Vereines Deutscher Ingenieure*,

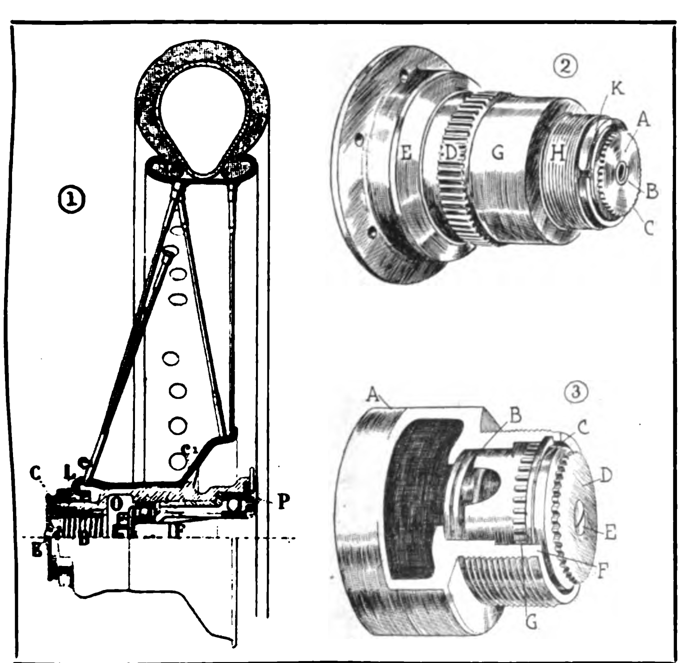

Fig. 2—(1) R.A.F. demountable wire wheel on a front-wheel spindle—(2) auxiliary hub upon which pressed-steel wheel hub is mounted—(3) the barrel or plug serving, together with the screw cap, to secure the wheel

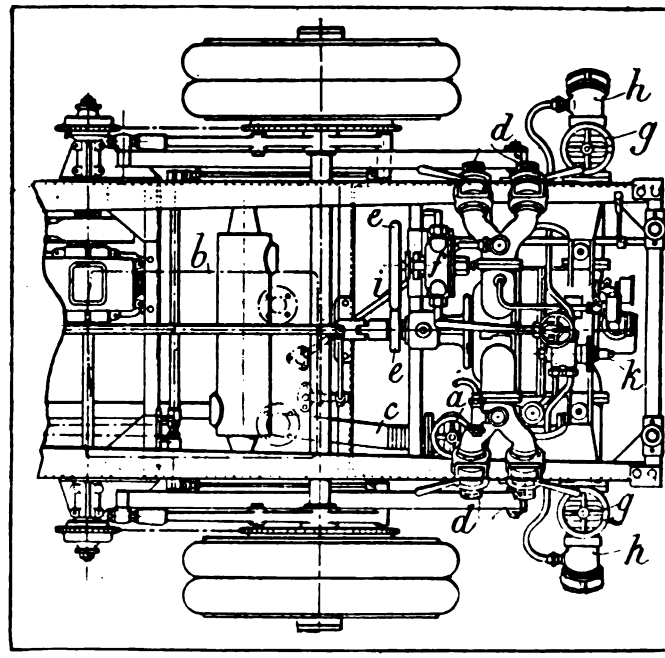

Fig. 3—Rear end of Fiat fire engine chassis with centrifugal pump

the three-cell centrifugal pump can draw water from a depth of 4 meters and discharge it at the rate of 1,200 liters per minute with the motor going at 2,000 revolutions per minute and the manometer pressure registering about 10 kilograms per square centimeter. At still higher motor speed and the pressure increased to 16 kilograms, the discharge can be raised to 1,600 liters. As will be noticed from the drawing, the vehicle is chain-driven, and the pump shaft is in continuation of the transmission shaft extending from the gear box and may be coupled to it.

The method adopted for starting the pump is somewhat different from any employed in German fire engines of the same general type. There is mounted upon the chassis a water tank *b* which normally is connected with the water jackets of the motor cylinders but whose content, when the valve *e* is opened, is also driven by the cooling-water pump into conduit *c* and thence into the four pipe joints *d* where fire hose are attached. As soon as the pump is to be started and its shaft has been coupled to the motor, a friction gear *ee* communicates the rotation of its shaft to an air pump *f* which evacuates the air from the suction conduits of the centrifugal pump which may be connected with the latter at any moment by means of the joint *h* and the valves *g*. Consequently, when this is done and as soon as the centrifugal pump has consumed the water in the tank *b*, these suction conduits are filled with water and the centrifugal pump continues its work through them, drawing from the local water supply. It also replenishes the tank *b* with water from this source through the pipe *i*. The connections between the air pump *f* and the suction conduits *h* are opened or closed by means of a six-way valve *k* placed at the rear of the vehicle.—From *Le Génie Civil*, August 3.

Metal Wheels, General Design and Tire Wear—A correspondent cites his experience with two fast cars, the motors and chassis of which were practically alike, excepting that the last one acquired by the experimenter had a wheelbase about 10 inches longer than the first one. In both cases Rudge-Whitworth wire wheels were used, but in the first vehicle the carriage body was built out over the wheels and also had a considerable rear overhang, extending several inches farther back than the frame reaches, while in the second vehicle the whole carriage body was kept entirely within the space between the axles and so narrow as to clear the planes of the wheels. Yet, the weight of the second car was 20 kilograms greater than that of the first one. With the first car, three tires had lasted only for 2,000 kilometers and two other ones for 5,000 kilometers, and this had been considered very unsatisfactory, although the average speed at which the car had been driven had been very high—tending up toward 60 miles per hour wherever the road would permit. With the second car, the tire results were much more satisfactory, none of the tires showing signs of giving out after a mileage of 5,600 kilometers attained at the time when the report was rendered. The upshot of the correspondent's reasoning is that while the wear of tires may be much affected by the nature of the wheels it is perhaps still more affected by other factors relating to the distribution and suspension of the weight of the chassis, the carriage body and the occupants, which are seldom considered as of great importance in this connection.—From *La Vie Automobile*, July 27.

Details in a Well-Known Car—In a brief description of the latest Cottin-Desgouttes cars, which are among those most used in the hilly portions of France, some details are mentioned which seem worth noting. The carbureter takes its heated air from the space between the cylinder casting and the valve casing, thereby renewing the air in this space and contributing to keeping the valve springs and stems cool. The carbureter is heated by a piping, D in Fig. 4, which connects directly with the water jacket and also acts as a bracket assisting in supporting the carbureter. The pan marked E is cast in one with the upper portion of the crankcasing and takes the place of the mud pan with evident advantages. A wire screen B prevents the oil in the bottom part of the casing from swashing. A force pump with spring-pushed ball valves drives the oil through tube A to a horizontal distribution-tube running lengthwise of the casing at a level higher than that of the crankshaft, whence it drops through short leads to the three shaft bearings, and from these it is thrown by centrifugal action in the now usual manner through bores in the shaft, the crankpins and the crankpins to the connecting-rod bearings.

A special method has been adopted for obtaining a brake effect upon the transmission shaft when disengaging the clutch for the purpose of a gear change while avoiding this effect when the clutch is slipped for other reasons. The clutch is of the multiple plate variety, as indicated in Fig. 5 at B, and a conical brake band C is mounted upon the hollow member A upon which the clutch spring RR acts when compressing the clutch plates. This spring is made in two parts, however, of which the front one has more convolutions than the rear one, and between these two parts there is slidably mounted upon the squared shaft a female cone D which, when pressed into engagement with the brake band C, serves to retard the transmission shaft as desired. But when the clutch spring is drawn back only a little, the two brake elements do not come into contact. C moves back farther than D, as the part of the spring with which it moves is longer, but D also moves back somewhat. Only when the clutch spring is fully compressed, completely releasing the multiple plate clutch, is the condition brought about under which C overtakes D, retarding the rotation of the transmission shaft and facilitating the contemplated gear change.

In the front wire wheel construction used for Cottin-Desgouttes cars a notable feature is the end-thrust ball bearing which permits mounting the wheel on the spindle without undue tightness and yet with adequate provision against play. Of the two races of this bearing, one, B in Fig. 6, is secured upon the spindle and the other, C, is secured in the wheel hub, and the road shocks are thus absorbed in the bearing from whichever side they come.—From *Omnia*, August 3.

Improved Iron and Steel Castings—An advancement in the art of obtaining castings free from pipes and blowholes by the use of silico-calcium as a scavenging agent in the melt has been substantiated through experiments by Professors Donath and Luszner at the technical college of Brünn, Austria. It has a high affinity for sulphur, forming calcium sulphate, while the silica combines with the oxides and other impurities (nitrogen) and forms a slag which floats on top of the melt. With iron containing 26 points (a point being one hundredth of 1 per cent.) of phosphorus and nearly 10 points of sulphur, the silico-calcium treatment reduces these proportions to 20 points of phosphorus and 6 points of sulphur. In the case of an open-hearth steel, the treatment affected the contents as follows: 72 points of carbon was reduced to 70 points, 12 points of silicon was raised to 18 points, 92 points of manganese to 95 points (this gain apparently representing only the admissible error in the determination), 10 points of sulphur was reduced to 6 2-3 points and 7.4 points of phosphorus to 5.4 points. The sulphur and phosphorus taken out of the metal were found in the slag. The mechanical properties of the steel obtained in this manner are identical with those of steel treated with aluminum, with the additional advantage that the spots or grains of alumina often found in the latter are avoided.—From *La Technique Moderne*, August 1.

New Gray & Davis Starter in Detail

Six - Volt Compound - Wound Motor Has Been Added to Lighting System Formerly on the Market

Pedal-Operated Device Will Spin Heaviest Motor for Sufficient Time to Start in Cold Weather

THE Gray & Davis self-starter, recently announced in THE AUTOMOBILE, is of interest to automobile engineers in that it is especially adapted to the use of a 6-volt current. This voltage has been selected by the Gray & Davis concern for two reasons: first, that it requires no special battery equipment, and, secondly, that it may be added to the Gray & Davis lighting system without adding any undue complexities to the wiring scheme of the car. The added complication of the electric motor is almost imperceptible, being merely the mounting of the motor itself below the floor boards of the car and the addition of a starting switch located near the battery that is generally placed on the rear right end of the car next to the side channel frame.

There are two sizes of the starter. The largest is the variety that will be seen in the 1913 Peerless cars. It is heavy enough and develops enough power to turn over the largest of the six-cylinder motors for a sufficient time to start it in the coldest weather. The motor on this large size starter weighs 70 pounds. Unlike most of the electric starters which have recently been put upon the market this is not a motor-generator. The generator is separate and independent, being mounted on the side of the motor. The starting motor is never in operation unless the foot is on the pedal that is used to start the car.

Motor Is Geared to Flywheel

The motor is of the compound wound type running on direct current and is geared to the flywheel. The reduction is about 20.8 to 1 from the motor to the flywheel. The heavier of the two motors is designed to turn over at 1,200 revolutions per minute on a current consumption of 200 amperes. The lighter motor, which is adapted for starting purposes on the smaller four-cylinder motors and weighs about one-half as much as the larger, will turn over at 1,500 revolutions at a current consumption of 100 amperes. The weight given by the manufacturers of the smaller starting motor is 38 pounds. The voltage of the smaller motor is the same as the larger motor, being normally rated at 6. Both the motors have been shown by the manufacturer's tests to be capable of operating under an overload of nominally 200 per cent. In case the gasoline motor should suddenly go dead on a railroad crossing the starting motor can be called into action and will carry the car across. The makers state that the storage battery they use in connection with the lighting and starting system will be sufficient to carry the car for 2 miles without the aid of the gasoline motor.

The installation of the starter is shown in elevation. The upper or plan view shows the starter's position relative to the control pedals and to the longitudinal frame members. With left control the starting motor would be located on the right side of the car so that there would be no complication in the brake and gear-shifter mechanism. The plan view also shows the relative positions of the starting pedal, switch, battery, etc., as well as the mechanism through which the apparatus is under control. When the pedal is depressed the switch is thrown in and the gears are put in mesh through which the starting motor drives the motor. After the motor is turned over and started the clutch is engaged in the usual manner, there being no change in any way in the clutch mechanism generally fitted to the car. When the clutch is let in and the motor speeded up the roll clutch indicated in the illustration comes into action and cuts out the motor so that it rests absolutely idle while the car is in motion. As shown in the plan view, both the rods which lead to the switch located in this case on the rear right of the chassis frame and the rod which controls the engagement of the starting motor gearwheel with the flywheel gear are adjustable for length. This is accomplished by a left and right screw device similar in action to a turnbuckle. The clutch which is used for the purpose of disengaging the electric starter may also be regulated to throw off the starting mechanism at any desired speed.

The dynamo, which is familiar to those who have used the Gray & Davis lighting system in the past, is what is known as the constant-speed type and can be driven from the motor or any other moving shaft by gear, belt or chain. The special centrifugal governor takes care of any of the varying speeds of the motor and keeps the armature revolving at a uniform rate by allowing the clutch to slip when the speed of the motor increases. When the motor is running so slowly that it is below the charging rate of the dynamo an electric cut-out comes into play and prevents the current from discharging back from the electric battery through the dynamo.

Centrifugal Clutch Important

The centrifugal clutch in the dynamo is the key to the system in that it not only is the part that keeps the current in the battery for use in starting the motor, but permits the battery to be charged at the normal rate. The centrifugal clutch combines a centrifugal governor with a friction clutch. The latter consists mainly of two disks, one of aluminum faced with asbestos fiber 1-8 inch thick running on three ball bearings. The other disk is of smooth cast iron. The aluminum disk is the variable speed disk, as it always runs at the same relative speed as the motor, being driven therefrom by a belt or by gearing. The cast-iron disk is pressed against the asbestos fiber facing by a strong vanadium spring, which is controlled by the centrifugal governor weights. When the speed of the dynamo mounts over 1,200 revolutions per minute or what would correspond to a car speed of about 12 miles an hour, the governor weights fly out to such a distance that the clutch releases its hold sufficiently to permit it to slip. This keeps the armature speed of the generator down to the required 1,200 revolutions per minute.

The cut-out which prevents the discharge of the battery through the dynamo at low speeds operates on the magnetic principle. When the generator speeds up the electric magnet attracts the magnet armature and closes the circuit between the dynamo and the accumulator battery.

Knox Brings Out a New Six-Cylinder

Four Models on the Market for 1913—An Increase of Stroke Made on Four-Cylinder Motors

Important Body Refinements Adopted—Silence Made an Important Feature

FOUR models of cars will be produced by the Knox Automobile Company, of Springfield, Mass., for the season of 1913. Two of these, the models 44 and 45, are four-cylinder cars of identical specifications except for the wheelbases; while the remaining two comprise the big six car which was produced for 1912 by the Knox company and which is to be known next season as the model 66, and the little six or model 46. The little six is the only entirely new model added to the line and while the other three are put out under the 1913 date only minor changes have been found necessary.

The changes made in the models which have been continued for this year have been principally in the line of body refinements except one important change in the four-cylinder motor, that is, the increase of the stroke by 3-4 inch. The stroke of this motor was formerly less than the bore, the dimensions being 5 by 4 3-4 inches. In making the stroke 5 1-2 inches for the coming season the stroke bore ratio has been changed from .863 to 1.100. The other refinements incorporated in the 1913 models include a three, instead of a two-blade fan, oil-gauge on dash, clock speedometer, slides over pedals to prevent gases from entering passenger compartments, Perkins acetylene starting and lighting outfit, windshield base moved to top of cowl instead at begining of cowl, choice of horizontal or vertical tire carrier the horizontal tire carrier has a permanent trunk rack and the vertical tire carrier has a folding trunk rack, changed shape of mud guards, a graceful reverse curve being used this year instead of the straight type seen in the 1912 cars. The door, latches are now concealed whereas last year they showed above the body line.

New Radiator Is of V-Shape

Chief interest centers in the little six known as model 46. This is an entirely new car and involves features which are new to Knox design. The first point which strikes the eye is the V-shaped radiator. This radiator has been adopted by the Knox company on account of the splendid results obtained with it in racing. On opening the hood of the car it will be seen that in this model the engineers have cast the cylinders in pairs, not

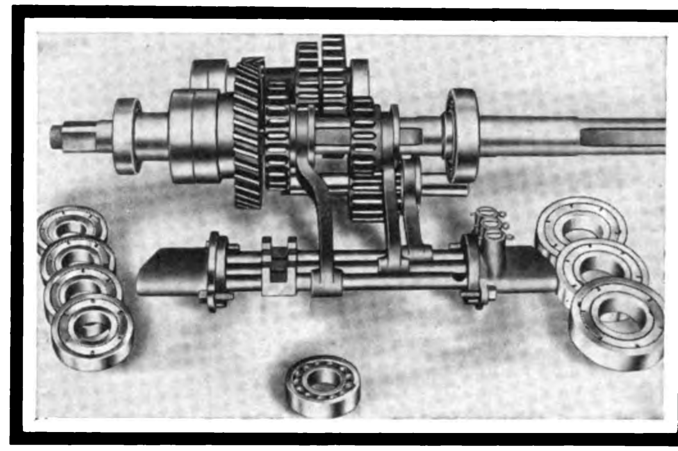

Fig. 2—Assembly of Knox gearset showing annular ball bearings

following the practice in vogue with the Knox four-cylinder cars where the cylinders are cast singly. Other departures from standard Knox practice: the placing of the intake and exhaust valves on opposite sides; the use of bolted-on instead of clamped-on manifolds; 45-degree conical valves are used instead of straight sided, although the other features of the cylinder head construction remain practically the same; cam rolls of large diameter are used with a spring inside the push-rod guide to hold the roll on the cam, thus making for silence; rounder cam contours are used; chain drive is used for the camshaft and magneto shaft; silence is sought in every direction, aluminum valve action covers being placed over the rocker arms on to that of the cylinder; bosses are cast in the cylinders to take the Perkins starting system and allow the acetylene to flow in such a way that a whirring action of the acetylene gas results, making starting more certain; nickel-plated wiring containers are mounted on the cylinders; a wood knob is fitted on the top of the gear shifter lever; torsion rod is placed on right instead of left of car; two separate entrances of water manifold to the radiator and extra large brakes are used. In all other essential points the construction of the little six-cylinder car is similar to that of the other models.

The bore of the little six car is 4 3-8 inches and the stroke 5 1-2 inches giving a bore-stroke ratio of 1.256. The cylinders as stated are cast in pairs and are of grey cylinder iron. The cylinder heads are all detachable and when so detached carry the valves directly with them as shown in Fig. 5. To remove the cylinder heads in order to reach the cylinder of the motor for cleaning out carbon or for any other reason, it is only necessary to unbolt the water manifold and take out the six bolts of the flange that holds the head to the body of the cylinder. The cylinder head can then be lifted off and the interior is exposed to view. The sections of water manifold above each pair of cylinders may be removed independently if desired and this will permit of the removal of each pair of cylinder heads singly. The main cylinder water-jacketing is connected to the water-jacket of the head by a small by-pass which is removable and which is rendered water-tight by a copper asbestos gasket. These small by-passes are seen in Fig. 4, where the left side of the motor is shown, they are located between the exhaust manifold and the metal pipe holding the ignition wires. As may be seen they are held in place on the cylinder by two bolts, one at the top and the other at the bottom of the by-pass.

The pistons are of grey iron and are fitted with four rings, three of which are above the wristpin and the other is below. The wristpin is fixed and is held secure against an oscillating movement by a stud bolt which passes directly through the bushing into the boss on the interior of the piston. This construction has been used in the four-cylinder Knox cars during the past and is illustrated in the part sectional view given at Fig. 3, where the four-cylinder Knox is shown. The connecting-rods are of I-beam section and are arranged to take a lead-pipe which is a factor in the oiling system as will be explained later. The crankshaft has a bearing between each of the separate cylinder castings making four main bearings on the little six cars and five on the four-cylinder model. The material from which the crankshafts are made is chrome-nickel steel, double heat treated. The connecting rods are 3 1-2 per cent. nickel steel. The camshaft which is driven by silent chain from crankshaft is also a heat treated steel and is mounted on the right side of the motor.

Valve Mechanism Slightly Changed

The valve mechanism is of the Knox type, but has been improved in some of the minor details. The points at which these improvements have been made are at the cam follower and over the cylinder heads where a unique adjustment device and aluminum cover plate have been fitted. The cam contours have been made more round also tending to give silence to the operation to this motor. This feature has not been carried far enough, however, to cause the motor to lose power, although a correspondingly slower opening and closing of the valve is a result of this change in design. As has been noted the employment of roller cam followers is used in conjunction with the changed cams. The aluminum cover plates as shown in Figs. 4 and 5 are held in place by two wing nuts, one at the forward end of the cover plate, and the other at the rear. The removal of these two nuts allows the cover to be taken off and exposes to view the compression cups and the valve rocker arms.

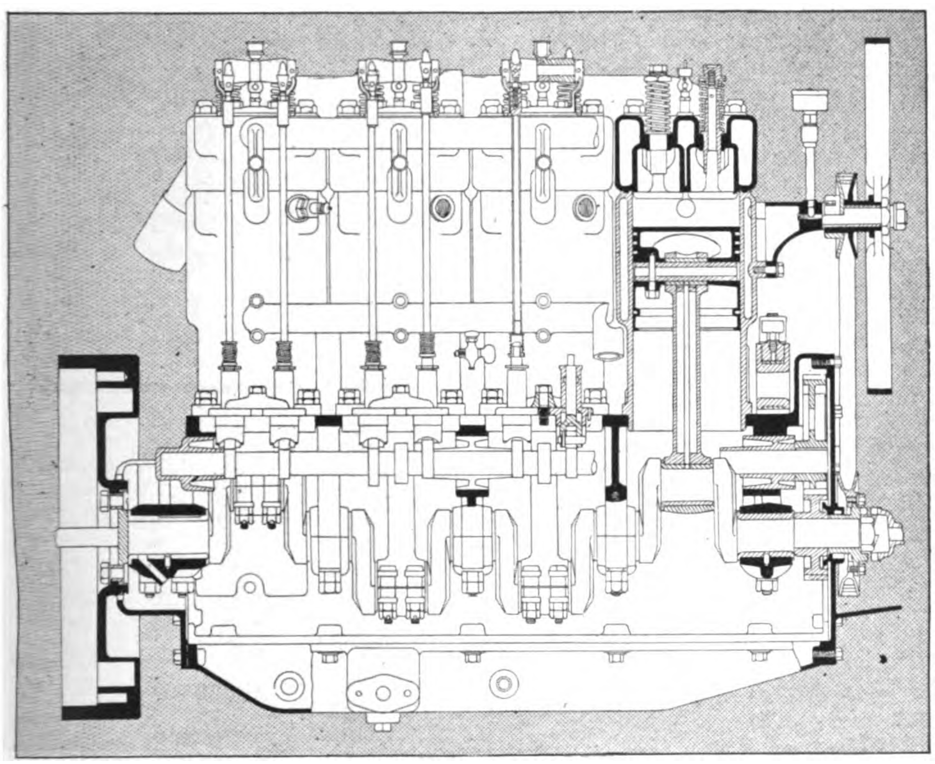

Fig. 3—Elevation and part sectional view of Knox four-cylinder motor

The lubricating scheme is what is known as the De Dion circulating system. There is no splash at the connecting-rods of any kind, the oil being delivered under pressure to all the important bearings throughout the motor. The oil pump is of the gear type and has an independent lead to each of the main bearings and to the cam shaft bearings. In the crankshaft at each main bearing there is an aperture which registers with the oil duct in the main bearing bushing. The crankshaft is hollow and the oil being under considerable pressure at the main bearing is forced against the slight centrifugal action in the crankshaft at this point and enters into the core of the crankshaft from where it finds its way through a drilled lead into the lower connecting-rod bearing. Between the two flanges of the connecting-rod there is a copper pipe which runs from the lower connecting rod-bearing to the wristpin. The upper end of this pipe terminates at the hollow wristpin bushing. The course of the oil is apparent. After entering the hollow crankshaft it

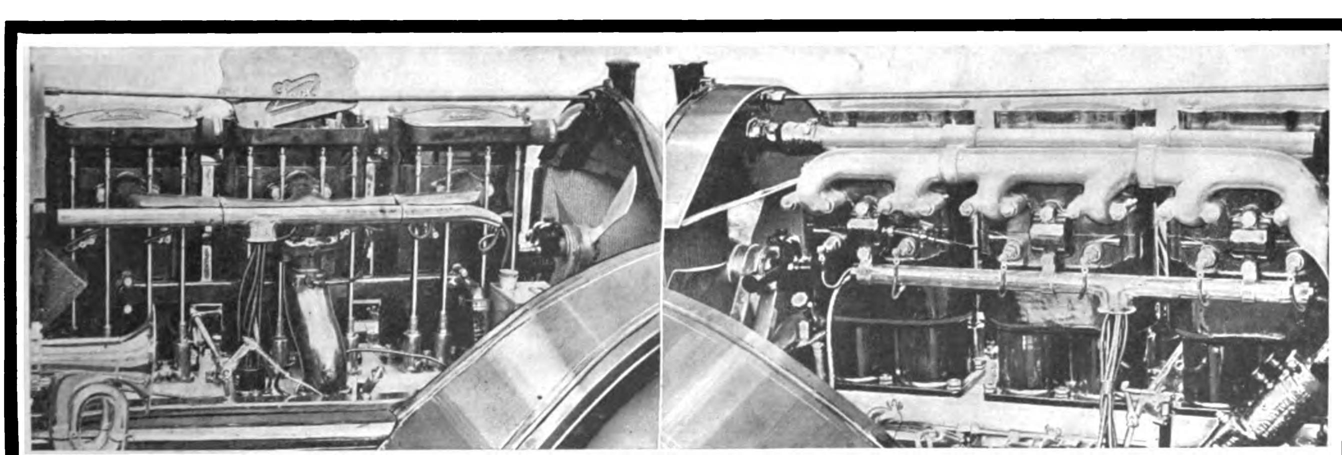

Fig. 4—Showing the right and left sides of the motor as exposed to view when the hood is lifted

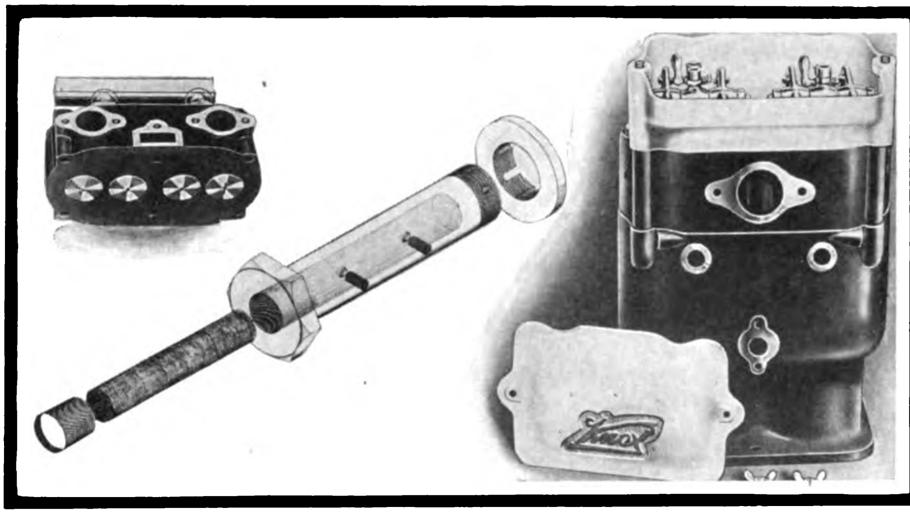

Fig. 5—Cylinders with valves, lubricated shackle bolt, assembled cylinder block

is forced up through the pipe along the connectings rods into the wristpin lubricating the bearing at this point and then passing out through the walls of the cylinder. After lubricating the different bearings the excess oil will drop back into the crankcase and will be re-circulated after having passed through a fine mesh screen.

Water Manifold Is Y-Shaped

The cooling system of the little six differs from the other model only in the shape of the radiator. This new type on the little six has a capacity of 3 1-2 gallons. The entire system including the jackets has a capacity of 28 quarts. Another distinguishing feature of the little six model is the fact that the water manifold is divided into two parts where it enters the radiator. The Y-shaped manifold is intended to subdivide the stream of cooling water as it leaves the cylinders so as to use every available part of the V-radiator. In order to get greater cooling efficiency the fan design has been changed also. A three-bladed fan is now used and tests show that a direct draw is secured through the entire front of the radiator and uniform cooling of the entire radiator surface is secured.

Two absolutely independent systems of ignition are employed on all Knox models. A Bosch magneto of the newest high-tension type is connected to one set of spark-plugs while the auxiliary system is furnished by batteries and a 4-unit Connecticut coil and timer in the case of the two 4-cylinder models, and a 6-cylinder Connecticut distributor with batteries and coil in the two 6-cylinder models. The spark-plugs are mounted on opposite sides of the cylinder walls and are placed below the removable cylinder heads. By this arrangement it is not necessary to disconnect any wiring when removing the cylinder heads for the purpose of cleaning the spark-plugs, piston heads and valve pockets. The wiring is contained in two independent nickel-plated tubes. This type of tube is deemed by the engineers of the Knox company, superior to insulated tube for the reason that should there be any tendency toward a short circuit from one of the high-tension wires the short circuit will be through the pipe containing the wires to the ground instead of from one wire to another. These nickel-plated tubes are clamped to the intake manifold on one side of the cylinders while on the other side a connection is made by a bracket held by the lower of the two bolts securing the waterjacket connection between the cylinder heads and the main part of the cylinder as may be seen in Fig. 4. The pipes give a neat appearance to the side of the motor and hold the wires securely against damage through vibration. At each spark-plug there is a hole drilled in the pipe through which the wire is lead to its respective plug.

To further carry out the ideas of the designers in having the appearance of the side of the motor as neat as possible all the manifolds this year are bolted to the side of the cylinders instead of being clamped thereto. Besides giving a neat appearance, a much better engineering job is made in that a tight connection is made between the manifold flange and the cylinder flange without as much stress being taken up on the bolts.

Necessary work, under the hood of the motor, is rendered very easy as far as accessibility goes because the engine is carried high for the low center of gravity of the car. It is not difficult to reach such parts as the fan-bearing adjustment, the carbureter adjustment screws, the oil cups of the steering mechanism or any of the other parts of the car that will require attention after a long run. Some of the adjustments are very readily effected. The fan belt may be tightened by merely pulling up on the fan after loosening the nut which holds it in place and then re-tightening the nut. The grease cups for the various exterior motor bearings are turned toward the operator so that they will be at hand when he lifts the hood. This is true of the cup on the fan bearing as well as those on the timing gear case and the steering gear.

The view of the right side of the motor in Fig. 4 shows the water-jacketing for the Stromberg carbureter although the carbureter itself is just out of view being concealed below the side frame of the car. The water is taken from the water-jacket, just below the exhaust pipe and is allowed to circulate around the carbureter, it is then lead into the suction side of the centrifugal water circulating pump. A drain plug is fitted in the lower part of the carbureter water-jacket which permits of the draining out of this jacket if it desired to run the motor without it in warm weather, according to the advice of the carbureter manufacturer. The rest of the gasoline system is of standard design. The feed to the carbureter is by gravity, the tank being contained under the front seat in the touring models while in the roadster types or raceabouts it is placed back of the front seats. The capacities of the gasoline tanks in use on the different models of cars are as follows:

Model	44	45	46	66
Touring	20 gallons	20 gallons	24 gallons	20 gallons
Raceabout	16 gallons	16 gallons	24 gallons	16 gallons

Figures on fuel economy are not now extant but the oil consumption of the Knox cars is stated to be 1 gallon to 800 miles on the six-cylinder cars and 1 gallon to 700 miles on the four-cylinder models.

Details of Clutch Construction

The clutches used with all the models remain unchanged from previous years. They are of the three-plate type with cork inserts in the center plate. The clutch is run dry, the cork having the quality of requiring no lubrication. The fly-wheel completely

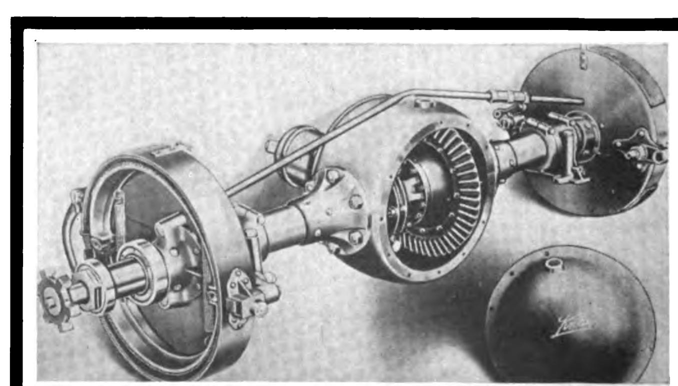

Fig. 6—Rear axle, showing brakes and differential plate removed

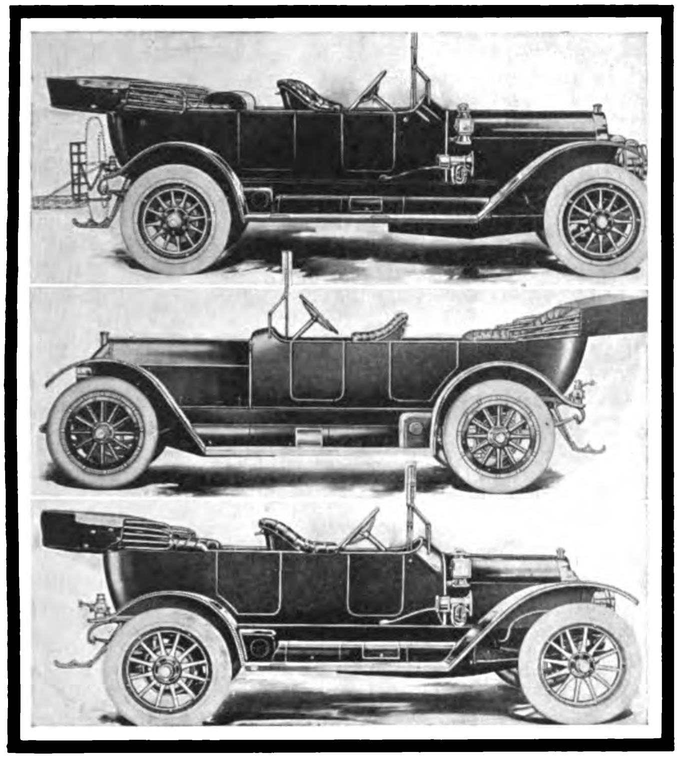

Fig. 7—Knox model 66, six-cylinder torpedo with folding baggage carrier. Model 46, little six torpedo, note the V-radiator. Model 44, the smallest chassis with a torpedo touring body.

incases the clutch and renders it dirt and waterproof. There are sixteen spiral clutch springs used with this clutch, they are arranged in a ring within the fly-wheel housing and put the desired pressure on the central driving plate which is provided with the cork inserts. Pressing down on the pedal relieves the pressure from the drive plate and allows the clutch brake to come into action thus stopping the spinning of the shaft and rendering it more simple to change gears. The clutch brake consists of two friction plates located between the clutch and the gearset which are brought into contact the instant the clutch is fully released. The friction plates are faced with Raybestos, which can be renewed if it becomes worn after long use.

Three-Speed Gearset Employed

The Knox company is among those who are believers in the three-speed gearset. The selective type is used, the shafts being of 3 1-2 per cent. nickel steel. The carrier shaft has four splines and is made of the same material as the other parts of the gearset. The entire gear-box assembly is illustrated in Fig. 2 where the four-spline shaft is shown together with the gears and the imported annular ball bearings upon which the shafts are carried. The length between bearings is short as may be seen from the compact arrangement of the gears. The gearshift quadrant is a modified H the reverse being one more notch to the left than the main body of the H. The center control now used on all models enables the lever to be near the gear-box itself and hence reduces the number of levers through which the control of the transmission is effected and allows of a somewhat easier shift.

A universal joint housed in a leather boot is placed just behind the gear-box and transmits the drive from the gearset to the propeller shaft. The drive through the nickel steel propeller shaft is a straight line when the designed load is carried. In the little six, contrary to usual practice, the torsion rod is mounted on the right side of the differential housing. At the rear end of the propeller shaft another encased universal joint is fitted through which the drive passes directly to the floating bevel gear rear axle. Some of the details of this axle may be seen in Fig. 6 which shows the axle with the differential cover plate removed. The axle bearings are Hess Bright ball and the pinion is integral with the shaft. The brakes are also shown in this illustration and as may be noted, they are of the expanding and contracting types acting directly on the rear wheel drums. The emergency brakes are the expanding while the regular set are the contracting.

The front axle is a nickel steel drop forging with the wheels and pivots mounted on Timken roller bearings. Nickel steel Elliott steering pivots are used, taper fits being utilized in conjunction with a nut and cotter pin fastening allowing the pivot levers to be taken up in case of wear. The steering gear itself is of the irreversible double thread and nut type fitted with adjustments which render it possible to take up lost motion throughout its mechanism.

Cold pressed nickel steel frames are used. The depths of these vary at different points through the length in order to meet the different requirements at different points of the chassis. Three cross frame members are used, one at the rear, another amidships and the third just in front of the flywheel. The springs are semi-elliptic in front and three-quarter elliptic rear on all models the lengths and the wheel sizes of the different models being as follows:

Model	44	45	46	66
Front	42 inches	42 inches	42 inches	42 inches
Rear	50 inches	50 inches	54 inches	50 inches
Wheels	36 x 4½	37 x 5	37 x 5	38 x 5½

The same size wheels are used all around on each car and they are all of the wood artillery type. The rims are all of the Fisk bolted-on type with Fisk demountable rims as standard equipment. Hand-buffed upholstery is used throughout and battleship grey, Brewster or Thistle green, blue royal purple and a number of other colors are optional with the purchaser of Knox cars.

The equipment consists of a full electric lighting system on the sixes and on all models a glass front, dash clock and speedometer, combination bulb and electric horn, motor-driven tire pump, gasoline gauge, shock absorbers, coat rail, robe rail, foot rail, floor mat, tire carrier, jack, baggage rack, tire pump (hand), tire repair kit, set of tools, complete set of lamps and headlights. The headlights are gas on the four-cylinder cars. On the limousine bodies or other styles of town car folding seats, speaking tubes and various other accessories are part of the regular equipment.

The enumeration of the principal innovations given above shows that in the execution of its latest model the Knox company's engineers have well followed the trend of European and American design, both inasmuch as efficiency of the mechanism and comfort of the passengers are concerned. At the same time, none of the well-approved principles of design or construction have been thrown overboard in the building of these latest models. In every respect, progress has been coupled with caution and all important changes were made only as a result of long-continued experimenting.

Painting radiators is a peculiar sort of work, remembering that whatever color one puts on the radiator frame and front will be continually exposed to a very high degree of heat. It is for this reason that all makers have practically agreed that black paint is one of the best and most durable colors for the radiator. The proper method of painting the radiator is to apply a very thin coat of lampblack in solution, and, after it has dried, to apply another equally thin coat. Lampblack has sufficient body and color depth to be effective even after only two applications, and, as it is composed of pure carbon, is not subject to decomposition as other colors which are made of chemical compounds and secured to the surface by means of organic binders. Lampblack will wear off under continued strain of service, but it will last long, as even together with the heat it suffers constantly the atmospheric elements have no effect on it. It is principally the mechanical hardships that radiator paint has to undergo in service that ends the life after a relatively short period.

Loose Clips Cause Broken Springs—Automobile and Motorcycle Records—Quick Crankshaft Changes—Winter Storage of Car—Repair on Leaky Manifold—Arguments for and Against Left Control—Motor Skips After Starting

Troubled by Breaking Springs

EDITOR THE AUTOMOBILE:—I have broken the left front spring on my car three times in close succession and am beginning to be disgusted with my misfortunes in this direction. I do not understand the car as well as I might and perhaps do not pay attention to details which I should not allow to pass unnoticed. As this is largely due to ignorance on my part I wish to correct it as much as possible. What I would specifically like to know is what to do with the springs to keep them from breaking as I am afraid to take my car over any of the roads around this vicinity. This morning I noticed that the bottom leaf of the forward right spring seems to be out of line with the others. As I noticed this same thing the day before the other spring broke the last time, I am afraid that this one is to go also at the first bad strain although it seemed tight enough when I hammered it back into line.

Port Jervis, N. Y. CHARLES FLAGG.

—The whole trouble is simply in the fact that you do not keep the spring clip bolts tight. This advice has been given scores of times through these columns and is also to be found in every instruction book brought out by car makers. With a hammer gently tap the spring leaves into line as shown in Fig. 5. When this is done tighten the spring clip bolts as tight as they can possibly be turned. When this is done nothing but an extraordinary stress will break the springs. If you are traveling in very rough country continually, it would be well to use shock absorbers or a rubber spring pad above the lower clip. This will deaden the effects of a blow and render the rebound less sharp. When springs are broken it is nearly always on the rebound.

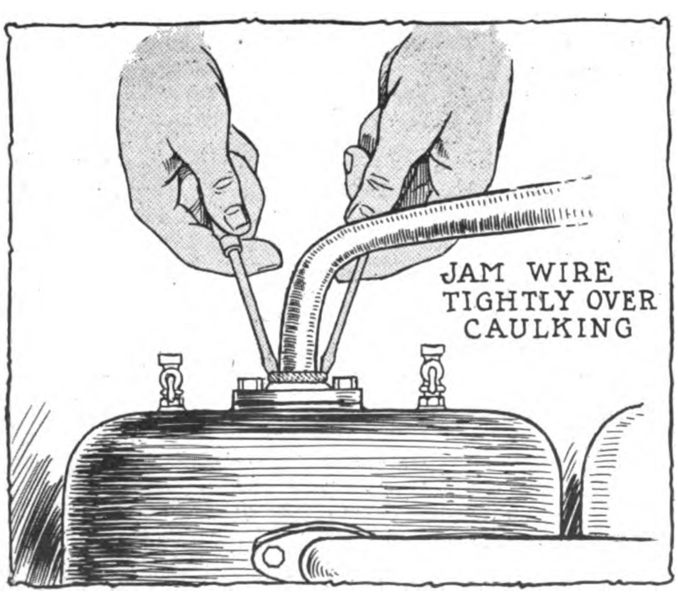

Fig. 1—A step in temporary water manifold repair on road

Automobile Faster than Cycle

Editor THE AUTOMOBILE:—Which has made the fastest mile up-to-date, an automobile or a motorcycle? Please give the names of the drivers and where the records were made.

New Haven, Conn. ANDREW McSWETE.

—The answer to this question was given in detail on page 1179 of the issue of May 23, for the current year. Briefly, the fastest time ever made by an automobile and incidentally by any human being who afterwards lived to tell of his experiences was made by Bob Burman in the Blitzen Benz car in 25.40 seconds at Daytona Beach, Florida, April 23, 1911. This is at the rate of over 141 miles an hour. The fastest motorcycle mile record was by Ray Seymour in 36 4-5 seconds at Los Angeles on May 17, 1912, this is at the rate of very close to 99 miles an hour.

Speed in Replacing Crankshaft

Editor THE AUTOMOBILE:—In the 4-inch race held at the Isle of Man some time ago, if I remember rightly, there was a record change of crankshaft made by the Metallurgique car representing Belgium. Recently I had a discussion about replacing a crankshaft with a gentleman who claimed that it could not be done under a day. I have done considerable contest work and have seen many quick shaft and bearing changes and believe I am right in saying that it can be done much more quickly than this. What is the quickest crankshaft change of which THE AUTOMOBILE has any record?

Norristown, Pa. HENRY L. BROWNBECK.

—According to the Metallurgique agency in New York the change to which you refer was made in 8 hours. Over the same course in 1908 one of the Deasy cars sustained a broken crankshaft. The break occurred at the forward end and owing to an exceptional form of the central main bearing, which was extra long, being designed to support other parts of the motor at this point, the car was enabled to make two or three circuits of the course on two of the cylinders after it was declared out of the race. THE AUTOMOBILE has no record of official times made in changing crankshafts, but for average touring car work it requires all of a day.

Proper Way to Store a Car

Editor THE AUTOMOBILE:—I own a Hudson 33 car and do not intend to run it after the cold weather sets in. What is the best and proper way to leave a car for the winter? What I particularly refer to is the oil, water, tires, etc.

Hartford, Conn. A SUBSCRIBER.

—THE AUTOMOBILE will shortly publish a detailed story on the overhauling of the car preparatory for storing it for the winter. As far as the mere storing of the car is concerned, however, the following directions apply as regards the oil, water, tires, and parts of the car which require special attention:

(1) Drain out all the water from the radiator and the jackets, letting the draincock stay open until the entire system has run

dry. The cock at the bottom of the radiator is always placed at the lowest part of the water system so there is no difficulty in allowing every bit of the water to run out.

(2) Let all the gasoline out of the tank and drain out the carbureter. If you wish to save the gasoline put it into an absolutely gas-tight vessel so that the volatile constituents will not evaporate during the winter. If this is done carefully the gasoline will be ready for use in trying out the engine in the spring; and will probably save you the trouble of lugging a supply from the nearest garage before the car is running. Close up the tank carefully by screwing the filler cap in place in the same way as would be done were the tank filled with gasoline. Do not give the cap a couple of turns and let it go at that because the cap is apt to be knocked off and should any flakes of rust or other foreign material get into the tank the trouble which could develop would be surprising.

(3) Remove the oil drainplugs in the bottom of the crankcase and let all the oil flow out. When it has all come out put the plugs back and pour about a gallon of kerosene into the crankcase. Next, make a piece of cardboard of sufficient size to make a conspicuous label and paint these words upon it:

KEROSENE IN CRANKCASE! DO NOT RUN!

Fasten the label to the motor where it can be seen and where it will not be detached. Then when you take the motor out of storage the crankcase will be clean when drained.

(4) In the storing of the tires for the winter great care must be taken or they will show a marked amount of deterioration at the beginning of the following season. Wash the casings thoroughly with soap and water after jacking up all four wheels. When every sign of dirt, oil and grease is removed take the tires off and remove the tubes from the shoes. Next paint the inside of the shoe with graphite which may be secured from any of the graphite concerns especially for the purpose. The same directions apply to the outside of the inner tube which should also receive a generous coat of the graphite. The tubes and casings should then be wrapped securely in brown paper and afterwards in cloth. When this is done store them in a cool dry place where the temperature will remain about the same all winter. Thirty degrees Fahr. is a very good temperature for rubber which is subject to deterioration when exposed to either heat or light.

(5) If you use the gas generator which was furnished with the Hudson 33 if desired, remove all the carbide from it and give it a thorough cleaning out immediately before the residue has time to harden to the point where it has to be chipped off. Whether using a Prest-O-Lite tank or a generator, remove all the rubber connections between the copper pipes and the tank and lamps and treat them the same way that the tires were treated. If left exposed to the atmosphere and light all winter, they will be worthless in the spring. Take the lamps off, cover them with polish but do not rub this off until the spring. It would be also advisable to take them off and wrap them up, leaving them in a safe place where the lenses will not be apt to be cracked. Excelsior is excellent, and if the car owner leaves his lamps packed in this he can be sure they will be safe in the spring.

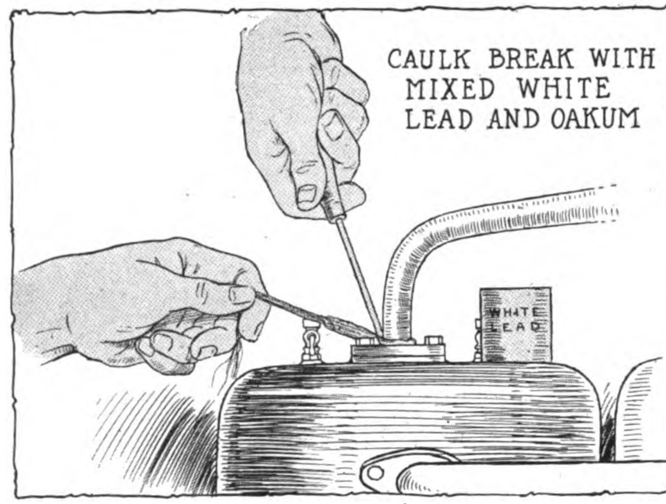

Fig. 2—Caulking the crack in the water manifold connection

Owner Makes Temporary Repair

Editor The Automobile:—Thinking that you may be interested in a temporary repair made while on the road the other day I am sending you a description of same, together with a few rough sketches (reproduced). After going over an unexpected obstacle in the road which gave the car a tremendous shock, I noticed that the water manifold was leaking badly just at the connection to the cylinder head. It was impractical to proceed with the water manifold in the condition in which I found it, and as the country is very hilly around this part of New Jersey I did not wish to attempt the run without any cooling water in the jackets.

Instead of taking the car to a country garage where, as I have learned by previous experience, incompetent workmen abound, I decided to make the repair as best I could myself. At the hardware store, which was also the grocery and post office, I purchased a small can of white lead and a little piece of hemp rope. The hemp rope was picked apart and made a very good form of oakum, which was very effectual for caulking purposes after it had been mixed with white lead. After first jamming a little white lead into the break, being very careful not to get too much into the interior of the manifold, Fig. 3, a small ring of the white lead and oakum was formed and pushed into the crack. This was jammed in as shown in Fig. 2, none of it being allowed to penetrate into the manifold and clog this. After being solidly kneaded down into place it formed a very tight ring which could not be depended upon, however, to hold itself in place. The last step of the repair was to form a strong supporting ring that would hold the packing in place and this was done by means of wire. A ring of wire, from which the insulation had been removed only at the ends, was twisted about the manifold just above the repair, as shown in Fig. 4. The pliers were twisted around several times in order to make this ring very tight. Then, with the aid of two screwdrivers, as shown

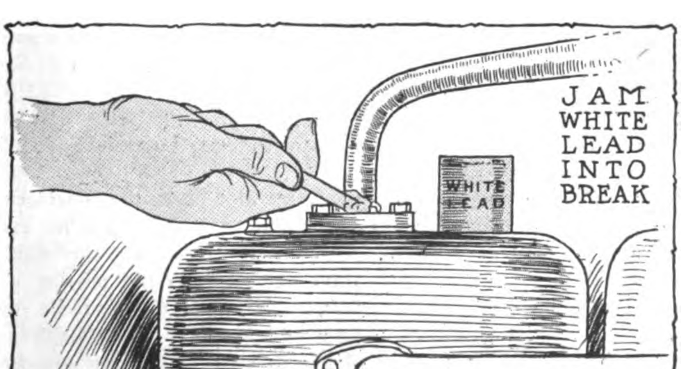

Fig. 3—White lead useful in manifold repair made on road

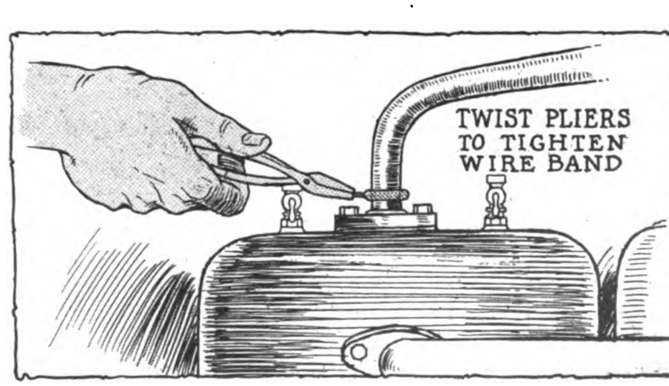

Fig. 4—Wires twisted to make a tight firm ring to bind caulking

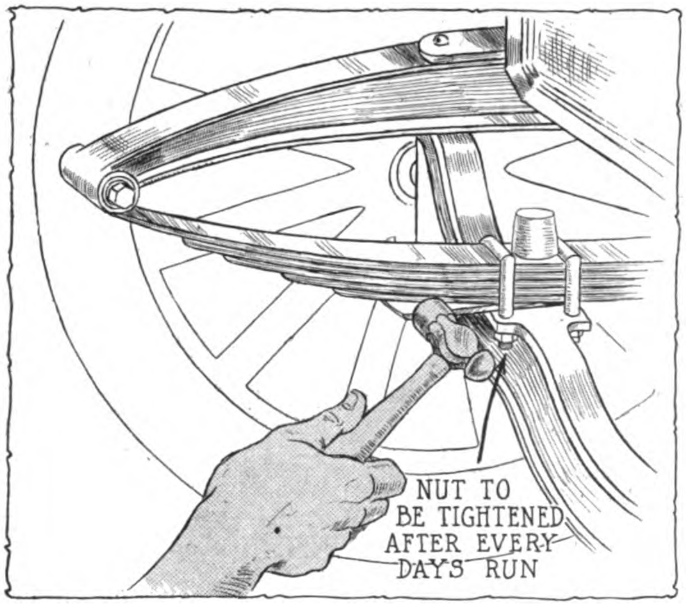

Fig. 5—Lining up the springs before tightening the slip bolts

in Fig. 1, the ring was jammed down hard over the caulking. This repair held so well that it was with difficulty removed when it became time to make a permanent repair, the latter being done by brazing a metal band around the weak point.

Hackettstown, N. J. JACK DRUMMOND.

Strong for Left Side Control

Editor THE AUTOMOBILE:—The editorial and also articles on the right or left side control question, recently published in THE AUTOMOBILE have been very interesting.

Having used both types of control for the last 2 or 3 years, under all conditions of driving in different parts of the country, I cannot see any fault worth considering with the left side control, but do think there are several bad ones with the right side. The left side control cars which I have been driving were among the very first of the high-grade cars using left side control in America, and are not and never have been experiments but the outcome of deep forethought on the part of their designers, whose aim was correct design and not selling arguments. Having just returned from a trip through some of the largest cities where traffic is dense and driving difficult, I am of the opinion that the user of a left side controlled car will never care to return to the once popular right side control. The advantages of the left side control are undoubtedly with both the passengers and the driver. Your August 1st editorial in THE AUTOMOBILE was very good and true up to the paragraph where you argue that right side control has at times in allowing the driver to "watch the ditch on the right" in passing oncoming vehicles. Right there is the weak point which kills the argument, because the basis of it is wrong, that is, "watching the ditch on the right."

Which would you prefer to take the chances with, a car coming toward you and passing you on the left at 25 to 45 miles an hour or a possible ditch on the right?

We can safely assume the ditch on the right to be 90 per cent. of the time possible to go into and come out of without serious damage, but hitting the passing car on the left will always mean more or less disaster.

Therefore you want to sit on the left so as to be sure to gauge your passing clearance with the oncoming car on the left, and when there is not enough clearance for both on the road the chances will have to be taken with the ditch on the right.

In my above spoken-of trip I drove sometimes a right and sometimes a left-control car, twice a day 15 miles from the lake shore hotel where I was stopping to the factory in the city, over a narrow brick road just wide enough to pass another car with about 12 inches clearance, the surface of the road on the right of the brick being very deep mud it was not advisable to run into it unless forced to do so by the oncoming driver on the left. The result of this driving situation was that I never felt safe unless I could watch the clearance between the oncoming car and mine, which with the left-side control was always possible to do.

Not all the drivers coming towards us were expert judges of space and twice I was forced into the mud with no further consequences than a slight delay in getting out.

"Watching the ditch" with a right-side control would have certainly meant new left side fenders, hub caps, etc., for our car, and possibly a wrecked car with some one hurt.

In driving the right-side control car over this road it was a matter of guesswork as to how much clearance I had over the other car; it was having to take the chances on both sides.

As to the left-side control in passing another car going in the same way it is not the car being passed that one wishes to watch, but the left side of the road in order to get the chance to cut over to the left when the road is clear of oncoming vehicles, and here the advantage of the left-side control shows up in the driver's ability to see around and to the left of the vehicle ahead which is to be passed.

Of course, if the road is wide enough for three or four cars abreast, the position of the driver is not so important, but it is the close places where fine steering has to be done and accurate driving is necessary that the left-side control shows to its best advantage.

Of course, the factory's side of the situation is mostly governed by the thousands of dollars it will cost them to change their right-hand existing designs to left-side control.

The problem that the foreign sales organization has to cope with in marketing left-side control cars abroad will probably never be solved until some day when international conferences decide on some uniform code of road usage which will result in one world-wide custom of driving.

Charleston, S. C. M. B. PAINE.

Is Disgusted with Left Drive

Editor THE AUTOMOBILE:—I notice the discussion of the left vs. right-hand drive in your columns, and as I am pretty thoroughly disgusted with the left drive (I am using left drive now) after using the right drive, I wish to show through your columns just why the left drive is wrong. It is so clearly wrong that I am at a loss to understand how any manufacturer of cars in America could ever be induced to build cars with driver's position on the left.

Taking up the various reasons advanced, point by point, let us first consider:

(1) Cars approaching from opposite directions. With left-hand drive, the driver has no view whatever of the right side of the road, the ditch, gutter or curb that may be there. The real danger, especially on narrow roads or streets, lurks at his right—never in the car approaching, for the driver of the approaching car is also on the lookout to avoid collision. Now, if each car is right-hand drive, the drivers can see the right-hand side of the road, and also can see each other, for they are on the same level approximately. The right drive is the only drive that will permit the drivers to see the sides of a narrow road and the approaching car. As for estimating the distance between the cars in passing, ask any driver accustomed to a right-hand car if he ever has any trouble in this respect. This estimation I find to be almost instinctive, as, I am sure, do all drivers.

(2) Cars passing in the same direction. There the consideration by the man passing another car must be for the other car. Ethics demand it, if nothing else, and here again the right-hand drive triumphs. You leave the car you are passing on the right, but as the driver of your car is also on the right you are sure never to scrape your neighbor's car, even though he is facing away from you and not in position to look out for himself as he is when meeting you. Some good friend may

come back and ask what about the curb in this instance so I give the answer now: It is a chance you must take. I said above that the consideration by the overtaking car must be for the overtaken car not for himself.

(3) Cars stopping at right side of street. Right-hand drive, with center control on the order of that in the Owen or Reo 5th, I think it is—anyway the cam handle shifting lever can be so designed, as can also the relation between the steering wheel and front seat, that entering the front seats from the right side is perfectly easy, and it should be done. And with the right-hand drive, the driver, who is often the host, takes his place after his guests are seated. The left-hand drive forces the host to take his seat first, which is a violation of hospitality.

(4) Right or left-hand operation of control lever. This makes no difference whatever, as I know from experience that the normal person is ambidextrous in this respect, and the left hand, after a little practice, is every whit as quick and as accurate as the right.

(5) As for all the other questions, such as torque reaction from the motor, etc., etc., in my opinion the car could better afford to be re-designed throughout, the motor made to reverse its direction if necessary and all other essential changes made to retain the right-hand drive.

Here is one man, and he has talked to many others like himself, who has registered his promise that, should he ever buy another car it will be a right-hand drive, even if it has to come from abroad, in the event all the American makers come to the left-hand drive.

Montgomery, Ala. C. L. Johnson.

Has Trouble Meshing Gears

Editor The Automobile:—I am having a little trouble in properly meshing the gears on my car. The trouble is really in two directions, first that while the car is stationary I sometimes can move the gear shifter lever into the required notch and at other times I cannot. I have four speeds and am often compelled to start on a second instead of first. My other trouble is in dropping back to a lower speed in climbing a hill. I cannot get the lower gear into mesh without making considerable noise. Could you help me out through the Letters Department of The Automobile?

Suffern, N. Y. Charles Peat.

—The difficulty you have in meshing the gears while the car is not in motion will be readily cured if you will let the clutch in with the gear lever in neutral for just an instant and then try to mesh the gears again. The reason that the gears do not mesh is that they are not properly aligned for the moment. If the gears do not mesh after the first attempt repeat the process until they do. In dropping from high to a lower speed on a hill you will find that your gears will mesh without much rattle if you will make the change by a quick firm motion the instant the clutch is disengaged.

Motor Skips When Starting

Editor The Automobile:—I have a 1911 model T Ford and have driven it barely 5,000 miles. Outside of the trouble i will mention the car has run to perfection al the time and I have never had a minute's trouble with it in any way. I think that I understand the car very well, as I have had one of the same make before, as well as four others of different makes.

For the last month or so nearly every time the machine is cranked it will run on one, two or three cylinders for from one to three or four minutes. It generally hits on one or two cylinders for that length of time and finally catches all four and runs perfectly. It will do this no matter whether the motor has been stopped two minutes or over night. When this missing occurs there are none of the vibrators working except on the cylinders that are working. This would seem to show that the trouble lies either in the magneto, vibrators or timers. I have cleaned out the times in good shape, but get no better results; also have taken off the magneto posts and found a little waste under the spring. I removed this, but it did not remedy the trouble. I adjusted and filed off the vibrators to no avail. The vibrators are kept as loose as possible as that is the way they have to be. The coil on this car is a Heintz. Could you tell how to find the source of the trouble?

Van Wert, O. A. Reader.

—The fact that the motor starts to fire on all cylinders as soon as it has been running for a few minutes precludes the idea that there is anything wrong with the magneto, vibrators or timers, as you suppose. There are four causes which may be responsible for this trouble; they are as follows: Dirty spark-plugs, electrodes too far apart, too rich a mixture at low speeds and too lean a mixture at low speeds.

In getting at the trouble first take out the spark-plugs and clean them well with gasoline. Be sure that the electrodes are bright and clean before putting the plugs back into the cylinder. After you have done this start the car and see if the trouble still continues; if it does, take the plugs out again and examine the gaps between the points. It is not true that the gap at the plugs should be the widest possible that the current can jump, for two reasons. The first is that the jump made by the current can not be as great in the cylinder where the gases are under pressure and the second is that the spark will not be as hot when the jump is extreme because it will be thinned out to a considerable extent. The gap should not be any greater than 1-32 inch at the most and a shade less than this will give even better results. After bending any points together that may be too far apart, again try the car and see if it works satisfactorily. If it does not it is then time to blame it on the carbureter and not before.

When changing the carbureter adjustment be very sure that you have carefully noted the adjustments as they stand before starting to make any changes or else you will be apt to find yourself in more trouble when you finish than at the start. If the carbureter you are using has two adjustment points for the gasoline, that is a low speed and a high speed screw, make the adjustments on the low speed point first by starting the motor and then turning the nut to produce a slightly leaner mixture. After you have made the mixture slightly leaner at low speeds, speed up the motor and see if it is necessary to change the high speed adjustment. If it is, make the required change to make the motor run as smoothly as it will possibly run. Now take the car out on the road and see if the trouble still occurs. If it does, the remedy will lie in making the adjustments necessary to produce a richer mixture at low speeds.

Accidents in the City

Careless Driving Not Responsible for All the Accidents Although a Large Number Are Due to This Cause

Neglect in Using Non-Skid Devices Places Many Cars at the Mercy of a Slippery Street

THE recent agitation among the insurance companies regarding the great increase in automobile accidents within the last few years and the marked intention of some of the accident insurance men to increase their rates has led the more careful owners and drivers to inquire what the causes of these accidents are. It is only natural to expect that the majority of these mishaps take place in the city where there are more cars and this is found to be actually the case. According to the insurance experts the greater part of the accidents are not due to carelessness, but nevertheless there are a great many which are directly traceable to this and no other cause.

One of the most prolific causes of accidents in city streets is skidding. Not less than 80 per cent. of the skids encountered are not at all due to negligence on the part of the driver. An accident which may happen to any one occurs when the car comes upon a freshly sprinkled stretch of asphalt and is compelled by traffic exigencies to make a quick stop. When the brakes are set hard on an occasion of this kind, the car is sure to start sliding because the back wheels are locked. If the frictional grip of the tires on the wet surface of the road is sufficient to check this slip before it becomes dangerous, there is no danger to be feared. Where the skid is not checked, however, the car is entirely out of the driver's control, unless by a mere chance he may again apply the power and secure sufficient traction to get the car again under command. Where the skid is not prevented, an accident is extremely probable if the traffic is dense. An accident of this kind is infrequent when the relative number of the cars in use in the streets of a city like New York is considered, still it is sufficiently frequent to make a considerable number when taken in the aggregate.

Accidents on Slippery Streets

An accident of this kind occurred recently to a large Fiat car passing through a prominent New York street. In this instance the street had been rendered wet by a short shower which only lasted for a few moments. The driver of the automobile did not deem the street slippery enough to take the precaution of placing chains upon the tires and shortly afterwards ended by finding his car in the unfortunate position depicted in Figs. 1 and 2. The car started to skid and being in a position near the curb the rear wheels brought up against the side of the gutter and the result was the bad break shown in the two illustrations just mentioned. A new wheel had to be bought for the car just because the trouble was not taken to apply the non-skids.

The chief objection to asphalt as a pavement is its slipperiness at the slightest moisture. The dust which settles on the surface of the asphalt combines with the water to make a thin layer of paste which acts in about the same manner as a slippery grade of axle grease would do should it be spread upon the surface of the road. It is a fact that a little moisture on the asphalt road will make it more slippery than would be the case with a heavy rain. This is due to the fact that when the rain becomes sufficiently heavy it washes the mud off the surface of the road and takes away the slippery mixture which is so apt to cause a skid at the slightest semblance of locking the wheels. The advice which is often handed out by people who are in a position of knowing to "put the chains on at once," is no airy persiflage. The uncomfortable feeling of sitting in a car that has passed beyond the driver's control and is swinging about end for end, has only to be felt once to convince any one of the advisability of taking the little extra trouble necessary in putting on the tire chains. If any definite proof of what experienced owners of large numbers of city-going vehicles think of the advisability of guarding against the fatal skid, it is only necessary to ask the managers of the large taxicab concerns. The positive instructions issued by these people to their drivers leave no room for further doubt.

Collision on account of the ignorance of traffic regulations also sends many cars to the repair shops and passengers to the hospital. There is only one piece of advice necessary in this connection and that is to secure a booklet from the municipality and study it. You will then know what you are expected to do and just what you can expect of the other driver. These booklets are gotten up by cities for the special purpose of instructing the driver of a car what to do in the crowded city streets. They are not only words of advice, they are words of law. Ignorance of the law is no defense of its infraction and will not keep an offender out of jail or free from the imposition of a fine. The traffic policeman is an excellent institution, but entire confidence cannot be placed in him unless every driver understands his signals and whistles.

Carelessness Causes Collisions

An Abbott car that only escaped many broken parts because of exceptionally strong construction at the strained point is shown in Fig. 3. This was the result of a city accident, in one of our Western towns. An attempt was made to cut

Fig. 2—Fiat skidded into gutter because of no non-skid device

across the rear of a car when the inevitable car going in the opposite direction caught the forward part of the automobile and reduced it to the state shown in the illustration. Accidents of this kind are frequent and are really caused by careless driving, for there is no excuse for a driver not exercising every possible care at a street-car crossing. Many drivers have the very pronounced fault of speeding through cross streets between avenues and then when they reach the avenue taking a chance without slowing down. As a rule, the driver on an avenue or a boulevard expects the driver on the side street to enter carefully and it is up to him to do so, for the driver going on the avenue has the right of way over the driver on a side street. This carelessness in entering the avenue causes so many accidents that it is not far behind skidding for effectiveness in this direction.

Caution Will Avert Trouble

When approaching an avenue slow down to almost a stop if the avenue is much traveled. If you intend to turn into the avenue the hand should be extended to signal a possible driver behind that a turn is to be made. This will prevent him from coming alongside unawares and cutting into your car by going straight ahead just as you are making the turn. If the turn is to be made to the left the car should be driven straight across the road past the central intersecting point of the street and the avenue and the turn made beyond this point. If the turn is to be made to the right it should be made close to the curb so as to allow a vehicle coming straight down the avenue to pass.

Another way to prevent accidents in crowded driving is to always sound the warning signal when passing a car. A driver will often make a sudden swerve to avoid the deep holes which are frequently found even in the most traveled of the city streets. Should another car be in the act of passing as this swerve is made by a driver who does not know that there is a car on his left, an accident having serious consequences to the running gear of either or both cars may ensue.

Accidents are even possible when the car is left standing. Should the car be left on a hill without the emergency-brake lever set as it ought to be, it is apt to gather momentum and become a source of danger to other cars as well as itself.

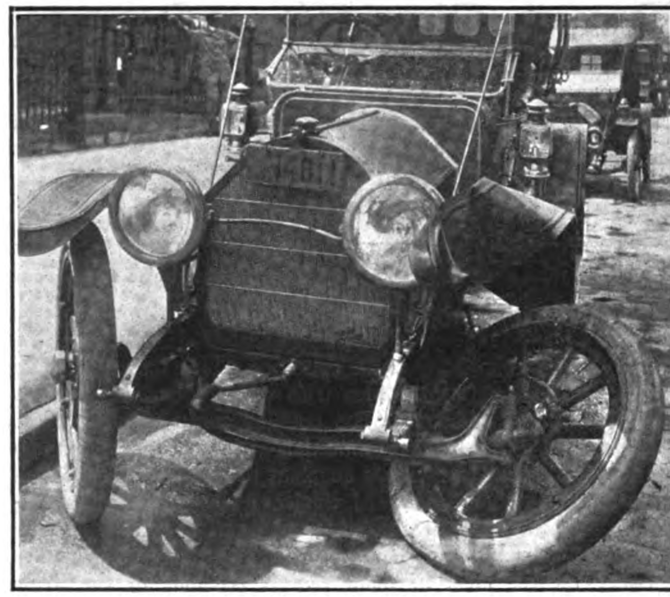

Fig. 3—The results of a collision due to careless city driving

The condition in which the brakes of a car are kept is a factor that must be considered. A car which cannot be stopped quickly is a menace to the public. Most states require that a car should have adequate braking facilities, but it is not a law that can be enforced, as it is impracticable to hold a brake test on every vehicle at short intervals. This should be a matter for the car owner to take care of, not for the sake of others alone, as his own safety depends on the care expended on this part of the car to a marked extent. Rear end collisions due to the fact that the car behind cannot be brought to a standstill quickly enough are the cause of many punctured radiators and broken gasoline tanks. Vigilance, regarding both vehicles and pedestrians, is a necessity in city work.

Harking Back a Decade in the Automobile World

Some of the Events and Activities Which Distinguished the Industry 10 Years Ago as Recorded By The Automobile and Motor Review

FROM *The Automobile and Motor Review*, August 30, 1902: The heavier class of commercial vehicles, comprehended under the general term lorry, a word comparatively unknown in this country, has already reached a high degree of perfection in Great Britain, particularly the steam lorry.

The Cannon steam racer; the 40-horsepower Mercedes-Simplex and the 35-horsepower Darracq were the features of the entry list at the Brighton Beach race meeting last week. The Cannon machine was barred at the last minute because the driver does not control the engine but it made a few exhibition miles. In one of these trials it cut the mile record for steamers to 1:07 3-5. The car uses 400 pounds of steam pressure. The Mercedes-Simplex carried off the gasoline honors winning the open 10-mile event in 11:54 4-5.

Rules for the Automobile Club of America reliability run to Boston and return have been published. These rules provide for gasoline, steam and electric entries and for three and four-wheeled vehicles. Every contesting car shall carry an official observer who shall be furnished by the club. While any necessary repairs may be made after reaching night controls, the practice of shipping skilled mechanics to control points by train so that new engines may be installed in contesting cars is forbidden.

The necessity of adapting the ratio of gear transmission to the resistance encountered, inherent in all vehicles with explosion motors, is usually met in practice by providing from two to four pairs of gears of graduated sizes, adjacent to each other on parallel shafts, by means of which the first shaft, when run at any given speed, may communicate from two to four different speeds to the second shaft. For the purpose of reversing, an intermediate pinion is arranged in one or another way to mesh between two gears on the first and second shafts, or sometimes a sprocket chain is employed instead.

The race meet last Saturday at Brighton Beach must be classed as a failure. The entry list included only a couple of foreign racers, a couple of American road cars and a few skeleton freaks. The attendance was moderate but the program was drawn out to an intolerable length and continued almost to dark.—Editorial.

W. H. Russell, a New York chemist, claims to have discovered a hydrocarbon gas that will prove a substitute for gasoline in automobile operation. Mr. Russell says that his gas is non-explosive except under compression through electric spark. The gas is generated while the automobile is in motion and is stored in an 8-pound tank.

Exports from New York covering automobiles and parts for the week ending last Saturday amounted to $16,300.

Repair Shop Time System

Two Types of Card Used to Control the Operative Efficiency of the Men During Working Hours

Checking Methods Are Open to Improvement and the Trend Is Toward Simplicity

UTMOST simplicity is the condition which makes a system a success. As the idea with which a business man introduces a more or less detailed control system in his establishment is to reach a condition where he may eliminate useless or harmful factors and supplant them by useful ones and raise things to a high plane of efficiency by a small number of essential operations, it is clear that an excess of details must be guarded against lest they counteract their purpose.

Labor records must be made out, if possible, by the workmen themselves, and it is a matter of course that this part of their occupation should take them as little as possible away from the work for which they are engaged. As much of the necessary writing as can be should be done at one time, to reduce the number and thereby the extent of interruptions of work. If a man records his time when starting and stopping his day's work, when going out at noon and returning to the shop, and when beginning and finishing overtime work; when he also records the time at which a certain repair is begun and ended, he furnishes the office with enough data upon which conclusions and improvements may be based. It is all very well to try and know everything about one's business, but after all that is not the final end of one's being there. An office and its work is always but an adjunct to a factory or shop.

The system for recording the time spent by the workmen in the shop and on individual jobs comprises two forms, one of which is a clock card and the other a so-called job-time card. Both of these cards are originally marked by the office with the names of the workmen using them and after the cards are filled out completely their records are checked by a foreman and a clerk before being sent to the bookkeeper's department for calculating the wages due to the men.

The starts and stops of work are recorded, in most shops, by means of the International type of time clock which stamps the time of ringing in or out on a card suitably lined and cut for this purpose. The time card has ordinarily six columns, of which only one may be stamped at a time. The proper column is brought to register with the stamp inside the clock by the movement of an indicator into one of six notches on the front of the clock, whereby the frame in which the time-card is placed is put into the correct position.

One of the most widely used designs of a time-card is Form 5, which is tan-colored and 5 1-2 by 3 1-2 inches. It is printed with the name of the White Company, 631 West Fifty-seventh street, New York City, and spaces are provided for filling in the name of the workman, whose time is recorded on this card and the week during which the latter is used. In addition thereto the shop number of the worker is entered on the card. There are six stamping spaces in each line and seven lines are provided, one for each day of the week. The spaces are designed to be filled when the workman arrives in the morning, goes out for and returns from lunch, and leaves in the evening; start and stop of overtime work are specifically entered on the card. Besides these six columns there is a blank space in every line, in which the total working time of the day is entered. At the close of the week these totals are footed and the sum recorded at the bottom of the car, and when the workman is paid he signs the card as a receipt for his wages which are based on the times given by his clock card. Slight variations in the design of the clock card are found with various companies. Some companies mark the six columns Morning in and out, Afternoon in and out, Overtime in and out; others provide a space for the rate at which the worker's time and overtime are paid; still others print rules or regulations on their cards, for instance: "Each man his own timekeeper. We pay by this record, your own recording," etc. However, the same principal features appear on almost all the cards, so that they are stamped in the same manner.

Several Types of Clock Cards

A special type of time-clock card used by the Peerless Company, of New York, is here shown as Form 10. This is a white card, 4 by 5 1-2 inches, printed on one side only, on which the name of the workman, the week during which the card is used, and his rate of payment are entered. The other records are "in and out" times printed by a time clock in the morning and evening, at lunch and when a man works overtime. There is a series of stamping spaces along every side of the card. Every morning the total number of working hours of the man during the previous day is calculated and the amount due to him for his work is entered on the card. When he receives his wages he is made to sign the card, which is preserved and filed for future reference.

Very much more variation is found in the forms, however, on which the distribution of the men's time is recorded. One blank, Form 6, is very similar to Form 5, it being also a clock card, and of the same size as Form 5. It is used by the Studebaker Brothers Company, of New York, 140 West Fifty-second street, to record the time spend by each man on every particular job on which he works. This card is made out in addition to the ordinary clock card. Form 6 is green where work is done on jobs which are paid in cash, while charge jobs are recorded on white blanks. The idea of morning, afternoon and overtime has been carried out also in the design of this blank although the spaces are marked differently. At the same time the design of Form 6 permits of repeated, though uneconomical,

interruptions of one job without confusion of the records. As this card is used only for a specific job, the job or order number assigned to the work when the car is taken over by the superintendent of the Studebaker repair department is marked on this card when it is first started. After the repair, so far as one man is engaged in it, is completed, the card is filed away and the total times for each day are figured as in the case of Form 5.

Job Time-Cards in Many Designs

To avoid any trouble arising from mutual inspection of the workmen's time-cards, the men file their cards in a suitable frame when they go out, but turn the stamping side against the wall. The reverse of Form 5 is Form 3, and the reverse of Form 6 is Form 4. The green card being used in connection with but one job, it is filled out with every item of the repair work as the latter proceeds. On Form 3 as well as on Form 4 the name of the workman to whom the card is assigned is written, so that a glance over the rack in which the time-cards are kept shows the shop foreman or inspector which men are out and which are in.

Besides the job clock-card, other forms are in use on which the time taken by each job and by every step of the same is entered. If, for instance, a car is brought into the shop to have its valves ground, the carbureter adjusted, the brakes relined and lost motion taken up in the steering gear, these items are entered on the job time-card, as shown in Form 2, which is used by the White company. This form provides space for entering the number of the job which it is given when first taken over by the repair department, the date when this is done, the number of the car and the name of its owner, the progressive steps of the work and the time taken by each. As the work proceeds the time taken by every stage of the repair is entered and when the work is finished is checked by the head repairman, who is in a position to supervise the work and prevent excessive charges of the men.

Form 1 is a similar design and used by the service department of the Haynes Automobile Company, 250 West Fifty-fourth street, New York City. This Form 1 is marked with the name of the workman and the date of the week, as well as the name of the car owner, the number of the tag with which his car is sent into the shop and is filled with the hours spent on his car. The details of the work are given in the daily time distribution card of the man, Form 12, which is described below in detail.

Another system of recording time distribution in the shop is used by the American-Marion Sales Company, Broadway and Sixty-third street, New York City. This company uses a time sheet, Form 7, which is made out when a car is sent into the repair shop, and is then marked with the date on which this is done. The job number is also marked upon the form, but the name of the owner is omitted. On the other hand, this form provides a column for the names of one or more workmen who were engaged in the repair of the car and for elaboration of their labor thereon. The hours and minutes spent by each on each job are also entered on the form which, when the work is ready to be delivered to the customer, is checked over by the machinist for technical inspection and by the foreman for correctness of the men's time. Then the total time expended on the car is figured, and the sheet is forwarded to the bookkeeper's department.

An apparently similar card is used in the shop of the Peerless Motor Car Company, 1758 Broadway, New York City; this card, Form 12, is filled out by every workman in addition to his time-card. On Form 9 he enters whatever work he does during the day and on which order or job it should be charged; the time of starting and stopping every job is printed on the card by a special time stamp in the following manner: A number of widely spaced lines are used for entering the various jobs on them; these lines are intersected by downward lines marking the columns on the card, and in the last column a short line drawn from left to right is inserted between every two lines, giving two spaces for every job. In the upper space the starting time is stamped, while the lower space is reserved for the stopping time. The bookkeeper's department then calculates how much time of a man's work was spent during the regular working day and how much is to be figured as overtime. Ordinarily each man uses one card a day, but if he works on a large number of jobs, two or more cards are given to him, all of which are turned over to the foreman in the evening. The

Form 8—Proposed time-clock card shown in full size; black printing on bluish-white paper, goes to office daily to have wages figured on it, being kept on rack during daytime

printed at intervals from 1 to 6 p. m., and a space for remarks is left on the bottom of this side of the card. Whenever a job is started it is written on the line corresponding most closely to the time of the start. The order number of the car, on which the repair work is done, is also recorded, as is the rate of payment of the workman. All time-cards are sent to the bookkeeper every night, who distributes the men's time on the customer's charge accounts.

As reference to the captions of the various blanks indicates, there are practically no two forms of the same size, except the clock cards, which are made for its customers by the leading time-clock manufacturer. The disadvantage of having half a dozen forms in a system and each of a different size must be obvious to every office worker, and it is the office workers who have to do principally with the handling of the shop records. Therefore, as many cards, sheets and other blanks as possible should be made in the same size.

Following this idea, a time-recording system is outlined below which like most of the others comprises two cards, in which all the features found in the various designs shown above are contained. The system uses two cards, one of which is the weekly time card, while the other is a daily workman's card, on which every job, or rather, operation he does is entered with a fair measure of detail. The clock card is of the standard size, while the job-time is of the same width, but twice as long as the clock card, and is folded around its middle line.

Improved Form for Clock-Card

The clock-card, which is based on the conventional type, but includes a few additional points of information, is illustrated as Form 8. On its head the name of the company appears, thereunder the date on which the week ends, during which the card is to be used. The name of the employee and his shop number follows, and a space is left under this line, in which a short rule or statement of the company may be printed. Besides the six stamping columns which are marked the same way as in Form 5 two columns are provided in which the totals of regular and overtime for each day are figured either at the end of the week or every morning, when the cards are turned over to the office of the company's bookkeeper. These totals in turn are footed, regular and overtime hours, the amount which is paid to the workman for them is calculated and then entered on the card. The sum of both amounts is paid to the workman at the end of the week, and he is made to receipt on the card, which is then filed by the bookkeeper's clerk. On the same day the card is stamped in the lower right-hand corner. All workmen's cards for one week are made into a package and stored away for future reference.

The second card, Form 11, as has been stated before, is 3 1-2 by 11 inches and folds around its middle line so that, when folded, it is as large as Form 8. The Men's Job Time Card, Form 11, like the clock card, gives the name of the employee and his number, the date on which the card is used and the number of regular and overtime hours which the man worked during the day. The caption of the card appears in large letters, so as to avoid confusion with the clock-card blanks, although this may be easily prevented by using different colors for the two forms. Under the caption it is a good thing to print a rule calling the workman's attention to the fact that his prompt and correct payment depends upon his truthful filling out of the blank, and the more personally the note is worded the more effective should it prove, as such a phrasing compensates for the severity of the order itself.

Proposed Blank for Job Time

Five columns ruled on the front side of the card below the caption of the card, and over the entire reverse side of the blank, offer the opportunity of recording every important detail of a repair, so far as the time consumed by it is concerned. Each of these columns is crowned by a head, which runs as follows: Stamp here, Job No., Description of Your Operations, Hours, and a check mark. For the stamping of this card the ordinary, large time-clock cannot be used, but a smaller type of time-stamp may be applied to advantage. This type of clock may be bought with a stamping mechanism giving the time as it changes from minute to minute; the stamping mechanism is ordinarily located just above the clock proper and is actuated by pressing down a handle. A clock which gives a one or two-line record like the following

Aug. 15-12
3:35 p. m.

is about the most suitable for the purpose wanted. Every time a man starts on a job or finishes it he stamps the card. After stamping for the start, he enters on the card the job number of the car on which he is put to work, and the specific work which he is made to do. When he finishes a job he stamps the time in the first column as closely to the descriptive text as possible, so that the card offers positively more space than will be required by any one worker in a day's time. This insures simplicity of the system and means that every man must provide a main clock card for the week and six daily cards, all of which make one compact little package.

On the following morning the foreman goes over the cards of the day, enters the time each operation took on the card and checks it if it is correct. Then the form is held on a rack on his desk and at the end of the week is sent to the office together with the main clock card.

The wages of each man are figured by the bookkeeper, after which both clock and job-time card are filed away in alphabetical order, each set of clock or job-time cards making a compact package which is always ready for future reference.

Labor-Day Tours to Nearby Beauty Spots

Suggestions for Spending the Coming Holidays Amid Nature's Wonders Adjacent to New York City

LABOR Day, which falls this year on September 2, following the week-end holidays, affords another excellent opportunity for automobile touring. For the benefit of automobilists of New York and vicinity and visitors in and about the metropolis, the following series of short tours has been prepared and is suggested to them as a fine way to spend the holiday.

Following is a summary of the various routes:

1. New York to Poughkeepsie—Pittsfield, Mass.—Waterbury, Conn.—New York. This will make a delightful run of 2, 3 or 4 days through the most beautiful sections of Westchester County, the lake district of Putnam County, the Berkshire hills of Massachusetts and Connecticut and the scenic route from Waterbury to New York. Following the usual route to Yonkers and Tarrytown, swing eastward to Briarcliff and Yorktown Heights to Lake Mahopac. From the lake the way is east to Carmel and thence to Luddington, Stormville, Hopewell Church and by a wide swing to Fishkill Plains and New Hackensack to Poughkeepsie. This is rather longer than by the direct route following the Albany Post Road from Yonkers, but the latter highway is undergoing repairs and to avoid detours that might lead the tourist into numerous difficulties, the longer and more picturesque route is recommended. The distance is 87.6 miles and may be easily done in 5 hours. From Poughkeepsie to Pittsfield, Mass., is 85 miles, and the route passes Rhinebeck, the Astor country place, Pine Plains, Ancram, Copake, Hillsdale. Shortly after leaving that place there is a stiff climb, but from the summit there is a mountain view that is ranked among the most wonderful in this section. The state road is followed through South Egremont, Great Barrington, Stockbridge, Lenox to Plainfield. Caution for stringent police regulations at Lenox and Stockbridge.

The tourist should be able to make Pittsfield from New York in 1 day's running, although the schedule calls for 172.6 miles. The roads are excellent and the country traversed is beautiful and interesting.

Many Fine Landscapes to Be Seen

The third section of the tour is to Waterbury, retracing the course to Great Barrington, where it turns east through Sheffield, Ashley Falls, Canaan, Norfolk, Torrington; there another series of wonderful landscapes will be unfolded. Thence through East Litchfield, Thomaston and Waterville to Waterbury, a total of 74.9 miles. The run to New York is 88.2 miles via Bridgeport and along the north shore of the sound and about the same through Danbury and south to the Westchester County line, meeting the Boston Post Road or going cross-country to White Plains. By making night stops of Poughkeepsie, Pittsfield and Waterbury, a leisurely 4-day trip is afforded with plenty of time to spare for detours and explorations. If Pittsfield and Waterbury are used as night stops there will be a 3-day tour of many attractions. Those who simply wish the tour for the sake of riding will find that the run to Pittsfield and return in 2 days will give them a satisfactory ride over the course outlined.

2. New York to Newburgh, Port Jervis and New Jersey Hills. Leaving New York, the most picturesque course will be found by following the route given above to Fishkill, crossing the Hudson via ferry to Newburgh, about 80 miles by this longer route. From Newburgh the course lies westwardly to Liberty, 57.7 miles, touching Coldenham, Walden, Pine Bush, Ulsterville, Ellenville and Woodburne. This section contains some good dirt roads, but is largely macadamized. From Liberty to Port Jervis the run is through the Mongaup Valley touching Stevenson and the village of Mongaup. From Port Jervis to New York the way passes through Milford, Pa., to Hainsville, N. J., from there through Culver Lake, Branchville, Newton, Sparta, passes down the Berkshire Valley to Dover and thence to Parsippany and Montclair. From Montclair to New York there are numerous good routes, but perhaps the best is through Rutherford to the Weehawken Ferry.

This tour may be done in 3 or 4 days according to inclination. It is about 250 miles long by the route suggested, but may be shortened 20 miles by following the direct route to Newburgh via the Fort Lee Ferry and the New Jersey and New York route on the west side of the Hudson. If that course is followed to Newburgh it is easily possible to reach Port Jervis in 1 day's run and return through the New Jersey hills the following day. However, the spur of the Blue Ridge which lies to the west of Newburgh may prove attractive for exploration if time is at hand for that purpose and it may be desirable to put in at least a day in covering the distance from Newburgh to Port Jervis. A detour on the return trip will probably attract some tourists. Instead of taking the road to the left at Branchville which leads around the south end of Lake Hopatcong, the right fork passes through Hackettstown and over Schooley Mountain and east through German Village to Morristown.

A Route for High-Powered Cars

Catskill detour from Newburgh, 3. Not recommended for any but high-powered cars. The route from Newburgh may be along the Hudson to Kingston, 34 miles, but it has some bad stretches and is not so agreeable for ordinary touring as if the party takes the route via New Paltz, which is longer. This passes through Plattekill, New Paltz, Eddyville and Wilbur and is about 36.2 miles over good roads. North from Kingston there is a fine macadam road to Saugerties. This is followed by good country road to Evesport, West Camp and Catskill. Leaving Catskill the next section of the run will be found to test even a car of 40 horsepower as it runs through the heart of the Catskill Mountains. This course lies almost due west to Palenville then up into the hills at Haines Falls and Tannersville to Phoenicia. The route traverses the territory where the adventures of Rip Van Winkle were staged. From Phoenicia the return course is via Beechford, just north of the Ashokan reservoir to Woodstock and Saugerties. The course toward Port Jervis is a return over the original road to Kingston and thence southwesterly to Ellenville, where the main route is picked up.

There is an easier route through the Catskills that may be followed by the average automobile without much difficulty. This is identical with the route given to Catskill and then west into the hills via Leeds, Cairo, East Windham, Windham, Prattsville to Grand Gorge, 41.8 miles from Catskill. At Grand Gorge the road turns south passing Roxbury, Arkville, Griffin's Corners, Pine Hill, Shandaken to Phoenicia, thence to Saugerties. From Catskill to Saugerties by this route is 106 miles and will be found to be about the mileage for a full day's running. The whole detour by the long route via Grand Gorge is 200 miles. Thus for a 3-day tour it will probably be well to make the first night stop at Catskill, spending the second day in the hills and the third in returning. If the short route via Palenville is used, the trip need cover only 2 days, although there will be some hard running on the second.

4. South New Jersey. Cross to Staten Island by the Municipal Ferry and run down the east side of the island to New Dorp, thence on the fine main road through Huguenot and Tottenville, crossing to the New Jersey side at Perth Amboy. Cross the Raritan River and continue south through South Amboy, Keyport, Matawan, Marlboro, Freehold, Adelphia to Lakewood.

From Lakewood to Atlantic City the course is via Toms River, Forked River, Waretown, Barnegat, Absecon to the resort city. This is a run of 115.8 miles, all of which is over fine roads. A variation of the above is to continue east from the route given above at Keyport to Long Branch and down the coast road to Point Pleasant, where a cross-road takes the party to Lakewood. This adds about 10 miles to the itinerary, but gives an opportunity to visit Asbury Park and a score of similar resorts.

Leaving Atlantic City for Cape May, the low country necessitates a swing west to Mays Landing and thence south following the coastline to Cape May passing through Tuckahoe, Seaville to Cape May Court House. The resort lies 13 miles to the south. The roads are not so good on this day's trip, but will be found passable at moderate speed. The distance is 63.3 miles. The return trip may be via Philadelphia, in which case the course will be to retrace the road to Cape May Court House, then taking the left branch road touch Goshen, Dennisville, Eldora, Leesburg, Dorchester, Port Elizabeth, Millville, Vineland, Newfield, Malaga, Franklinville, Clayton, Glassboro, Gloucester to Camden. This makes a total of 86.7 miles. Great caution should be used about Cape May Court House in crossing the railroad.

Roads From Camden to New York

From Camden to New York is an easy run over splendid roads via Trenton, and the choice of several routes is given, all of which are familiar to automobilists. The distance is 85 to 102.5 miles, depending upon which route is used. The Staten Island-New Brunswick route is interesting and that via Morristown and Montclair is fine. All told, this tour embraces 355 miles without detours. Including the Long Branch variant and the long way from Philadelphia to New York the total would come to 375 miles. The run from New York to Cape May though Lakewood and Atlantic City can be easily made in a long day's run and the return via Philadelphia affords a distinct change for the course back to the metropolis. If a day is spent in skirting the coast to Atlantic City the itinerary of the trip may be extended to cover 3 days or more.

5. Long Island. A complete circuit of Long Island contemplates starting from the Queensboro Bridge and following the north shore of the island, turning south at Greenport and skirting the south shore to the point of beginning. The course is from Long Island City to Winfield, Corona, Flushing, Bayside, Little Neck, Manhasset, Manhasset Hills, Roslyn, East Norwich to Huntington. In this part of the trip there may be several short detours along the shores of the numerous deep inlets that pierce the north line of Long Island. From Huntington east the main towns and villages are as follows: Centerport, Commack, Smithtown, St. James, Stony Brook, East Setauket, Port Jefferson, Miller's Place, Wading River, Riverhead, Aquebogue, Jamesport, Mattituck, Cutchogue, Southold and Greenport. This gives a distance of 103.9 miles, which undoubtedly will be much amplified and augmented when it comes to actual touring. The country from Huntington east is varied in scenery, but the roads are good on the general average and the temptation to try out a dozen or so of the bypaths north and south of the main route will probably account for a large addition to the contemplated mileage. There are numerous quiet little places where a night stop can be made and no trouble should be encountered in this respect even if no advance provisions are made to care for such a contingency. From Greenport the way lies across Shelter Island Ferry to Shelter Island, where another ferriage brings the party to Sag Harbor. This whole section is the vacation spot for tired dwellers in the metropolitan district and has a large summer population. Turning west after leaving Sag Harbor the route passes through Bridgehamptom, Southampton, East Quogue, Quogue, Westhampton Beach, Eastport, East Moriches, Center Moriches, Moriches, Brookhaven, Bellport, to Patchogue, traversing the lowlands along the shores of Shinnecock, Moriches and Great South Bays. The last leg of the round takes in Blue Point, Bayport, Sayville, West Sayville, East Islip, Islip, Bay Shore, Babylon, New Point, Amityville, Freeport, Baldwin, Rockville Center and Jamaica to Long Island City.

The total distance as outlined is 219 miles, but it may be extended indefinitely to any desired distance.

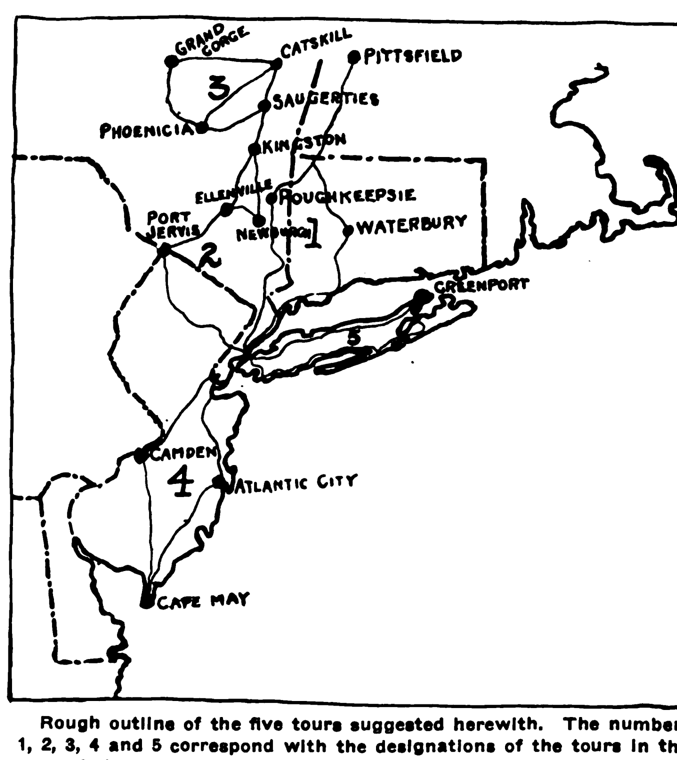
The five routes suggested are all delightful in different ways. The run into the Berkshires is the easiest as far as grades and general excellence of the roads are concerned. The section covered presents a continuous panorama of beautiful landscapes besides being interesting from the historical viewpoint.

Some Splendid River Views

The run through Newburgh to the Delaware Water Gap, while familiar to many of the automobile public in and about New York, is always a favorite. The big detour into the Catskills has some novel features. In the first place, the river road north of Newburgh, while poor in spots, is worth while covering on account of the gorgeous river views to be had from the car. If the automobile is a big, powerful machine and the tourists wish to enjoy something rather novel in the way of traveling, by all means let them make the trip through Palenville and up into the Catskills by the short route suggested. While not positively dangerous, much care should be used in driving along the mountain trails. The other, more circuitous route is not specially difficult, even for a car of moderate power.

The trip to Cape May is over magnificent roads and some that are not so magnificent. South Jersey is somewhat of a laggard in the matter of good roads, but within the last 2 years great improvements have been made in the main highways. The course through Lakewood to Atlantic City is like a boulevard, as is also the Philadelphia-New York run.

The Long Island tour will depend for its enjoyability upon the desires of the tourists. It can be made a hurried jumble of scenes, none of which will prove satisfactory, and it also may be made quite as delightful as any automobile trip in this part of the world. A prearranged plan of tour on Long Island will probably work more harm than good unless the party has some definite idea as to places for its regular stops. One-day trips can be made easily to and from each of the places named as the terminus of the first section of any of the trips except Long Island, and if a swift ride is what is desired, it is perfectly possible to go to Greenport and return in a day.



Rough outline of the five tours suggested herewith. The numbers 1, 2, 3, 4 and 5 correspond with the designations of the tours in the text of the article

Tours From St. Louis

Several Interesting Trips Offered to Automobile Enthusiasts Who Want to Go Touring Over Labor Day

The Territory Within Reach of St. Louisians Includes Chicago, Indianapolis, Springfield and Kansas City

ST. LOUIS, MO., Aug. 26—Automobilists of the Mound City who desire to take a 2 or 3-day trip over Sunday and Labor Day, have the choice of more than half a dozen routes on which they may spend the holiday to advantage, both enjoying fine scenery and making the acquaintance of some of the most interesting sections of the country.

Among the routes selected as ideal are the following: Tour No. 1, to Keokuk, Ia., 193.1 miles; No. 2, to Springfield, Mo., about 265 miles; No. 3, to Indianapolis, 243.6 miles; No. 4, to Chicago, about 350 miles; No. 5, to Kansas City, 310.5 miles. All the above are one-way mileages only.

Chief in popularity this year should be route No. 1, to Keokuk, Ia., the main attraction at the objective point of the tour being the huge new dam put in by the North American Securities Company, which will soon supply St. Louis with water. Either Hannibal, Mo., or Quincy, Ill., offers excellent attractions as an overnight stop, either going or returning, should it be deemed inadvisable to spend the night in Keokuk. Hannibal, 133.4 miles from St. Louis, will be remembered as the birthplace of Mark Twain. His old house has been transformed into a museum, and the Hannibalites are exceedingly proud of it and of the fact that the foremost humorist of modern times was a fellow townsman of theirs. At Bowling Green is the home of Champ Clark, Speaker of the national House of Representatives.

If there is plenty of time at the disposal of the party the return trip could be made by way of Springfield, Ill., or the trip could be further extended to take in Davenport, Rock Island and Moline. As regards the roads to be encountered on this tour, they range from fair to good, no great length of really bad roads being met with in the entire distance.

Through the Ozark Mountains

Another tour that will provide much in the way of beautiful scenery is that to Springfield, Mo., through the magnificent Ozark Mountains. While the roads traversed on this trip will not be of the best, the travelers will be amply repaid by the succession of charming prospects to be met with while journeying through the mountain country, some of them pronounced by seasoned travelers the equal of any to be found in the world. Interesting side journeys to inspect the Rolla caves, the wonders of Ha Ha Tonka and the Niangua River will add to the enjoyment of the tour, as will an examination of the world-famed lead and zinc mines of the Ozarks. The round trip may be made comfortably in 4 days, and the accommodations to be secured en route will be found adequate, especially at Rolla, which, in the matter of distance, would seem to be the natural stopping place in both directions.

While the roads of lower Illinois, by reason of the prolonged rains and floods of this year, are not at their best, a tour across that section to Indianapolis, *via* Vandalia and Terre Haute, will prove decidedly interesting to the automobilist. The old National Road, which will be followed the entire distance, is usually in very fair shape, and should it be decided to cover the distance in 3 days instead of 4, Terre Haute will prove to be an ideal overnight stop in both directions. It would be quite possible to vary the return trip by a detour through Champaign and Springfield, the distance from Indianapolis to St. Louis by this route being 333.3 miles.

The tour from St. Louis to Chicago, *via* Springfield, Peoria and Ottawa, is a favorite with the motorists of the Mound City. The roads are in such condition that it is quite possible to make the one-way trip in a single day; not a few St. Louisans have turned this trick within the past 2 years. On the route to Springfield the travelers will traverse the coal fields of southern Illinois, mining seemingly having crowded agriculture from the lead as the leading industry of the inhabitants. The entire distance from Springfield to Peoria is over dirt roads, which, except in rainy weather, will be found to furnish excellent going. Of the two main routes between Peoria and Ottawa that *via* Henry and La Salle is selected, the gravel roads which predominate in this section being especially good on this route. From Ottawa to the Windy City a practically level country is encountered the entire way, the entrance into Chicago being by way of Aurora and the West Side park system. The return route could be varied by taking in Bloomington, the road conditions on this route being good except in wet weather. If the trip is to consume 4 days, Peoria will be the natural overnight stop going and Springfield (or Bloomington, if the route variation is decided upon) returning.

This latter trip is a short cut, being 225.8 miles from Chicago, through Bloomington to Springfield. The start is made at Michigan and Jackon avenues, following the latter and passing through Garfield Park to Austin avenue to Forest Park. The route proceeds to Joliet, following the drainage canal. This town is the county seat of Will county and southwest of it there are still some old Indian mounds left. The Forest of Arden, a private park, is one of the most beautiful spots in the state.

Numerous Points of Interest

In Joliet there are also a number of enormous steel furnaces of the Illinois Steel Company, together with the plants of the American Steel & Wire Company and American Refractories Company. Northwest of the city the state penitentiary is located. From Joliet the route passes through Minoka and Morris to Dwight. After leaving Dwight, the tourists enter the richest farming region of Illinois and after a ride of about 20 miles reach Pontiac, whence the route is followed to Chenoa and Lexington, then to Towanda and Bloomington, 149.3 miles from Chicago. The remaining 76.5 miles lie in historical territory. Leaving Bloomington and passing Miller Park, the tracks of the Chicago & Alton Railroad are followed through a rich farming section. About 38.9 miles from Bloomington, tourists enter the town of Lincoln. This town was founded in 1853 and named for Abraham Lincoln and with his consent before he had achieved state or nation-wide fame. Lincoln, himself, drafted the town charter and practiced law there for a number of years. Beside the college and state school for feeble-minded children the town is noteworthy for the large coal mines situated in its neighborhood. Proceeding southward from Lincoln, Elkhart is reached, where the old homestead of Gov. Richard J. Oglesby is still standing. From Elkhart, the route leads to Williamsville and after a further 15 miles to Springfield.

While the country traversed by route No. 5, to Kansas City, is in some sections rather uninteresting, quite a number of St. Louisians are preparing to take the trip over Labor Day. To add interest to the tour the travelers could leave the route here mapped at Florence, rejoining it at Marshall, where another option is offered of going to Independence *via* the northern route, which hugs the Missouri River quite closely in some places, and stopping at Waverly and Lexington en route. For many miles these routes follow the new Missouri cross-state highway, which also constitutes a portion of the projected transcontinental road. Good stretches of macadam are to be found for a score of miles adjacent to St. Louis and Kansas City, but the remainder of the route is mostly over natural dirt roads, which, although generally excellent in dry weather, are almost impassable in some places after prolonged rain. The negotiation of the round trip in 4 days is well within the capabilities of the modern car. Marshall and Columbia would seem to offer the best attractions as overnight stopping places in either direction, assuming that the route variations as here outlined are decided upon.

Return Route From Chicago

Tourists who, after having gone to Chicago, wish to return by way of a detour, should find the trip through Champaign, Ill., and Indianapolis, Ind., very agreeable. The total mileage of this tour is 289.2 miles. The way leads through Washington Park, south on Cottage avenue, and to the right on Michigan avenue, passing through Roseland, Kensington, Riverdale and Dolton. There a poor road about 1 mile in length is encountered, which is followed by macadam road. The latter is followed past the Glenwood Industrial School for dependent boys, 26.1 miles from Chicago. This institution is remarkable and excels most other schools of its kind in the country. Passing through Chicago Heights, 29.8 miles from Jackson and Michigan Boulevards, the route leads through Steger, Beecher, Grant and Momence, along the Illinois Central tracks, to Kankakee. In this city the St. Viateurs College, a Catholic institution, as well as the state insane asylum, are worthy of inspection. Kankakee is equally important as an industrial and railroad center. From here the road leads directly to Champaign, through one of the richest farming sections of the United States and passing through Chebanse, Clifton and Askum. Champaign is 25.6 miles from Kankakee.

The distance from Champaign to Indianapolis is slightly longer, namely, 128.3 miles. The route leads through Urbana, Ill., and Homer over very good roads to Danville, where Lincoln spent many years of his life practicing law. The balcony of the Feldcamp home, whence he delivered a famous oration, is still in evidence, and, like the soldiers' monument, is a preferred point of interest to tourists. The road then proceeds to Covington, where the Wabash river is crossed, the tourists entering the state of Indiana. Here the tourists find materially better roads than on the preceding stretch of the route. About 30 miles farther Crawfordsville is entered, famous for Wabash college and known as the former home of Gen. Lew Wallace. About 8 miles south of Crawfordsville, Garland Dells, known as the Shades or the Yosemite of Indiana, offers a very attractive side trip, full of wild, romantic landscapes. From Crawfordsville a straight road leads through Jamestown, Pittsboro, Brownsburg and past the Motor Speedway into Indianapolis.

Calendar of Coming Events

Shows, Conventions, Etc.

Aug. 24-Sept. 9....Toronto, Can., Display of Automobiles, etc., at Canadian National Exhibition, Transportation Building.
Sept. 5-15.........San Jose, Cal., Automobile Show, San Jose Automobile Dealers' Association.
Sept. 14-21........Chicago, Ill., Annual Fall Festival and Show, Chicago Automobile Trade Association.
Sept. 17-20........Denver, Col., Convention International Association of Fire Engineers.
Sept. 23-Oct. 3.....New York City, Rubber Show, Grand Central Palace.
Dec. 7-22 ....Paris, France, Paris Automobile Show, Grand Palais.
Jan. 4-11..........Cleveland, O., Annual Automobile Show.
Jan. 11-25, 1913...New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25.........Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1.....Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show.
Feb. 10-15.........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 24-March 1...St. Louis, Mo., Annual Automobile Show.
March 3-8.........Pittsburgh, Pa., Annual Automobile Show.
March 8-15........Boston, Mass., Annual Automobile Show.
March 17-22.......Buffalo, N. Y., Annual Automobile Show.
March 19-23.......Boston, Mass., Annual Truck Show.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.

Race Meets, Runs, Hill Climbs, Etc.

Aug. 30-31........Elgin, Ill., Road Races, Chicago Automobile Club and Elgin Automobile Road Racing Association.
Sept. 1-2..........St. Louis, Mo., Track Races, Universal Exposition Company.
Sept. 2............Indianapolis, Ind., Speedway Meet.
Sept. 2............Winnipeg, Man., Track Meet.
Sept. 3-6..........Chicago, Ill., Commercial Vehicle Reliability Run, Chicago Motor Club.
Sept. 11-14........Buffalo, N. Y., Third Annual Reliability Tour, Automobile Club of Buffalo.
Sept. 17...........Milwaukee, Wis., Grand Prize Race.
Sept. 20...........Milwaukee, Wis., Wisconsin Challenge and Pabst Trophy Races.
Sept. 21...........Milwaukee, Wis., Vanderbilt Cup Race.
Sept. ....Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-11..........Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 12............Salem, N. H., Track Meet, Rockingham Park.

Truck Salesmanship

THE salesman capable of selling pleasure automobiles is not by virtue of his salesmanship qualifications in this field necessarily a post-graduate in the sale of motor trucks.

Selling pleasure cars calls for one fund of information; selling motor trucks presupposes an entirely different store of knowledge.

The motor-truck salesman meets the purchasing executive in his business atmosphere. When he discusses buying motor transportation he discusses a department of the business—a department which is to-day attaining greater and greater proportions in the perspective of the various departments of his business. This is so because of the greater despatch demanded by the consumer and because of the retrogression ot the horse in that his capacity for work is not so great to-day as it was 10 years ago, due to greater street congestion, greater radius of delivery and differences in street pavements.

A comprehensive knowledge of transportation is the prerequisite of the truck salesman.

To-day the neophytic salesman is often an infant groveling at the feet of the so-called transportation executive of the big business house which is in the market for motor power. True, he knows horsepower, wheelbase, load capacity, tire sizes, exaggerated speeds. estimated cost of upkeep, estimated annual capacity and a score of other estimated factors, but when it comes to talking power transportation he has often failed to lift the veil and survey the broad field of action in which the motor truck is establishing its position in to-day.

Too much effort is being expended by motor truck salesmen on truck mechanics and not enough on pure transportation. This is natural, it is the one subject the salesman would be conversant with and, since it is his rôle to lead the attack on the prospective buyer, it is his duty to select his own munitions of war and handle his campaign as he desires.

The buying executive for the large corporation is rarely a mechanical engineer, and while he may summon to conferences one or a corps of consulting engineers, these engineers are rarely qualified to adequately pass judgment on the truck design because of their general ignorance of this new field of power transportation and the many new factors it involves.

The events of the last 12 months record over a score of examples of where purchasing executives have held such conferences, in fact, series of them, and in the final act have selected the truck with the lowest price in preference to trucks that are to-day considered the best, mechanically considered, in the country. Other examples of this nature but prove conclusively that truck mechanics in a large percentage of the cases is not the keystone of the sale.

It is deplorable to record, yet it is an indisputable fact, that not a few of our biggest industrial concerns, whose judgment is impeachable in their own mercantile buying lines, have selected grossly inferior products in the truck field and have in fact done so in spite of the better judgment or the advice of consulting mechanical engineers in their employ.

Examples of this nature but prove that transportation is the subject to emphasize. Transportation is what the maker must school his selling executives in, it is the one form of attack that is most needed. It is most needed because it contains the strongest, most convincing arguments for motor trucks as compared with animal power.

Transportation is an argument on which many of the so-designated transportation executives of large business houses are amazingly ignorant. Recent researches have shown that few concerns know exactly what animal transportation costs. When pinned down in argument to actual facts and requested to show books revealing costs extending over long periods, they are unable to do so.

There has been more activity in securing horse costs within the last year than there was in the 10 previous years.

So deplorable have animal transportation systems been with many mercantile houses that they refused to have the transportation facilities incorporated in the business of the company, but organized a subsidiary company to handle the transportation and placed a shipping executive in charge. How could the purchasing executive of such a firm be expected to discuss sanely the relative cost of animal and motor power in trucks? And yet, the unschooled salesman is a mere puppet in the hands of such a transportation braggadoccio.

From over sixty leading cities in America, in which a canvass has been made, comes the almost universal response that mercantile houses have but the scantiest figures on the cost of horse transportation, and when these figures are analyzed it is generally proven that many items that should be in such calculations have been neglected. If the salesman is not master of the situation he will be forced to acknowledge figures of cost as correct which are far from being so, not due to wilful intent but to neglect and ignorance.

There must be determined standards of cost for transportation in different fields of business. A large electrical concern recently stated that it paid $42 a month for electric current to charge the battery of a small runabout used in one department of the business. A transportation expert called into conferences on the question of substituting electrics for horse vehicles immediately refuted such a claim without having once looked into the details. He was too familiar with costs to have such a statement thrust upon him for a single second. An investigation verified his judgment.

We have standards of money value, banks establish standard rates of interest. The merchant knows he has not to pay 20 per cent., as 6 per cent. may be the standard current rate, but in the transportation field these various necessary standards have not been determined and there are not a few shipping or transportation executives in business houses talking as absurdly on horse costs as the merchant who would claim to get all of the money he wanted at ½ per cent. per annum. This only accentuates the necessity for the establishment of proper standards.

Truck factories must do much to determine these standards; they must direct a country-wide campaign of collecting the necessary information needed to arrive at a determination of such standards. Each individual agent, no matter the state in which he is located, cannot do this, no more than the local bank in a Texas town can determine the money rates to the country. **Factors nation-wide enter into these problems of standards of transportation cost, and the only certain way the truck interests can insure themselves of ready response is by general co-operation through their large organizations as well as by continuous co-operation between makers and their many dealers.**

Wisconsin State Law Supreme

Attorney General Decrees That No Municipality or Community Can Make Automobile Regulations Conflicting Therewith

MILWAUKEE, WIS., Aug. 26—A decision by Attorney General Bancroft of Wisconsin that no city, village, county or other form of government lesser than the state can make any laws or ordinances fixing requirements with regard to the operation of motor vehicles which conflict with the state law, has brought dozens of cities and villages to their senses. The state law, which is declared supreme by the attorney general, fixes the speed of motor cars in cities at 15 miles per hour, and on country roads at 25 miles per hour. The object of the law is to make the speed limits uniform throughout the state. Some cities have made limits of 10 and 12 miles per hour, while Milwaukee county has passed a law making the limit on country roads 20 miles per hour. All of these ordinances are outlawed by the decision, although many city attorneys declare they will carry the cases to the highest court to determine if the state has the power to rule absolutely in such cases. La Crosse, Wis., has an ordinance fixing the speed at street intersections at 6 miles per hour. The attorney general says local requirements are taken care of the provision in the state law which requires every driver to proceed at a speed which is "reasonable and safe" at all times.

NEW ORLEANS, Aug. 24—European automobile manufacturers are securing an advantage in Latin America which is certain to cost American factories many sales. With the exception of Mexico City, Buenos Aires and Rio de Janeiro, makers of American cars have neglected active efforts in the cities which lie south of the Rio Grande. On learning that the streets of practically all of the places were paved with cobblestones for the most part, the tendency has been to postpone any idea of propagation that may have been entertained until better streets are constructed.

European manufacturers have adopted different tactics. They have secured high-class agents whose duty has been to stir up a desire for better streets rather than attempt to make immediate sales of cars.

Richmond to Have Annual Show

Automobile Association Seeks Charter With the Object of Holding Exhibitions—Atlanta's Show to Take Place Early in Fall

RICHMOND, VA., Aug. 26—The Richmond Automobile Association has petitioned the state corporation commission for a charter. The maximum capital of the new corporation will be $50,000 and will be limited to the ownership of 10 acres of land. The object of the association is to hold annual automobile shows, the first one being proposed for February of next year. There are now near on to 3,000 automobiles in use in Richmond and it is thought this number will be greatly exceeded by the time of the first show.

Officers of the Richmond Automobile Association are J. T. Anderson, president, and W. D. Wartton, secretary and treasurer. The board of directors will consist of the officers named and E. D. Hotchkiss, Jr., Barton H. Grundy and Leigh R. Page.

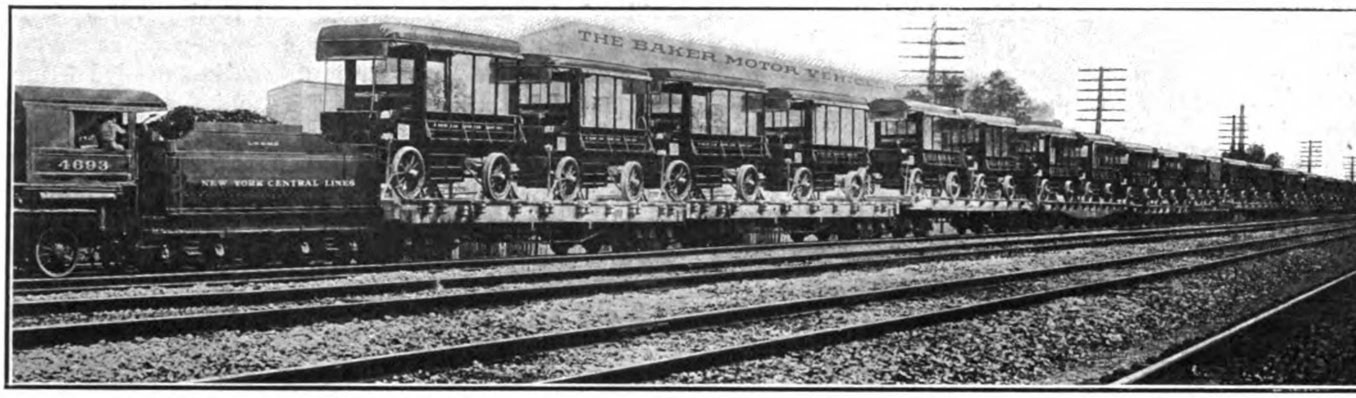
Atlanta Plans an Early Show

ATLANTA, GA., Aug. 26—Plans are going steadily forward for Atlanta's third automobile show, which is scheduled for the early fall.

Instead of having the show at the tag end of the Southern buying season, as was the case last year, this one will be given at a time when Southerners are beginning to buy cars, it will come at a time when money is easiest in Dixie and it will come before any other shows have taken the edge off the enthusiasm of prospects. The dealers in automobiles and accessories who constitute the Atlanta Automobile and Accessories, the promoter of the exhibition, are inclined to be sanguine as to the amount of business to be done as a result of the show.

Already arrangements have been made to combine with another exhibition which comes after the automobile show in the matter of decorations and in this way the automobile show will get the benefit of decorations that cost $16,000 at a price a great deal less than that.

Wylie West, acting as chairman of the show committee of the Atlanta Automobile and Accessory Association, is in general charge of the work.



Trainload of electric delivery wagons leaving the factory of the Baker Motor Vehicle Company, Cleveland, O.

TRAIN Load of Trucks—The accompanying photograph represents a recent partial shipment of Baker electric trucks to the American Express Company. When the cars now on order are shipped the American Express Company will have Baker electric trucks in service in eighteen cities as follows: New York, Chicago, Boston, Dallas, Portland, Springfield, Buffalo, Milwaukee, Lawrence, Mass., Kansas City, Memphis, Worcester, Syracuse, Rochester, St. Louis, Cleveland, Cincinnati, Los Angeles.

Hupmobile Honored at Turin—The Hupmobile was given first prize for cars of its class at the recent first International Motor Exposition held at Turin, Italy.

Trautman Is Manager—C. W. Trautman has been appointed manager of the Buffalo, N. Y., factory branch of the Detroit Electric Company.

Whitney Department Moved—W. N. Whitney & Co., Albany, N. Y., has moved its automobile department to 450 Central avenue, which salesroom and service station was formerly occupied by the United Motor Albany Company.

President MacAlman Back—President John H. MacAlman, of the Boston Automobile Dealers' Association, has just returned from a 2 months' tour of Europe, during which he visited all the large cities on the other side and inspected the various motor car factories.

Stuart Withdraws from Company—George C. Stuart, for a long time a member of the Mank-Stuart Motor Car Company, agents for the Cadillac at Portland, Me., has withdrawn from the firm and the company is now known as the Miles B. Mank Motor Car Company.

Bisons After Road Men—The Automobile Club of Buffalo, N. Y., has come out with vigorous arraignment of the New York State Highway Commission appointed by Governor Dix alleging that the abominable condition of the roads throughout the state, and particularly in Erie County, has been brought about by political favoritism and incompetency.

Motor Line in Franklin Park—James F. Shea, recently appointed superintendent of the Boston park system, started a motor bus line through Franklin Park, one of the biggest parks in the country, last Saturday, his aim being to make the place more popular. The cars start from Blue Hill avenue and over 2 miles at a leisurely gait, being driven by chauffeurs in the employ of the city.

Field Day for Chalmers Men—The first field day of the employees of the Whitten-Gilmore Company, of Boston, Mass., agents for the Chalmers line, took place last Saturday, when special cars conveyed the men and their friends to Glen Echo Park, Stoughton. A number of athletic events were run off and the day ended with a dinner at which E. A. Gilmore and Charles E. Whitten were the honored guests.

Large Registration in Minneapolis—The city assessor of Minneapolis has listed 4,724 automobiles in 1912, as compared with 3,044 in 1911. The valuations are $2,296,900 and $1,721,655. The value of the additional machines, 1,700 in all, is given at $571,000. This is on a 50 per cent. basis. The fourth ward, containing some of the best families, reports 1,848 machines, and the eighth, similarly blessed, reports 1,017 cars.

Burlington Wants More Time—The aldermen of Burlington, Vt., are considering a plan to put into force traffic regulations for the business section of the city to apply to all vehicles because of the increase in the motor traffic. Some of the regulations seemed to be too drastic, one in particular providing for a 4-mile limit while passing along by street cars. The matter has gone over for further investigation.

Danger in Mexico—Rebel activities close to towns in the Federal District and close to the limits of the City of Mexico are causing a falling off in motor car touring in this section. The dead bodies of a chauffeur and another occupant of an automobile were found lying upon the highway near a suburban town recently, and it is supposed they were killed by Zapatistas, as the rebels under Emiliano Zapata are called. It is even considered dangerous to make the trip to and from the Country Club at night.

Automobiles Excluded at Isleboro—As a result of Capt. F. C. Pendleton, of Brooklyn, N. Y., driving his automobile through the roads of Isleboro, Me., that had been shut to motor traffic on the grounds of an unwritten law the residents of that town called a special town meeting and by a vote of 58 to 7 directed the selectmen to take steps to exclude automobiles from the island kingdom. The selectmen are in a quandary for they do not know whether or not they have the authority to exclude motor vehicles from the town limits. If they find they cannot do so a bill will be sent to the next legislature asking for such authority.

Studebaker's Atlanta Building—The Studebaker Corporation, Atlanta, Ga., has arranged for a four-story fireproof building at Peachtree and Harris streets for its store in that city.

Toledo to Frisco in 19 Days—Richard Sheldon, a Toledo, O., automobile enthusiast, drove his new Chalmers Six into San Francisco, Cal., recently, after 19 days of actual running time.

Licenses Fatten Ohio Treasury—State Treasurer Creamer, of Ohio, credits the automobile department of the state with having brought into the state treasury $33,874.59 during the months of June and July.

Two Trucks for Toledo—Service Director Cowell has been authorized by Council to expend $9,000 for two 5-ton trucks to be used by the street department in hauling garbage from the collecting stations to the reduction plant.

Horses Scarce in Manitowoc—The assessment list of Manitowoc, Wis., gives but 549 horses for 1912, as compared with 721 in 1911. The number of motor cars owned in the city in 1912 is 152, as compared with 75 a year ago.

Williams With Locomobile—L. W. Williams, for some time connected with the advertising department of the Locomobile Company, Bridgeport, Conn., has recently entered the truck sales department of the same company.

Wilson Eastern Sales Manager—George D. Wilson, sales manager of the Warren Motor Car Company, has resigned to take charge of the sales of the Warren car for several eastern states with headquarters in New York City.

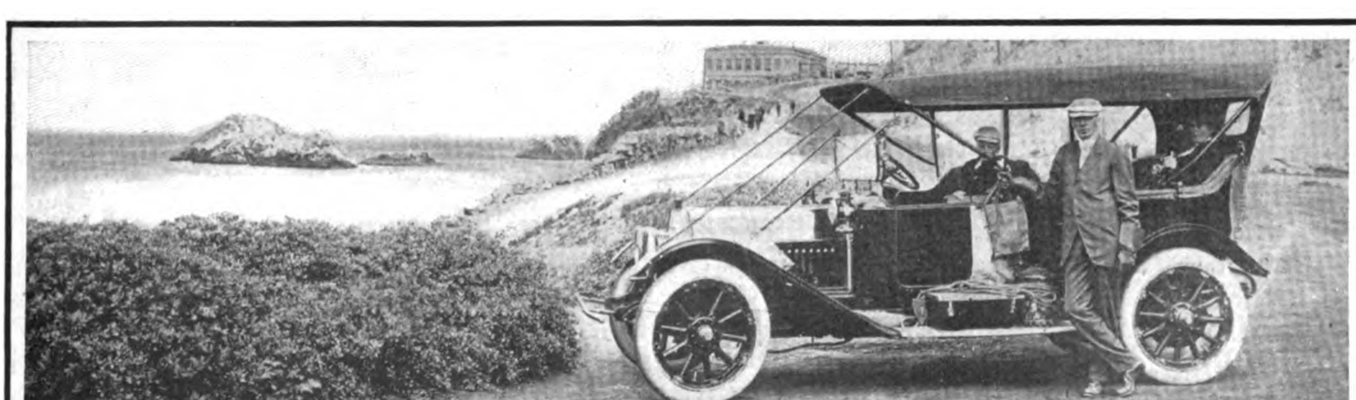
White Truck Takes Prize—A White 3-ton truck took the silver loving cup at the Long Branch Business Men's parade, Long Branch, N. J. The prize was offered on the basis of appearance, quietness of engine and lowest cost of upkeep.

Dennis Company's Toledo Quarters—The Dennis Motor Company, Toledo, O., agents in Ohio and southeastern Michigan for the Alco, Cino, Rambler and Detroit electric cars, have moved into their new quarters at Madison avenue and Fifteenth street.

Abolishing Water Bars—D. T. Bates, supervisor of highways for Bennington County, Vt., has declared war on the old-fashioned water bars and he has already wiped out more than sixty on the road between Pownal and the Rutland county line. There are 103 others remaining and these will be removed speedily.

Weeks' Permit for Canada—The custom service in Canada has inaugurated a new system of permits which adds greatly to the pleasure in taking Canadian tours in automobiles. With the present arrangement it is possible to get a 7-day permit to drive a car, licensed in the United States, through Canada. This permit is secured from the custom official at the point of entry.

Motorists' Mecca, Atlantic City—Motorists' Mecca is what Atlantic City, N. J., may be called during the week of September 30 to October 5. In the holding of the American Road Congress, the American Automobile Association is co-operating with the American Association for Highway Improvement, while the National Association of Road Material and Machinery Manufacturers will conduct a most comprehensive exhibit on the big pier.



The new Chalmers Six in which Richard Sheldon and family, of Toledo, O., crossed the continent. Seal Rocks in the background

New salesroom and garage of the Chicago Lozier branch

New Road for State Fair—Owners of automobiles will find a new road and free parking space at the state fair, Detroit, Mich., September 16 to 21.

Seely School's New Quarters—The Seely Automobile Sales and Training School has moved into its new quarters in the Ireland Building, South Bend, Ind.

Jiffy Company's Detroit Office—The Jiffy Automobile Curtain Company has opened a general sales office in Detroit with headquarters at 527-528 Ford Building.

Angier Joins Pope Forces—Irving O. Angier has joined the sales forces of the Pope Manufacturing Company, Hartford, Conn., as traveling salesman and will cover the Southern States.

Davidson Goes to Detroit—M. D. Davidson, formerly with the Boston branch of the Oldsmobile and also the R-C.H salesforce in the Hub, has gone to Detroit to accept a position as district sales manager with the R-C-H company.

Keyless Lock Company's Factory—A two-story, fireproof factory building, in which will be manufactured brass and aluminum motor car castings, is being erected in Indianapolis, Ind., by the Keyless Lock Company. It will cost about $75,000.

Pennsylvania Issues 55,000—The Automobile License Bureau of the State Highway Department, Pennsylvania, has issued 55,000 licenses to date, and applications are coming in every day.

Brevard Joins Zenith Company—Proctor Brevard, experimental engineer of the Hudson Motor Car Company, has resigned and joined forces with the Zenith Carburetor Company, Detroit, Mich.

Milwaukee's Orphans' Day Outing—The sixth annual orphans' outing of the Milwaukee Automobile Club, Milwaukee, Wis., was held on August 28. William H. Pipkorn, manager of the first five outings, was again in charge.

New Kalamazoo Company Formed—A new company has been formed in Kalamazoo, Mich., under the name of the National Compression Mixer and Primer Company, to manufacture a device which will eliminate the waste gasoline in automobile engines.

Wolverine Club's Elections—Bert Miller has been elected to the board of directors of the Wolverine Automobile Club, Detroit, Mich., in place of Charles Gilmour, who recently resigned. W. G. Bryant, the club's attorney, has been elected vice-president.

Ware Company Building Factory—The Ware Motor Vehicle Company, St. Paul, Minn., is building a concrete factory at Raymond and University avenues in that city. The company is building a four-wheel drive car in four models: 1,500 to 2,000 pounds, 1 1-2-ton, 2-ton and 3-ton types. The Model gas engine is incorporated in the machine and Wilcox-Bennett carbureter.

Oldsmobile Has Moved—The Boston, Mass., branch of the Oldsmobile Company has moved into the new building erected for it on Commonwealth avenue and now just as soon as renovations can be made in the old quarters on Massachusetts avenue and Newbury street the Boston branch of the Buick will be moved there from the Motor Mart.

Changes in Packard Staff—Russell Huff has been made consulting engineer; J. G. Vincent, chief engineer; G. R. Bury, manager motor carriage sales department; G. S. Loomis, manager specifications department; C. R. Norton, manager of truck sales, and C. E. Morton, assistant in the truck sales department of the Packard Motor Car Company, Detroit, Mich.

Campbell Continues Good Work—Secretary Chester I. Campbell, of the Boston, Mass., Automobile Dealers' Association, who recently took 3,000 orphan, blind and crippled children on an outing, gave another outing to the inmates of the almshouse and home for aged couples of Wollaston and Quincy, taking about 50 on a trip to Sharon, where they all had a delightful day.

Reorganize Berkshire Motors Company—A meeting of the stockholders of the Berkshire Motor Company was held in Boston a few days ago for the purpose of reorganizing the concern. The Pittsfield Electric Company recently placed an attachment for $2,500 upon the stock of the company and this brought about the plan to reorganize because of the effect upon the company's credit.

Dallas Joins Anti-Noise Cities—The decision of the Dallas city government to permit the use of all adequate automobile warning signals and to restrict the use of all signals to an abrupt short sound means that Dallas will hereafter take rank with Chicago, St. Louis and all other cities in that regard. The City Commission merely passed an ordinance making it a violation of the law to make unnecessary noises.

Automobile Incorporations

AUTOMOBILES AND PARTS

BRANTFORD, ONT.—Keeton Motors, Ltd.; capital, 200,000; to manufacture automobiles. Incorporators: Forrest M. Keeton, William G. Houck, William J. Verity.

CAMBRIDGE, MASS.—Blake Automobile Company; capital, $100,000; to deal in automobile business. Incorporators: E. C. Blake, L. E. Gibson.

COLUMBIA, S. C.—Lyon Motor Car Company; capital, $50,000; to manufacture automobiles. Incorporators: E. B. Lyon, J. M. Black, J. E. Johnson.

CORTLAND, N. Y.—Brockway Motor Truck Company; capital, $100,000; to manufacture motor trucks. Incorporators: George A. Brockway, Charles S. Pomeroy and Frederick R. Thompson.

DETROIT, MICH.—Standard Motor Truck Company; capital, $50,000; to manufacture motor trucks. Incorporators: Howard Wilcox, W. K. Ackerman.

INDIANAPOLIS, IND.—Mais Motor Truck Company; capital, $1,000,000; to manufacture motor trucks. Incorporators: Frank H. Wheeler, Walter M. Pearce, S. Lockard, William H. Brown, Jacob V. Stimson, Henry G. Francis.

JAMESBURG, N. J.—Ex-Cel Motor Trust Company; capital, $250,000; to manufacture automobiles. Incorporators: T. C. Corwin, A. Englehardt, A. A. Kelley.

LA CROSSE, WIS.—General Motor Car Company; capital, $10,000; to deal in motor cars and commercial cars. Incorporators: Joseph P. Krett, Louis L. Fox, Henry F. Fox.

LAWRENCE, PA.—Lawrence Automobile Company; capital, $40,000; to deal in automobiles. Incorporators: L. C. John, Earl M. Kyle, J. P. Gill, J. P. Cope, C. A. Brookover, George Greer, R. M. Jamison, T. F. Moorehead.

MANSFIELD, O.—Eagle & Vincent Automobile Company; capital, $15,000; to manufacture automobiles. Incorporator: C. H. Engle.

NEW YORK CITY, N. Y.—Curran Patent Company, Manhattan; capital, $10,000; to manufacture motors. Incorporators: Harry L. Curran, Charles H. Wilson.

NEW YORK CITY, N. Y.—Harman-Yount Company; capital, $10,500; automobiles, etc. Incorporators: Daniel H. Hanckel, Frederick B. Hunt, Helen M. Kelly.

NEW YORK CITY, N. Y.—Henderson Eastern Motors Company; capital, $20,000; to manufacture automobiles. Incorporators: Harry Harris, E. Knight Harris, Leopold Friedman.

NEW YORK CITY, N. Y.—George Leveene Company; capital, $5,000; to deal in automobiles, etc. Incorporators: George Leveene, John L. Meyer, Charles E. Lauten.

OWENSBORO, KY.—Ames Motor Company; capital, $100,000; to manufacture automobiles.

New Lee Tire Agency—The Kelly-Field Company, Philadelphia, Pa., are sales agents for Lee tires.

Start-Lite Jackson Equipment—The Jackson Automobile Company, Jackson, Mich., has adopted the Start-Lite Junior lighters for 1913 standard equipment.

Barnard's Grand Rapids Branch—Augustus H. Barnard, sales manager for the Grand Rapids Motor Truck Company, has established a branch in Minneapolis.

La Vigne in Detroit—The La Vigne Gear Company, originally of Detroit, Mich., is about to leave Milwaukee, Mich., its present quarters, to return again to Detroit.

Ford Shipment Largest Made—The largest shipment of automobiles ever made has just left Detroit, Mich., for Kansas City, Mo. In the shipment were 630 complete Ford cars.

Roberts Is Transferred—C. L. Roberts, of the New York City branch of the Marquette Company, has been transferred to the Oakland division of the General Motors Company.

Dutch Rubber Company Incorporated—The Dutch Rubber Company, Akron, O., was recently incorporated with a capitalization of $1,250,000 to manufacture and sell rubber articles.

Oakland's 1913 Plans—The Oakland Motor Car Company of Pontiac, Mich., will turn out 11,500 cars for 1913. For the coming year a six-cylinder model and also a car at $1,075 have been added.

Denver-Salt Lake Record—Frank Botterill, of Salt Lake City, Utah, and E. M. Grady, of Denver, Col., made the trip from Denver to Salt Lake City in two days, excelling any attempt heretofore by at least 2 miles to one.

Moore with Gramm-Bernstein—W. H. Moore has resigned from the Gramm Company, Lima, O., to take a position as manager of the sales department of the Gramm-Bernstein Company, truck manufacturers, Lima, O.

Overland's Buffalo Building—The Willys-Overland Companl, Toledo, O., has purchased land at Main and St. Paul streets for the construction of a three-story building to be used as a salesroom for the Buffalo branch of that company.

Automobile Incorporations

San Antonio, Tex.—Guarantee Motor Car Company; capital, $10,000; to engage in the automobile business. Incorporators: J. F. Hagan, H. J. Smith, C. W. Voss.

GARAGES AND ACCESSORIES

Baldwin, L. I., N. Y.—Acme Automobile Rental Company; capital, $5,000; to carry on a renting business. Incorporators: George Wintjen, Adam Meiselbach, Allen C. Ewing.

Buffalo, N. Y.—Buffalo-Akron Transit Company; capital, $2,000; to engage in automobile bus line, etc. Incorporators: William H. Pensyres, Gilbert Kunz, Fred Christiansen.

Cleveland, O.—Mutual Oil & Automobile Supply Company; capital, $10,000; to deal in supplies. Incorporators: M. L. Steuer and others.

Columbus, O.—Southern Taxicab Company; capital, $10,000; to engage in the taxicab business. Incorporators: James J. Keating and others.

Hempstead, N. Y.—Smith's Garage; capital, $2,000. Incorporators: Lawrence Schultz. Joseph Pensock, Ray McCombs.

Indianapolis, Ind.—Koogle Automobile Company; capital, $10,000; to conduct a repair business and also to sell tires and tops. Incorporators: I. G. Koogle, O. P. Kline, L. D. Buenting.

Macon, Ga.—Wade Garage Company; capital, $12,000; to carry on a garage business. Incorporators: Phelps Wade, Edward T. Wadley, M. E. Richardson.

New York City, N. Y.—Reliance Taxicab Company; capital, $500,000; to conduct a taxicab business. Incorporators: Nicholas F. Yeagle, Elizabeth Yeagle, Katherine Lally.

New York City, N. Y.—Fox-Hegyi Company; capital, $6,000; to paint and repair automobiles. Incorporators: Otto Hegyi, Ida Hegyi.

Toledo, O.—Walker Tire Chain Company; capital, $150,000; to manufacture a patented anti-skid automobile and truck chain. Incotporators: H. F. Rohrman, Hugh Williams, Maurice A. Carter, Charles E. Newman.

Youngstown, O.—Folberth Carbureter Company; capital, $70,000; to manufacture a carbureter. Incorporators: E. A. Hegg, J. F. Williams, Thomas L. Morgan.

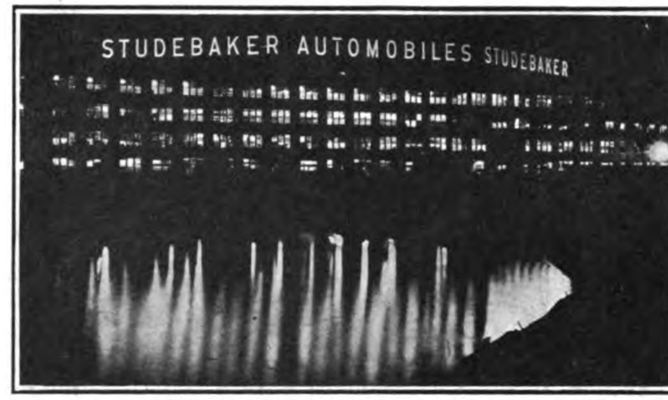
CHANGES OF CAPITAL

Dayton, O.—Nation Automobile Company changed its name to Majestic Motor Car Company.

Detroit, Mich.—Ignition Starter Company; increase of capital to $500,000.

Cleveland, O.—South End Garage Company; increase from $500,000 to $1,000,000.

Pittsburgh, Pa.—Penn Motor Car Company; increase from $5,000 to $141,950.



Detroit plant of Studebaker Company and electric sign

Stowe Elected Vice-President—George H. Stowe became a stockholder and was elected vice-president in charge of the sales at the annual meeting of the stockholders of Carl H. Page Company, New York City dealers in Chalmers cars.

Auction Sale Accessory Company—On Wednesday, September 4, 1912, at 2 o'clock p. m., at 1516 Grand avenue, Kansas City, Mo., there will be a bankrupt auction sale of the entire stock of automobile accessories of the Auto Specialty Company.

Automobile Displaces Horse—An old horse drawn stage that has been in service for nearly 50 years between New Albany and Corydon, Ind., has been displaced by an eight passenger motor car bus. The motor car is making two round trips daily.

Encouraging Michigan Writers—Michigan is laying plans to have her boys wrest literary honors from Indiana, the State Fair Association having set a premium on literary effort in the awarding of an R-C-H car to the boy who shows best in essay writing.

Charges Against Gasoline Dealers—Attorney G. A. Will, of the Automobile Club of Minneapolis, Minn., has complained to the state oil inspection department that some dealers are delivering a lower test gasoline than automobilists are paying for. Samples have been taken from supply houses to investigate the charge.

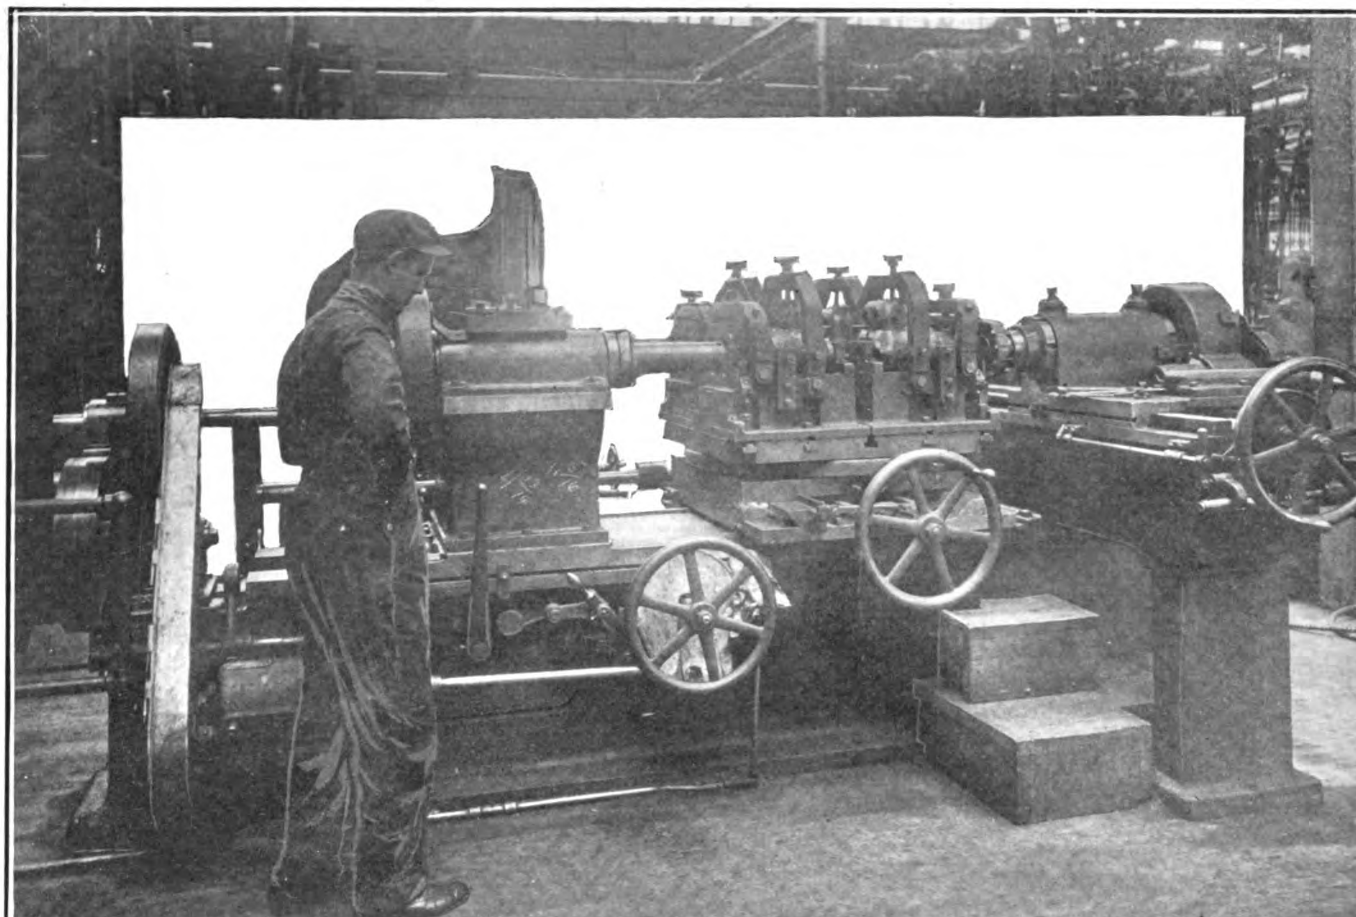
Book on Record Run—A booklet on the record run of the Wolverine-Detroit commercial car in the Wolverine Automobile Club run from Detroit, Mich., to Indianapolis, Ind., and back has just been issued. A brief account of the run is given, together with interesting illustrations depicting the rough roads encountered.

Studebaker Has Immense Sign—What is claimed to be the largest electric sign in the world has been installed by the Studebaker Corporation on its Detroit factory, which is plant No. 5 of the company's chain of works. The sign, which is illustrated herewith, contains, according to the Studebaker company, more than 2,000 electric bulbs which make it visible for a very considerable distance.

State Road Contractors Warned—C. Gordon Reel, State Superintendent of Highways of New York, has notified the Touring Club of America that state road contractors have been instructed not to leave tarred stone roadbeds unprotected by a top dressing between the close of work on Saturdays and the beginning of work on Mondays, a period during which motor traffic is generally the heaviest.

Starter Company Adds Plant—To manufacture the Disco electric lighting, starting and ignition equipment, the Ignition Starter Company, Detroit, Mich., has taken over the plant of the Gray Motor Company, giving the Ignition Starter Company 20,000 square feet of additional floorspace. The increase in the capital stock to $500,000 has been based on the increased value of assets of the company and for putting new capital into the business for further developments.

Factory Miscellany



Showing the machine used for boring out cylinders in the factory of the Lozier Motor Company, Detroit, Mich.

This is a view of the big Beaman & Smith milling and boring machine used in the factory of the Lozier Motor Company, Detroit, Mich. The complete machine which is shown in operation is capable of simultaneously finishing eight cylinders which are cast in pairs. While four of the cylinders are being bored out the other four are in the milling part of the machine. The milling part of the device is shown in the foreground, while the boring cutter is located in the rear of the machine away from the operator. As the machine is shown it is working to its capacity, that is to say, there are four of the cylinders in the miller and four in the boring part of the instrument. By mounting the cylinders on the turntable in the manner indicated they can be readily swung from the boring cutter to the miller. It requires 30 minutes to mill and bore a set of cylinders while the size to which they are bored is regulated entirely by the diameter of the cutter which can be changed at will.

TIMKEN'S Factory Nearly Completed—The new four story addition to the Timken-Detroit axle plant is rapidly approaching completion. It is 150 feet long and 75 feet wide. The shipping department will occupy the ground floor, while the other three will be devoted to manufacturing purposes.

Luverne's Six-Cylinder Car—The Luverne Automobile Company, Luverne, Minn., announces the addition to its line of a 50-horsepower, 6-cylinder Luverne touring car.

Moves to New Bedford—The William A. Carroll Company, of Merrimac, Mass., which manufactures carriages, automobile bodies and other vehicles, is to move shortly to New Bedford, Mass., where a new factory has been built for the company.

Timken Adds Modern Shop—The Timken Roller Bearing Company is adding to its Canton, O., plant the most modern grinding shop in the world. Dimensions of the newcomer to the factory group are 64 by 240 feet. The building will be ready for occupancy November 1.

Mutilate California Road Signs—The Automobile Club of Southern California is giving serious attention to discouraging the practice of shooting up or otherwise multilating the road signs which have been found so convenient to tourists and which have been erected at much expense.

Put on Night-Shifts—The American-La France Fire Engine Company, Elmira, N. Y., has been forced to put on night-shifts to care for the business that is being received from every section of the United States. Since July 1 four complete motor-propelled fire-fighting trucks have been shipped from the local factory every week and at least one new order for a fire truck is being received daily.

Kalamazoo's Axle Company Remains—The automobile axle department of the Lee & Porter Manufacturing Company will remain in Buchanan, Mich. The deal by which this department was to have been taken over by a Kalamazoo company and removed to Kalamazoo has fallen through. The Lee & Porter company is considering the manufacture of automobile bodies as an addition to its present product.

Firestone's Office Building—The contract for the erection of a one-story office building for the Firestone Tire & Rubber Company, Akron, Ohio, has been awarded to Morrison & Errickson, of Akron.

Jones Speedometer Adds Factory—The Jones Speedometer, New Rochelle, N. Y., has facilitated its shipments by adding a factory, much larger than its plant at New Rochelle, at Bush Terminal, Brooklyn, N. Y.

Takes Big Contract—The Columbus Buggy Company, of Columbus, Ohio, has entered into a contract with Tyler Bros., of Boston, Mass., to furnish that concern with 100 Columbus-electric cars for distribution in New England.

Hess-Bright Moves Office—The Hess-Bright Manufacturing Company, Philadelphia, Pa., moved its office July 5 from Twenty-first street and Fairmount avenue, Philadelphia, to its new factory at Front street and Erie avenue, of that city.

Newspaper Men Visit Factories—Newspaper men have been flocking to Detroit, Mich., during the past few weeks on a tour of inspection of her automobile factories. Up to the middle of August scores of reporters, automobile department editors, advertising representatives and even newspaper proprietors had called at the several factories.

Michigan Buggy Enlarges Factory.—The Michigan Buggy Company, Kalamazoo, Mich., has found it necessary to enlarge its factory and ground has been broken for a 50,000-foot addition. This annex will directly adjoin the main factory building on the north side. The basement of the new building will be an addition to the service department of the company, which is said to be conducted on a modern and efficiency basis.

Ford's Walkerville Factory Addition—The Ford Motor Company, of Canada, has let contracts for an addition to the plant at Walkerville, the new addition being 75 by 505 feet. It will be four stories high, of concrete, and will be an extension of the present building. The total floor area will be about 300,000 square feet. It is the intention of the company, next year, to build all its parts in Canada. In subsequent seasons, however, they will have a strictly made-in-Canada car.

Tent Used by Henderson—Having started shipments for 1913 cars, and being crowded for room to manufacture its cars, the Henderson Motor Car Company, Indianapolis, Ind., has erected a huge tent in the factory yard to facilitate matters. The big white top has a diameter of 80 feet. Until the new addition to the factory is ready for occupancy, September 15, the overflow from the first assembly will be housed under the canvas. The tent, which was raised recently, has a capacity of over 30 cars. and will relieve much of the congestion in the factory.

Haynes Installs Fire Protection—A complete fire-protection system has been installed in the Kokomo, Ind., factory of the Haynes Automobile Company. It consists of an extensive sprinkler net extending throughout the plant, the water being supplied from a 75-foot water tower which contains at all times 50,000 gallons of water which is fed to the sprinklers by gravity. In addition to this a large electric pump is being installed which will be capable of supplying water to a number of points in the plant. Furthermore, hydrants communicating with the municipal fire department are scattered throughout the building.

Berlin's New Rubber Factory—The property owners of Berlin, Ont., carried a by-law granting a bonus of $25,000 to the Canadian Consolidated Rubber Company, for the purchase of 15 acres on which to erect an automobile tire factory. The company, which has already extensive interests in Berlin, receives the $25,000 and a fixed assessment for ten years for that amount, after it has expended a quarter of a million dollars in buildings and equipment. The company agrees to employ 100 skilled workmen the first year, 200 the second and 500 in five years. The building operations are to commence immediately.

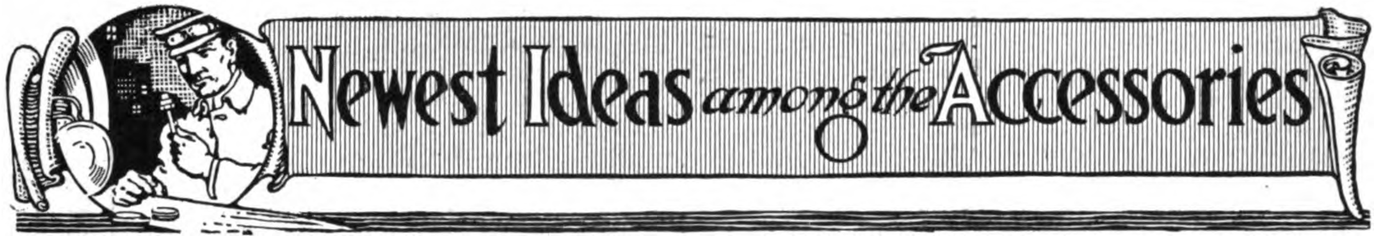
To Double Its Facilities—The Milwaukee Auto Specialty Company, Milwaukee, Wis., manufacturing Radium batteries, ignition devices, tire irons, bumpers and other motor car accessories and specialties, has started work on the erection of a new building, to occupy the entire corner of Seventh and Chestnut streets, adjoining its present works. The building will cost $25,000 equipped. The company recently purchased the former Zwietusch soda fountain factory at Seventh and Chestnut streets, including adjoining acreage, and the growth of the business has made necessary the doubling of its manufacturing facilities.

Krit Constructs Testing Track—The Krit Motor Car Company, Detroit, Mich., has installed a novel test track on a piece of vacant property adjacent to its factory on Grand Boulevard. The company believes that by constructing this track it has eliminated the chances for accident, which are not small when testers drive their cars through the streets of the city. The track has been constructed to give the cars all road conditions in their try-outs. There is a smooth, level stretch for speeding, a rough place and a section of sand, so that the tester can determine the performance of the car on each of these types of road.

Newmastic Man to Make Rims—The Newmastic Tire Company, of New York City, has increased its working capital from $150,000 to $250,000, and besides enlarging its business in the line of tire filling, it will soon take up the manufacture of an entirely novel type of demountable rim, invented by O. A. Parker, a member of the company. This new rim will supplement the virtues of the filled casing and permit of adjusting the pressure in the tire filler in proportion to the load placed thereon. The method by means of which this end will be accomplished is the use of a locking ring which compresses the bead of the casing; this locking ring engages the rim in the manner of a nut wedging on to a bolt, so that the operative width of the rim may be decreased at will of the driver.

Hyatt Jersey Plant Busy—The Newark, N. J., plant of the Hyatt Roller Bearing Company is working to its full manufacturing capacity. Bearings and all their parts, as well as a large number of the machine tools required for their making, are produced and thoroughly tested at this factory. The Jersey plant of the company comprises half a dozen buildings, in which all equipment is directly driven by electric motors having a total of 1,000 horsepower, 500 of which are made in a gas producer, while six 200-horsepower steam boilers provide the remainder of the power which is generated in steam engines which drive electric dynamos. While the executive departments of the company are located at Detroit, Mich., the Newark plant has also a complete engineering staff which attends to all requirements and needs brought up by the production and sales departments.

Timken-Detroit Axle Company's new plant, now under construction



Pitless Turntable—Rattleproof License Plate Holder—Complete Tourists' Luggage—Roller Bearing Interchangeable With Ball Types—New Tire Tool—Remy Distributer of Bakelite—Portable Steel Garage

Pitless Automobile Turntable

THE Pitless Autó Turntable Company, 1316 West Ninth street, Kansas City, Mo., manufactures a turntable, Figs. 1 and 6, which may be installed in any garage or salesroom, as it requires no pit. The turntable consists of a circular frame which is braced by six diametrical stayrods; the frame has a smoothly ground surface and serves as a running track for eight casters on which the automobile to be turned is supported. This rests directly upon two parallel runways of a strong steel, which are 15 feet wide and 3 inches above the floor, being directly carried by four ball-bearing casters or rollers each. These rollers are connected by hangers to the runways and one of the rollers is equipped with a foot-brake shoe which, when applied to the periphery of the roller, holds it securely in position on the circular track. Another ball bearing, which is of the thrust type, supports the central portion of the turntable, where the stayrods intersect and are strengthened by a king bolt. Thus the track is the only portion resting directly upon the floor. The manufacturer supplies the turntable in any one of four sizes, which are designed for the operation of automobiles having wheelbases up to 90, 116, 124 and 145 inches. The tread range of the first type is from 46 to 56 inches and of the others from 50 to 60 inches, the runways being sufficiently wide to permit of tire changes being made on them. The turntable ranges in weight, for the various sizes, from 1000 to 1500 pounds and is shipped by the factory crated so that it may be readily installed at its destination by the owner.

Michigan Number Plate Holder

The latest type of license plate holder, made by the Michigan Sign Holder Company, 231 North Ionia avenue, Grand Rapids, Mich., is shown in Fig. 2. This license plate holder is made of strong sheet steel, 6 by 4 inches and may be attached to any portion of the radiator, bottom, top or face, by means of nuts and bolts inserted through the holes in the holder. The mechanism by means of which the license plate is held in place consists of three prongs the ends of which are bent over toward the front in U-style. Two of these prongs overlap the bottom edge of the plate, while one is in position near the middle of its top portion; the two prongs are slidable in tracks extending from bottom to top of the plate, and each may be locked in any position, independently of the other, by means of a screw. The upper, central prong is attached by a spring to the bottom portion of the holder and is also slidable in a track. In installing the plate in the holder, the two bottom prongs are positioned flush with the lower edge of the holder, the lower edge of the number plate is placed in their U-ends and the upper prong is drawn up until it snaps over the upper edge of the license plate and holds it securely in place. It is evident that the use of this holder obviates all rattling of the plate; another advantage is that the number plate may be easily and quickly exchanged without necessitating a change of the position of the plate holder or the removal of the same.

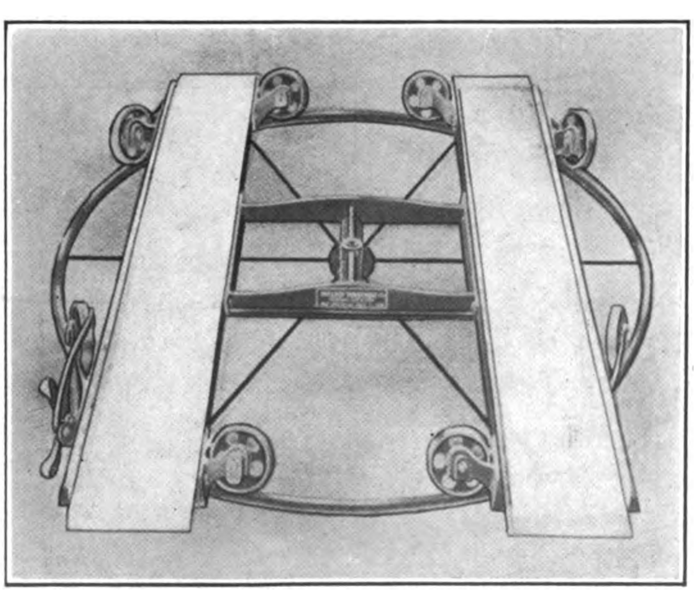


Fig. 1—Pitless automobile turntable for garages

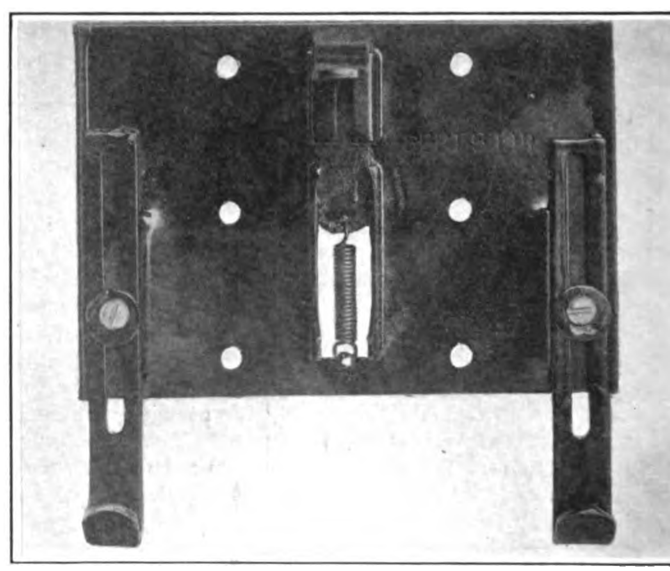

Fig. 2—Michigan automobile license plate holder

Moore-Packard Luggage Outfit

A touring luggage equipment comprising twelve pieces has been designed by C. J. Moore, of the Packard Motor Car Company, Detroit, Mich., which is specially adapted for the requirements of automobilists traveling in Packard cars. The equipment, Fig. 3, is very complete and designed to take care of whatever raiment and commodities are carried by such tourists, every piece being waterproof and having a special place on the automobile. It comprises two trunks which are carried on the trunk rack, together with a suitcase attached directly below them, two suitcases carried on the left running board, a tire trunk on the right running board, a lunch kit on the left front fender and two suitcases above it, an ice box on the right front fender and a hat box above it and two suitcases which are carried inside the tonneau and directly under the robe rail.

The trunks are fitted with trays, the suitcases with dividing boards, and the ice box with two trays, one being intended for ice and the other for eatables. Sufficient ice may be carried to last for ten hours, even in summer. Complete lunch equipment for seven persons is contained in the lunch box.

Standard Interchangeable Bearing

Interchangeability with ball bearings of the same size is the feature of the latest type of annular roller bearing made by the Standard Roller Bearing Company, Fiftieth street and Lancaster avenue, Philadelphia, Pa. The same system of numbering as in ball bearings is used in this roller type which is claimed to have twice the carrying capacity and life of a ball design of the same size. The rollers are spaced in a retainer and have grooves which are engaged by annular projections on the races, whereby side movement of the former is prevented.

Nelson Never-Sware Tire Tool

The Miller Brothers Auto Supply House, 1105 Fourteenth street N. W., Washington, D. C., sells a small and handy tire tool, the Nelson, Fig. 5. It consists of a bar of iron bent at an obtuse angle to give two levers of different lengths, the shorter one of which is again bent in a right angle. Near the obtuse angle a ratchet lever is attached to the short arm along which it may be moved and be locked in any relative position thereto. Between this ratchet lever and the right-angled end of the short lever a hook is slidably arranged on the lever. If the hook whose end is designed to rest on a spoke is in this position near the felloe, it provides a pivot around which the right-angled end of the tool may be forced against the tire bead, holding it away from the rim and permitting of removing the locking rings, while the tool may be held in position by the proper adjustment of the ratchet lever.

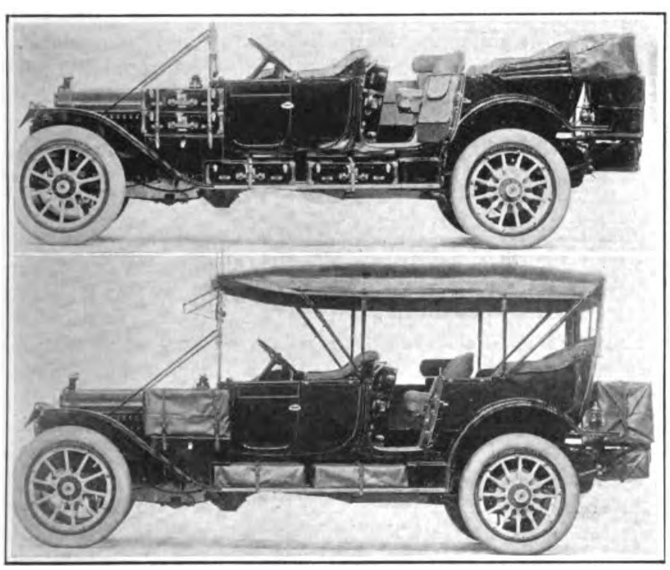

Fig. 3—Moore luggage equipment on Packard touring car

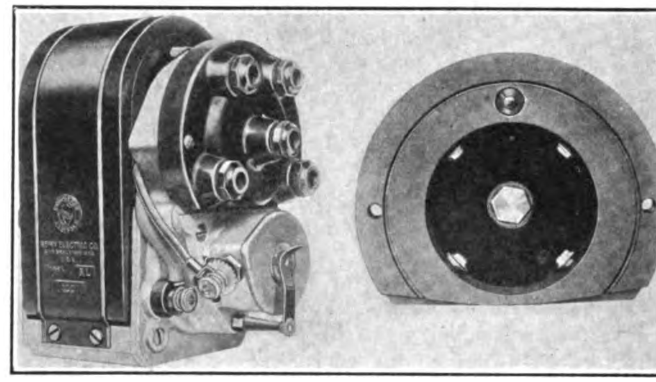

Fig. 4—Remy magneto with latest type of distributer

Remy Bakelite Distributer

Bakelite, an insulator material of recent origin, is used in the latest design of Remy magneto distributer, Fig. 4, constituting the main new feature thereof. The design of the distributer is not unlike former types but its size is larger than before, as may be seen in the view showing the distributer in place on the magneto. The principal new feature of design is the shape and location of the binding posts of the distributer. While the distributer formerly used on Remy magnetos had long posts which were vertically positioned on the top portion of the device, the latest type has short, converging addenda protruding from the front of the distributer casing.

Garry Portable Fireproof Garage

The portable fireproof garage made by the Garry Iron & Steel Company, Niles, O., may be furnished in any of three sizes, 12 by 16 feet, 14 by 18 feet or 16 by 20 feet, which weigh 1400, 1570 and 1825 pounds, respectively. The frame is of pressed-steel beams which are easily assembled and between which the wall sections of corrugated galvanized steel are installed. A gable roof covers the structure which has two double entrance doors, each of which is 4 feet wide and 8 feet high, and is provided with a padlock hasp. Each building has three fireproof windows.

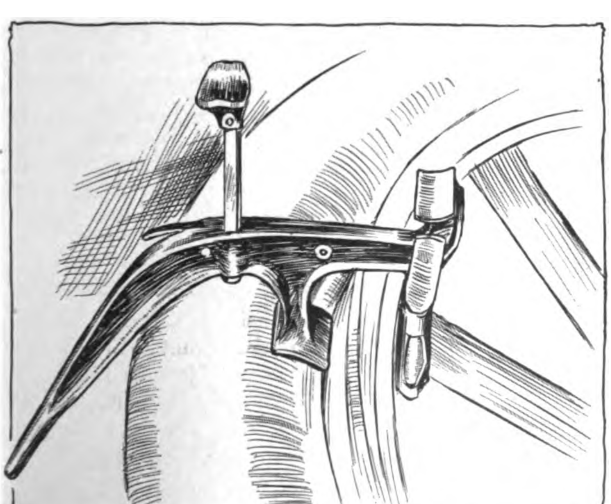

Fig. 5—Nelson Never-Sware tire tool

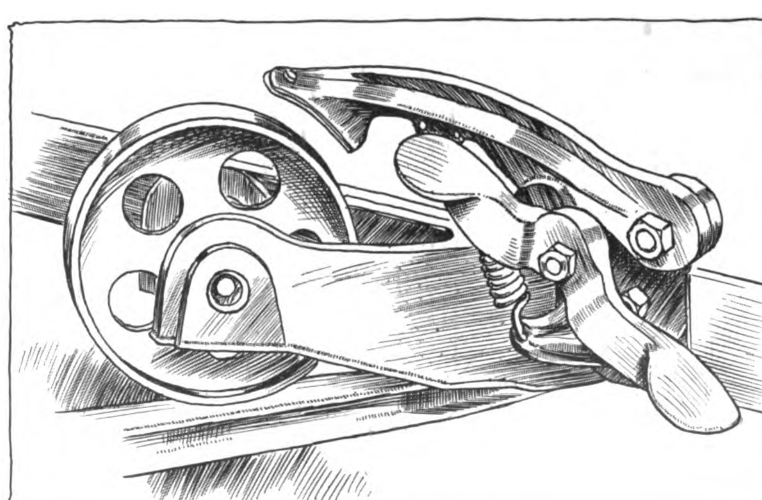

Fig. 6—Ball-bearing roller and brake shoe of Pitless turntable

AUTOMOBILE Lamp and Dimmer—Comprising two semicircular plates attached to the burner for dimming the light.

This patent refers to the construction shown in Fig. 1 in which a dimmer is illustrated, comprising two substantially semicircular plates which overlap each other. These plates are supported by vertical shafts held in bearings of clamps which are secured to the burner. The clamping members carry means for rocking the shafts and thereby altering the relation of the dimming plates to the burner.

No. 1,034,536—to Francis H. Tobias, New York City. Granted August 6, 1912; filed October 23, 1911.

Spark-Plug Construction—Containing two electrodes in an insulator core, which are both connected to the original source of current.

This patent relates to a spark-plug as the one in Fig. 2, which consists of a core C of insulating material which in one place is shaped with an annular-expanding flange F. Above this flange a metal ring R and a bushing B surround the casing, the bushing being threaded externally. These threads engage the internal ones on the shell ring Q, which also has an external thread to fit into the motor cylinder head. Two electrodes E and E1 pass through the insulator core and their lower ends are bent to form a spark-gap, while their upper ends are equipped as terminals adapted for connection with current sources. A V-shaped recess S is formed above the spark-gap.

No. 1,034,835—to Lewis T. Rhoades, Mont Clare, Pa. Granted August 6, 1912; filed March 15, 1911.

Internal-Combustion Motor Starter—In which fuel is injected into the cylinder whose piston is arrested at a point of the power stroke.

The subject matter of this patent is a starter having a fuel supply receptacle and a communicating passageway leading to the cylinders of the explosive engine. Means are provided for arresting each of the engine pistons at a certain point of its power stroke. These means consist of a movable member connected with the engine crankshaft, which is in engagement with a stationary member yieldingly supported. By throwing movable and stationary members out of engagement and simultaneously injecting a portion of the fuel from the receptacle into the cylinder in which the piston is arrested, the engine is started.

No. 1,031,908—to James A. Brown and Carl G. Bosch, Cedar Rapids, Ia. Granted July 9, 1912; filed May 18, 1911.

Spring Shock-Absorber—Consisting of two curved springs, which are designed to check the recoil of the elliptical ones.

In Fig. 3 the subject matter of this patent is illustrated. The shock-absorber, which acts in conjunction with a semi-elliptic spring S and a C-shaped spring member S1 connected by a swing link L, consists of a spring S2 which has a compound curve and is attached at its middle portion to the spring S, and with its end portions to those of the latter. Another curved spring S3 has one end secured to the body of the car.

No. 1,034,231—to Philip Edward Haugh, Millvale, Pa. Granted July 30, 1912; filed February 16, 1912.

Spring Wheel for Automobiles—Consisting of spring-pressed plungers serving as spokes and a spring rim.

The idea of this patent is seen in Fig. 4. The wheel consists of an outer, or felloe, portion F and an inner portion I which are spaced from each other. In the felloe portion there are longitudinal tubes T, the side walls of which are partly cut away so as to form guideways in which a pivot pin P is adapted to travel. The tube contains springs S tending to hold the pivot pin in a central position by bearing against blocks which in turn bear against the pin P. Each pivot pin is in engagement with a driving plunger or spoke P1 which is slidably disposed in a guideway in the inner portion I of the wheel and is pressed outwardly by the spring S1.

No. 1,034,475—to Marius Mathiesen, San Antonio, Tex. Granted August 6, 1912; filed March 19, 1912.

Engine Primer—Consisting of a pump and suitable pipes and nozzles for injecting gasoline in spray form into the cylinders.

The priming attachment described in this patent consists of an elongated equalizing chamber which is adapted to contain gasoline under pressure and communicates with a distributer pipe. In communication with the distributing pipe are tubular members each of which contains a check valve and ends in a spray nozzle, one of them being arranged in the head of each cylinder and one in the intake manifold. The gasoline is drawn from the lead connecting the fuel tank and carbureter by means of a pump.

No. 1,030,931—to Eugene Silver, Omaha, Neb. Granted July 2, 1912; filed January 27, 1912.

VOL. XXVII NEW YORK—THURSDAY, SEPTEMBER 5, 1912—CHICAGO No. 10

The AUTOMOBILE

Mercedes Lowers Records at Elgin

De Palma Wins Elgin and Free-For-All Races — Stutz, Mercer and Mason Winners of Their Respective Events

Mercedes, No. 4, driven by Ralph De Palma, winning Elgin and free-for-all race, August 31, on Elgin course; races run simultaneously. His average for the Elgin race was 68.4 miles an hour and in the free-for-all 76 miles an hour, distances 254 and 305 miles

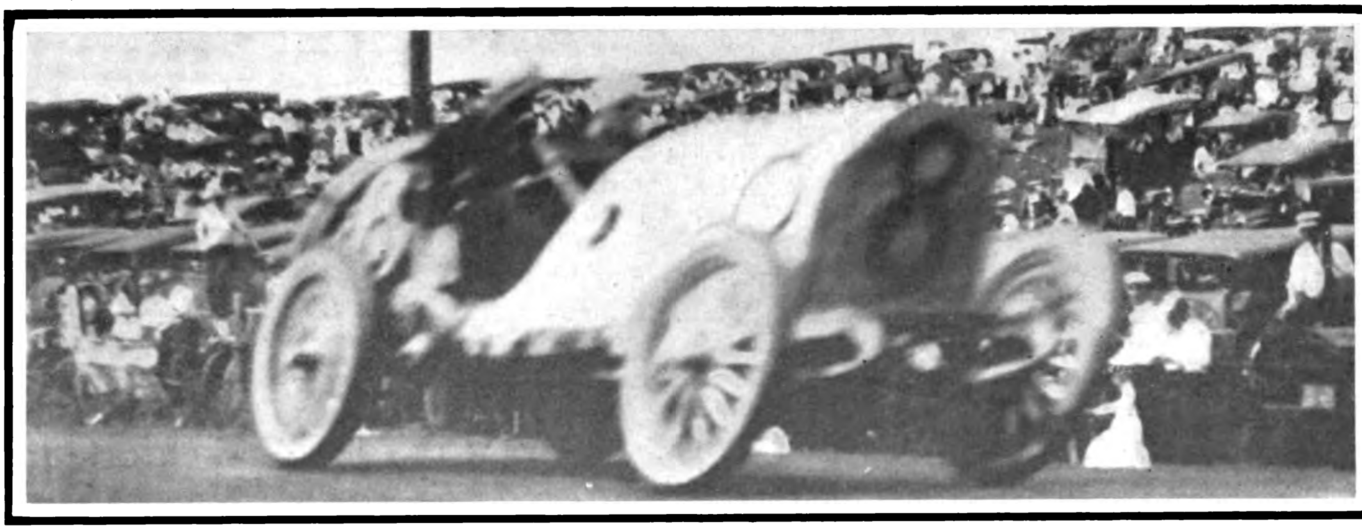
ELGIN, ILL., Sept. 3—Ralph De Palma won the Elgin National trophy race and the free-for-all race at Elgin, on Saturday, August 31. Ralph Mulford was second in the former event and Erwin Bergdoll was second in the free-for-all. On Friday Hugh Hughes was an easy victor in the Aurora trophy race, with Pullen second. The Jencks trophy race went to Endicott, while Charles Merz won the Illinois trophy event, with Anderson second.

De Palma, driving a Mercedes, for the first time in his racing career won, overcoming the ill-luck which has overtaken him on all previous occasions. His speed for the 254 miles and 1,050 feet of the Elgin National race was 68.4 miles an hour, while for the free-for-all race, which was run simultaneously with it, he averaged 68.9 an hour for 305 miles and 204 feet. His fastest lap, the last lap of the longer race,

Bergdoll, prominent driver in the Elgin free-for-all contest

SUMMARIES OF THE ELGIN RACES

FREE-FOR-ALL		
Distance, 305 miles and 204 feet		
1—De Palma	Mercedes	68.9 m.p.h.
2—Bergdoll	Benz	67.5 m.p.h.
3—Mulford	Knox	66.6 m.p.h.
ELGIN RACE		
1—De Palma	Mercedes	68.4 m.p.h.
2—Mulford	Knox	67.3 m.p.h.
3—Merz	Stutz	64.2 m.p.h.
4—Roberts	Mason	63.8 m.p.h.
5—Anderson	Stutz	63.3 m.p.h.
ILLINOIS TROPHY		
1—Merz	Stutz	66.11 m.p.h.
2—Anderson	Stutz	65.6 m.p.h.
AURORA TROPHY RACE		
1—Hughes	Mercer	65.0 m.p.h.
2—Pullen	Mercer	62.3 m.p.h.
3—Trussell	Falcar	54.0 m.p.h.
JENCKS TROPHY RACE		
1—Endicott	Mason	60.57 m.p.h.



Bergdoll's big Benz traveling at over 67 miles an hour in the free-for-all. He led throughout the greater part of this race

was made at a speed of 74.6 miles an hour. The lap distance is 8 miles, 2,499 feet, and his time for the lap was 6:49. Bergdoll, in a Benz, was entered only in the free-for-all race, and in coming in second averaged 67.5 miles an hour for the thirty-six laps. Mulford, in a Knox, averaged 66.6 miles an hour.

Saturday's races were easily the most sensational yet seen at Elgin, and the winners were always in doubt up to the last minute. Tire trouble deprived Bergdoll of the longer race when it seemed as though he would be the sure winner. No serious accidents took place, although Mulford was overcome by the heat and Clark, driving a Mercedes, and his mechanician, were pitched over a fence, while several others ran into the straw-banked turns.

The crowd was a record one, and completely filled all available space. Officials of the meet estimated the attendance at 60,000. Weather conditions were ideal for both days, and perhaps had something to do with the time made by the leaders. On Friday the time was slow in the various events, but Saturday's figures made up for this. De Palma succeeded in his last lap in making the remarkable speed of 74.6 miles an hour, establishing a new record for the Elgin course.

Friday's races were less exciting than those of the following day. Hughes, driving a Mercer, in winning the Aurora trophy race, had things all his own way, and was never headed during the entire run. The Mason Special, driven by Endicott, was also an easy winner, the only other two contendants for this event being a Ford, driven by Henning, and a Herreshoff, driven by Wordingham, both of which cars were out of the race long before the finish, due to accidents. The Illinois trophy race, won by Merz in a Stutz, had four contenders at the start, while

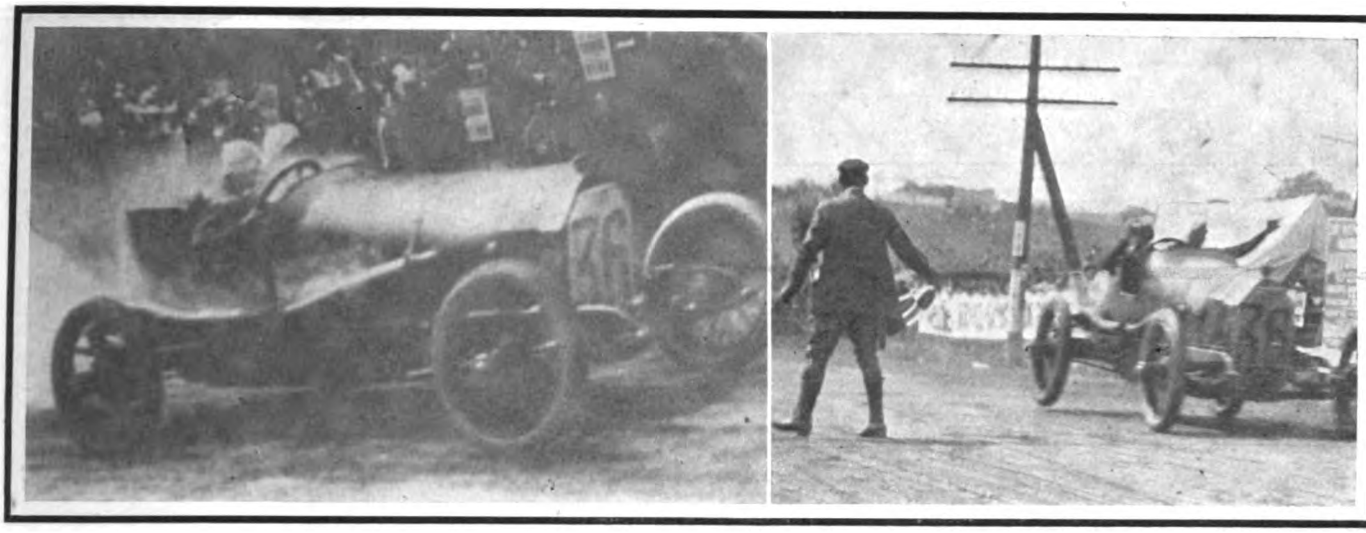
Ralph Mulford letting up on his Knox Six for a few seconds in the free-for-all. Later in this race he was overcome by the heat



Winning Mercer with Hughes at the wheel swinging around a turn and car being flagged at the finish of the Aurora Trophy

only one other car, another Stutz, with Anderson at the wheel, finished. Damage to their machines prevented the other two entrants from becoming serious rivals of the Stutz cars, and the race developed into merely a Stutz family quarrel.

One feature of the Elgin races this year was the remarkable freedom from accidents and the entire absence of fatalities to either contestants or spectators. Each driver and mechanician was examined by the surgeons of the Elgin National road races, who reported that all were physically fit to take part in the races. These physicians stated they were unable to find any of the contestants suffering from diseases which would in any way tend to cause sudden illness during any race, and a carefully made table showing the age and rate and character of pulse of each man was submitted to the referee. This is practically the only racing association which adheres strictly to such a rule.

Saturday's Features

THE feature races of the Elgin meet were those run on Saturday, which were for the Elgin National Watch Company trophy and the free-for-all. They were the most sensational ever seen by the Elgin racegoers. While there were fifteen entries, only ten cars lined up for the long grind of 254 miles in the Elgin National race, and 305 miles in the free-for-all, which event was only added this year. The two races were run simultaneously, several of the cars competing in both, the Benz entry, which was driven by Bergdoll, Philadelphia's millionaire racing driver, not being eligible in the Elgin National race for the reason that its piston displacement was over 600 cubic inches

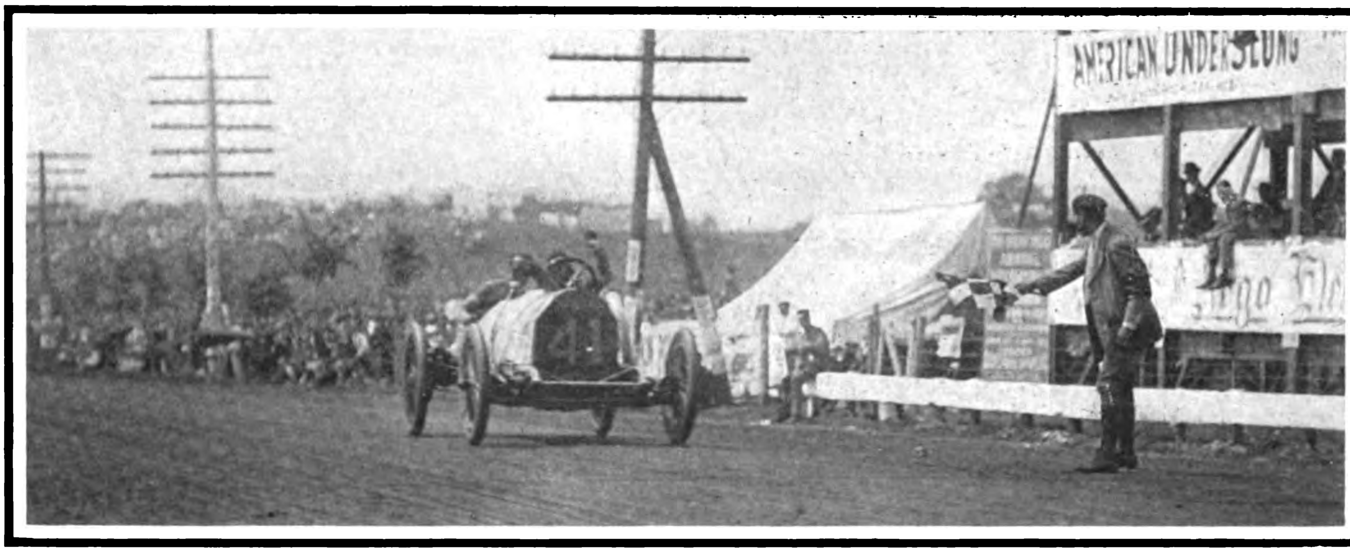
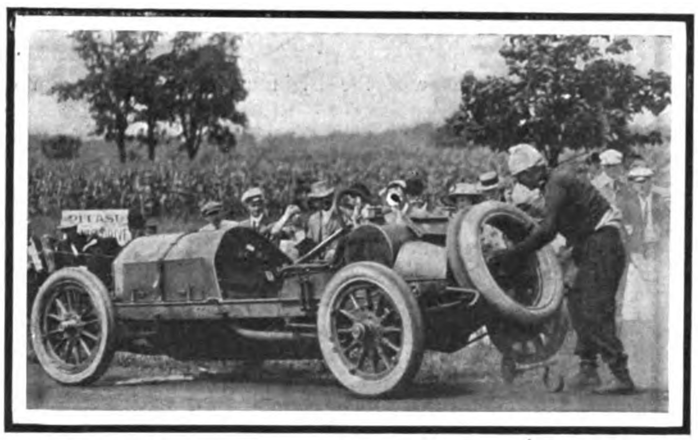
Stutz 24 with Merz driving, receiving the winning flag and at the right making its victorious dash in one of the late laps



Mason Special, H. Endicott driving, as it came up to the line all alone at the finish of the Jencks Trophy race, its competitors having withdrawn



Mercer 35, Wishart driver, repairing two blown-out tires

which was the maximum permitted entrants in that contest.

It was a representative gathering of famous racing drivers that lined up before the immense crowd in the grand stand, awaiting Starter Wagner's tap on the shoulder, which was the signal to begin the long run. Ralph De Palma, who has had perhaps the greatest amount of ill-luck during his career in the speed game, was at the wheel of the big Mercedes, entry No. 4. Ralph Mulford, last year's Vanderbilt cup winner, was in control of the Knox Six and was given a rousing cheer when his car was pushed into position at the tape. Eddie Hearne, in the 70-horsepower Fiat, lined up in the fifth position, and looked rather diminutive behind the immense red hood of entry No. 5. Erwin Bergdoll, in the big Benz, was the eighth to line up. Behind him was Charlie Merz, in his Stutz winner of the day before. Hughie Hughes, winner of last year's Elgin Kane Count event. and Friday's Aurora trophy race, was the last to get into position.

It was easily seen that the crowd liked Mulford. After a delay of 15 minutes, while the pit men tinkered with De Palma's Mercedes' stubborn clutch, Mulford was sent off at 11:15 amid a cloud of smoke. The familiar sight to old followers of the races of two men cranking the big Knox was repeated before the enthusiastic crowd. Mulford's mechanician was at the crank, while he was aided in his efforts by a pit man, who pulled on a long leather strap. The big motor took up its work and Mulford was away down the stretch.

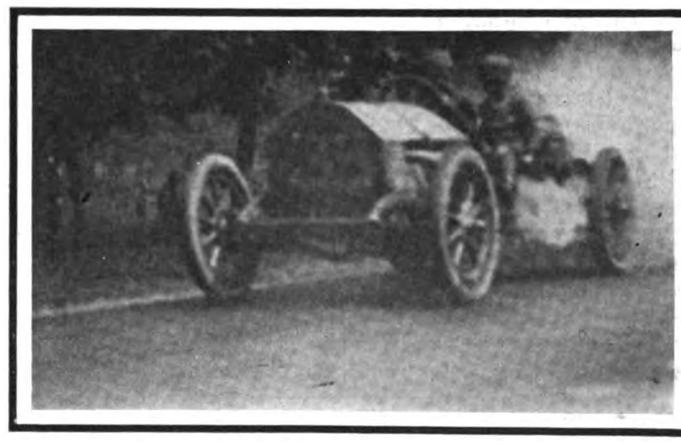
Line-up of the contestants in the Illinois and Jencks Trophy races—the eventual winner of the longer race—Stutz 24 is in the middle ground

Next came Clark in Mercedes No. 2. The powerful car jumped into motion at a word from the starter and was off after Mulford. Then came the little Mason, winner of the day before in the Jencks trophy event. Following it, De Palma, in Mercedes No. 4, came to the tape. The onlookers were in sympathy with him, and more than one hoped his ill-luck of the past would not deprive him of honors this time. The little Italian determinedly shot his car down the course. Then Eddie Hearne, driving the Fiat which, according to the program, Teddy Tetzlaff was to drive, was sent off. It was doubtful if he would be able to finish the race because of his weak wrist. Following Anderson's Stutz, Bergdoll, in the Benz, received the word from Starter Wagner. After what seemed an interminable wait, Charlie Merz, in the other Stutz, was away. This left only the two yellow Mercers at the tape. Wishart was next to go, Hughie Hughes alone remaining. It was not until nearly time for Hughes to come to the line that his attendants cranked his motor, and with the good wishes of the crowd he was off after the others.

Hardly was Hughes out of sight around the Hornbeek turn when Mulford, running well, hove into sight, and had soon completed his first lap. Then came De Palma, in his Mercedes, driving like a demon, having passed Clark in the other Mercedes and Roberts in the Mason in the first lap. He was soon out of sight after Mulford. He had made the circuit in 7:08, 7 seconds faster than Mulford, putting him in first place immediately. This gave Mulford second position, while Hughie



Trussel's Falcar which finished third in the Aurora Trophy

Hundreds of cars were massed about the course at various points of vantage from which the automobilists might obtain a clear view of the course

Hughes was third, Metz fourth, Hearne fifth in the Elgin National race. Considering all the cars, the Benz, which was not entered in the Elgin National, was second, with Mulford in the Knox third, and Hughes fourth.

Bergdoll was driving at terrific speed, and succeeded in coming to first place in the second lap, while De Palma, also getting all the power out of his Mercedes, had to be contented with second position. Mulford was now in third place. In the third lap Mulford changed positions with De Palma, Bergdoll in the Benz still retaining the lead. This he held from lap No. 2 on through the twenty-second lap, or 186 1-3 miles of his long grind of 305 miles. In this lap he was obliged to stop on the back stretch on account of tire trouble. This delay gave De Palma the lead, which he maintained in the twenty-third and twenty-fourth laps. He would, no doubt, have led Bergdoll longer had he not been obliged to stop at the pit at the end of the twenty-fourth lap to take on gasoline and oil and to replace his left rear tire. This wait put Bergdoll again in the lead, which he retained for ten of the remaining twelve laps of the free-for-all race. De Palma was now in second place, while in the same lap Mulford was a close third, which position he had held since the fifteenth lap, or 127 miles had been passed. He was pressing De Palma closely, and in the twenty-sixth lap succeeded in regaining second position, about 2 minutes behind Bergdoll, in the Benz, while De Palma was less than a minute slower than he.

The twenty-ninth lap saw tire trouble for both Mulford and De Palma. The latter stopped at the pit after completing this lap and to him the short wait seemed endless. He was all eagerness to be away. But before he was off again Mulford also stopped at his pit for identically the same reason. Immediately De Palma saw his chance. He pressed his attendants to their utmost and was away again, fairly lifting his machine from the ground in getting off. There was only a single lap remaining to the Elgin National race, and De Palma realized it fully. It was the fastest lap of his race, and he made it in 6:49, for the first time in his career crossing the tape the winner of a race. But he did not slacken his speed, for he had still six laps to go in the free-for-all race in which he was also entered.

The course from the main stand before post call

Mulford was next to finish, and while De Palma's average speed for the Elgin National race was 68.4 miles an hour, that of Mulford was slightly less, as the tables show.

Meanwhile, the other cars were changing their positions somewhat. After completing three laps, Hearne was obliged to quit Fiat No. 5 because of his wrist becoming too weak to properly control the car. George Hill, mechanician for Tetzlaff, took his place in the big red machine. He lost no time in getting the Fiat under way again, and drove daringly and with the nerve of a veteran for twenty-three laps. When Hill took the wheel he was in sixth place, but in the sixth lap Clark's Mercedes, which had been in fifth position, was put out of the race by accident, giving this position to Hill in the Fiat. In the eighth lap Hill took the fourth position in the Elgin National, which had been held by Merz in the Stutz. Two laps later he took third position from Anderson in the other Stutz, and retained it through the thirteenth, when he dropped to seventh place, Merz regaining his former place in the van. Trouble with the transmission was rapidly taking on serious proportions, judging by the

Pullen's Mercer, place winner in the Aurora Trophy

noise emanating from Hill's machine, and after completing twenty-six laps he was obliged to quit the race on this account. He was then in sixth place.

The first car to drop out was the Mercedes, driven by Clark, which, after staying in fifth place on the fifth lap, was preparing to negotiate the Hornbeek turn, the first after passing the pits, and was driven into the straw banking of the turn and damaged sufficiently to put it out of the race. Clark miscalculated the turn, ran into a small concrete culvert located at this point, with sufficient force to blow up one of his tires. This sent his car swerving to the right and into the fence, breaking both rear wheels and pitching himself and his mechanician over the fence. Neither man was seriously hurt, each being only slightly bruised. Had it not been for the straw bales banking the turn, the accident would undoubtedly have been serious. Curiously enough, Clark had objected previously to the use of the straw for this purpose.

As a safety element these straw bales at the four turns demonstrated their worth. Not only did they save Clark and his mechanician, but they prevented injury to Wishart, whose Mercer got off the course at one turn, and to Wordingham, who also ran into them, ditching his Herreshoff car and breaking one of its wheels, without injury to himself or his companion.

Following Mulford, Merz, in Stutz No. 12, was next to finish in the Elgin National race. He came into this position, due to the accident to Wishart's car in the twenty-fifth lap, when the latter's oil lead and water pump broke, and to Hughes' Mercer, which was running well up to the eighteenth lap, when it burned out a crankshaft bearing, rendering it useless as a contender for honors.

These various accidents left only three cars to contend in the free-for-all. These were Bergdoll's Benz, De Palma's Mercedes and Mulford's Knox. The final performance of these three cars was the most sensational of the 2 days' meet. Bergdoll was in the lead at the beginning of the thirty-first lap, with

Pierce and Case Are Sued

Stephenson, Manufacturer of Utility Car, Charges That Milwaukee Companies Violated Agreement to Buy Plant

Packard Dealers, 150 Strong, Formulate Plans to Tour United States and Canada

MILWAUKEE, WIS., Sept. 3—The Stephenson Motor Truck Company, of Milwaukee, Wis., manufacturing "Utility" commercial cars at South Milwaukee, on Saturday, August 31, filed a suit in the Circuit court at Milwaukee against the Pierce Motor Company and the J. I. Case Threshing Machine Company, of Racine, Wis., charging them with violating an agreement whereby the Pierce and Case owners agreed to purchase the plant of the Stephenson company for $100,000 worth of the capital stock of the Pierce company. The trial will be transferred to Racine county by mutual agreement and promises to be most interesting. The official complainants are George L. Stephenson, Charles Matthews, A. E. Halderman, Fred M. Stephenson, Paul Durant and Frederick Gettelman, and the official defendants are Frank K. Bull, Richard T. Robinson and F. Lee Norton.

The complaint charges that from the time of the alleged agreement, in January, 1912, the Case company agreed to act as sales agent for the Stephenson company until the Stephenson works were taken over on August 1, 1912. It is charged that the defendants have refused to comply and that the Stephenson company, by reason of discontinuing all of its own sales agencies, and announcing to its patrons that it was no longer selling its product directly, suffered a great decrease in sales and now has on hand a large number of motor vehicles which it cannot sell because of the termination of its own selling outlets.

It was stipulated, the complaint says, that if at the time of the purchase of the Stephenson company's plant, scheduled for August 1, 1912, the assets amounted to less than $40,000, the difference was to be subtracted from the amount of the capital stock to be paid to the directors of the Stephenson company, and that if the assets exceeded $40,000 in value, an additional amount of stock was to be added to the consideration.

It is stated that the Stephenson company became affiliated with the Pierce and Case companies because of the desire to add commercial vehicles to the Case line of products, which includes Case cars, manufactured by the Pierce Motor Company, which is owned by the directors of the Case company.

Insurance Probe Meets Snag

The problem of automobile insurance, particularly as it applies to commercial vehicles, is still some distance from a solution. The matter was referred to James S. Marvin, assistant general manager of the N. A. A. M., for investigation and report and Mr. Marvin ran into an obstacle early in the proceedings. After conference with the insurance men Mr. Marvin found that the first element of information required from him by the insurance men was as to how long trucks are kept in garages and how long they are in service each average day.

As such figures must be gained by a detailed canvass and as no such general detailed canvass has been made, the pursuit of that special line had to be postponed until such time as the figures should be available. Such a canvass will be undertaken in the near future.

Packard Dealers to Cruise

DETROIT, MICH., Sept. 2—About 150 dealers and salesmen from the principal cities of the United States and Canada, will be guests of the Packard Motor Car Company on a 3-day lake cruise, which will constitute the annual convention of the Packard sales corps.

The steamer City of St. Ignace has been chartered. The route extends through Lake St. Clair and Lake Huron, then down into Lake Erie to Buffalo and return. The boat leaves Detroit Tuesday, September 3, and will stop in Cleveland for a theater party the evening of September 4.

The dealers will be accompanied by a number of Packard officials, including H. B. Joy, president; S. D. Waldon, vice-president; Alvan Macauley, general manager, and H. H. Hills, sales manager.

In addition to business discussions there will be various forms of entertainment, including concerts by the Packard brass band.

More Cars, or More Service?

With upwards of 40,000 actual automobile freight cars in service upon the various railroad lines of the United States and with the prospective shipment of 100,000 carloads of automobiles from the factories to market, the supply of freight cars for this service would appear to be sufficient if each car suitable for automobile shipment could be made to make 2 1-2 trips each during the shipping season.

Reports from Detroit that an effort was being made to persuade the railroads to furnish 50,000 more freight cars for automobile traffic have been circulated recently.

Some additions to the present equipment will be made but nothing approximating the number requested. According to the railroads the additional equipment will be about 5,000.

Automobile Securities Quotations

With the approach of the time limit of the extension granted to the United States Motor Company by its creditors, a period of inactivity has settled upon the market for automobile securities. Sellers and buyers appear to be about evenly balanced with volume of trading rather on the small side. There is a distinctly strong undertone in the market for shares generally which finds expression in the stiffness of American Locomotive, both issues of General Motors and the standard investment shares, but with the exception of General Motors the upward movement has been fractional. Goodrich, which was listed on the New York Stock Exchange last week, has maintained its advance and the other rubber shares partake of its strength. The table showing the current level compared with the market last year is as follows:

	1911		1912

According to traffic managers of several of the big automobile companies the requirement is not so much for more cars as it is for more service from present equipment.

The average time for a trip from Detroit to New York is about 60 hours and from any factory with first-rate handling facilities to any point of consignment 1,000 miles away is not more than 5 days. The return trip should take no longer and the various delays, loading and reconsignment ought not to occupy more than 1 month.

On this basis, figuring the shipping season at 120 days and the number of automobile cars available at 50,000 and the average time of the round trip at 40 days, the cars should be able to transport 150,000 carloads. At an average of 2 1-2 automobiles to the carload, they would account for the shipment of 375,000 automobiles, or considerably more than the probable output.

The difficulty that lies in the way of such a solution of the trouble is that automobile cars are used for other purposes during the rush season.

Imports Large—Rubber Steady

Imports of crude rubber for the week ending August 24 amounted to 14,272 packages to which must be added 1,673 packages of waste, the whole valued at $1,768,000. The waste was valued at $59,000. Local trade has been quiet and while the actual sales are said to be small, the volume of imports in connection with the steady market means that the demand is sufficient to maintain prices. This would argue in favor of a large general business. Prices remained about stationary throughout the past week, the level being at $1.20 1-2 per pound for up-river fine.

Market Changes for the Week

The holidays stifled activity in the materials market to some extent this week, and as a result there are few changes to note as compared with last Wednesday. The metal market was rather steady all through the week, with no special activity except in the cases of lead and tin, both of which gained materially during the week. Both Lake Superior and electrolytic copper remained at their nominal quotations throughout the week, and the same holds for the prices of steel products, among which beams and channel products continue to be sold at the ask price.

Fine up-river para rubber declined 1 cent a pound on the first day of the week in response to the London trend, and has since remained at the same price. Gasoline, oils and lubricants also underwent no changes. Linseed oil formed an exception in this respect, rising from 68 to 69 cents on the last day of the week, thereby recovering from its decline about 2 weeks ago. Cotton oil was also strong and closed 19 cents higher than the market opened.

Receiver For Thomas

Judge Hazel Directs G. C. Finley to Take Charge of the Affairs of Defunct Company—Receiver Silent as to Future

Assets of Thomas Company $740,000 in Excess of Liabilities and Reorganization Is Not Improbable

BUFFALO, N. Y., Sept. 3—Judge John R. Hazel, in United States District Court here last Thursday granted an order appointing George C. Finley, secretary of the M. D. Taylor company, and Adolph Rebadow, attorney of the law firm of Rebadow & Ladd, receivers for the E. R. Thomas Motor Car Company. The order provides that the receivers for the automobile company are to continue the business of that concern and bond for the receivers was fixed at $50,000. Application for the appointment of receivers for the Thomas company was made by Charles B. Sears, of the law firm of Rogers, Locke & Babcock. The E. R. Thomas Motor Car Company was represented at the hearing by William L. Marcy, of Moot, Sprague, Brownell & Marcy.

The receivership of the Thomas plant resulted from action in equity brought by creditors on the grounds that the E. R. Thomas Motor Car Company, while entirely solvent, was temporarily unable to meet its obligations. Extension notes given at the time of the reorganization of the Thomas company a year ago could not be met at maturity. The notes, which totalled $250,000, fell due this year on August 1. The holders of $210,000 worth of these notes agreed to grant a 3-month extension but holders of the remaining $40,000 declined.

The E. R. Thomas Motor Car Company succeeded about a year ago to the business of the E. R. Thomas Motor Company when that concern was reorganized. The liabilities of the Thomas company today are said to be $960,000 while assets total $1,700,000. Merchandise creditors of the Thomas company are to hold a meeting in the near future and it is anticipated that a reorganization of the company will be the result. At the meeting which will probably be held this week the receivers of the Thomas company undoubtedly will act on the resignations of Frederick R. Humpage, president of the Thomas plant; William L. Gleason, vice-president and general manager, and John J. Ramsey, treasurer. The resignations of these prominent automobile officials was received with the greatest of surprise. The resignations are said to have been tendered together, but authorities in the Thomas plant decline to give further statements on the matter until action has been taken by the company's receivers. President Humpage declines to state why he resigns from the concern but probably will discuss the matter after the receivers' action.

Concerning the matter of the continuation of the business of the Thomas company, George C. Finley, receiver for the concern, has this to say:

"I am unable to say at this time just how long the business will be continued. The receivers have taken hold of it, and intend to put the business on its feet if that is possible. Of course, we do not know just at present what the exact conditions are in the plant. The permanent continuation of the business will depend greatly upon what we find." The forces of the plant were reduced about 200 in number on Saturday but the business will be continued if possible.

Chicago Show Blanks Issued

Application blanks for space at the thirteenth annual automobile show at Chicago have been issued. The pleasure car section will be held February 1-8 and the commercial vehicle section February 10-15. The rental rate is fixed at 90 cents a square foot for each show.

U. S. Motors Plan Due

Committee Working on Reorganization Scheme to Be Announced Before Friday of Next Week

Important Meetings of National Organizations Scheduled To Take Place Early in October

FRIDAY, September 13 is the date upon which the 90-day extension granted by the creditors of the United States Motor Company will expire and before that date a plan of reorganization will be presented to the creditors and owners of the company. In fact, three different plans have been suggested to the creditors' committee and while official confirmation is lacking, it is quite certain that one of these plans, modified by suggestions of the merchandise creditors will be favorably reported.

The first draft of this plan has been prepared but pending official action those interested decline to say anything about it. Meetings of the committee have been held three different times within the past week and the announcement of the main facts contained in the plan may be expected at any time.

It is understood that some additional capital is necessary and that it will have to be secured; that one or more of the companies connected with the organization will have to curtail its production and that the 1913 manufacturing campaign, already well under way, will be conducted on conservative lines so as to avoid extraordinary calls upon the company's resources prior to the season when adequate returns are available to meet such calls.

At the headquarters of the company it was learned that shipment of the 1913 product is continuing satisfactorily and while all the officers are guarded in their statements, there is a feeling of growing optimism as to ultimate results.

On the New York curb a sharp break was scored in both common and preferred issues, but later there was a good recovery, the net loss being only fractional. It was reported after the break that the selling pressure was by speculators who had loaded up at recent lower levels and took profits on the subsequent rise.

Big Meetings for October

Meetings of the Automobile Board of Trade and the National Association of Automobile Manufacturers, scheduled for the first week in October promise to be among the most interesting gatherings ever held by those organizations. There will be the regular monthly meetings of the associations; the twice postponed convention of salesmanagers; the allotments of space at the national shows and probably a gathering of automobile makers, the like of which has never been witnessed so far in the industry.

There are a number of live topics to be considered by the members, including the tentative merger and the scope and extent of the big organization that will result.

The probable date of the sales managers convention is October 1.

Exported Cars Less in Price

WASHINGTON, D. C., Aug. 31—According to figures compiled by the federal bureau of statistics, $30,000,000 worth of American automobiles and parts found markets abroad during the fiscal year 1912, as against less than $1,000,000 worth 10 years ago. The figures show that the exports of motor cars to foreign countries in the fiscal year were valued at $21,500,000; of parts thereof, including tires, $6,750,000. If to this were added the shipments to Hawaii and Porto Rico, we get for the year's sales of American cars outside of continental United States a round $30,000,000, since the value of motor cars and parts thereof sent to Porto Rico was nearly $1,000,000 and to the Hawaiian Islands a little over $1,000,000. The total number of cars exported to foreign countries was 21,757, valued at $21,550,139, averaging slightly less than $1,000 each, while those to the non-contiguous territory were higher, averaging $1,600 each.

The export price of American cars in 1912 averaged less than in any earlier year in the history of the export trade. The average for 1912, dividing the total number of cars exported into stated value, was $990 each, against $1,100 in 1911, $1,380 in 1910, $1,700 in 1909, and $1,880 in 1908.

On the import side the motor cars imported last year amounted to but about $2,000,000 in value, against more than $4,000,000 in 1907. The average import value of the cars brought into the country last year was $2,216 each, against $2,138 in 1911, $1,936 in 1910, $1,788 in 1909 and $2,392 in 1908. Thus the export price of American cars has fallen from $1,880 in 1908 to $990 in 1912, while the import price of foreign cars entering the country has only fallen from $2,392 in 1908 to $2,216 in 1912, the reduction in price on the export side being 47 per cent. and on the import side but 8 per cent.

Marion Names District Managers

INDIANAPOLIS, IND., Aug. 31—In connection with the active sales department which the Marion Motor Car Company is now organizing, there have been appointed four district sales managers who are men of wide experience and acquaintanceship.

These men are C. H. Tyler, who has just resigned as manager of the United States Motor Company's Cleveland branch; C. B. Riggs, who gives up the management of the Oldsmobile branch in Kansas City; W. W. McClure, who has been associated with the Marion interests in Texas, and Howard W. Harrington, who has been in charge of the Marion on the Pacific Slope.

To Build Argyll Engine in Canada

OSHAWA, ONT., Sept. 3—The Hackett Motor Car Company, Ltd., of this city have secured the patent rights to manufacture the Argyll engine in Canada. Hitherto the Argyll car has been made in Scotland only but an enterprising group of Canadian capitalists have purchased the manufacturing rights for the Dominion. This concern will be known as the Hackett Motor Car Company. Last spring they bought out the plant of the Matthew Guy Automobile Works, Oshawa, and the equipment there will be enlarged to enable the company to turn out a very largely increased output. It is the intention of the Hackett company to build high-class automobiles equipped with the Argyll valveless engine. It is announced there will be a four and a six-cylinder model. They will also build a cheaper car with a different engine. The latter will be a thoroughly reliable and up-to-date car, and it is the intention to place it on the market at a price below $1,000.

Alco Truck at Wells, Nevada

WELLS, NEV., Sept. 3—The Alco transcontinental truck reached this place today after passing through a series of tropical floods. Much work had to be done in road construction as the poor existing roads had been washed out in many places. The total distance to date is 3,323 miles and there still remains about 650 miles to travel before reaching the destination. Progress has been slow for 2 weeks on account of the extraordinary difficulties that had to be surmounted.

Bumper Crops in North Dakota

FARGO, N. D., Sept. 3—Bumper crop conditions in North Dakota this fall are attracting the attention of automobile manufacturers and dealers everywhere with the result that a number of new agencies have already been established or announced for

Fargo and many other cities. Old agencies already in the territory are increasing their sales forces to handle the increased amount of business which the dealers believe is assured.

Crops in the state are now beyond the prospect stage and it is certain that the farmers will harvest the biggest yields of the past 15 years. While harvest and threshing have been delayed by the heavy and frequent rains during August the work is now far enough along to forestall further weather damage and to give reliable indications of what the yields will be.

Wheat, the leading crop of the state, will give a yield several bushels above the average for the last ten years and almost double the yields reported for the two previous years, both of which were attended with crop failures. Reports that the heavy rains had started the grain sprouting in the shock are denied by farming experts who have traveled through the state. In certain sections of the state grades have been lowered but the damage is not sufficient to affect the state as a whole.

Flax, barley, rye and oats are all yielding crops far above the average. Corn is ripening rapidly now and experts believe that for the first time in the history of the state the farmers will raise their own seed corn for 1913 planting. Potatoes have been attacked by a form of stem rot. In spite of what damage this may do the yield is likely to be so large that the price will go very low.

Automobile salesmen are already busy among the farmers of the state and the number of orders received at the branch houses is increasing rapidly.

Receiver for King Company

It was reported in New York, on Tuesday, that the Union Trust Company, of Detroit, had been named receiver for the King Motor Car Company, by the United States District Court under bond of $5,000. An order granting an extension of time for the making up of certain stock on hand has been allowed. The company has been in existence since the spring of 1911. Charles B. King, the designer of the product, was backed in the venture by H. Kirke White.

The stockholders of the company are, generally speaking, rated as wealthy men and three plans for continuance of the business on a permanent basis are under consideration.

These plans are as follows: First, one of the stockholders is ready to take over the business. Second, a reorganization of the corporation with the present stockholders, starting all over again and third, it is reported that an outsider stands ready to take over the corporate interests.

The car was widely advertised in New York and had secured quite a material business in the metropolitan district.

J. R. Ballinger Killed in Accident

CHICAGO, ILL., Sept. 3—J. R. Ballinger for 4 1-2 years connected with the Stromberg Motor Devices Company, Chicago, Ill., was accidentally killed on August 30 when the car which he was driving from Chicago to Elgin for the races overturned in passing another machine. At the time of his death Mr. Ballinger was assistant to the sales manager of the Stromberg company. When he first took a position with the concern he was employed as stenographer and had risen rapidly to his present position. He was 27 years of age. No successor has as yet been appointed.

Exporters to Meet and Dine

The American Manufacturer's Export Association has announced its third annual meeting and banquet which will be held at the Hotel Astor, September 20-21. The association's members now transact an export business of $160,000,000 and an effort is being made to secure additions to the membership before the opening of the Panama canal so that the total business represented shall be above $500,000,000 a year.

W. B. Campbell is president of the association and Henry T. Wills, secretary.

Testing Convention Meets

International Association Comes Together and Begins Considering of Long and Interesting Program

Opening Session Is Attended by Delegations From Every Progressive Nation

WITH an attendance estimated at 600, including representatives of every advanced nation on the globe, the sixth congress of the International Association for Testing Materials came together Monday morning in New York. The convention will remain in session until September 7 and on the following day the official tour as outlined in previous issues of THE AUTOMOBILE is scheduled to commence. This will take up all the time until Sunday, September 15.

President Taft is the patron of the congress although not present personally. The opening day was devoted to organization and a formal reception to the members and ladies under the joint auspices of the American Society for Testing Materials and allied societies.

The real business of the congress commenced on Tuesday when the army, State of New York and the city welcomed the delegates and the professional sessions commenced.

In the metals division the speakers were: E. H. Saniter and twelve others who treated hardness and wear tests, impact tests and slag inclusions. Mr. Saniter used as an illustration in the testing of hardness and resistance the dry abrasion process on lubricated material and his conclusions were that hardness tests are unreliable as indicators of wearing properties.

F. Robin spoke on wear tests, showing results were not uniform under varying conditions and that each specific form should have its special test.

R. Guillery on tests for hardness, elastic limit and resilience under impact described three machines for making tests. The first was a ball-hardness machine with micrometer to measure the indentation caused by spring pressure upon the specimen. The second was an elastic limit device equipped to compress a truncated cone specimen while an autographic record is made to locate the point where set begins. C. Grard on studies of hardness of steels said that he believed it practicable to specify hardness and impact test requirements in steel specifications.

G. Charpy on impact tests recommended the study of the different testing machines and apparatus and reported for the committee the recommendation that a system of calibration and checking should be established as a prime requisite. He said that the relation between impact-test results and service value not having been fully established, the collection of statistics on the subject is recommended.

A. Schmid treating on the influence of shape of testpiece and treatment on notched-bar impact tests said that the previous size of testpiece was too large and that 10 mm., 60 mm. in span, with notch 2.5 mm. deep of radius 1 mm. gave satisfactory results.

The other speakers took up various phases of steel tests, treating of tough steels, brittleness, resilience, tensile-impact, slag inclusions and non-metallic impurities.

The Society of Automobile Engineers through the Iron and Steel Division of the Standards Committee adopted a set of strict steel specifications which has been augmented and modified from time to time and the international society with which the test congress is affiliated accepted the standards as applied to automobile making. The specifications, however, were not applied generally on account of the small limits of tolerance allowed. Some sort of action relative to the S. A. E. specifications will probably be taken before the close of the sessions.

Segregating Truck and Car Marketing

Pro and Con of Problem as Shown by Tendencies and Experience of the New York Selling Establishments—Drift Is Now Toward Separation

WHEN the automobile industry was young, it was considered quite the thing to have its advertisements read about like this: "The Bildad Motor Car Company has secured the agency for the Splitquick Truck, one of the most prominent among the commercial vehicles. This completes the Bildad line, which now contains in addition to the Splitquick truck, the Lemon gasoline, Pulmonary Electric and the reliable Asthma steam cars."

Mr. Bildad's sales force handled three lines of pleasure cars and the business wagons with admirable impartiality even if the salesmen lacked much detailed and definite information about any of the stock.

There were several New York agencies which sold, or attempted to sell, as many as six different makes of automobiles at once. Gradually the conviction came to the proprietors of the agencies that two lines of different makes represented about the limit for a single store and while there are a number of agencies along Gasoline Row that handle two lines, those that split up their energy by attempting to market three or more, except in such houses as group several varieties of foreign makes or allied types of commercials, are unimportant in number.

The reason for this conclusion is that when the industry developed beyond the experimental stage it tended to become highly specialized not only in manufacture, but also in marketing practice.

There are two factory branches which handle both the pleasure and commercial lines with the same sales force from the same salesroom and seven branch houses and agencies which have both lines but which conduct them separately as to showrooms and salesmen. The remainder center attention on a single line, except as has been noted with reference to the foreigners and the allied lines of commercials, such as the LaCroix agency for foreign cars and the International Motor Company and General Motor Company.

Tendency Is Toward Segregation

Such makes as Packard, Pierce and Peerless handle both lines from their local establishments, but the departments are kept separate with scrupulous care. The White Company is an example of the other phase of the situation where the two types of the automobile art are handled indiscriminately.

The tendency is toward separation and centralization of effort upon a single objective point. The arguments of those who follow such procedure as the White Company are that the fact of handling trucks and pleasure automobiles of one make does not constitute the scattering of energy to any material extent while it does embrace certain special advantages. The main elements of these are that where a business man has purchased an automobile for his personal use and is satisfied with its performance, he is likely to be prejudiced favorably toward the line of trucks manufactured by the same company as turned out his pleasure car. Numerous instances are cited by companies that conduct their business in this way to show that the identical salesman who conducted the sale of the pleasure car in the first instance is the best man to handle the commercial negotiations and in some cases the only man who can do so under the circumstances.

The concerns which separate the two departments argue that bankers, brokers, lawyers and other professional classes which constitute a very large proportion of their total customers, are not interested in trucks. That any energy diverted from the selling of pleasure cars is not counterbalanced by an equal or greater gain in efficiency in selling trucks. That the business men who are interested in trucks may have no interest in pleasure cars, and that while there is a certain advantage in having the successful salesman of a pleasure car conduct the negotiations for truck sales to his own customers, in other respects the idea is not economical.

Among the companies that handle a single variety of automobiles or trucks the idea of centralizing effort is more pronounced than it is in any other type of automobile selling. While there are dozens of such establishments in New York, such as the Abbott, Oakland, Pullman, Moon and Cadillac, the experience of the latter concern is a strong illustration. The Cadillac salesmen are massed to sell one car. They are carefully schooled in the features of their wares, as, in fact, are all the more efficient salesmen of the present. But, in addition to knowing their own car, they are cautioned that the less they know about competitive lines the better will be the results attained.

Their motto is that comparisons are odious; let the other fellow do the comparing.

Both Ideas Have Their Advocates

Within the past year several companies that have had the selling agencies for trucks of different makes than the pleasure cars handled by them have abandoned them because of the radical difference found in the clientèle of the two branches of the automobile business and the amount of specialization required by the salesmen.

They learned that the truck salesman must be a scientist, diplomat and business man rolled into one individual and that when such a combination exists it would be a shame to require him to follow the routine of the average salesman of pleasure cars. On the other hand, they found that the average run of pleasure car salesman is about as far from availability as a truck salesman as it is possible to be.

Maintenance guarantees are not the rule in selling pleasure automobiles, but at the present stage of the industry, operative and maintenance costs as estimated and stated by truck salesmen before sales are a distinct factor. Such procedure may be poor business, but in viewing things as they are, it can not be avoided.

The regular manufacturers' guarantee as to material and workmanship is all that is required of the concern selling pleasure cars. This varies to some extent, running from 90 days to life, and with it the salesman has but little to do. While the usual truck guarantee is couched in somewhat similar general terms as covering these points, the salesman is obliged to show operative and maintenance costs down to the mill per wagon mile and in many instances must guarantee such costs as well as the working of the truck in service.

Unjust as such practice may seem, it is a fact, and dealing with the fact guesswork on the part of the salesman might prove disastrous to the company. Therefore, a much more extended knowledge of all those factors is required of the truck salesman than of his brother in the pleasure car end of the business, just as the pleasure car salesman must possess certain other qualities applicable to his line which would be wasted in the truck trade.

Summed up, the reason for segregating the branches of the automobile industry is based upon the diametrically opposed character of the trade and the reasons for conducting the sales of trucks and cars with the same force and from the same salesroom in the particular instances where that plan has been used with success, is that there is a material relation between the buyers of pleasure cars and trucks. Both views are perfectly tenable from the standpoints of each class of sellers and the reasoning of both is identical up to the final conclusion.

Communications from the Manufacturer

G. W. Dunham, of the Chalmers Company, Claims That S. A. E. Formula for Rating Horsepower Does Not Do the Modern Motor Justice

WHEN a mathematical formula will not give the right answer, it is time that formula was abandoned. When the A. L. A. M. or S. A. E. formula for rating horsepower will not give the horsepower which an engine will actually develop, it is time another method of figuring was adopted.

There is but one kind of horsepower, and that is work accomplished. There is but one way definitely to measure one horsepower—that is by lifting 33,000 pounds 1 foot per minute. One horsepower in an engine is the capability of doing work equal to lifting 33,000 pounds 1 foot per minute.

For instance, a man lifting 33,000 bricks, each weighing a pound and setting them on a platform 1 foot high in 1 minute, would be doing one horsepower of work. If, by means of a hoisting device, he could raise a block weighing 33,000 pounds, 1 foot a minute, he would be doing work equal to one horsepower. Whether it is a man, a steam engine, an electric motor, or some other means of power, one horsepower represents exactly the same amount of work.

In a high-speed gas engine, such as is used in an automobile, the horsepower varies. In the case of the man-lifting bricks, the faster he works, the higher will be his horsepower rating. The same is true of engine work. Thus, an engine developing a certain horsepower at 300 revolutions per minute will develop very much more at 1,000 revolutions per minute and still more at 1,500 revolutions per minute. If properly designed, its horsepower development will be still greater at higher speeds.

It is therefore obvious that, in rating an engine of a certain size, the speed of the engine has a direct bearing on the horsepower rating. An engine with four cylinders, each of which is 4 inches in diameter, with a stroke of 4 1-2 inches, could be given any number of different ratings. Each might be accurate for the speed at which the engine was running when the horsepower was rated. It could be truthfully stated that such a motor was a 12-horsepower motor, if rated at 600 revolutions per minute; or you might say that it was a 20-horsepower motor, if it was rated at 1,000 revolutions per minute; and if it was rated at 1,200 revolutions per minute it could accurately be called a 25-horsepower motor.

Theoretical vs. Practical Rating

It is necessary for comparative purposes to set some speed at which a motor should be rated. Again, there are two ways of rating a motor at a given speed—one is theoretical and the other practical. A theoretical rating may be obtained by figuration, by using a certain formula to arrive at the horsepower.

In some instances, the use of such a formula is the only possible means, as in deciding what size of motor would be required to do certain work. Yet, at best, the formula method is rather misleading.

Where the motor is already in existence, there is a second means—that of testing the motor for horsepower. This means is positive and practical. The motor is connected with a testing apparatus, run at a certain speed, and the horsepower is actually measured.

The Royal Automobile Club of Great Britain some years ago decided upon a formula for computing horsepower which was later adopted by the engineers of the mechanical branch of the A. L. A. M. This formula, rating the motor at 1,000 feet piston speed, was decided upon, in this country at least, by a comparison of results of horsepowers obtained in actual test from numerous motors of various sizes and compressions.

By 1,000 feet piston speed is meant a motor running at such a number of revolutions per minute that the piston will move up and down in the cylinder at the rate of 1,000 feet per minute. For instance, if the stroke were 6 inches, the piston would travel down 6 inches and up 6 inches with each revolution of the motor, i.e., it would travel 1 foot with each revolution. Thus, in that motor, at 1,000 revolutions per minute, the piston would travel 1,000 feet. If the stroke were less than 6 inches, the motor would have to run faster than 1,000 revolutions per minute, and *vice versa*.

This formula was adopted several years ago, and great strides have been made toward motor efficiency since that time. There is something wrong with a motor today that will not develop 50 per cent. more horsepower than its rating by the A. L. A. M. formula. Such a rating is neither doing the motor justice, nor giving the parties interested an accurate idea of the power developed. There is, therefore, a necessity felt for a new rating by which motors of different sizes may be compared. At the present time there is no such formula and there is no standard speed. Various makers are rating motors of the same size at different horsepower, according to the speed upon which they base their calculations.

Explanation of Chalmers Method

In the case of the Chalmers motors, although the old A. L. A. M. rating would not be reasonable, it was thought desirable to stick as close to the once-accepted formula as possible. The most reasonable workout seemed to be according to the old motor speed of the A. L. A. M. formula, and actually test the motors at 1,000 feet piston speed.

Therefore, Chalmers motors are tested at 1,000 feet piston speed per minute, and the horsepower is determined by actual measurement.

The Chalmers 36 develops, as an average, 36 horsepower at 1,000 feet piston speed, or at 1,143 revolutions per minute. Yet, by the A. L. A. M. rating, its horsepower is only 29. The Chalmers Six develops 54 horsepower under the same conditions, but by the A. L. A. M. rating its horsepower is only 43 1-2. Thus, the inconsistency of the old A. L. A. M. formula is apparent.

On the other hand, it would be possible for us to test our motors, as some do, at 1,500 revolutions per minute and claim over 40 horsepower. I know of one instance where a motor of less bore and stroke than the Chalmers 36 is given a higher rating. This is obviously unfair both to the manufacturer who rates his motors at the accepted 1,000 feet piston speed, and to the purchaser who accepts as truthful a manufacturer's rating of his motor. Personally, I consider all ratings made at other than 1,000 feet piston speed distinctly misleading unless the revolutions per minute is given.

Rating the motor in the actual test at 1,000 feet piston speed seems advisable, as this is about the speed of the motor in ordinary actual use. This is obvious, upon consideration, inasmuch as the large motors, with longer strokes, will allow the car to be geared higher so as to let the motor run slower for a given speed of the car than would be possible with a small motor.

GEORGE W. DUNHAM, *Chalmers Motor Company.*

THE OTHO Motor Company, of Boston, Mass., has just reported that any type of storage battery may be used in connection with their starter, which was described in THE AUTOMOBILE for August 22. It was stated in the description that Exide batteries alone were of service with this starter. The demands of the starter are a relatively high amperage sustained for a short length of time as distinguished from a lighting current where a continuous flow at low amperage is a necessity.

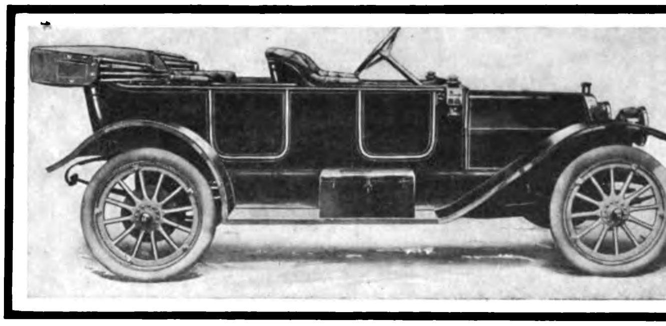

Fig. 1—Halladay model 32 touring car for 1913

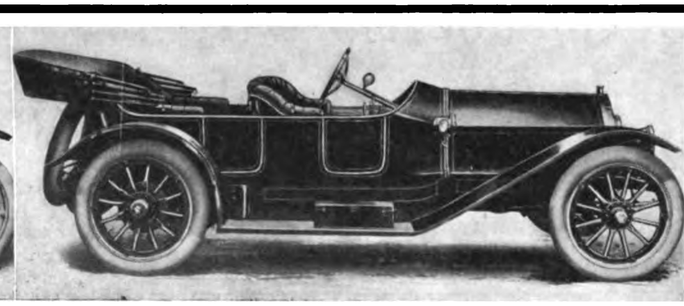

Fig. 2—Six-cylinder model 50 with toy tonneau

Halladay Model 50 Is Now Six-Cylinder

Four-Cylinder Model 40 Is Continued with Minor Changes While the 1912 Model 30 Becomes 32

Long-Stroke, L-Head Motor, Developing Over 40 Horsepower, S. A. E., Is Used in Model 50

THE announcement of the Streator Motor Car Company shows that another American maker has joined the ranks of those who are making six-cylinder cars for the season of 1913. One of the models of this concern has been changed in bore and stroke as well as in number of cylinders and makes the sole six-cylinder car that will be produced for 1913. Other than the necessary changes incorporated in this car which has grown from a four to a six there are no mechanical changes of importance noted in the Halladay line for 1913. This year the three chassis were named the 50, 40 and 30; next season there will be the 50, 40 and 32. Model 50 has now six cylinders; model 40 is continued with minor refinements and model 32, the outgrowth of model 30, remains unchanged except for small body alterations.

The model 50, around which chief interest settles owing to the remarkable trend towards little sixes for the coming season, is equipped with the latest Rutenber six-cylinder motor. It has a bore of 4 1-8 inches and a stroke of 5 1-4 inches. The cylinders are of the L-head type and are cast separately, as may be seen in Fig. 5, where the left or valve side of the motor is shown. The cylinder castings are of soft grey iron and have the valve cages cast integral with the water jackets. The pistons are of the same material as the cylinders and are fitted with four rings. The latter have square-lapped joints and are distributed near the top of the piston, three of them being above the piston pin, while the other is in the same plane as the pin, serving both as a piston ring and as a guard against the possibility of the wrist-pin working its way longitudinally through the piston and bearing against the interior of the cylinder. The piston pins are made from hardened and ground steel tubing with phosphor-bronze bushings.

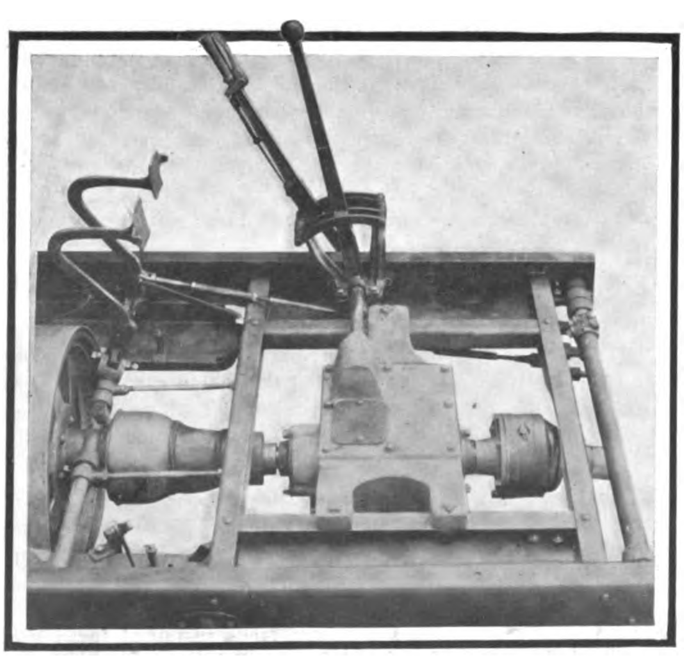

Fig. 3—Control mechanism on the model 32, showing the suspension of the gearbox

The entire valve action in this motor has been given special attention and is worthy of study as it has been made thoroughly up to date and typical of modern valve practice. The camshaft is placed in the same horizontal level as the crankshaft and by this arrangement there is no idler wheel between the camshaft drive wheel and the wheel on the end of the crankshaft. The teeth on these wheels are helical in form and carefully made to insure silence. The camshaft is a drop forging with integral cams.

Camshaft Has Large Bearings

The shaft is mounted on four large bearings lined with die-cast bronze bushings in two parts, which may at all times be taken up should wear occur. The valve tappets are actuated by a specially designed system which has been followed out with the idea of securing the utmost silence at this point. The actual valve follower is a roller which is carried in the center of a short lever pivoted at one end to a special boss which is a part of the crankcase. The bottom of the valve push-rod rests upon the other end of the short lever. Since the cam is applied between the fulcrum and the push-rod the lift on the latter is twice that of the cam follower, which gives a relatively quick opening and closing of the valve as well as a maximum total lift.

As far as adjustments go on the valve action it is only necessary to drop the bottom of the crankcase to expose the whole mechanism to view and enable any one making repairs or adjustments on this part of the motor to reach any desired part. The valve lifter fingers may be removed in pairs from beneath the crankcase and the lower halves of the camshaft bearings may also be taken out singly if desired.

The connecting-rods are long drop forgings with bearings of ample dimensions at each end. The bearings are lined with a special die-cast babbitt material and are split horizontally. Seven main crankshaft bearings are used. They are carried on bridges supported by the upper half of the crankcase. Adjustments on these bearings are made by removing the bottom of the crankcase in the same manner as for the adjustments on the camshaft bearings.

The oiling scheme is a combination of the force-feed and splash systems. The oil is contained in the base of the crankshaft, which is divided into two parts. These two parts are separated by a horizontal partition which forms a cover to the oil reservoir located in the bottom and also a foundation upon which rest the oil troughs necessary in the oiling arrangement. The capacity of the oil reservoir is in the neighborhood of 2 gallons. The oil is drawn from the reservoir by means of a gear pump driven off the camshaft and housed within the crankcase. This pump takes the oil through seven independent leads to the bearings of the crankshaft and sends the lubricant into these bearings under pressure and in great quantities. The oil flows out of both ends of the main bearings, which are the only ones taken care of by the forced feed. The lubricant flowing from the main bearings furnishes the source of supply for the splash, as it runs into the splash troughs which are located below the throw of each crank. As the cranks sweep around a sufficient quantity of oil is scooped up by the bottom of the connecting-rods to lubricate the interior of the cylinder, the camshaft bearings, connecting-rod bearings and timing gears. The entire crankcase is filled with an oil mist which is sufficient to take care of all the bearings in the interior of the crankcase.

Provision for Overflow of Oil

As the oil is supplied to the crankcase more rapidly than the main bearings and the splash systems take care of it, there must be some means of overflow. Standpipes are provided which permit of a flow of the lubricant back to the crankcase whenever it tends to rise above the level of the splash troughs. The oil re-enters the reservoir and is then ready to be used over again. Before again passing to the suction side of the pump, however, the oil is passed through a strainer of fine-meshed screening which will take out the impurities to a great extent. In addition to this the oil supply should be thoroughly renewed every month. An oil indicator shows the level in the reservoir.

The cooling system is taken care of by a large centrifugal pump mounted on the same shaft as the magneto on the right side of the motor. The pump and magneto shaft is driven by a separate gear and carries at the end a pulley wheel from which the fan is driven by a belt. The fan is made of aluminum in one piece and has six blades. A cellular radiator is the remaining factor in the cooling system.

Two entirely independent systems of ignition are used on the model 50, there being no connection at all between the two systems. One system is through a Bosch high-tension magneto, while the other system consists of a set of batteries, coil and distributer. As has been indicated, the Bosch magneto is carried on the same shaft as the water pump. A special connection between the water pump and the magneto sides of the shaft allows either of these two instruments to be removed separately and independently from the other. This shaft is lubricated by grease cups on the ends of long stems which render them particularly accessible when the hood is raised.

A cone clutch is used on the model 32. It is shown taken down in Fig. 8. Leather facing is used on the driven member, which is shown along with the universal joint on the rear

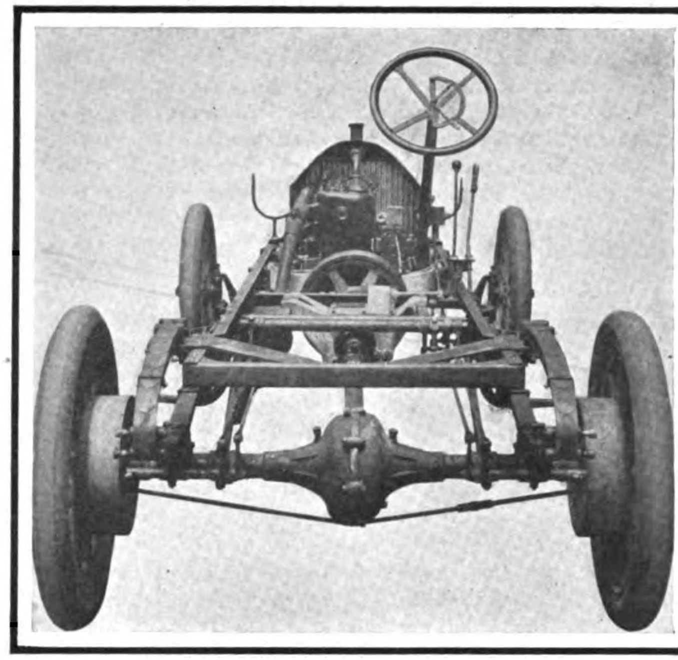

Fig. 4—Rear view of the model 32, showing suspension and details of chassis construction

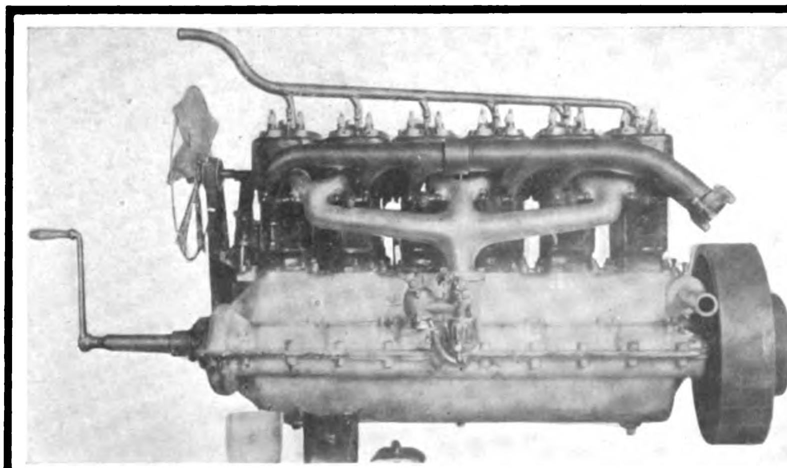
of the short driven shaft in the illustration just referred to. From the clutch the drive is transmitted to the gearset, which is located amidships. The suspension of the gearset is particularly rigid as two independent transverse members are made use of to carry the weight of this part of the transmission. This system of supporting the gearset is shown in the chassis view, Fig. 4. As may be noted, they are of deep channel section and have the advantage of not only supporting the weight of the gearset, but of also protecting the entire framework against racking strains. Four forward speeds and one reverse speed is given by the gearset used on the six-cylinder car. The highest speed is geared higher than direct drive having a final ratio of 2 3-4 to 1, while the direct drive has a final ratio of 3 1-2 to 1. According to the usual usage the direct drive will be the more often used in this case, while the higher speed will become handy for work through open country on very good roads where the high gear ratio may be conveniently used.

Annular ball bearings are used throughout the gearset, while the gears themselves are of chrome vanadium steel. The shafts are of the same material as the gears and are carried on closely spaced bearings. The universal joint between the gearset and the propeller shaft is of extra large size and will permit of considerable disalignment between the shaft and the axis of the



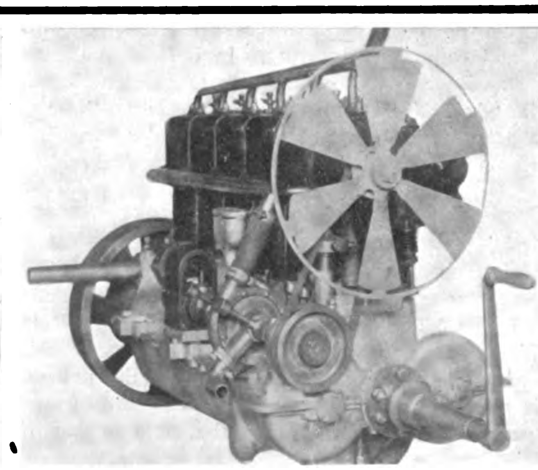


Fig. 5—View of the left side of the motor used on the Halladay model 50, showing the manner in which both intake and exhaust valves are inclosed. Fig. 6—Quarter front view of model 50 motor

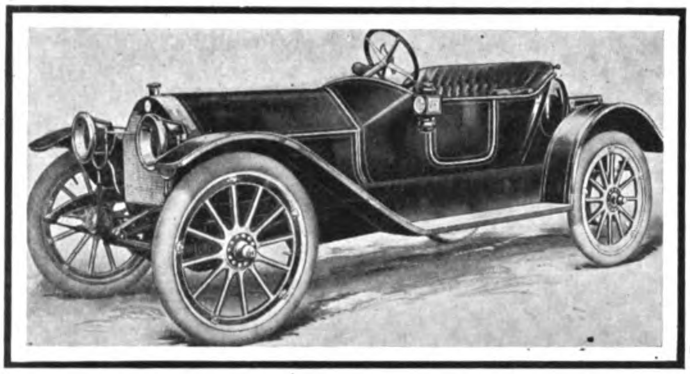

Fig. 7—Halladay 1913 model 40 equipped with roadster body

gearset shaft. In order to take care of the large bearing surface in this universal joint a grease cup is mounted upon it. The cup can be reached by lifting the floor boards just below the driver's seat. The propeller shaft is inclosed in a torque tube of generous size. One end of the torque tube terminates at the forward universal joint, while the rear is fastened to the differential casing on the rear axle.

A floating rear axle supported by a pair of radius rods, also visible in Fig. 4, transmits the power to the road wheels. The axle is carried entirely upon annular ball bearings. The housing of the rear axle which under the floating construction carries the weight of the car is of pressed steel joined in the center. This connection is shown in Fig. 4. In order to reach the differential wheels for the purpose of making adjustments or repairs it is only necessary to remove the eight bolts from the housing, when the entire rear system may be disassembled. Two grease cups are mounted on the differential housing to take care of the annular ball bearings. A strut rod, which is adjustable for tension by means of a turnbuckle, relieves the axle to a large extent of sagging strains and makes the structure in the rear more rigid.

There are two sets of brakes. They are both of the internal expanding type acting on the same band. The springs are three-quarter elliptic in the rear and semi-elliptic in front. All the spring shackle bolts are fitted with integral grease cups. In fact, as may be noted in the chassis view, special attention has been paid to the placing of grease cups through the wearing part of the chassis. The frame members are of straight channel without a drop or toe-in throughout their entire length. The side members are amply supported with deep transverse pieces connected gusseted joints. An irreversible steering gear is used on this car. There are two wheelbases for this model, 134 inches on the seven-passenger type and 128 inches on the four-passenger cars. The tires are 36 by 4 1-2 inches all around.

Model 40 of the Halladay line begins its third season without constructive change but with several refinements in details of body and equipment for 1913. In it is used the same size of motor as in the 50 except that there are four cylinders instead of six. Aside from dimensions of the parts, the construction is almost the same as that of the six-cylinder car. The wheelbase is 118 1-2 inches and the tires are 36 by 4 inches.

Model 32 Has Long Stroke Motor

Model 32 is almost the same as the 1912 model 30. Either a Rutenber or Continental motor is supplied. This is of the long-stroke type with a bore of 3 3-4 inches and a stroke of 5 1-4 inches. The details of construction of the Rutenber motor of this size are the same as those of the larger model already described, while the construction of the Continental motor is similar in many respects. Except for dual instead of double ignition, the general design of the car is the same as that of the larger model.

There is one point about the construction of the 32 motor that is worth emphasizing and that is the size of the camshaft bearings. These are so large that the entire camshaft, cams and all, can be withdrawn through the bearings without removing the latter. The cylinders are offset 1-2 inch from the crankshaft to give maximum torque with minimum friction. The Briggs dual magneto is used. The wheelbase is 112 inches and tires are 34 by 3 1-2 inches front and rear.

Two types of bodies are supplied on the model 32, a five-passenger touring and two-passenger roadster with trunk and gasoline tank on the rear deck. A neat arrangement is used for carrying a spare demountable rim and tire at the rear of the car. Three rigidly supported brackets from the body and frame grip the rim so that no straps are necessary, and the rim and tire are held rigid with no chance for the tire to chafe, as there is nothing with which it can come in contact except the rim on which it is inflated. The cars are all equipped with a provision for adjusting the carbureter from the seat and with ventilators in the dash.

Three bodies are fitted to the Halladay 40, a five-passenger touring, a four-passenger toy tonneau and 2-horsepower roadster. In its external appearance the 40 has been modified somewhat for greater refinement and comfort. The fender lines have been greatly improved. The running boards are made wider and thicker and covered with a very heavy cork carpet and nickel binding. Black and nickel finish has been made the standard. The upholstering has been increased in thickness and 8-inch cushions are used. Foredoor ventilators, demountable rims, dash control on carbureter and the special spare rim holders are furnished as standard equipment. The car also is electrically lighted throughout, the current being supplied by silent chain-driven generator when the car is in motion, and by storage battery when the car is standing still.

The two bodies fitted on the model 50 include a seven-passenger touring car and four-passenger toy tonneau; the equipment is the same as that on the 40.

Credit to Reference Works

In the two articles entitled Metric or English Measurements? which appeared in the issues of August 22 and 29 of The Automobile, credit should have been given to the following publications: W. Hallock and H. T. Wade, Outlines of the Evolution of Weights and Measures and the Metric System; F. A. Halsey, The Metric Fallacy. The parts and figures regarding the two systems of measurement as given in these works proved of great assistance to the author of the articles mentioned.

Disco Starter Improved

Model 16 Possesses Several Refinements Designed to Make It More Certain in Action and Easier to Operate

Distributor Valve Altered to Produce a Better Mixture Ratio—Engine Valve Self-Cleaning

THE Disco starter which will be seen on several prominent cars bearing the 1913 date will have several changes for the coming season. There is no difference in the principle involved in this starter which is of the acetylene type, but the distributing valve by means of which the gas is directed to the motor cylinders has been changed to a considerable extent. The engine valve is now a combination check valve and priming cock which involves a self-cleaning feature. These two new parts with the refinements involved in each represent the changes which have been made over the starter of last year. The model is to be called the Disco 16.

The new distributing valve is similar in principle to the one used on the original Disco starter but the operation is different. With the new distributer needle valve the distributing operation is performed by opening and closing the valve apperture by turning the handle to the right and then back to the closed position. The valve handle as it appears on the dash and also with the dash plate removed is shown in the accompanying illustration. When the starter is not in use the handle must be left in the off, or closed position, which is perpendicularly downward. As the valve is closed when the handle is down it will not be possible for the vibrations and jars to which the car is subject to shake the valve open. The handle is weighted sufficiently to hold it safely in the closed position.

New Valve Gives Two Charges

The valve employed in the past was of the same type but had to be given a continuous turn for one rotation. The new valve gives two distributing charges instead of one on opening and closing the valve handle and a mixture of the correct proportions, it is claimed, will surely be forced into the cylinder by this method. Last year, if it was desired to start the motor while cold it was necessary to turn the handle of the valve two or three times and it was found that there was a tendency among users to give the cylinders more gas than was needed even when cold. With the double charge distribution used on the model 16, it is thought that there will seldom be occasion to turn the handle more than once to the right and back.

The engine valve which involves the priming cup and self-cleaning feature is shown to the extreme right of the illustration. In the past models the priming cup was used in conjunction with the engine valve but the self-cleaning feature has been added for the model 16. When the lever is in an upright position as it is in the illustration, the engine check valve is in operation and is so placed as to admit gas from the distributer into the motor cylinders. The check valve will not, however, permit any of the gases from the engine to back through the tubing to the distributer as it automatically closes against pressure which would tend to return the gases in that direction. When the handle is turned to the left it opens a passage from the priming cup direct into the cylinders so that gasoline may be injected into the cylinders if desired, or the cup may be left open to blow out the cylinders by turning the handle to the right. When the handle is in the latter position the passage is past the ball check and is not closed to any degree by the check.

The weight of the Disco starter complete, exclusive of the acetylene tank, is approximately 4 pounds. It consists of the distributer valve, the engine valve, both of which have just been described, and the necessary copper tubing that connects the acetylene tank with the distributer and the distributer with the different motor cylinders. When the distributer handle is turned to the right and then back to its original position a current of gas has been allowed to flow into each cylinder. This acetylene mixes with the air that is in the cylinder and forms an explosive mixture. The range of explosion of acetylene is very large as it will explode when in the proportion of 63 parts of acetylene to a hundred parts of air all the way to three parts of acetylene with 100 parts of air.

When the acetylene has been introduced into the cylinder it is necessary to fire it in the same manner that would be used in starting on the spark. The switch is turned on and the charge ignited. After the first explosion or two, the engine should pick up its own cycle and continue on the fuel supplied by the carbureter. As there is a charge of acetylene in each cylinder after the distributing valve has been opened, there will at least be four explosions from the acetylene alone, this should be sufficient to turn the engine over at least seven times.

Under Cold Weather Conditions

In cold weather conditions or after the car has been left standing for a long time in cool weather it will sometimes be necessary to put a heavier charge of acetylene in the cylinders or even to run the car on acetylene until it becomes sufficintly warm to run on the carbureter. To run the motor on the acetylene it is only necessary to keep the foot against the handle of the distributer valve, keeping it in an open position so that the gas has access to the cylinders.

In order that the starter will work satisfactorily it is necessary that the engine should balance, that is, at least one of the cylinders must be in a firing position so that when the ignition is switched on there will be a spark in one of the cylinders.

The installation of the Disco starter requires the replacement of the ordinary compression cock by the priming cock and valve previously described and shown in the illustration. The distributer valve is attached to the dash in some convenient location for starting and the copper tubes are run from the distributing valves down the engine valves. The standard valve attached to the acetylene tank is then removed and replaced by a special two-way valve, the larger tube of which is connected to the lamps while the smaller takes care of the starter. The copper pipes are then connected so as to give a flow from the tank directly to the distributing valve. After the lamps have been connected up and all the joints in the tubing made tight the starter is ready for use.

New Disco distributer valve, with and without dash plate; improved model 16 engine valve with self-cleaning feature

Movement for Domestic Motor Fuel Started in Germany to Oust Gasoline—What Mufflers Should Do and How—A Proposed Piston Improvement—Ten Years of Progress in French Automobile Construction Outlined By Expert

ROYALTY Urges Benzol for Fuel—Under date of July 25 Prince Henry of Prussia issued a call to German owners of automobiles exhorting them to turn to benzol as a motor fuel, mostly for patriotic reasons, and it is predicted that this call from the brother of the Emperor and the most influential patron of automobilism in the German-speaking countries will not pass unheeded. In the United States the benzol produced at gas and steel works from bituminous coal is used largely for enriching illuminating gas or is turned back into the heating processes incidental to steel production, while that contained in coal tar is largely wasted at present, but the question of a much-increased production of this fluid is also here entering upon the order of the day, since the price of gasoline has been increased about 33 per cent. during the past six months, and because the demand for benzol for the chemical industries is growing with the advancement of the latter, while coal tar is now required in large quantities for road improvements and for this purpose is more valuable the less benzol it contains. Under these circumstances the German attitude to the subject, as voiced by Prince Henry, becomes a matter of interest, even apart from its probable influence on the design of carbureters for automobiles intended for export to the German market. Prince Henry covers the subject as follows:

"Lately new tests have been made with benzol with a view to the displacement of the foreign product benzine (gasoline) by German-made benzol. A 40-horsepower Benz car was driven, for example, 669 kilometers from Hemmelmark near Kiel to Friedberg near Frankfurt am Main at an average speed of 40 kilometers per hour, and the fuel consumption was only 109 liters of benzol. A 100-horsepower Opel car was driven 680 kilometers, from Frankfurt am Main over Bochum, Dusseldorf, Cologne and back to Frankfurt, at 60 kilometers per hour, using 138 liters of benzol. The fuel efficiency was thus found to be at least equal to that of benzine. And as benzol costs only 24 pfenning per liter as compared with the present price for benzine of 45 pfennig per liter, a saving of nearly 50 per cent. is established.

"Several technical objections were formerly raised against benzol, such as soot formation and overheating of the cylinders. But these troubles can be obviated by suitable modifications of the carbureter, giving an increased air supply. The above mentioned tests, in which the heat generation and soot formation were normal, were made with a "Favorit" carbureter, which is designed especially for benzol. The high freezing point of benzol can be materially lowered by a small admixture of benzine and therefore constitutes no drawback. Of interest, and at the same time an argument for the suitability of this fuel, is the fact that so far more than 20 per cent. of the German benzol output has been exported for use in French automobiles.

"The national interest constitutes however the center of gravity in this matter. The prices of benzine are dictated to us from abroad, especially from America. German automobilism is at present completely dependent upon importations, and this means a great national danger in case of war. Every automobile owner should—entirely apart from the pecuniary saving involved—contribute his share toward a more general employment of benzol which is produced from German coal by German workmen and German engineers, so that in an emergency the benzol industry may be enabled to take care of Germany's needs. Through private negotiations, the German Benzol Society at Bochum, representing the united benzol industry, has with laudable patriotism declared itself prepared to guarantee that the price of benzol will not be raised within a measurable future, even though a strongly increased demand should raise its cost of production by making it impossible to turn out a sufficient supply as a byproduct.

"Therefore, German automobile owners, drive with benzol!" (Signature of Prince Henry).—From *Automobil-Betrieb*, middle of August.

Mufflers Which Increase the Power—In the agitation against the wanton use of muffler cut-outs on automobiles and motorcycles and the total absence of mufflers in aeroplanes and motor boats, the argument offered by those whose earsplitting practice gives offense is mainly based on the assertion that the muffler consumes power and tends to overheat the motor by retarding the escapement of the exhaust gases. L. Ventou Duclaux, one of the engineers connected with the testing laboratory of the Automobile Club of France, writes interestingly on this subject, in part as follows:

When the cylinders of a motor are fitted with exhaust pipes of a few centimeters in length, the burned gases which are expelled under pressure at the moment when the exhaust valve is raised from its seat strike the atmosphere at once. A clash is thereby produced to the right of the exhaust orifice, and it is this clash of gases which makes the noise. There is also established a counterpressure which has the effect of hindering the evacuation of the cylinders. Any expedient which serves to reduce this counterpressure results in reducing the noise of the exhaust.

On the other hand, if the escape of the burned gases is assisted in any manner it is possible to avoid losing power at the same time as the noise is reduced, and in certain cases power may even be gained through the suppression of the noise Already several years ago Mr. Lumet proved by tests made in the laboratory of the Automobile Club that for any given speed of a motor it was possible to add a little to its power by fitting it with exhaust pipes of a certain length. The muffler contest of 1905 had previously demonstrated that a certain muffler pattern dampened the noise without absorbing power but also that the majority of mufflers consumed a notable percentage of the motor power.

The muffler problem comprises two elements: (1) so far as the noise is concerned, to devise an apparatus which will make the burned gases empty into the atmosphere at a minimum speed and (2) so far as power is concerned, to promote the flow of the gases.

These two problems are usually solved simultaneously. It is sufficient to produce in an enclosed space of suitable capacity a decided cooling of the burned gases immediately at their exit from the motor. The cooling reduces their volume and consequently their speed. This cooling process must however not go beyond certain limits, as otherwise more power will be spent in producing it than can be gained from its effects. It can be brought about either by expanding the gases suddenly in a considerable space or by making them pass through tubes surrounded with circulating water. The same result can be obtained by circulating the hot gases in contact with baffle plates which absorb some of their heat, and leaving it to the apparatus to get rid of the heat by radiation. But in apparatus of this class power is necessarily consumed, since they block the exhaust more or less. Some constructors have also tried to reduce the speed of the hot gases by directing them into jets with opposed nozzles and playing one stream against another, creating eddies, but this method has not given good results.

In order to obtain the best results it seems necessary to cool the gas as much as possible while leading it out with a minimum of friction against the walls of the apparatus. It is consequently useless to aim for a radical cooling of the gases, for this cooling takes place so much more slowly as the difference is less pronounced between the temperature of the gases inside of the piping and that of the atmosphere, and experience shows that the resistance caused by passing the gas through the long piping, which may be necessary to effect such complete cooling, means a power loss. In fact, mufflers have now been designed which choke the noise very well and at the same time add slightly to the power. Tests made recently by the Automobile Club of America on 4-cylinder motors showed that a muffler, the origin of which is left unmentioned, produced the following results:

At 300 revolutions 13.5 horsepowers, as against 13 horsepowers with open exhaust.

At 1000 revolutions 43 horsepowers, as against 41.5 horsepowers with open exhaust.

At 1800 revolutions 47 horsepowers, as against 46 horsepowers with open exhaust.

Still more recently tests have been made at the laboratory of the Automobile Club of France with a Galaine muffler which is composed of three concentric tubings. The tube of smallest diameter is open at both ends and forms the part which is fitted to the exhaust conduits of the motor. It is cut with slits at right angles with its axis. The second tube is pierced with holes. The third is external and has no apertures. The burned gases are divided in two portions. One follows a straight line and empties directly into the atmosphere. The other passes through the slits of the inner tube and the holes of the second one and mixes in the final discharge with those which have followed the straight course. Toward the end of the apparatus an ejector permits the escape of the deflected gases. The passage of the gases in the central tube creates suction, drawing gas back through the slits and holes and further facilitates the expansion and discharge of the deflected gases.

A Renault 4-cylinder motor, 75 by 120 millimeters bore and stroke, fitted with this apparatus developed 7.08 horsepowers, while with free exhaust it gave only 6.72 horsepowers, which represents a gain in power of 5.35 per cent, all the while the noise of the exhaust was very satisfactorily obviated.—From *La Vie Automobile*, August 17.

Trémolières Piston—Representing one of the first rational attempts at the improvement of piston design, with a view to the reduction of friction and safeguarding of the compression, the Tremolières piston was recently mentioned in these columns (THE AUTOMOBILE, July 18), the description being taken from one of the French automobile publications, but it would appear from the illustrations reproduced herewith, which are of a more definite character, that the description first offered was incomplete or misleading in some details. The objects aimed at in the Trémolières design are the retention and equable distribution of lubricating oil over the whole rubbing surface of the piston, and the means adopted for this end are oil-retaining grooves, connected by cross-channels and a considerable reduction of the actual rubbing surface below the piston rings. Fig. 1 (1) gives a view of the complete piston (with the piston rings A released from the confining pressure of the cylinders, so that the ends of the rings do not meet). Fig. 1 (2) shows the relations between the cylinder wall G and the piston surface below the piston rings, and Fig. 1 (3) shows details of the piston rings and the oil channels *a*, *c* and *d*. Those marked *a* are circumferential grooves upon the rubbing surface of the rings, while grooves *c* connect one ring's oil supply with that of the next one and grooves *d* carry oil behind the rings. BB are oil retaining zones turned in the piston surface, so formed that the lower portion *b1* of each zone acts as an oil retainer during the upstroke and the upper portion *b* likewise during the downstroke of the piston. CC are grooves connecting these zones. Only the lowest zone B1 is isolated. DD are the zones which remain in rubbing contact with the cylinder wall save for the oil films which the gas pressure and the resistance to the piston movements carry unto them from the adjacent oil-retaining zones. It is said to have been demonstrated that this construction—the weight of which, as compared with that of ordinary pisons, is not mentioned—has produced an increase of power and a velvety piston action in a number of French motors in which it has been tried.—From *Omnia*, August 17.

—

Progress of Ten Years—An analysis of the changes which automobile design has undergone since it was first thought to be approaching finality is presented by the well-known engineer and editor, Charles E. Faroux, and is reproduced in the following with abbreviations.

It was during the first two years of this century that the operation of automobiles became sufficiently safe and regular to assure them their place among the standard means of transportation. Before that time all had been groping, and many automobiles of strange appearance were seen, but, as many will remember, from the year 1902 people began to recognize the different manufactures by the shape of the motor hood, which is equivalent to saying that other differences in the chassis became too inconspicuous to attract the notice of the general public. The age of refinements had begun. In looking backward over the period of ten years which has elapsed since, we shall see that certain organs of the automobile have been the object of a rapid evolution, that others have remained almost what they were, and that some, after undergoing various changes, have returned to the forms first given them.

The motor ten years ago was heavy and had small power,

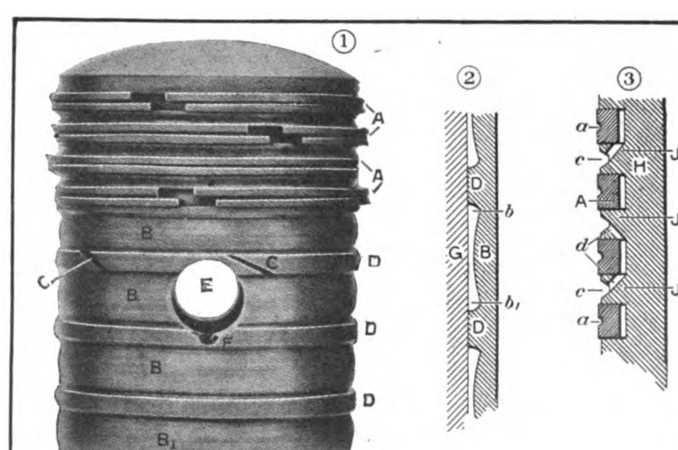

Fig. 1—The Trémolières oil-distributing anti-friction piston

low compression and small speed. It turned at from 750 to 900 revolutions per minute. Only a few single cylinder motors reached 1200 or 1400 revolutions and gave rise to technical arguments from which in course of time they have emerged victorious. Piston speeds and mean pressures were very low and the weights of reciprocating masses were considerable. The two-cylinder casting was the rule, the monobloc unknown. Admission valves were actuated by suction and the cam shaft gears were often exposed. The motor was regulated by blocking the exhaust on the hit and miss plan. Throttling was unknown. The unclutched motor turned in a series of spurts and checks, with the governor spasmodically tending to maintain a constant speed by the inadequate means just mentioned. Variations of the vehicle speed were obtained by maneuvering with the gear speed levers. The small 4-cylinder motor did not exist, and the number of cylinders was in practice determined by the power it was desired to obtain. Up to 8 horsepowers the motor had one cylinder, from 8 to 12 or 15 it had 2 and only above that 4. Six and 8-cylinder motors were in the state of samples or projects only.

Lubrication was effected by splash only. Variations related to the means for getting the oil into the crankcase—by hand pump, by gravity or by exhaust gas pressure. While valves were automatic, carbureters were not so. Their biblical simplicity included merely a float chamber and a jet. It was not till 1903 that Col. Krebs introduced automatic regulation of the gas mixture acting on the air supply, and later came the modern apparatus acting on the fuel, by which perfection is almost realized.

Ignition at that time was the nightmare of the chauffeur. Electricity by degrees triumphed over hot tubes but had for its source only dry or storage batteries. An ignition system for four cylinders involved a network of wires and of organs for the distribution and transformation of current which gave the driver many a sweet pause of perplexity. Low tension magnetos with wipe spark were placed in the market, but it was a long time before apparatus became known which would function for hundreds of thousands of kilometers without a murmur of trouble.

Vehicle frames existed in all possible variations excepting the one which is now standard; that of pressed steel. Panhard used armored wood. Charron forced wood into a steel tube which was afterwards rolled flat. Some used the rolled structural steels of commerce, but a large majority used the drawn tube borrowed from the bicycle industry, only larger. While strong and light, the latter did not lend itself well to convenient and sightly methods for mounting the various organs of the vehicle or the carriage body. The pressed steel frame first appeared in 1903 and gradually displaced all other forms. For axles, tubes were used and also solid oval or rectangular sections of forged iron or soft steel. The I-section came only with the Mercedes school of design which brought us annular ball-bearings, push-pedals, honeycomb radiators and multiple sliding gears with lateral displacement; also the modern form of the front wheel spindle and its mounting. Some firms continued to use adjustable ball-bearings, of the bicycle pattern, in the wheels up to 1906.

The rivalry between wood and wire wheels was sharp at this period, and the victory of the wood wheel seemed definite in 1903. Yet, the wire wheel returns now to give it battle again, but in demountable form and with many improvements. Vehicle springs were nearly what they are now, only shorter, more arched and less flexible. Often the rear springs were placed directly under the chassis, but on the whole the progress in spring suspension has been slight except in the matter of shock absorbers and elastic shackles which were unknown in 1902. [Shock absorbers were used on motor cycles and some racing *voiturettes* in France at that time, however, and auxiliary springs mounted as elastic shackles were known in the United States. The improvement in alloy steel spring materials which has taken place after 1902 would also seem to be so important a factor that the progress in spring suspension must be said to have been anything but slight or insignificant.—Ed.]

The cone clutch with leather facing was generaly adopted but was far from possesing the qualities which it has acquired since. It wavered between slipping and seizing. It was often mounted upon the transmission shaft and the cone easily came out of alignment with the flywheel. The clutch spring was usually supported on the motor shaft. The mounting of the cone on the flywheel axis, the equalization of the engagement and the interpositon of universal joints between the clutch and the gearbox were important improvements. The multiple disk clutches and the plate clutches were at the beginning of this period only projected.

Gear changes were in most cases made by the sliding gear system, though some belt transmissions still survived as well as some epicyclic gears actuated by expansion rings or brake bands. But the gearboxes gave three or four speeds by means of a single shifter, which made them very noisy by reason of the length of the shafts and the resulting vibrations. Peugeot, however, had multiple shifters controlled by cam grooves in cars with horizontal motors, which arrangement has been readopted in another form more recently. [The author refers perhaps to the cam-controlled gears in one of the Panhard motor trucks.—Ed.] But the lever with lateral displacement and its simple and direct control of the shifter forks was not known in France. Only the Mercedes cars were equipped with it. Direct drive on the high speed existed in Renault cars but was not general.

Bearings were usually of the parallel type and if ball bearings were used they were of the adjustable cone and cup pattern. The steels used in gears and for cutting gears were not those to which we owe the silence and strength of modern cars. The battle between chain and shaft drive had just begun, and the Paris-Vienna race, in which the light shaft-drive cars won, became the signal for the commercial victory of shaft-drive construction. It is notable that its first form was the same in the large features as that which won out recently at Dieppe: Two universal joints; the springs clipped to the axle; no push struts or torsion tube; all stresses transmitted through the springs.

As for worm drive it may be supposed that none had been thought of, but as a matter of fact a Dietrich car with horizontal motor was equipped with worm drive to each of the rear wheels, and Louet constructed a rear axle worm drive which he brought out in 1903. While the wheels and the cardan shaft drive seem to be returning to the forms in which they first appeared, other organs have remained practically unimproved; especially the brakes. Little has been done since 1902 to improve their efficiency. About 1904 the external camel's hair brake bands gave way to internal metallic brake shoes. That is about all. We still absorb the momentum stored in the fast-moving car by first transforming it into heat by means of friction. Braking by the motor has not yet become general, perhaps by reason of the cost of the required construction. The steering system was established so well in 1898 that the improvements effected since that date relate only to those refinements which make the guiding of a modern vehicle so easy. The steering post has been given more slant, the tie-rod has found shelter behind the axle, lubrication and facilities for taking up play have been provided where needed, but the general design remains unchanged.

From this brief synopsis of the changes which have come over the automobile during the past ten years it will be seen that, although the chassis in its external aspect differs but little from its progenitor of 1902, the sum total of improvements in the design of details coupled with the gains accomplished through the use of better materials and a complete revolution in production methods make the vehicle of 1912 stand apart from the earlier type as sharply as modern man is distinguished from the cave-dweller. And in this résumé no account is taken of the advances in the forms and conveniences of the carriage work.—From *La Vie Automobile*, July 27, August 10 and 17.

American Cars in England

Change of Opinion Regarding Our Product and Increased Sales Command Formulation of British Defense

Organ of English Industry Voices Sentiments and Ideas of United Kingdom's Manufacture and Trade

FOR the past few years, during which the average price of the American automobile has been lowered continually, the manufacturers of this country have made determined and concentrated efforts to break into foreign markets, especially those of Europe, Great Britain and Australia. They have been singularly successful in the case of the last-named continent, while their success in continental Europe has so far been rather limited. But in England, the number of American cars has been increased constantly of late, and this development has given rise to a serious agitation of the British industry and trade.

While, in the beginning, the Britons rested on the hope that the inferiority of the American product would soon stop and nullify the influx of such cars, as the British imports of American bicycles had lasted only a short time, the trade of the United Kingdom soon proved to be mistaken. As *The Motor* (London) recently remarked, the Americans had learned their lessons in the bicycle days and now profited thereby. The quality of cheap American automobiles is never out of proportion to the price paid for them, and, as a result, their market among the middle class is constantly increasing.

Our above-mentioned contemporary has analyzed the situation and has arrived at the conclusion that the American success in Great Britain is due to five reasons: (1) To the low cost of production and low price of the cars, which is made possible by the standardized production methods applied in their manufacture; (2) special inducement to the purchasers of the cars in offering them completely equipped machines, which gives the car the appearance of a bargain in another way; (3) the ample reserve power afforded by the use of relatively large power plants; (4) simplification of the mechanism, that is, power plant and driving units; (5) energetic business methods.

Merit of Our Product Recognized

The fact is, that, though for years American cars were called nasty and cheap, the British public has come to recognize that the Western product is not only a mechanism by the use of which one may gain automobile experience for little money before investing in a larger and more costly car of European or British make. The people have come to see that the American automobile is a low-priced but meritorious product, the cheapness of which is due to the great production of American plants and the standardized basis on which this production is attained. True, the low-priced American car is not on a par with the refined machines turned out by several high-class European factories; but, as the former gives satisfactory service and has a fair length of life, it appears to be worth the money which the British pay for it.

A connoisseur or expert will, in most cases, buy an automobile at any price, provided the quality of its material and workmanship warrant longevity. But even they do not buy with a view of keeping a car forever, and this would be the only condition under which the average purchaser could afford to invest in a high-priced car; so that every reasoning induces him to choose a low-priced machine. For him the American automobile is the solution of the problem, and the satisfaction which the buyers of these cars get out of their machines serves to constantly increase the sales of the latter.

The great engine power and simplicity of mechanism in American cars are bound to impress the purchasers favorably. In addition to the relative cheapness of American machines, these factors complete the democratic appearance which always attracts the average buyer. One more factor tending to strengthen this impression lies in the American business, that is selling methods which are named as the fifth large cause of the progress of American automobiles in Great Britain. The American salesman, shrewd and direct at the same time, and to whom salesmanship has become a science, is entirely different from his European confrere who always stands on a different plane than his prospective, either above or below him. The congeniality of the American salesman toward his customers is one of the largest factors in the introduction of United States products in foreign countries and is one of his greatest assets, which has proved valuable all over the world. His competitors may despise his methods, but they are all beginning to recognize their effectiveness, and ultimately will come to adopt them at least in some measure unless they desire to sacrifice their trade.

The English are beginning to see that nothing except concerted effort of all their automobile industry and trade could stop the American tide or turn it to advantage. As *The Motor* (London) says, the battle will have to be waged in every department from the designer to the advertising man and salesman. Americanization, vaccination of British effort with American ideas, is the only way of balancing the invasion of mass-produced automobiles. It will not do to merely build small and cheap machines which are miniature copies of the large, expensive ones; the lesson to be learned cannot be learned from any but Western teachers.

Automobile Business a Pioneer

It may be said that the coming of such a transformation as is foreshadowed by the British article cited several times, marks the beginning of an era of general introduction of American industrial and business methods throughout Great Britain and Europe. It is the era of scientific management, of maximum efficiency, of the most practical application of science which has been conceived by American business engineers under the pressure of American conditions. The foreign industries may not see the advantages of scientific management as yet, but they are bound to awake to them sooner or later and to avail themselves of this new key to the still unclosed gates of success. The start which we have, on this side, in this new line of effort, is sufficient to keep America ahead in the race, provided she keeps pace with foreign engineers and the work evolved by them.

And how is supremacy to be preserved by us? The first steps have been made; engineers are constantly traveling to Europe and Great Britain to study the developments of quality made by the engineers who are active there. This work must be continued and increased by established and developing engineers who not only visit the factories to study the results of foreign work, but also the mental methods by which transatlantic engineers develop their new ideas, by which they work out the improvements of present designs and constructions. If there is one field in which we have much to learn from foreign engineers, it is their methodical thinking methods, for it is only on the strength of this that European automobile engineers have been developing, during the last few years, mechanisms which have entirely changed the appearance and the construction of automobiles. Of course, it was not all their work, but their work, done in proportion to their number, was very remarkable.

What Will Be Required of Us

In competing with the British we have to proceed from quantity to quality, while they must go the opposite and more difficult way. It is for us to take prompt advantage of this fact. In doing so, we have a wide basis to build upon and whatever materials and tools and, last but not least, money, there is required in the developments we have to undergo, is at hand. But the well-determined effort to overcome our shortcomings and attain whatever necessary qualities we do not possess now, is all that is necessary for our success.

Checking Cars in Garages

There Are Two Ways of Keeping a Record of the Time When Cars Enter and Leave the Building

Checking Sheets and Time-Clocks Have Advantages if Utilized in the Right Way

MR. AUTOMOBILE OWNER: If you were to be summoned to court today and another car owner claimed that his machine was damaged in a collision with your machine last night; if you knew you had been at home last night and that proving an alibi for your car could save you the expenditure of a large sum of money for damages; would you be in a position to conclusively establish such an alibi? This case may not happen frequently, but such an incident may occur at any time. Is not the logical conclusion that an owner should know the whereabouts of his car during every hour of the day or night?

Mr. Garage Man: You are in a position to keep for the automobile owner entrusting you with the care of his car a full record of the time when his car enters and leaves your garage. He wants such a record, he needs such a record; and it is you, and only you who can provide it. It is your business to watch over his car while he is not using it. You may not be legally obliged to keep such a record for him, but knowing that service, complete and efficient, is the one basis on which you may build up a large and profitable business, you will not refuse his just demand. There is a choice of means and ways by which you may keep such records for your patrons, and the more elaborate and reliable they are, the more valuable will be the result of your effort to yourself and to your patrons.

There are two principal systems of recording the time at which cars leave their garage and return to the same. They differ as to the degree to which the personal equation is involved in their execution and to which the possibility of a mistake enters into them. The first system consists in the use of large sheets which are suspended on boards near the garage entrance and on which the number of every car and the name of its owner, together with the time, are entered every time the car passes through the door. The second system consists in the use of a daily clock card for every car in the garage. The time clock and card rack are in the charge of a special boy or clerk.

It stands to reason that both of these systems, if carried out with an efficiency of 100 per cent., work equally well. But in this case the second system has a considerable advantage over the first, mainly because once the cards are filled out with the name and number of every car, the clerk has nothing to do except to stamp them from time to time. In the first system, on the other hand, the name and number of the car, perhaps even the name of the driver, must be written on the sheet by hand, in addition to the time of the car passing through the door. This shows that in case of a large garage, where a car passes through the door every minute, the sheet method of recording cannot be kept up save at the expense of correctness, as the man entering the times on the sheet is bound to get very tired in a short time.

In selecting a time system several things have to be taken in consideration. These are:

1—The number of cars kept at a garage.

2—The average frequency with which the cars housed at the garage leave and enter the same, giving an idea of the average number of times a car passes out of and into the garage in a day.

3—The resulting average number of cars passing through the door during an hour of the average week day with average weather.

4—The class of patrons the garage caters to and their expectations of service; that is, the extent to which they expect the garage to keep tab on their chauffeurs.

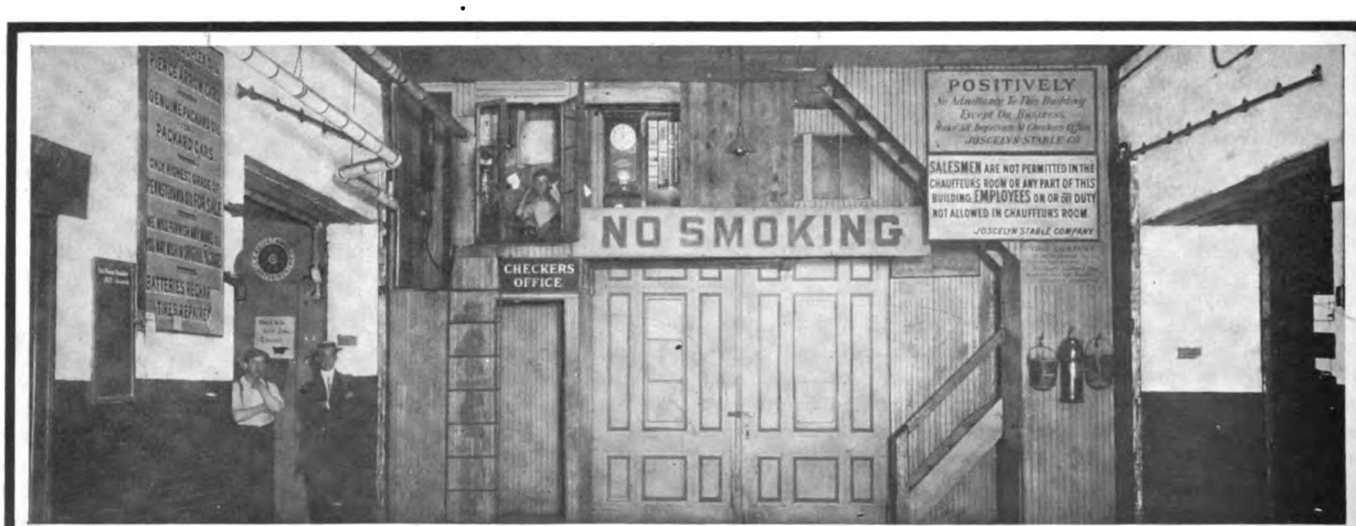
The sheets used by various companies for recording cars entering differ greatly in the way the details of information are arranged on them, and we therefore refrain from illustrating a large number of them, giving only a few representative designs which contain practically every point brought up in connection with this class of records.

Number of Cars Served a Factor

It is a matter of course that the number of cars served by a garage has a large bearing on the design of a checking sheet. If there is a large number, say more than a score, of cars kept at the garage, there should be not more than one line a day devoted to each car.

There are patrons who are less particular about the whereabouts of their cars during the day than others. As a rule, however, an automobile owner prefers to know his car is in the garage when he is not using it; for, while there are some chauffeurs to whom one may safely entrust the car, these can hardly be said to be in the majority. Most owners are very positive about their desire to have no one except themselves use their cars. The more strict the patrons of a garage, the more positive and unfailing must be its records.

One form of recording sheet which is very elaborate and gives an opportunity to enter a car on four trips a day, that is, leaving the garage four times and returning, is used by the White



Entering the Joscelyn Garage, New York City, every car passes the checker's office where its time is recorded by a stamping clock

RECORD OF CARS

NAME OF OWNER	NAME OF DRIVER	TIME OUT	TIME IN	REMARKS

Form 1—Checking sheet used for its own cars by the White Company. Form 2—Checking sheet used for infrequent callers in the Packard establishment

company, 631 West Fifty-seventh street, New York City. This blank, Form 1, is 1 by 2 feet, is of white paper, ruled with red and blue lines. It provides a space for entering the name of the car owner, that of the chauffeur if he drives the car, and the license number of the car.

Form 2, which is shown under Form 1, is used by the Packard Motor Car Company, of New York, for cars coming in for repairs. The names of the owner and driver of each car are entered on this sheet, together with the time of arrival and the time of departure. The Packard company does not conduct a public garage and therefore this system covers comparatively few cars per hour. Moreover, the case of cars coming in once and then not for another month or so, makes it impossible to use a system other than a sheet on which the cars are entered by hand.

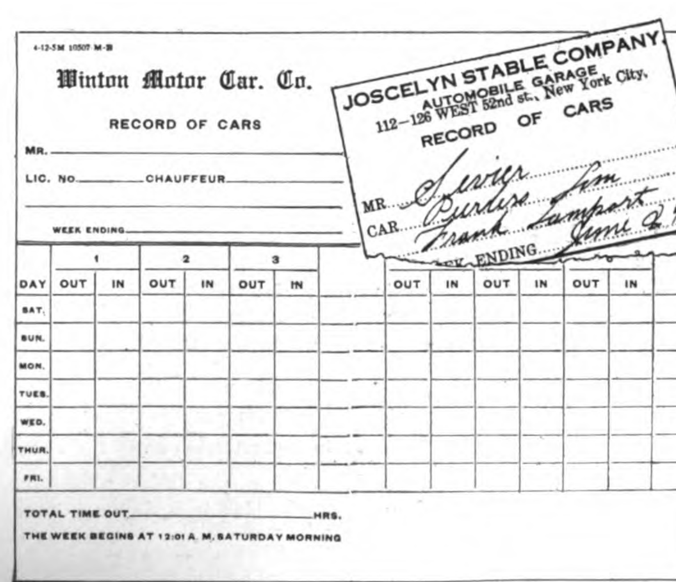
Packard Has Time-Clock System

For its own cars, demonstrating machines and those owned by members of its organization, the Packard company uses a time-clock recording system, in which the International type of recorder is used, together with recording cards of the ordinary design. As Form 3 shows, this type of clock card differs very little from the sort used in keeping time of shop workers. The design is practically the same, only the six columns are named differently and allowance is made for the names of car owner and driver on the card, as well as for the number of the car. Another difference between this card and the shop time card is that the design here shown is twice as wide, but folds to the ordinary size, so that it may be kept on the common type of card rack. The double card, however, gives an opportunity for making twelve records on it, six each for entering and leaving the garage. The cards are kept on the rack in the alphabetical order of the respective owners' names.

Form 3 is used by the Winton Motor Carriage Company, Broadway and Seventieth street, New York City, and is made in duplicate, one copy being on a tan pasteboard card and the other on thin white paper, which is sent to the car owner at the end of the month. If the owner also keeps track of the times when he uses his car, it is easy enough to see whether his driver takes the car out without his knowledge. The Joscelyn garage uses another type of clock card, which differs but slightly from Form 2 and is shown as Form 4.

The latter company handles 300 automobiles daily in the busy season and the cars pass by the recorder at a rate of one a minute. To insure the recording of every car and give the recorder a wide range of vision, he is located in a balcony about 15 feet above the ground, whence he can see part of the interior of the garage as well as the door which is opposite his post.

Opinions on the value of checking systems for cars are naturally divided, and, while the advantage of having a record is not to be underestimated in certain cases, there are also arguments being raised against conducting a recording system. One of the greatest advantages became obvious in the case of a New York automobilist several months ago. His car was said to have been seen at a certain time and place and to have figured in a collision. The records, however, showed that the car was in the garage at the time and the owner of the car thus had an excellent alibi. On the other hand, some garage men hold that most recording boys or clerks are other than absolutely reliable and therefore subject to being bribed by chauffeurs who want to go out on a joy-ride without having any record made of their departure. One garage man put the situation in this drastic way: "If your chauffeur goes joy-riding, fire him and get one who does not." He was very positive in contesting the value of a system in which the personal equation left any opportunity for error and fraud and stated that few owners demand that the garage keep tab on their chauffeurs. There is little opportunity for such abuses, however, if records are made with a carbon copy which is mailed to the owner.



Form 3—Winton's time-clock card, which is made in duplicate
Form 4— Joscelyn Garage uses similar clock card

Has Trouble with Gear Shift

EDITOR THE AUTOMOBILE:—I have noticed the discussion in the issues of THE AUTOMOBILE for August 1 and 8 on gear shifting and would like to state my case.

The machine is a 1912 Maxwell Special and shifting from low gear to intermediate makes a grinding noise. The heavier the car is loaded the louder the noise. From intermediate to high it is all right. After shifting gear, on any speed, the clutch makes a rumbling noise along with jerking of the machine.

This machine has metal multiple-disk clutch and progressive type transmission.

I have taken all the grease out of the gearbox, but can find nothing wrong except that the end of the square shaft that carries the sliding gears toward the clutch has about 1-8 inch play. Should the bronze bushing that it runs in be loose in this bearing? I also notice that the countershaft runs at the same speed when shifting from low gear to intermediate as when the gears are engaged. It also runs at a high speed when the gears are standing in neutral position. This shaft will stop running only if the clutch pedal is pressed clear down to the floor board, but this cannot be done when the car is in motion as the brakes, being connected with the same pedal, will stop the car.

The clutch has been washed out with gasoline and new oil put in the clutch box. Any information you can give will be greatly appreciated.

New Albany, Ind. F. KAHLER.

—You are evidently troubled more by a dragging clutch than anything else, although there might be a small amount of trouble in the clearance you mention. You have probably noticed that you are compelled to move the clutch pedal through considerable distance before the clutch begins to disengage. This should not be the case, for, in this car, the brake is interconnected with the clutch and should you be compelled to press down too far the forward progress of the car is checked on account of the application of the brakes. The clutch should be adjusted so that the pedal will act more quickly in disengaging it. The linkage of the clutch is shown in Fig. 7, as is the point for making the desired adjustment, the latter being marked A. The length of this lever can be changed to bring the pedal to the desired position.

The play which you mention in the bronze bushing should not prove serious other than having a tendency to make the car noisy on low gear. It would be well to give the clutch another thorough cleaning with kerosene or gasoline in order to be sure that it will be in its best condition.

Jay Eye See Dimensions Given

Editor THE AUTOMOBILE:—Will you please tell me the bore and stroke of the Jay Eye See car? Has it a six or a four-cylinder engine?

Alton, N. H. H. B. TIBBETTS.

—The Jay Eye See car is a four-cylinder Fiat machine. The motor has a bore of 9 1-3 inches and a stroke of 8 5-8 inches.

Does Not Like Splash System

Editor THE AUTOMOBILE:—I have been very much interested in the discussions that are being carried on through the pages of THE AUROMOBILE and believe that there is room for one very valuable one along the lines of whether or not the splash system of lubrication has really justified itself. I am a firm believer in the force-feed system, because it puts the oil in the spot where it is needed, and, what is more, puts the very quantity that experience shows is required into each particular bearing. I believe that when the motor speeds up to a considerable extent the splash system does not adequately take care of the lubrication, unless there is some auxiliary means of adding to the supply in the crankcase by the use of a small hand pump or some other such device. Besides the drawback at high speeds, it has another at low. That is when the car starts off there will generally be a large cloud of blue smoke emitted which alone shows that much unnecessary oil is being burned. When the motor is running idle at the curb with a splash system of lubrication it does not take the spark-plugs very long before they become choked to such an extent that the motor dies. I am at a loss to know what the defense of the splash system can really be when it would not be very much more expensive to install a good non-splash system.

Newark, N. J. LOUIS BOURGEOTTE.

Likes the Metric System

Editor THE AUTOMOBILE:—I have read with much interest the first part of your article on Metric or English Measurements, and wish to be allowed to make a few remarks on just one point.

You say that "workmen are all educated to the foot, inch and yard system and it would take considerable time to get them accustomed to any other method of determining the size of any piece."

I take exception to that statement, as my experience is to the contrary.

When we established our American factory a year ago we decided to keep the metric system so that our parts could be interchangeable with the parts made by our European factories. I wish to say that we have never found one workman who had any trouble on account of figuring in millimeters. Our operators throughout use metric scales and metric micrometers, and I wish to say that the use of this latter is somewhat easier than that of the English one, as the pitch of the micrometer screw is exactly ½ millimeter, whereas the pitch of the English micrometer is 1/40 inch.

I agree with you that changing from one system to the other would be rather expensive, as it would involve a change in the machinery and a change in the measuring devices.

The automobile industry in France, with which I am familiar, uses a great deal of American machinery, which is proof that the builders are able to supply machinery built for the user of the metric system. In fact, I have catalogues of American tool makers which offer the choice of either English or metric adjustments, according to the desires (and wishes) of the purchaser of the machinery.

I believe that the changes made would affect only such parts as lead screws or nuts in lathes or milling machines, and, of course, in some cases, changing these parts would involve considerable expense and delay.

Changing of measuring devices would, in most shops, be still more expensive, but, once this change is made, would not the saving in time in the drafting room alone pay for it in a very short time?

Detroit, Mich. G. R. HEFFLY, Zenith Carburetor Company.

Considers Radiator Useless

Editor THE AUTOMOBILE:—For one interested in the internal combustion motor the unraveling of its mysteries is an absorbing study. The individual views and ideas are so varied concerning it that the beginner in search of information thinks that a book telling all that is known and unknown about it would be a big volume, especially the unknown part. Speaking of two-cycle or four-cycle it seems to me that the four-cycle can be so improved as to enable it to easily surpass the two-cycle. A lively discussion in a journal is an interesting and useful source of information, and Mr. Tismer, in his Communication, states he is looking for a fight and moves to abolish the radiator. As to that, I can heartily second the motion, for, to me, the almost general use of this device is no positive proof of its necessity; but his statement, "one but has to look over the efforts to improve engines by more perfect scavenging and the failure of those efforts to look askance at an attempt towards improvement in that direction," seems to lack the pioneer-like traits of character that he deplores in "present practice." This has induced me to send in a description of not only an air cooling arrangement, but also a scavenging arrangement that is, I believe, about as nearly perfect as anything that can be secured. I invite free criticism. Referring to the sketch, Fig. 1 represents the completion of the explosion stroke. As the crank reaches the outer, or lower, dead center the slide valve begins to open and is wide open by the time the piston begins its return stroke. The burnt gases, if under any pressure, go out under their own volition and are further expelled by the returning stroke of the piston until it has almost reached the port, when the cam on the half-time shaft begins to open the poppet exhaust valve at the top of the cylinder. The piston, passing the slide valve port, continues the expulsion of dead gases from the upper end of the cylinder through this poppet valve unto the end of its stroke. Meanwhile, the shaft, operating the slide valve, running at crankshaft speed, but about 90 degrees late, has closed the outer end of the port, this port being situated about the middle of the piston stroke. The piston then begins its return or suction stroke. The poppet valve, remaining open, draws in the cool air from the atmosphere (the burned gases being sent out with such force as to be beyond the recovery of intake) until it reaches about half its downward stroke, the cam having then moved far enough to allow the spring to close the poppet valve. The suction opens the inlet valve from the carbureter, admitting the explosive mixture until the end of the suction stroke, when the inlet valve closes, the crank again passing the lower dead center. The slide valve again opens and the piston on its return stroke drives out through the slide valve port the air that has come through the upper end of the cylinder, cooling it and driving downward ahead of it the remaining foul gases that were in the compression space, perfectly scavenging it. Both the air and remnant foul gases are driven out. The piston passing the port, the mixture is compressed in the upper end, the spark made and the cycle repeated. If efficiency means the utilization of all the heat units in available power, can an engine that expands only to the point it compressed from be efficient? In Fig. 6 a charge of 4 inches is compressed, while in Fig. 1 it is represented in an explosive stroke of 8 inches. Note the simplicity of accomplishment; no transfer ports, nor passages, all inside the working cylinder, on one side of the piston and with no loss of time. The advantage is that, while using the same quantity of fuel as other engines, we get twice their crank leverage. The further expansion utilizing the heat in power development instead of wasting it in a muffler with its back pressure losses, doubling the time for the complete combustion of the fuel. Is not this absorption by expansion in longer power stroke utilizing the heat that is otherwise thrown away through the radiator greater efficiency through this same effort of better scavenging? Further, consider low speed efficiency, the loss by throttling. In this design, for a less power stroke, having no throttle valve, the lower end of the push-rod is moved in toward the cylinder, the angular end of the rod coming in contact with the nose of the cam delays the closing of the poppet

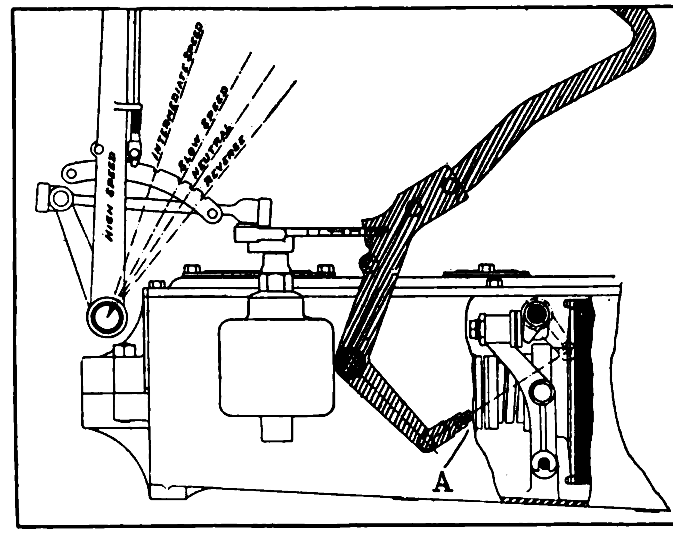

Fig. 7—Showing the arrangement of the clutch on the Maxwell Special

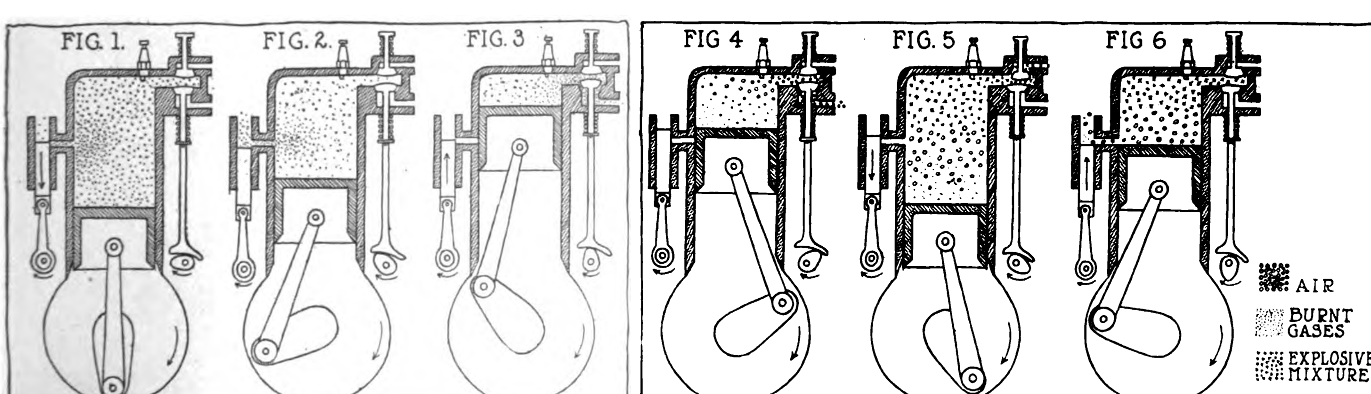

Fig. 1—End of explosion stroke. Fig. 2—Beginning of the scavenging stroke. Fig. 3—End of the scavenging stroke. Fig. 4—Start of suction stroke, only air admitted. Fig. 5—Inlet of explosive mixture. Fig. 6—End of stroke with cylinder scavenged

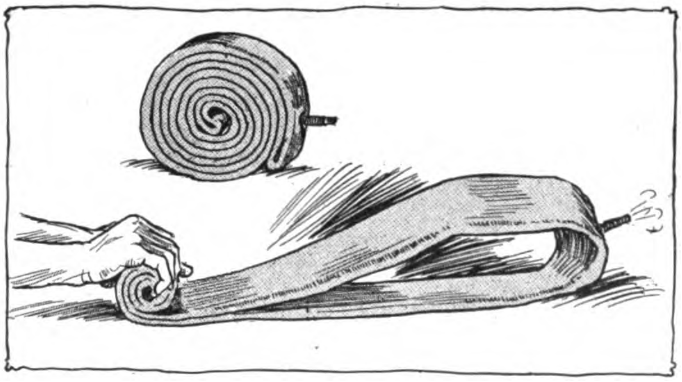

Fig. 8—Proper way to roll an inner tube to make it lie flat

valve, which delays the opening of the inlet valve admitting less explosive mixture, air taking its place. The compression pressure is always constant. The charge is ignited always under the same pressure, less fuel to be burned, less heat units liberated, less power but proportionally as the air acts as an absorber of the heat giving it out as power by expansion, giving a very economical and flexible effect. A six-cylinder engine of this design would take a car as far on a gallon of gasoline as any single-cylinder, not excepting the Only car which, it is claimed, went 40 miles on a gallon. As the perfect scavenging prevents carbon deposit, with a suitable carbureter this design will burn kerosene week in and week out. A gallon of kerosene being equal to about 1 1-2 gallons of gasoline, the kerosene having a little gasoline in it to facilitate starting. I will state that a carbureter, to burn kerosene, can be so small that, with the exception of the air valve, it can be put in one's vest pocket (my engine being 3 by 8). Kerosene can be bought wholesale for 7 or 8 cents per gallon, while the average man who buys his gasoline in small lots pays 22 to 25 cents per gallon. Consider the economy of this engine. What would be the increased efficiency to the average man's pocketbook? Now I would like to know the superior advantages of Mr. Tismer's high temperature; would the wearing parts last as long or longer? Would working under a hood on a hot summer day make it more pleasant for a driver? Would it improve the quality of any woodwork that happens to be near it, eh? He says he can "burn any old thing." Now, I thought it was the function of the carbureter to prepare the mixture for burning. Why make the cylinder do its own work and the carbureter's also unless he dispenses with the carbureter. A gun is an internal combustion engine, yet you do not hear of a sportsman heating his gun to make a long shot. A means of proper mixture may produce a great efficiency with very cool cylinder walls. He uses a compression pressure of about 80 pounds. Of what advantage would this be on a four-cylinder car when a very low speed is desired or climbing a steep hill. It would require a large and heavy flywheel, would it not? Is high compression absolutely necessary to rapid ignition and burning? I have burned kerosene when the compression was so low that turning the crank at twenty-five or thirty revolutions per minute there was not enough pressure to move the crank 1 inch from top dead center, owing to a leaky piston. Yet the engine ran as fast as the unbalanced conditions would allow, between 800 and 900 revolutions per minute. The cylinder was cool enough to permit putting a hand on it. Would not a longer power stroke than compression stroke be a better power, for hill-climbing, etc., would not require a high compression.

Bradenville, Pa. JOSEPH MUNDEN.

Take Good Care of Inner Tubes

Editor THE AUTOMOBILE:—I am driving a Hupmobile runabout and using 30 by 3-inch tires. Of late I seem to have run into a streak of bad luck, as every time I go out I am forced to make at least one tire change. In a short run the other evening down to Seaford, L. I., I had a puncture and am still at loss how to explain it except that there was a deep cut in the casing that possibly allowed a sharp stone to enter and cut the tube. I replaced that tube and was soon on my way. After going some distance we were compelled to stop, owing to the fact that the bars on a railroad crossing were down. After we had stopped I could hear the hissing sound of escaping air and soon saw that the same tire was again troubling me. I took out the tube which I had just put in and saw that there was a small cut in that also. I thoroughly examined the casing, but could find no nail or other sharp object. Is it possible that a cut in the casing would allow a sharp stone to penetrate and cut the tube?

2—I find also that very often the inner tube is stuck to the shoe when I remove the tire. What is it that causes this? It sticks so fast that at times I am afraid to pull it off for fear of tearing the tube. What can be done to prevent it from sticking?

3—One more tire point I should like to know is the best way to carry inner tubes. I use the clincher type of tire and when I make changes it takes me about 20 minutes from the time I first notice the puncture before I get started again. Anything that can shorten this time would be very welcome to me as I detest the work of dealing with articles that possess the usual obstinacy of the inanimate when a man is in a hurry.

Freeport, L. I., N. Y. OWNER.

—It is very possible and often happens that stones cut inner tubes by penetrating an opening formed by a cut in the shoe. The cure is to go over the cuts in your shoe before every trip and, wherever you find a cut, seal it with one of the plastic compounds which are for sale by all the large tire manufacturers. A more permanent job can be made with a vulcanizer and it would repay the trouble that it gives by increasing to a remarkable extent the tire mileage which you will be able to secure.

2—The inner tube will not stick to the shoe if you will powder it thickly with tire talc before putting it into the shoe. When there is no talc, the heat generated by running will be sufficient to vulcanize the tubes and shoe together to a sufficient degree to cause considerable adhesion.

3—You will have no difficulty in carrying the inner tubes flat, as they should be kept, if you are careful to exhaust all the air that is in them. To get all the air out, first remove the entire valve by turning the cap upside-down and using it for a screw-driver, as shown in Fig. 8. This will take the entire valve out and allow the air to escape readily. Pick the tube up and allow the part with the valve to hang down so that it will be possible to start rolling from the other extremity, Fig. 7. By the time the tire is rolled up all the air will be out and the tube

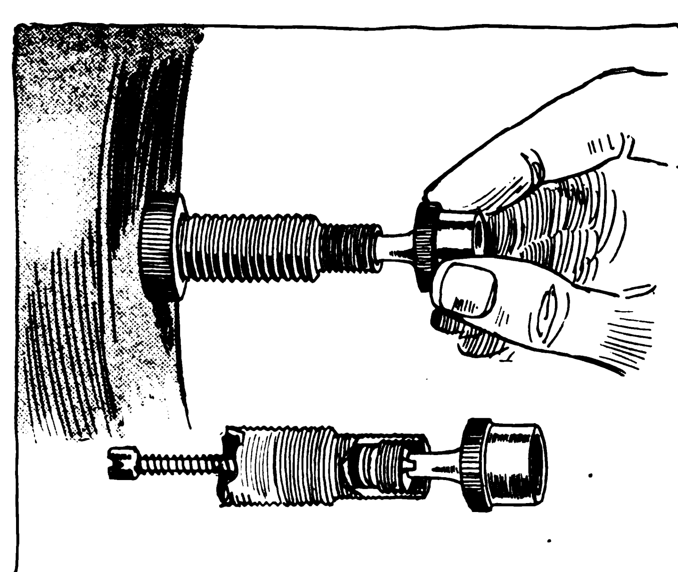

Fig. 9—How to remove the valve to allow all the air to escape

32x4	650	75	36x5	1000	90

will be found in such a condition that it will be comparatively easy to put it in a very small box. When the tube is in the box it should be thickly dusted over with the tire talc, as this serves to keep the rubber from becoming sticky, especially in hot weather, when the folds are likely to adhere to each other.

Never carry envelopes or shoes uncovered so that they are exposed to light, to temperature variations and to oils and grease. Very strong light, such as sunlight, has a tendency to make tires brittle so that they will crack in places. This at the same time takes away their elasticity. Tires, when stored by the man who knows, are placed in dark rooms where the temperature is kept as nearly constant at 50 degrees as possible, for temperature variations age them prematurely.

Interested in Over-Tiring

Editor THE AUTOMOBILE:—I have a 1911 Cadillac which has rims that take 34 by 4-inch tires. Would it be advisable to use larger shoes than these? If so, what size could be procured that would fit these same rims? The rims are of the Q. D. type. Would larger shoes affect the running of the car in any way? A discussion on this topic would greatly interest me and I should imagine many other car owners would find it of great value.

New York City. F. D. MARTIN.

—Regardless of the make of your car it has been proven before now that it is most economical in the end to slightly over-tire your car. The size of the tire is determined by the weight it has to carry and the experts in the employ of the different tire companies have figured out very closely just what tires should be used with a given weight. The car should be first carefully weighed when fully loaded for touring. That is, the passengers should be placed along with all the baggage that would be carried on a tour. If it is not feasible to get the weight of the car in that condition, it should be loaded up to the extent that it would be on a long tour and the weight on each axle taken in that condition.

The weight on each axle should be taken separately, as the loads will be different in front and rear. By running the car up on the scales which will be found at any railroad station the whole weight may be found as well as the weight on the rear axle. When weighing one axle at a time it would be well to get the car level by means of a spirit level before the weight is taken. If this is not done there will be a slight inaccuracy. The tires that the car makers recommend for each weight can be seen by the accompanying table, which expresses the ideas of the leading tire men. Should it be desired to over-tire the car, the next largest size tire having the same diameter is used.

As far as affecting the running of the car goes there will hardly be a noticeable difference when a slightly larger tire is used. If there is any tendency at all it will be toward making the car run easier over slight irregularities in the road. It is safe to state that in every instance where the heavier tire is used the increased first cost will be balanced by the decreased cost of upkeep.

Tire Chain As a Mud Hook

Editor THE AUTOMOBILE:—It often happens that one delays in putting on the tire chains until the rear wheels are actually stuck in the mud. When this occurs, it is often difficult to jack up the wheels, as the soft mud sinks under the weight of the car and the jack. An expedient which will pull the wheel out of almost any mud if the motor has power enough is to wrap the chain about the tire and rim in the manner shown in the sketch, Fig. 9. Fasten the ends of the chain around a spoke. Care should be observed in starting the car or the spokes are likely to be damaged.

Allegheny, Pa. MURRY FAHNESTOCK.

Conclusions From the Army Truck Tests

Every Year the Military Authorities of France Draw the Line More Strictly Between the Fit and the Unfit Among Commercial Motor Vehicles—Points Relating to Reliability and Accessibility Sharply Brought Out

GENERAL opinion among all directly concerned in the 30 days' trials of French motor trucks which were conducted under military supervision, from the town of Versailles as a center of operations, and have recently been concluded (see account in THE AUTOMOBILE of August 15), ascribes to these trials and the methods adopted for ascertaining all the essential facts in connection with the performances of the vehicles a much greater importance for the rational development of motor truck design and construction details than could be justly credited to any other tests ever held. The basis for this opinion is to be found in the duration and thoroughness of the trials, the total absence of prizes and awards and the impartiality of the military authorities. Observations have been made and opinions have been expressed in connection with these tests wholly without reference to considerations of commerce or publicity. Some of these observations will be found of value and interest to users, owners and makers of motor trucks anywhere, although local conditions may in some cases impose a different interpretation of the facts from that which is accepted as final, or conclusive for the present, in France.

In a general way the first notable conclusions after the trials had been in progress for some time, under rather severe weather conditions, were to the effect that the forty chain-driven vehicles had demonstrated no advantages by reason of their driving system over the twenty-two shaft-driven vehicles, that wood wheels are still preferable for trucks, that rubber tires are a necessity at all speeds exceeding 12 kilometers per hour, that even the wheels of trailer wagons must be so shod to make these vehicles sufficiently durable, that on the whole the trailer is an unsatisfactory adjunct and that motor brakes are practically indispensable. A large number of more detailed observations are of record. A well-known technical commentator, writing over the name of "Lambda" in *Omnia* of August 10, notes the fact that many constructors, among whom Renault, Saurer, Berliet, De Dion-Bouton, place a positively acting centrifugal governor inside of the crankcase where the driver cannot get at it, so that it becomes mechanically impossible for him to drive the empty truck faster than the loaded one or beyond its predetermined maximum speed. The wheel brakes need to be improved, he says. If the transmission, which begins at the clutch, is out of order or disconnected, one depends absolutely on the wheel brakes to hold the vehicle. They must be capable of doing this on the steepest hill, and he refers to the brakes on Parisian omnibuses as a model for imitation with regard to construction—which includes an oil-tight casing around the brake drum—as well as in regard to the system for keeping them in order. But, he adds, it would also be very desirable to have the motor brake, as used on Saurer or Panhard trucks, generally adopted. It represents the only braking method admissible for vehicles of considerable tonnage in hilly countries with long gradients.

DIAGRAMS OF MOTOR BRAKE ACTION

On this subject of motor brakes Captain Renaud gives additional information in a lengthy technical analysis of the trials appearing in several issues of *La Technique Moderne*. It is summarized graphically in the indicator cards presented as Fig. 1, showing, first, how the motor ordinarily functions, secondly, how it functions when the Panhard motor brake is applied and thirdly, how it functions when the Saurer motor brake is put into action. In the Panhard motor the camshaft for the exhaust valves is mounted so that it can be displaced lengthwise by pressure on a left-foot pedal; and as the clutch remains engaged when the brake is in action the driver's left foot is free for this purpose. The cams are broadened and are formed with two special bosses on that portion which does not engage the exhaust valve stems when the motor is in normal operation. But when the shaft is displaced these bosses produce the action shown in the second diagram, which is as follows:

Suction stroke—Induction of a small amount of air through the admission valve and the carbureter, whose air apertures are closed, resulting in an approximate vacuum in the cylinder.

Compression stroke—Sudden opening of exhaust valve causing an inrush of gas or air but followed by immediate closing of the exhaust valve and compression of the cylinder contents, both valves being now closed.

Third stroke—Sudden opening of the exhaust valve allowing the compressed gases to escape, again followed by immediate closing and the formation of an approximate vacuum by the descent of the piston; normal opening of exhaust valve at end of stroke.

Fourth stroke—Exhaust valve open and resistance none, excepting the piston friction.

THE POWER OF THE BRAKES

This method results in a negative work of the motor equal in volume to 65 per cent. of the work which the motor can develop for traction purposes, but, as the losses in efficiency which are normally due to frictions in the transmission mechanism of the vehicle become favorable for holding the car back, the total braking effect is, under the supposition of a transmission efficiency of 70 per cent. equal to 92 per cent. of the normal motor work. In other words, with this motor brake it is possible to hold a vehicle back on any hill over which the motor could pull it up by using the same gear speed for the braking that would be used for traction.

The means used in the Saurer motor are even more powerful. The camshafts are not modified and are not displaced longitudinally, but a worm gear control mounted upon a shaft placed in the axis of the steering post enables the driver to change the timing of the exhaust camshaft and at the same time acts upon the carbureter so that nothing but fresh air is admitted to the induction manifold. The admission valves are opened and closed as usual and the exhaust valves are opened at the end of the second (the compression) stroke and closed at the beginning of the fourth (the evacuation) stroke. The motor is thus transformed into a two-cycle air compressor with the following strokes:

First stroke—Induction of air at the admission valve.

Second stroke—Compression of air; all valves closed.

Third stroke—Opening of exhaust valve, escape of compressed air and induction of fresh air through the exhaust valve which remains open.

Fourth stroke—Compression of this air, all valves being closed.

First stroke—Opening of admission valve, escape of the compressed air followed by the induction of new air through the open induction valve, etc.

The total braking work reaches about 95 per cent. of the traction work of which the motor is capable and, counting with the resistance in the transmission mechanism as in the case of the Panhard system, this rises to about 130 per cent. of the normal traction work of the motor.

[There seems to be an error in the author's supposition that the work performed by the gravitation of the vehicle on the hillside can reach the percentages mentioned, since the air pressures reached under braking action under no circumstances approach those produced by the explosions in normal motor operation, and a comparison of the areas of the three diagrams seems to confirm this doubt. As, however, the motor brake is not intended to hold a vehicle on a hill or to drive it backward uphill but to permit it to descend at a moderate speed, the high percentages mentioned should not be required.—Ed.]

One of the military commissioners acting as judges has given separate expressions in *Omnia* of August 10 to some of the intimate observations which the close supervision of the long-continued and arduous work of the trucks permitted him to make. His most important remarks relating to the lessons of the tests are summarized in the following.

COMMENT BY ONE OF THE JUDGES

Most of the motors are capable of giving continued service without accidents or excessive wear, but few of them operate without injury to the chassis. A motor can evidently not be transferred successfully from a pleasure car chassis to a truck. Vibrations which are harmless or even unnoticed on a light chassis become very powerful on a truck frame. No very clear explanation has yet been given of this fact, although it may be that the touring car chassis is too flexible to furnish the reactions by which the vibrations grow in intensity. At all events I have seen an unexceptionable touring car motor communicate to all such pieces of a truck as rivets in mudguards and spindles of clockwork a wild rotation around their axes resulting in extremely rapid wear. It follows from this fact that the truck motor should be one of slow rotation. Perhaps the six-cylinder type would give good results, but the army regulations exclude it. The most experienced motor truck builders have this year equipped their vehicles with large slow-speed motors regulated by a governor. An ingenious expedient adopted by one of them consists in placing the governor under the influence of the speed lever, so that the motor is limited to 800 revolutions on the high speed, but can speed up to 1,000 revolutions on the reduction gears. This renders it practicable to maintain a very uniform vehicle speed in spite of gradients.

Magnetos and carbureters left nothing to be desired. Though the motors were left hot under the open sky every evening and were covered with dew in the morning, it was very rarely that they could not be started with a single turn of the crank, whether alcohol, gasoline or benzol was the fuel used. The commissioners are for that matter insisting that the magnetos and tires of all subsidized vehicles shall be made interchangeable even if of different manufactures, and the tendency among the truck builders to buy standard carbureters, rather than making their own, supports this standardization of the principal organs. In the case of radiators the same trend seems to be working toward the Solex type with centrifugal fan.

STRENGTH AND DIMENSIONS OF PARTS

Clutches on trucks should be more powerful than on a light vehicle with the same motor power. It is evident, for example, that at the start with a heavy load the clutch must be slipped longer and consequently must be capable of absorbing more work without overheating. The cone type has proved harsh in engagement and the multiple-disk clutch too slow in the release. The Dion-Bouton metallic plate clutch was the only one giving full satisfaction with heavy loads.

The majority of the gear boxes had four speeds, but these were often poorly assorted. The third speed was too near to the fourth and was very seldom used. In practice, when the motor was of sufficient power, three speeds gave as much satisfaction as four. The gears should be much stronger than on pleasure cars of the same power, because a harsh start or acceleration of a light car is relieved by yield and slip of tires but catches the gears of a truck as between hammer and anvil.

A MISSING CONSTRUCTION FEATURE

It is astonishing that no vehicles were presented at the trials in which the gear box was provided with a free shaft adapted to be thrown in mesh to actuate a pump, a crane or any other mechanical tool. In places where the truck must now await its turn among horse-driven trucks, having no better facilities than these for quick loading and unloading, and where the shortness of the haul prevents it from making up for waiting-time by its greater speed on the road, such an arrangement might turn a doubtful economical balance in its favor.

Even in the cases where iron-tired rear wheels gave satisfaction and endured the speeds demanded—and only two such cases went on record, in both of which the rear wheels were not drivers—little accidents occurred, such as fracture of brake rods and loosening of bolts, which could only be ascribed to vibrations originating in the iron tires. In one instance solid rubber tires bursted like pneumatics, and the cause seemed to be a weak axle which alternately bent and straightened under the influence of the road shocks and made the tires scrape to and fro transversely, finally splitting them.

If the program of the trials had included descents of several kilometers in length it is doubtful if the brakes, which were uniformly quite efficient for stopping the vehicles, would have proved acceptable as speed reducers. Hardly any size of mechanical brake would be sufficient for transforming the continued gravitation of heavy loads into heat without trouble. The motor brake, on the other hand, does not accumulate heat units, as it throws them out with every release of its air charge.

Spring suspensions are not yet what they should be. The chassis suffer greatly from the fast runs without load which are demanded of them. Results showed that the load should be between the springs rather than above them, confirming the experience established for touring cars. The shackles should be long and their joints carefully machined and lubricated.

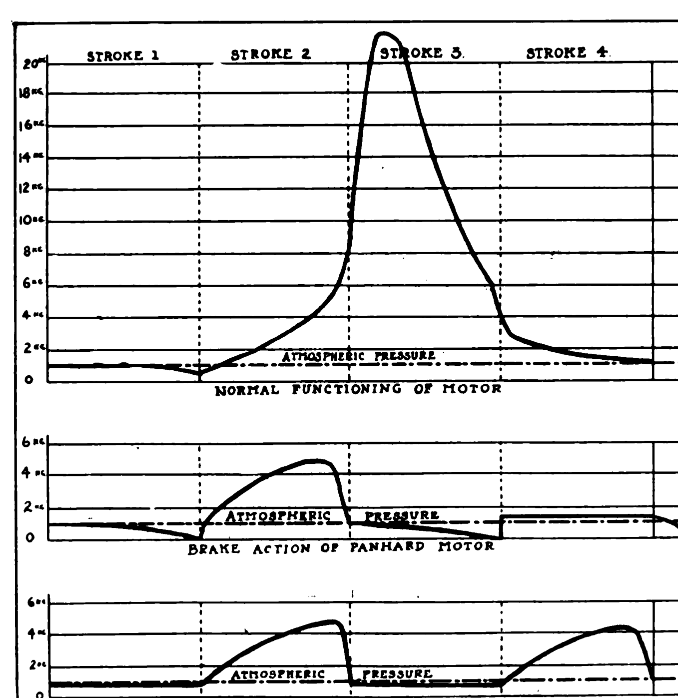

Fig. 1—How motor brakes transform the piston pressures

PATENT DEVELOPMENTS FROM ACROSS THE ATLANTIC

ALTHOUGH the attention of the automobile public in general has been centered on the patents issued in this country for some time, inventors in the lands over the seas have not been idle. In fact, they have been very busy emulating the ingenious Yankee and have conceived some ideas and produced some devices which bid fair to achieve worthy places in the automobile industry. Realizing the importance of these developments, THE AUTOMOBILE has prepared the following brief review of the most important patents issued by the British Patent Office during the month of July.

Valve Gear of Argyll Class—By means of which a sleeve valve is simultaneously reciprocated and oscillated.

The mechanism, Fig. 1, actuates a sleeve valve around or inside a cylinder by two cranks C1 and C2, which are driven from the half-time gear shaft. Reciprocating motion is imparted to the sleeve by the crank throw R and the link L which is connected to a pin P; the latter is carried in lugs on a collar C3 which bears on the flanges F at the lower end of the sleeve. The crank C2 has a spherical crankpin P1, from which a link L1 and connecting mechanism consisting of a universal joint—which is shown by shading—transmits the oscillatory motion.

No. 7,942 British—to J. S. Matthew and Argylls, Ltd., Alexandria, Dumbartonshire, England.

Double Horizontal Sleeve Valve Motor—In which two telescoping sleeves are provided for every pair of cylinders.

The sleeve valve mechanism for a four-cycle, four-cylinder engine shown in Fig. 2, comprises a pair of telescoping sleeves S and T serving one pair of cylinders C1 and C4, and another pair of sleeve valves U and V having the same relation to cylinders C2 and C3. Tightness between the valves and the guides in which they work is obtained by piston rings R surrounding the outer sleeves S and U. The inner sleeves T and V are hollow and the exhaust may pass through them to the exhaust pipe E. The inlet manifold is connected by leads P and P1 to the two pairs of sleeve valves, and the passage of gases into and out of the cylinders is governed by the registering of ports in the sleeves and the cylinders. The movement of the valves is controlled by a single half-time eccentric H carrying two blocks which work in slotted arms, whereby a stirrup S1 is reciprocated. This in turn oscillates a lever M. The sleeves S and T are connected to the stirrup S1 and the sleeves U and V to the arms of the lever M.

No. 8,510 British—to G. J. de Jong, Antwerp, Belgium.

Differential Gearset—Which is combined with the gears of a transmission set.

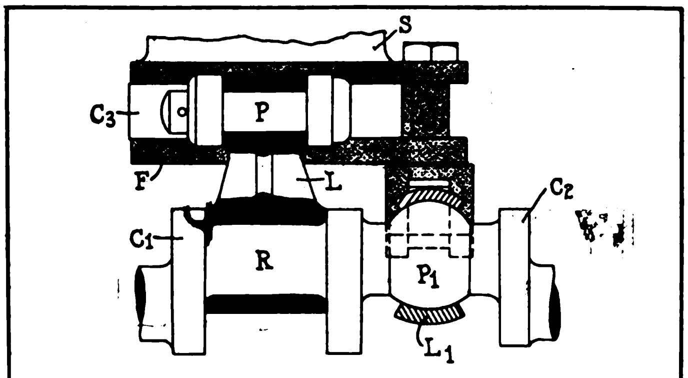

Fig. 1—Matthew and Argyll rotating and reciprocating valve

In this invention, Fig. 3, the driving shaft carries two bevel pinions A and B; these, and another pair A1 and B1 which are freely mounted mesh at diametrically opposite sides of annular bevel gears D, C and D1; any one of these gears may be clutched to the casing E of the differential and the entire mechanism is removable by withdrawing it in the direction of the drive shaft. Gears C, D and D1 and the casing E are mounted in ball bearings carried by the housing H and may be removed after taking the cover C1 off the large casing, whereby the

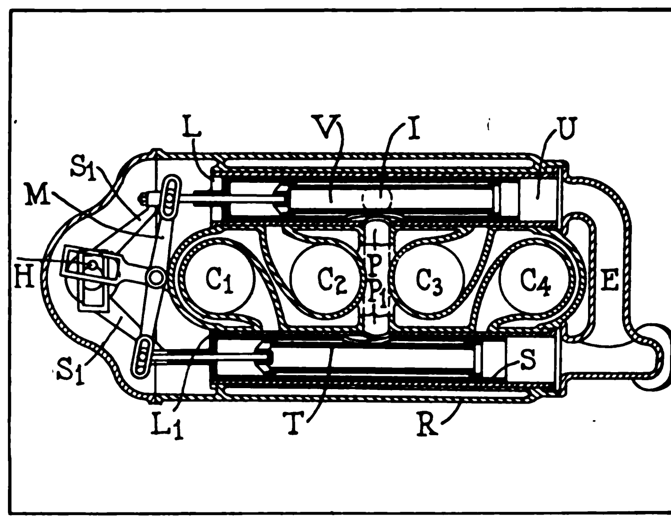

Fig. 2—De Jong double reciprocating sleeve valve motor

whole differential mechanism is lifted out. The gears D, C and D1 have internal clutch recesses receiving projections of clutch disks which slide in the casing E.

No. 7,608 British—to W. T. Martersteck, Sharon, Pa.

Combustion Engine Carbureter—In which the passage of air is controlled by a sleeve valve sliding in the mixing chamber.

The carbureter, Fig. 4, described in this patent has a straight passage extending through it, in which are located valves adapted to move transversely. These valves are arranged telescopically and are independently actuated. The mixture is controlled by a valve V which is cut away on one side and which contains a plug valve P. The lower end of the latter varies the air passage which surrounds the fuel nozzle N. The lower end of the valve V is cut away so as to fit over the nozzle while the plug leaves a small fuel and air space around the nozzle, even when it bears directly on the same.

No. 6,348 British—to F. H. De Veulle, Birmingham, England.

Fuel Feed—The demand of the engine regulates the supply.

This patent on fuel carburetion relates to the arrangement shown in Fig. 5, in which the pump P supplies a liquid fuel to the engine cylinder C, being controlled by the movement of a fuel reservoir on a counterbalanced lever L which controls the suction valve of the pump. The reservoir moves when the quantity of fuel supplied to it from the pump exceeds or falls short of that passing to the engine. Gaseous pressure is supplied to the reservoir from a gas bottle G.

No. 8,867 British—to C. Kloos, Amsterdam, Holland.

Internal Combustion Motor—In which the piston is so formed as to provide a channel between the combustion chamber and the space in which the combustible mixture is compressed.

In this engine, Fig. 6, the mixture is compressed in an annular chamber which is formed at the front of the cylinder. The mixture is introduced through a valve V and cylinder ports P and Q. The latter register, at regular intervals, with ports P_1 and Q_1 in the piston wall, and it will be seen that, when the port P is uncovered by the piston, the charge compressed in the annular chamber is transferred therefrom through the ports Q and Q_1 into the combustion chamber.

No. 8,878 British—to C. T. D. Sangster, Bournbrook, near Birmingham, England.

Hydro-Carbon Fuel Carbureter—In which the throttle has the form of a sleeve valve governing the main air inlet.

The principal feature of this carbureter, Fig. 7, is the use of a sleeve valve S which fits into the mixing chamber C of the carbureter. Sleeve S surrounds a throttle valve V which is also shaped as a sleeve valve, and, when moved up or down, covers or uncovers the main air port M of the carbureter. After descending to a certain level the throttle uncovers the auxiliary inlet A. The fuel nozzle which is seen in the lower portion of the carbureter is surrounded by primary air ports Q which are

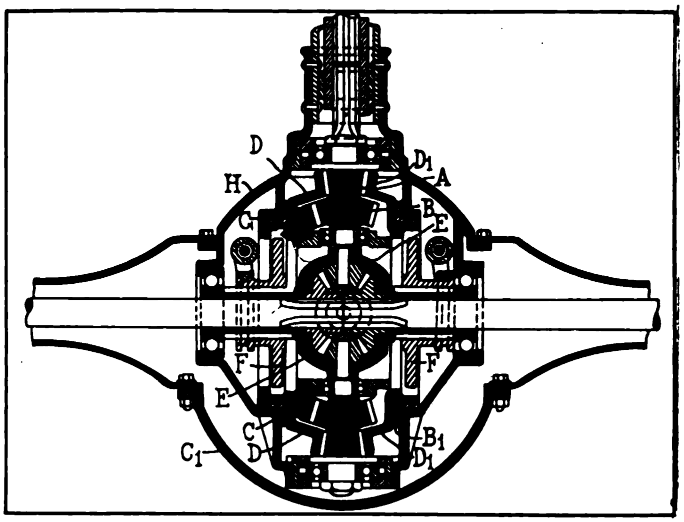

Fig. 3—Marterstock differential gearset for automobiles

controlled by a valve W loaded by a spring S_1 and actuated by the same handle bar which operates the throttle valve V.

No. 9,235 British—to J. A. Mackay, Harrogate, England.

Automobile Engine Carbureter—In which the air enters through tapered channels and is given a whirling movement.

In this carbureter, Fig. 8, the liquid fuel is supplied through a number of nozzles O in a transverse bar T, which is located between two tapered air channels C_1 and C_2 through which the air is supplied to the mixing chamber. The rotary valve V

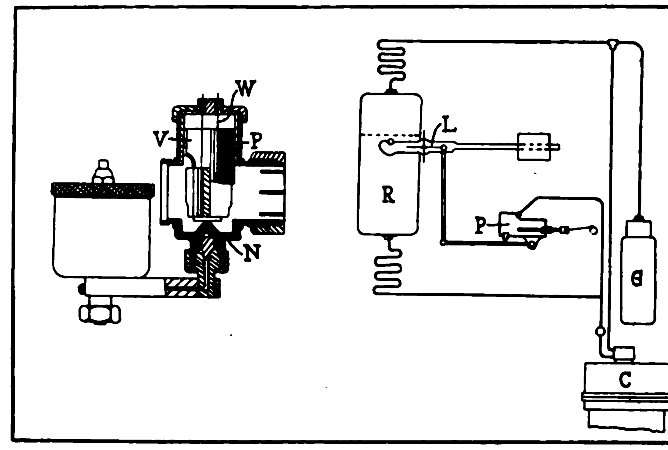

Fig. 4—De Veulle carbureter. Fig. 5—Kloos fuel feed

governs the extent to which the mixture passage P is opened, and the lower end of the throttle cylinder is provided with a choking plate which imparts a whirling motion to the air entering through the two supply channels. By this arrangement the movement of the throttle controls the ratio of mixture of air and fuel.

No. 9,252 British—to H. R. Barrett, Manchester, England.

Sleeve Valve Automobile Engine—In which two horizontal sleeves are reciprocated above the cylinder head through which the gases enter and leave.

This engine, Fig. 9, is designed to operate on the four stroke cycle. The inlet of the charge and the exhaust of the waste gases are controlled by a pair of tubular telescoping valves V_1 and V_2, the former of which contains a partition whereby it is divided into two chambers L and E which are in constant communication with the inlet and exhaust manifolds respectively. The valves are reciprocated independently of one another by the action of two cranks C_1 and C_2 driven at half engine speed and set at 45 degrees to one another. Ports in the valves provide communication between the cylinder combustion chambers and the proper manifolds at predetermined periods of the engine cycle.

No. 6,447 British—to Société des Establissements Lyonnais Rochet-Schneider, Lyons, France.

Spark-Plug—In which the positive electrode and its insulation may be moved up and down inside the shell.

The spark-plug described in this patent is shown in Fig. 10. Its positive terminal P and the insulation I are mounted inside a sleeve S which is slidable in the bushing of the plug and has a conical face adapted to seat on the gland G against which it is held by the pressure of a spring S_1. The sleeve moves toward

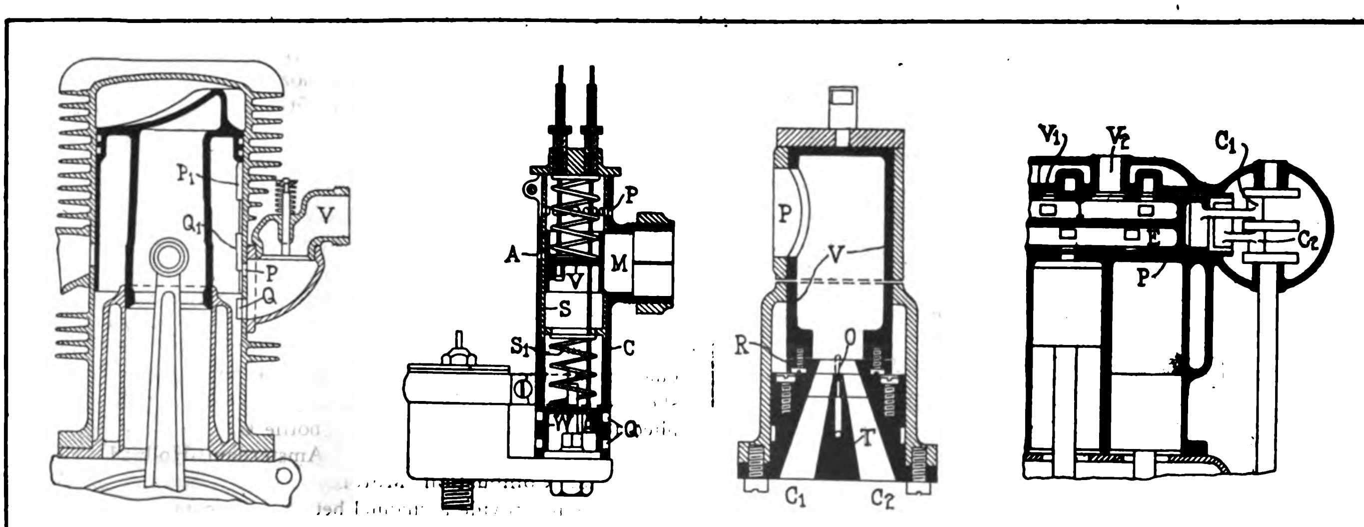

Fig. 6—Sangster internal combustion motor. Fig. 7—Mackay carbureter. Fig. 8—Barrett carbureter. Fig. 9—Rochet-Schneider motor

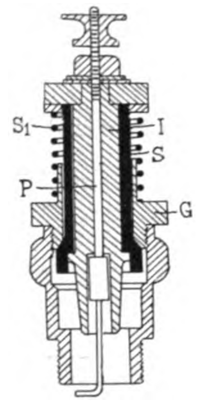

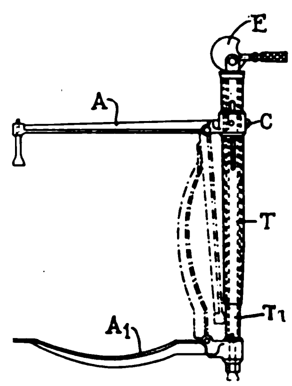

Fig. 10—Wallace-Green plug. Fig. 11—Zehnder valve tool

the interior of the cylinder during the suction stroke of the latter, whereby air is admitted and passes the sparking point of the electrodes. The shell may be provided with a brush or scraper against which rubs the central electrode P which is thereby cleaned of carbon deposits.

No. 77,787 British—to F. H. Wallace and T. Green, Stourbridge, England.

Valve Removing Tool—In which the arms for compressing or extending the valve spring are carried on two telescoping tubes.

The device referred to in this patent is a valve remover, Fig. 11, which is composed of two telescoping tubes T and T_1, each one of which carries a folding arm, A and A_1. The inner tube T_1 has an eccentric or cam lever E at its upper end, by means of which the device is operated. The arm A is hinged to the tube T by an adjustable collar C, and is fitted with a spindle S designed to engage the valve; the arm A_1 has a forked end for the purpose of embracing the valve stem.

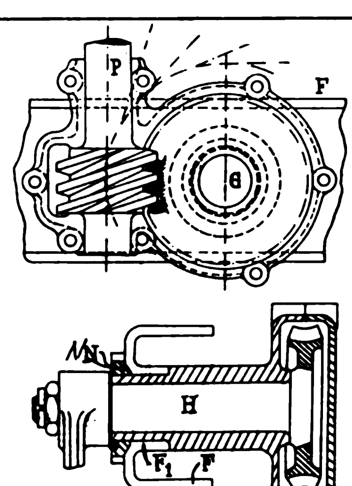
No. 7,654 British—to J. Zehnder, Granichen, Switzerland.

Steering Gear Adjustment—Obtained by interchangeable parts.

This patent refers to a method of adjusting steering columns to compensate for wear. In Fig. 12, the steering post P is adjustable around the worm spindle H; the worm and worm wheel are inclosed in a casing which is clamped to the frame F by means of a nut G. The portion F_1 of the frame may be replaced by a separate member.

No. 6,975 British—to A. Leruitte, Liege, Belgium.

Internal Combustion Motor—In which two pistons work inside of one another forming a separate compression and combustion chamber.



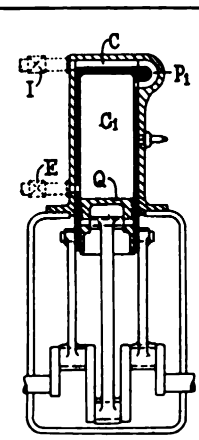


Fig. 12—Leruitte steering gear. Fig. 13—Downie engine

A scavenging engine is the subject matter of this patent. The cross section, Fig. 13, shows how the feature of perfect scavenging is obtained by the use of a double piston composed of an outer piston P and an inner one Q, both of which are actuated directly from different throws of the crank shaft but which have the same stroke. On the suction stroke of the engine the mixture is admitted through the pipe I into the space C, in which it is compressed during the following stroke by the piston P. Toward the end of the compression stroke when the piston P reaches its highest position, the compressed mixture is transferred from the compression space C through the passage P_1 into the combustion space C_1 where it is ignited, the explosion driving down the piston Q. The exhaust valve E is contained in a pipe just above the position which piston Q assumes after passing through lower dead center.

No. 6,119 British—to W. Downie, Stranraer, England.

Hydraulic Transmission System—In which a sleeve formed as a dog clutch may be shifted to engage a driven shaft or to move another sleeve on the same shaft which actuates a pump mechanism.

The transmission system, Fig. 14, which is the subject matter of this patent, is so constructed that it provides a direct connection between the driving shaft and the driven shaft or that the movement of the driving shaft may be made quicker or slower by means of a system of pumps. The connection between drive shaft and driven shaft is obtained by the engagement of the combined sleeve and dog clutch S with a member M on the driven shaft, while the pumps are actuated in the following way: If the sleeve S is shifted in the direction opposite to the one in which it engages the member M, it is brought into engagement with the sleeve S_1 on the drive shaft D. S_1 carries the mechanism M_1 which actuates the pump or pumps by means of which the gear ratio between the two shafts is regulated.

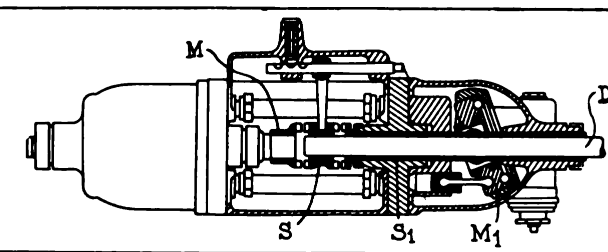

Fig. 14—Delaunay-Belleville hydraulic transmission system

No. 6,525 British—to Soc. Anon. des Automobiles Delaunay-Belleville, Saint Denis, France.

Non-Skid Device for Tires—Consisting of a transverse leather strap which is studded with metal plates.

This patent has reference to a tread band, Fig. 15, providing a non-skid surface for the tire casing. The band consists of a leather strap L which is faced with studded metal plates M bent around it and held to it by means of points P. This leather strap is passed from one side of the tire to the other in zig-zag manner, being fastened at the bead lines by means of hooks H which engage the spokes of the wheel and are made in two threaded parts constructed to permit of adjusting the straps.

No. 7,438 British—to W. Haseloff, Steinau, Germany.

Method of Carrying an Illuminating Number—The license number of the car is visible on the body.

This patent, Fig. 16, refers to the indication of the license number on the back of an automobile body, preferably by painting it on to the same. In order to have the number visible during the hours of the night a lamp which projects a powerful beam of light on the number is positioned below the same and attached by brackets to the chassis or the body of the car.

No. 4,864 British—to B. F. Ruettiger, Bonn, Germany.

Internal Combustion Motor—In which a large charge is admitted to the cylinders.

In this engine, Fig. 18, a single sleeve valve S opens the inlet port P toward the end of the suction stroke of the cylinder.

This feature of the design permits the residual dead gases in the cylinder to cool during the suction stroke and to contract, so that a relatively large fresh charge is drawn in when the inlet port is opened. The advantage thereby derived is still more accentuated by the fact that a late opening of the inlet port increases the vacuum in the cylinder, which also insures a maximum charge of mixture. The exhaust port E is located at the top of the cylinder and is opened at the beginning of the exhaust stroke, while the auxiliary port E1 opens toward the end of the power stroke. The inlet port P is arranged slightly above the lever of the port E1.

No. 5,014 British—to R. Miller, New York City, N. Y.

Carbureter for Automobile Motor—In which the primary air inlet is controlled by a sleeve valve providing also a choke tube for the mixture.

The carbureter, Fig. 22, described in this patent is of the float-feed type and the regulation of the fuel air ratio is obtained through the use of a sliding valve V. The lower part of this valve is shaped as a sleeve which may be moved up or down to vary the cross section of the main air intake A while the upper portion of the valve forms a plug which fits the carbureter housing, part of which is cut away at A1 to provide auxiliary air inlet. The fuel flows from the float chamber to the fuel nozzle N, the opening of which is governed by a needle valve F. The nozzle is held in place by a conical shoulder S and a nut N1, while a drain plug P1 is located at a passage communicating with the interior of the nozzle. At low engine speeds the valve V is held in its lowest position by a spring S1 interposed between it and the top portion of the carbureter housing which spring is compressed when the throttle is opened to speed up the motor. The mixture outlet is by means of an elbow extension arranged at the level of the plug portion of the valve.

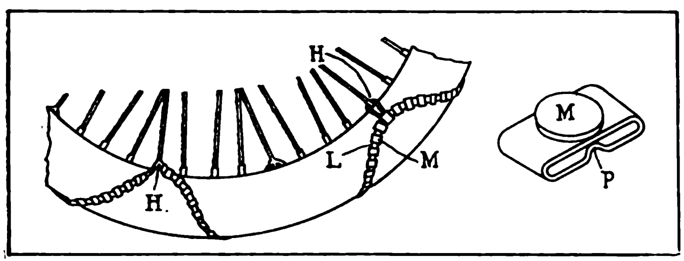

Fig. 15—Haseloff non-skid device for pneumatic tires

No. 5,215 British—to T. Carter, Weaste, Lancashire, England.

Sectional Rubber Tires—The tire blocks are each formed with a bead embracing the wheel rim.

The tire referred to in this patent, Fig. 20, consists of a number of individual rubber blocks or sections which are moulded with bead portions B fitting into the flanges of the wheel rim and with others, B1, bearing on the outside of these flanges. The bases of the tire blocks are covered with a layer of canvas C and are provided at their ends with holes H which are adapted to receive wooden wedges of plugs designed to hold the blocks securely in place. In the center of each block there is a sponge-rubber core R vulcanized in place. The patent also mentions that the rim may be formed with detachable segments removable for installing the blocks on the wheel. This method is used for mounting all blocks except the last one, which is put in place and secured by radial bolts engaging the holes H in the two neighboring blocks.

No. 7,930 British—to F. Milan, Lockwood, England.

Tire Protector and Cover—Being composed of narrow transverse strips of rubber and fabric.

The cover referred to in this patent, Fig. 17, comprises a series of narrow strips T of rubber and fabric, which are arranged transversely over the tire tread and secured to one another by means of metal side rings R which may be formed with scalloped ends so as not to cut the fabric and rubber. Fig. 17 shows cords C inserted in the protector strips; these cords have looped ends. The strips also have canvas tapes C1 and are secured to the rings R by buttons B engaging holes H in these strips.

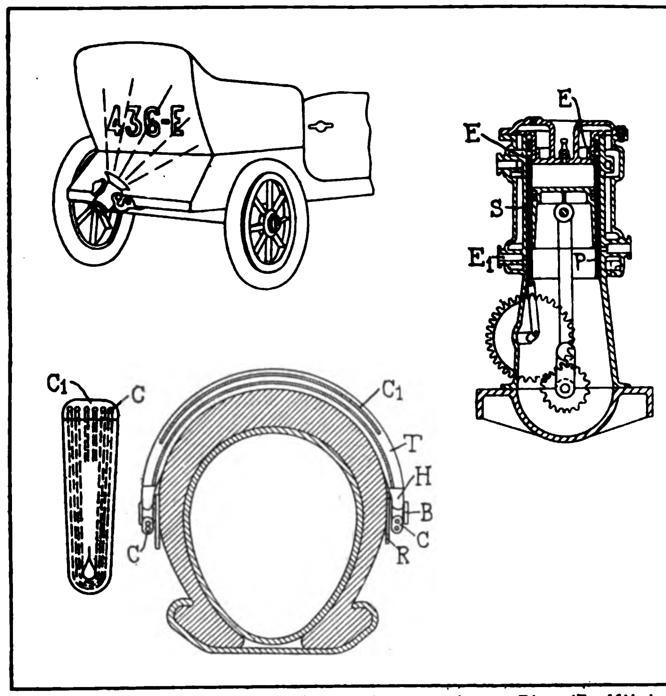

Fig. 16—Ruettiger scheme of carrying number. Fig. 17—Kitchen tire tread. Fig. 18—Miller sleeve valve motor

No. 7,338 British—to J. G. A. Kitchen, Scotforth, Lancashire, England.

Automobile High-Speed Signal—Wherein an electric circuit is opened when the axle revolves at or above a certain speed.

The signal, Fig. 21, described in this patent is displayed to the driver at any speed below a given number of revolutions of the axle. When the axle reaches this critical speed the shaft R, which may be fixed at varying distance from the axle A and which carries a centrifugal governor controlling an electric circuit, is rotated so fast that the deflection of the governor opens the circuit which it closes at lower speeds. The result is that the signal mentioned above ceases to be displayed to the driver.

No. 8,999 British—to R. Kaiser, Geneva, Switzerland.

Adjustable Spark-Plug—In which a contact between the central electrode and the shell may be made.

This patent described the spark-plug, Fig. 19, in which the terminal may be short-circuited owing to the following method of construction. The insulation I is surrounded by a rotatable sleeve S carrying a metal plate M which is a conductor of electricity. When the sleeve is turned into the position shown in the illustration, the metal plate M contacts with the insulated electrode P by means of a spring-pressed plunger P1. The sleeve is held on the plug by screws S1 in the plug body entering a groove in the sleeve.

No. 7,810 British—to D. W. Player, Folkestone, Kent, England.

English Test Solid Tires

Truck Department of the N. A. A. M. Presents Article by A. E. M. Turner Who Praises American Product

Blames Road Conditions for Small Mileage Obtained by Trucks in This Country

COMPREHENSIVE tests of solid tires in England, covering the use of thirty-seven British automobile trucks ranging in size from 1 to 6 long tons capacities, have been concluded recently with most illuminating results so far as tire mileages are concerned.

The truck represented six different makes, including some motor omnibuses and the average of the whole lot was 17,409 miles per set of six tires and based upon the consumption of three sets to each truck.

The compiler of the figures, A. E. M. Turner, of London, in commenting on the comparative service of tires states that with one exception, the British tire makers are behind those of the European continent and that the American tires were as good or better than those of the continental factories. In the face of the fact that users of American trucks get materially lower figures in miles than the appended table shows, the comment of Mr. Turner on the quality of American tires seems to prove that road conditions are accountable. In THE AUTOMOBILE last summer it was shown that the average of 1,000 truck tires in actual use was somewhat in excess of 11,000 miles. The British experience shows that the average guarantee of American tire makers is on the conservative side.

The article of Mr. Turner is presented by the truck department of the National Association of Automobile Manufacturers, as follows:

"The mileage shown as the result of using a particular size of rubber is the figure obtained from wearing out three sets of six rubbers, or eighteen tires in all. These results are all from vehicles used in actual service—not from manufacturers' demonstration machines—and have come from two or three vehicles each of the same make and load capacity in the different sets of results. To wear out eighteen tires might take a truck four years or more, and then even this would not give a representative result, as, while one truck might have an exceedingly careful driver who might get an extra 1,000 or even 2,000 miles out of his tires, three vehicles would be more likely to have average treatment meted out to them.

"All mileages given are for the band type of tire. Pressed-in or grip tires are used very little in England. The figures are from records kept on the services of large business concerns. (In making comparisons with American vehicles it should be remembered that English motor trucks are rated in long tons, equivalent to 2,240 pounds.)

"The six makes of chassis appearing in the table are the products of the following manufacturing companies:

Chassis	Manufacturer	Location
Karrier	Clayton & Co., Ltd.	Huddlesfield
Lacre	Lacre Motor Car Co., Ltd.	Letchworth
Leyland	Leyland Motors, Ltd.	Leyland, Lancashire
Commer	Commercial Cars, Ltd.	Luton
Belsize	Belsize Motors, Ltd.	Clayton, Manchester
Hallford	J. & E. Hall.	Dartford, Kent

"The Lacre 2-ton chassis has a four-cylinder 30-horsepower engine, which is exceptionally large for a British 2-ton truck, the average horsepower of seven makes of this capacity being 20 horsepower. The Lacre company have no engine between a two-cylinder 18-horsepower model and its 30-horsepower, four-cylinder engine.

"The remaining well-known make, the Dennis, has been purchased principally by McNamara & Company, Ltd., the big motor haulage contractors of Finsbury, London, E. C., but they will not part with tire mileages. The Dennis chassis are all fairly small-wheeled machines—32 and 34 inches all around—and I have heard various complaints of tire trouble in connection with them. I think the fact of the matter is that if a cheap, undersized or defective rubber has been fitted to a small wheel it simply hastens the collapse of the tire, but does not necessarily destroy it. As you no doubt know, an inferior tire seldom wears out, but it gets destroyed easily in ordinary use, collapses, leaves the rim or band, etc.

"London motor buses, running on 4-inch singles, front, and 4-inch twins, rear, fitted exclusively to cast steel wheels, give about 21,000 miles per set of six rubbers on an average. Peter Union (German) tires are instrumental in getting this big average.

"Trucks and wagons with live-axle types of final drive give, under fair treatment, a bigger mileage from tires than chain-driven chassis, mainly owing to the nice take-up of the drive.

"Of the few remaining cases in Britain where the driver is seated over the engine, it is found that the life, particularly of the front rubbers, is greatly decreased. The weight on the front rubbers is greatly increased, and the tendency, as the vehicle is being propelled over the road, is for them to be driven into the road. It is, therefore, most economical to have the engine under a bonnet, from the point of view of tire economy.

"The writer would like to add that he has been fairly actively in touch with rubber tires since 1892, and whether in carriage or solid motor tires, he has always found American rubber tires either distinctly better in quality, or at any rate as good as the best Continental tires. The main fault which I found in American tires was that there was not enough wearing rubber in them. They were merely shallow pads round the rim, and so we did not get a great mileage out of them. Their rubber, however, invariably wore with perfect evenness."

Truck Rating and Weight

Commercial Vehicle Committee of N. A. A. M. Studies Relation of Chassis Weight to Rated Capacity

Considers Both Gasoline and Electric Machines—Fair Degree of Uniformity Shown

IN the accompanying table are given the averages of the actual weights of American motor truck chassis of the various load capacity ratings, as supplied by the manufacturers of 325 gasoline vehicles and forty-nine electric models. Also, the means of the average weights corresponding with the curves shown on the accompanying chart; and for comparison the average of the weights of from three to ten most successful makes of trucks in each capacity rating.

For example, the average of the chassis weights of forty-nine different makes of 3-ton gasoline trucks is 5,509 pounds. To bear a uniform relation to the average weights of all other capacities the weight should be 5,600 pounds. But the average of actual weights of ten well-known and successful makes of three-ton trucks is 6,070 pounds, which exceeds the average of the 49 makes by 470 pounds. On the chart the dots indicate the average actual weights in the capacities most numerously represented.

Reference to the table will show that in most truck sizes the average weights of the selected few representative makes of gas trucks is in excess of that of all makes combined. The conclusion is that the companies that have had most experience rate their trucks lower or build them heavier and stronger than the new makers.

The weight of the body is an important factor in the problem presented but as the weight of similar body types is generally proportionate the lesson taught is valuable even without including the body weight in the summaries and averages. The accompanying article was formulated and presented by the Commercial Vehicle Committee of the National Association of Automobile Manufacturers and is one of a series of important publications touching the theory and practice of automobile truck engineering and operation.

These articles so far have included the distribution of trucks which appeared in last week's issue of THE AUTOMOBILE and the English tests of solid tires on the opposite page.

Knox and Benz at the pits waiting for the start

De Palma a close second and Mulford right behind. The Benz, except for three laps, the first, the twenty-third and the twenty-fourth, had been the leading car so far throughout the entire distance of 203 miles. It looked as though the three would finish in the order named above. Each was maintaining terrific speed, and no change in their relative positions took place until the thirty-fifth, or next to the last lap. Bergdoll was about a minute in the lead of De Palma, when on the back stretch he was forced to stop for tire change. This gave De Palma an opportunity for the second time that day, and in the thirty-fifth lap he passed the Benz car while it was still making the tire replacement. There was no stopping him now, and Bergdoll was obliged to cross the tape second to the Italian, after practically leading the field from the start of the 305-mile run.

Mulford did not finish his race. On the thirty-third lap, when nearing the grand stand, he was overcome by the intense heat, and nearly relinquished control of the speeding Knox. His mechanician leaned over and guided the big car to the pit. Mulford was lifted from the machine and assisted to the hospital tent by Referee Beecroft, while his mechanician, William Chandler, jumped into the driver's seat. One of the pit attendants got in beside him and the Knox was sent away again to make the remaining three laps.

Big Crowd on Friday

On Friday the Jenks Trophy, Aurora Trophy and Illinois Trophy events were run simultaneously before a crowd only slightly less than that which viewed the larger races of Saturday. Merz in the Stutz was the winner of the Illinois Trophy event, while his teammate, Anderson, was a good second. These two cars were the only ones to finish the race of twenty-four laps, or 203 miles and 1,896 feet. The Rayfield and National entries in this race did not finish, the former driven by Hobbs, being out in the third lap with a broken crankshaft bearing, and the National, piloted by Whalen, being obliged to quit the race after nine laps on account of a break in the magneto drive. This left the two Stutz cars the contenders for first place in this event, which was the longest of the day.

Merz led the Illinois Trophy race from the start, while up to the eighth lap Whalen in the National was a close second, cutting down the former's lead with each lap up to the fifth. In completing the fourth lap it looked as though Whalen might overtake his rival, so quickly had he gained. At the end of the fourth lap the time of the two leaders was as follows: Merz, Stutz—30:20; Whalen, National—30:44. Merz made this fourth lap in just 1 second less than Whalen, completing the circuit in 7 minutes and 34 seconds. In the next lap, however, Merz made the fastest time of his race and increased his lead over the National by 9 seconds. His time for this lap was 7 minutes and 28 seconds.

Anderson Passes Whalen

Whalen retained second place up to the eighth lap, while the other Stutz, driven by Anderson, was fast gaining. It was at the completion of his eighth lap that the latter succeeded in nosing out the National for second place. Whalen completed another lap, and was on his tenth circuit when misfortune overtook him and put his car out of the race. The magneto coupling broke and the damage proved of such magnitude that he was compelled to withdraw from the big races of Saturday.

Whalen's dropping out left the race entirely in the hands of the Stutz cars, which had a merry time of it together from the ninth lap to the finish. Both cars continued to perform consistently to the end, Merz maintaining his lead over Anderson

TABLE SHOWING PRINCIPAL FEATURES OF CONSTRUCTION AND EQUIPMENT OF THE CARS WHICH RACED AT ELGIN

practically as at the tenth lap. In his twelfth lap, however, Merz lost 50 seconds when he was obliged to stop at his pit for gasoline and oil. He was off again with a lead of but 8 seconds for the twelfth lap over his rival, Anderson. The latter took advantage of this opportunity to cut down the breach between himself and Merz and on completing the next lap the leader maintained his position by a margin of only 2 seconds.

In the following lap, however, Anderson was compelled to stop at the pit to take on gasoline and oil, losing 30 seconds for this, giving Merz a lead of 1 minute and 4 seconds for the fourteenth lap. From this time on until the end of the race the two cars stayed about the same distance apart. Anderson's fastest lap was his tenth, which he negotiated in 7 minutes and 31 seconds, 3 seconds slower than Merz's fastest of 7 minutes and 28 seconds.

The two pit stops for lubricant and fuel were the only ones made during the entire race, no tire trouble being met with by the two cars. Merz completed the race in 184 minutes and 32.25 seconds, while Anderson made the twenty-four laps in 186 minutes and 14.15 seconds. Merz averaged 66.11 miles an hour for the long grind of 203 miles.

Six cars in the Aurora Trophy race limited to machines of from 201 to 300 cubic inches piston displacement, were the next to be sent off by Starter Fred J. Wagner amid a cloud of smoke and in order according to their entry numbers.

Hughes Takes Lead and Holds It

Hughie Hughes in his Mercer, although the last to start, got the lead on the first lap and retained that position throughout the entire race of 152 miles. His time for the initial lap was 7:52, one of slowest of his race. His team-mate, Spencer Wishart, was in second position for three laps. In the fourth lap, giving up this position to Pullen in another Mercer. The latter did not lose this position throughout the rest of the race crossing the tape second to Hughes.

Hughes piloted his car at the average rate of 65 miles an hour, while Pullen's average speed was 62.3 miles an hour. The former made his fastest time on the next to the last lap, making the course in 7:23. Pullen's time on his fastest lap was 7:48.

The little Mason, driven by Roberts, ran a good race coming into third place on the fourth lap and staying in this position up to the fifteenth except for the ninth when Wishart succeeded in nosing it out and only momentarily, however. In the sixteenth Trussel in a Falcar gained third position and the Mason was

Velle truck used to transport the militia guards

unable to head it off in the remaining three laps of the race.

Hughes ran a consistant race throughout, stopping only once at the pit when he was far in the lead and even this stop was unnecessary. He informed the pit attendants that his team-mate, Pullen, had blown a tire on the back stretch. Wishart was obliged to stop at the pit in the eleventh lap for tire change. He ran two more laps and was obliged to drop out of the race because his oil lead broke, together with his water pump, beyond immediate repair. The other five starters completed the race. In the fourteenth round Roberts was forced to stop his Mason to tighen up the shock-absorbers on his car which, due to its light weight, was hard to hold on the road, especially on the rougher back stretch.

The fastest lap of the entire race was run by Hastings in a Falcar who in his ninth circuit succeeded in making a time of 7:22. Hughes' fastest lap was 1 second slower than this. He was not pushed, however, and no doubt could have cut his time down considerably had it been necessary.

Hughes' taking of this year's Aurora Trophy race makes him a two-time winner of this event.

The Jencks Trophy event went to Mason entry No. 41 which

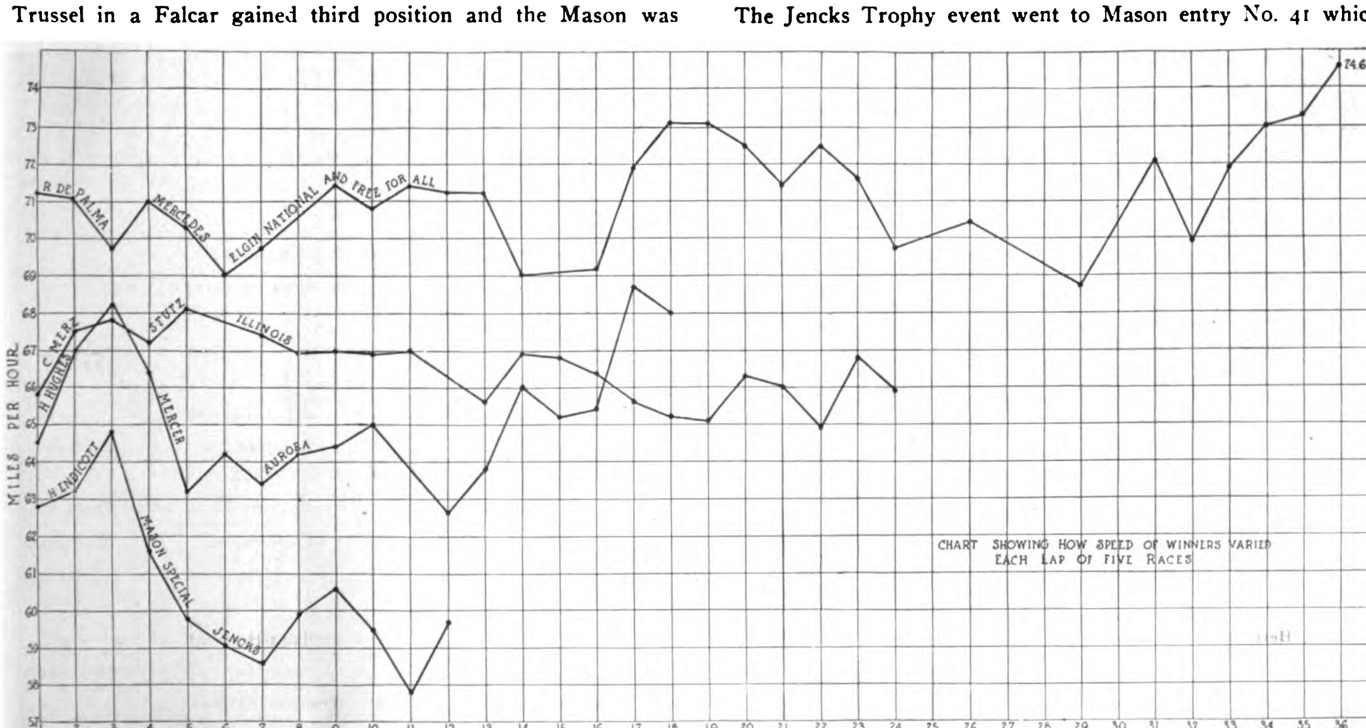

Chart showing variations of running speed of the winners of each race run at Elgin last week

Technical Aspect of Race

Car Design and Equipment Showed Numerous New Features

THE most marked feature of the Elgin meet was the small amount of tire trouble which even the bigger cars had. There were twenty-five recorded cases of tire replacement for the 2 days' racing, and on the first day, when the lighter cars performed, only two stops were made at the pits for tire changes. These were both in the Aurora trophy race, as neither car in the Jencks race nor in the Illinois trophy event had to slacken its speed for this purpose. This applies to the cars which finished in the several events.

Saturday's races saw sixteen tire replacements at the pits, ten of which were right rear tire changes, four left rear and a front change. On numerous occasions when it was necessary to stop at the pits for tire changes advantage was taken of the forced wait to refill oil and gasoline tanks.

On the second day's racing, seven pit stops were made to refill oil, gasoline and water tanks, two to change driver, and one for carbureter adjustment. On the previous day two stops were made to replenish tanks, one for carbureter adjustment and one for the tightening of shock-absorbers. The total number of stops on Friday was six and on Saturday twenty.

Practice troubles were few on the first day; there were no tire changes and the only other two breakdowns were those of Mulford, who broke his crankshaft, and of Hobbs, driving a Rayfield, who burned out an engine bearing. On Saturday, however, Tetzlaff, while in practice, put his car permanently out of the race by shearing one of the differential gears.

A noticeable feature of the Herreshoff entry was that the tires were carried on clincher rims and not on quick-detachable racing rims, which all the other cars used. Wordingham, who drove the car, was obliged to depend on the tires which were on the machine to last throughout the race as, had he been obliged to replace a damaged tire by the clincher method, the time required would have been sufficient to put him out of the running. The Rayfield car carried no extra tires and would have been obliged to run on a damaged shoe from any part of the course back to the pit.

Attention should be called to the fact that none of the cars were stock machines and all were entered under Class C, which requires that the manufacturers must have made at least fifty of the machines for the previous season. Most of the larger cars had been seen before by the racing fraternity and presented no strikingly new features of construction. The Benz car had its rear wheels provided with thin aluminum disks which were bolted to the spokes. This was done with the idea of reducing wind resistance and not for strengthening the wheels, as the metal was too thin for that purpose.

Most of the cars had the conventional type of racing-car exhaust, although the Mason entries had their exhaust pipes coming upward through the tops of the hoods, a feature which no doubt was of great annoyance to the drivers of these machines. The other cars, with the exception of the Ford and the Knox, exhausted below the chassis. The big Knox Six had an exhaust pipe for each cylinder, the six pipes coming out of the left side of the hood. The Ford car was nearly ruled out of the race because the exhaust manifold had been completely removed and no other scheme had been adopted to lead the gases outside of the hood. F. E. Edwards, Chairman of the Technical Committee, at first refused to let the car start, but later stretched a point and permitted it to enter the race, after the lower half of the hood on the exhaust side had been removed, permitting the gases to escape into the air.

The Mason cars were the only ones in the races which had left-hand drive, while Hugh Hughes' Mercer was also distinctive in that it was provided with wire wheels. In making tire changes, the entire wheel was removed and an extra wheel quickly put in its place. This method was undoubtedly faster than that of the other contestants who used demountable rims and many were favorably impressed with the wire wheel showing, both for aiding in keeping the car on the road and for the quick tire change feature.

was driven by Endicott at an average speed of 60.7 miles an hour. He had practically no opposition throughout the entire race and was the only one of the three starters to complete the run of 101 miles and 3,588 feet, or twelve laps. His total time was 100 minutes and 42.9 seconds. The other two entries were Ford and the veteran Herreshoff driven by Wordingham. It was too bad to push this well-known car into a race when it was not in condition and it was out of the race after one lap on account of a broken wheel. It was, however, running an easy second to Endicott's Mason when the accident occurred.

The Ford entry driven by Henning, which was another veteran, completed six laps when it was ditched and put out of the race permanently. Its performance, though slow, was consistent for the 50 miles which it ran. After it was put out of the race Endicott had things all his own way and finished in his own time without a single stop for tire change or for adjustment of any kind, but keeping his machine humming along at a fast pace all the way to the finish line.

Ralph De Palma's Story

Driver Who Won Double-Header Describes the Race

SOME interesting sidelights on the feature races of Saturday were told by Ralph De Palma, who stated that without a doubt it was the hardest contest in which he had ever participated. The weather was the hottest which has visited the Middle West this year, and the boiling sun beat down furiously upon the speeding drivers, much to their discomfiture. According to De Palma, the back stretch was the hottest, and was very much like an oven, despite the fact that the big Mercedes which he was driving was traveling at a speed of over 70 miles an hour. The heat from the engine swept directly back to the cars and occupants to add to that from the sun's rays.

De Palma changed three tires during the 305-mile run, all at the pits. This, of course, means that after each blow-out he drove for some distance on the flat damaged tire or rim. It was quicker to do this than to have to stop at the point at which the tire gave way, since the facilities for changing were better and more rapid at the pit. The Italian used a total of 29 gallons of gasoline for the thirty-six-lap free-for-all race, thus averaging 10.5 miles to the gallon. His tank has a capacity of 38 gallons, and while at the pit on one occasion he took on 10 gallons and the tank was half full at the end of the race.

Speaking of the course, De Palma stated that it was one of the best on which he had driven, and that it was an easy matter to pass any other car, the width being amply sufficient. At 90 miles an hour the slight roughness of the road surface is not noticeable at all, he stated, while at 60 miles the unevenness is perceptible, but is by no means a disturbing factor. The course is better than that over which the French Grand Prix is run in that respect, as in that event he was frequently obliged to run along for some 15 miles on the course before being able to pass any other car.

Perhaps the most interesting feature of De Palma's races and the one which brings out the obstacles with which he had to contend to win Saturday's events was that from the tenth lap on he was unable to throw out the clutch, it remaining frozen for the remaining twenty-six laps. He was having trouble with his clutch before the race, and delayed the start for 10 minutes while his attendants tried to put it in good condition. Had it been necessary for him to stop on the back stretch for any purpose, he could never have been able to start again. To change gears at that time it was necessary to speed the motor up to what was judged to be the correct speed, then to jam in the gears and run the chance of stripping them. This requires intimate knowledge of the motor's operation. When he stopped his car for tire changes at the pit it was necessary to stop the motor. It was in starting it again that the greatest chance of damage was run. The rear wheels rested in a pool of oil, and the fact had much to do with the prevention of harm to the transmission. If the motor had been speeded up sufficiently, De Palma threw in the lower of the two gears, which he was able to use, putting the strain immediately on the rear wheels. The oil allowed them to spin around in getting the car going again and gave sufficient flexibility to prevent damage. The Mercedes clutch is of the special spring type, the spring being coiled around a drum, and contracting on it when engaged. The drum became cracked, spreading out and jamming within the spiral, rendering positive and unalterable connection between the engine and transmission.

On the twenty-ninth lap the air pressure in the gasoline tank became so great that it was necessary to stop at the pit to reduce it. It had reached about 8 pounds to the square inch.

Some mechanical details of the Mercedes which De Palma drove may be of interest. The motor has a bore of 131.8 millimeters and a stroke of 180 millimeters, giving it a piston dis-

Harking Back a Decade

What Stirred the Automobile World 10 Years Ago—High Price of Gasoline—Racing on Road and Track

Chicago Automobile Facilities Transported More Than 2,000 Persons Every Day

FROM *The Automobile and Motor Review*, September 6, 1902: Every day from 2,000 to 2,500 persons in Chicago ride in public service automobiles, which have come to displace the horse-drawn carette and various forms of busses. There are at present seventeen motor vehicles divided into six lines which make quick trips through the shopping district.

A. C. Newby, of the National Electric Vehicle Company, of Indianapolis, has made a run in one of the cars turned out by that company of 118 miles on one charge. An ordinary 44-cell battery was used.

Exports from New York, including cars and parts, for the week ending August 30 amounted to $11,600.

C. A. Benjamin has left Syracuse to take charge of the Chicago branch of the Locomobile Company of America.

The American Bicycle Company, incorporated for $30,000,000 has defaulted on the semi-annual interest payments on its issue of 5 per cent. gold sinking fund bonds and proceedings have been instituted to have the concern adjudicated bankrupt.

Increasing demand for gasoline has served to advance the price of the 90-degree grade from 17 to 19 cents a gallon. While the big majority of automobile owners are comparatively wealthy men, it has been determined to ask the National Association of Automobile Manufacturers to investigate the underlying causes of the advance.

According to a report made to the National Capital Automobile Club, practically every physician of standing in Washington owns at least one automobile.

President Lee H. Smith of the Buffalo Automobile Club reports that the organization now has a membership of 200, which represents probably 1-5 of the total number of automobiles owned in Buffalo.

The Baker torpedo, Winton's Bullet and the Ford racing pair are to be seen at the race meeting which will be held in Cleveland.

The Fords were built particularly for track work and have been pointed for the 10-mile handicap and Australian pursuit races.

The Chicago Automobile Club has adopted a new system of classification for cars entered in its forthcoming meet at Joliet. The formula is to 1-100 of the weight into the horsepower, so as to give the horsepower per 100 pounds and then classify the cars according to similarity of results. Herbert Crane, of Racine, Wis., has adopted the motor vehicle as a means for delivering milk to his customers. Mr. Crane says that he only spends from 15 to 20 cents a day for fuel.

Low wheels came in by degrees. The vehicle world, usually so quick to snap up anything which had the appearance of being good, was peculiarly slow in adopting them. To produce a rigid wheel and at the same time preserve the elasticity so necessary to an easy-riding vehicle has been the aim of the manufacturers for years. It was not until the advent of pneumatic tires that the opportunity of accomplishing such a result became possible.

While there is a certain amount of opposition to all forms of automobile racing, we believe that the great majority of American motorists, including the makers, are in favor of a continuance of the sport on the road as well as on the track.

---

placement of 599.2 cubic inches. In English units the millimeter measurements given above are 5.2 by 7.06 inches. The carbureter is a Rayfield, while the magneto is of Bosch make of the two-spark type. The spark was set for 5-16-inch lead. The gear ratio on high is 1 5-8 to 1. There is no direct drive to the car, power being transmitted through gears for all speeds. The horsepower developed by the motor, which is of four-cylinder type, is 37 at an engine speed of 400 revolutions per minute, 90 at 1,650 revolutions and 114 at 1,850 revolutions. The pistons are of cast iron and are fitted with two rings each. At the top, the pistons have a clearance of .03 inch, at the middle .02 inch and at the bottom .015 inch. The clearances are much greater than those given to the average automobile to allow for greater expansion due to greater heat.

De Palma drove this same Mercedes in the Indianapolis races, and no alterations of any consequence have been made in it since then.

Moline Sees Labor Day Hill Climb

MOLINE, ILL., Sept. 3—Over 5,000 people lined the Sixteenth street hill Labor Day morning and watched Jack Stickney, in a stripped Velie, make the best time of the day, taking the free-for-all with a mark of 17 seconds flat. Stickney and Rose, both Velie drivers, carried off a majority of the honors, winning three firsts and a second. Oscar Priester, of Davenport, in a Pope-Hartford, won the Josephson cup in the amateur drivers' class, making the good time of 17 1-5 seconds. The Pope-Hartford cars took second honors with two firsts and two seconds. The summary is as follows:

Car	Driver	Time
CARS COSTING FROM $1,000 TO $1,800		
Velie	Rose	20:00
Velie	Stickney	21:80
CARS COSTING LESS THAN $2,000		
Velie	Rose	22:00
FREE-FOR-ALL RACE		
Velie	Stickney	17:00
CARS COSTING OVER $1,800		
Lozier	French	18:00
Pope-Hartford	Petersen	18:20
CARS COSTING $1,000 AND LESS		
Overland	Knowles	21:00
CARS COSTING $2,000, CARRYING FOUR PASSENGERS		
Pope-Hartford	Priester	18:00
Pope-Hartford	Petersen	19:00
AMATEUR-DRIVEN CARS		
Lozier	Priester	17:20
Velie	French	18:20

Manitoba Run to Be on Varied Roads

WINNIPEG, MAN., Aug. 31—To obtain every condition of road in the province from sand, mud, swamp, rough, rocky and the smooth, even, hard-packed roadway, the contest committee in charge of the annual endurance run has decided upon the following route:

From Brandon to Carberry and then from Carberry north to Neepawa and from Neepawa to Brandon.

From Brandon the contestants will return by way of Wawanesa, Glenboro, Treherne, Fannystelle and Starbuck.

This route will give a run of between 350 to 400 miles and will take in every variety of district.

Rain Spoils Brighton Meet

The Labor Day meet held on the Brighton Beach 1-mile track on Monday and which was scheduled to include seven events, was postponed after the fifth because Bob Burman declined to race on the wet track in his new 300-horsepower Blitzen Benz II. This event was announced as the star performance of the day.

The other attractions were a 5-mile match race between an E-M-F and a Bergdoll, the former, driven by Billy Burke, winning in 6:2.35; a 5-mile race between Stutz (Dave Lewis), White

(Kyle) and Marion (Strauss), finishing in the order named, with the Stutz arriving in 5:16.61; the same Stutz and White cars and their drivers against Burman in his Ohio, which was disabled on the homestretch of the first lap. This was won by the White in 5:5.14; the first heat of a match race for the Remy Brassard, between Burman, in Blitzen Benz, Hickman, in a Mercedes, Kyle, in the White, and Grennan, in a Benz, Burman going to a spectacular finish; 25-mile race between two Bergdolls, a Marion, Stutz, White and Cutting, the last driven by Burman and finishing in 25.28.56, beating the White by 12 seconds. The grandstand was filled fairly well despite the inclement weather.

A. A. A. Pathfinder Completes Trip

NEW ORLEANS, LA., Sept. 2—Coated with Louisiana mud, the pathfinder of the American Automobile Association's national reliability tour, a Flanders electric coupé, reached its destination in this city last week. The car was met by a column of 100 local automobiles and was escorted to the city hall where official welcome was extended. The pathfinder was 28 days in covering the route from Detroit.

Much of the highways covered is in excellent shape but the map-maker reports that many miles represent the most primitive stage of road-building. Little tire trouble was experienced en route.

Labor Day Races at Albany

ALBANY, N. Y., Sept. 3—Arthur Lang, of Albany, N. Y., on Labor Day competed with William Earl, of Kinderhook, at Parry's Island and defeated him in a 30-horsepower machine, making 5 miles in 8:11 3-4. The second event was won by Frank Baymer, who made 5 miles in 8:03, and the third event was taken by Sam Shaw in 7:57 for 5 miles. The final event was another 5-mile event which was won by W. Knapp in 9:09.

Garage Show Planned at Omaha

OMAHA, NEB., Sept. 3—Omaha will have a fall automobile show, during the Ak-Sar-Ben carnival week, in order that the 1913 models of the cars may be shown to the thousands of outsiders who come to the city during that time, the last week in September and the first in October.

It will not be held at the auditorium where the February shows are given, but will be a street or garage show. This was decided at a recent meeting of the Omaha Automobile Dealers Show Association.

The garages will be decorated with the association colors, green and white, some of the dealers having worked out elaborate decoration schemes. The Omaha streets are strung with rows of incandescent lights during the carnival, and these will be extended up along automobile row. All of the companies will have a complete line of the new models on display.

It is estimated that the combined automobile show and carnival will induce a large per cent. of the state dealers to visit the city, as many have already signified their intention of doing so. There will be a large number of prospective buyers.

The promise of bumper crops in the state is leading all of the automobile men to predict record sales this fall.

If the Patent Office Took Fire

It is claimed by the *Revue de L'Automobile* that paper can be made incombustible by means of an immersion in a very strong solution of alum and that the result is still better if the immersion is repeated after the first coating has been dried. The method is recommended for the safeguarding of documents, private or public, as it is inexpensive and, far from affecting the legibility and appearance of documents injuriously, even preserves the whiteness and the surfaces of paper to which it is applied.

Calendar of Coming Events

What the Months Ahead Have in Store for the Automobilist—Shows, Conventions, Race Meets, Etc.

American and Foreign Fixtures of Importance Set Down in Chronological Order

Shows, Conventions, Etc.

Aug. 24-Sept. 9....Toronto, Can., Display of Automobiles, etc., at Canadian National Exhibition, Transportation Building.
Sept. 5-15.........San Jose, Cal., Automobile Show, San Jose Automobile Dealers' Association.
Sept. 14-21........Chicago, Ill., Annual Fall Festival and Show, Chicago Automobile Trade Association.
Sept. 17-20........Denver, Col., Convention International Association of Fire Engineers.
Sept. 23-Oct. 3.....New York City, Rubber Show, Grand Central Palace.
Dec. 7-22 ....Paris, France, Paris Automobile Show, Grand Palais.
Jan. 4-11..........Cleveland, O., Annual Automobile Show.
Jan. 11-25, 1913...New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25.........Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1.....Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show.
Feb. 10-15.........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 24-Mar. 1.....Omaha, Neb., Annual Automobile Show.
Feb. 24-March 1...St. Louis, Mo., Annual Automobile Show.
March 3-8.........Pittsburgh, Pa., Annual Automobile Show.
March 8-15........Boston, Mass., Annual Automobile Show.
March 17-22.......Buffalo, N. Y., Annual Automobile Show.
March 19-23.......Boston, Mass., Annual Truck Show.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.

Race Meets, Runs, Hill Climbs, Etc.

Sept. 29-30........St. Louis, Mo., Track Races, Universal Exposition Company.
Sept. 9-11.........Chicago, Ill., Commercial Vehicle Reliability Run, Chicago Motor Club.
Sept. 11-14........Buffalo, N. Y., Third Annual Reliability Tour, Automobile Club of Buffalo.
Sept. 17...........Milwaukee, Wis., Grand Prize Race.
Sept. 20...........Milwaukee, Wis., Wisconsin Challenge and Pabst Trophy Races.
Sept. 21...........Milwaukee, Wis., Vanderbilt Cup Race.
Sept. ....Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-11..........Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 7-20..........National Tour American Automobile Association.
Oct. 12............Salem, N. H., Track Meet, Rockingham Park.
Nov. 6.............Shreveport, La., Track Meet, Shreveport Automobile Club.

Foreign.

Sept. 26-Oct. 6....Bourges, France, Agricultural Motor Car Exposition.
Nov. 8-16.........London, England, Olympia Automobile Show.
Jan. 11-22.........Brussels, Belgium, Annual Belgian Automobile Show, Centenary Palace.

Grand Prix for 3-Liter Cars—It is announced in *L'Auto* of August 20 that a long-distance road race for "light vehicles" with a maximum cylinder volume of 3 liters will be held in June, 1913, separately from the *Grand Prix* race of the Automobile Club, and not jointly with this event as at the Dieppe race this year. The reason for this decision is that the new regulations for the club's race provide a maximum fuel consumption of 20 liters per 100 kilometers, which provision is so liberal that motors with 100 by 200 millimeters bore and stroke and developing 140 to 150 horsepowers can keep within it, and that consequently mainly cars of very great power can be expected to compete for its honors. As, on the other hand, the public is more deeply interested in cars of smaller dimensions which come nearer to the type usually bought by it, the organizers consider it desirable that the race for 3-liter cars shall be continued from year to year. It is foreshadowed that a maximum fuel consumption lower than 20 liters per 100 kilometers will be stipulated for this race for light vehicles and that it will be placed so low as to bring the superiority in fuel economy for which the European and especially the French automobile industry have been striving, into sharp contrast with the performances of the small American cars whose rapidly increasing sale in the European market is based on merits of a different order and is causing great anxiety.

Increasing the Speed

ELGIN, ILLINOIS, with its now-famous 8.5-mile road racing circuit is fast climbing the scale of the Goddess of Speed, and if the promoters continue annually to improve the course it will not be long before it will hold the record for a genuine road course, as it is one of the very few courses over which road races are run in which the natural course of the Illinois roads is followed and in which advantage has not been taken of banked turns of large radius in order to get headliners in the press on the speed attained in miles per hour.

From an average speed of 62.5 miles per hour in 1910 to 66.45 in 1911 and to 68.4 this year in the Elgin race for under 600 cubic inches piston displacement over the same course shows the improvement that is being made in cars and also furnishes fuel to the ever-increasing inquiry, "What is going to be the speed limit of motor cars in road races in America?" These figures must be analyzed carefully; otherwise an increase of over 15 per cent. average speed within a lapse of 2 years might be misinterpreted. During the 1910 and 1911 races competition was limited to stock cars. This year it was a non-stock event, but with the same piston limitations of 600 cubic inches as ruled in the stock régime. It must also be borne in mind that roads are being improved from year to year, that drivers are becoming more expert and also more familiar with the course. With all of these matters considered the fact still remains that cars are annually becoming speedier. The fastest lap of 1910, 64.5 miles per hour was raised to 70.45 last year and carried still onward to 74.5 this year. At this pace the speed in a few years may reach the amazing average of 80 miles per hour for the race and easily 90 miles per hour for a single lap.

Of the many factors that are contributing to higher speed in racing cars, the **reduction in weight of reciprocating parts and car balance must receive premier consideration.** The reducing of piston and connecting-rod weight is becoming more general. With the forged steel piston machined to the minimum weight, with hollow tubular connecting-rods and with but a piston ring or two it is now possible with additional piston clearance to get reliability that endures the tremendous speed of hundreds of miles at over 60 miles per hour. Many engineers who have carved for themselves niches in the motoring temple of fame in pleasure car design, have become discards in racing car design, solely due to lack of familiarity with the unlooked-for strains that continued speed imposes on the car mechanisms. Thanks to French aggressiveness, many of these problems have been sufficiently exploited so that today there are a few milestones to blaze the trail in this comparatively unexplored field of car engineering. To date, where engineers have overstepped prescribed limits in weight reduction there have been breakdowns due to lack of fatigue factors in the parts, these, however, having proven their strength adequate for the short test. The forged piston and light connecting-rod are today in a status similar to that of the steering knuckle parts of 2 or 3 years ago when often half a dozen broke in a single race. Today the broken steering knuckle is an unheard-of factor in racing, and it is to be hoped that within a few short years the seized piston or broken connecting-rod will be equally extinct.

Car balance has won several races within the last 3 years, previous to which time it was not considered seriously, the engineer and driver working more on larger valves, improved timing and stronger chassis parts. Today the weight carried on the forward wheels and that carried on the rear wheels is considered to the second or third decimal place. The car is weighed and re-weighed and every effort made to get to get the weights the same. This insures a car that will hold the road no matter at what speed it travels and when a car clings to the roadway there is not any loss in slippage between the tire and the road such as there is when the car is bounding into the air and permitting the rear wheels to spin at abnormally high speed while off the ground, only to act as an emery wheel to grind off the rubber on the tire treads when they finally strike the road surface. Due to such conditions car balance is imperative; it saves the motor from racing, it saves the tires from grinding off the tread and it saves the driver the discomfort of being pounded as he so often is.

Racing is for advertisement and it is questionable if there is any other phase of a racing machine that attracts greater attention than its ability to cling to the road surface and to run smoothly at high speeds. Every car driver, and nearly every car owner who has toured over American roads is familiar with the pounding received in the tonneau seat due to stiff springs, poor body positioning, bad shock-absorbers and lack of car balance. To such the well-balanced car appeals with special significance.

Continued high speed has demanded more adequate lubrication, and while a few years ago there was often nearly half as many gallons of oil fed to the motor in a race as there were consumed gallons of gasoline today this extravagance has been eliminated and racing cars are being perfected which can carry an oil supply for a race of 500 miles, and one or two claim to carry capacity for 1,000 miles. The lubrication has been confined to force-feed to the bearings of the crankshaft and the connecting-rods. With such a system the amount of oil needed as compared with that consumed in splash is less than one-half and better results are being obtained. France is acting commendably in its announced rules for its 1913 Grand Prix race in which gasoline consumption is made a factor. The new rules require that the racer shall average approximately 14 miles to the gallon of fuel. The club is mastering the situation by insisting on manufacturing its own gasoline tanks, the fittings and pipings, and placing official observers over the cars to see that no violation of the rule is committed. Similar action was taken four or five years ago, but there was not any permanent result. Today with the rapid rise in the cost of fuel the enormous increase in the number of cars and other factors it is expected that something permanent will result so that, as far as motor efficiency is considered, there will be something rational in the racing machine, so that the stock product of the factory will benefit in this regard as a result of the races. That which is irrational cannot continue and even in free-for-all racing the rules must be marked by rational limitations. Otherwise the venture will consume itself in its own extravagances.

Canadian Customs Touring Rules

Great Increase in Number of Cars Crossing the Border Renders More or Less Red Tape Necessary

MONTREAL, QUE., Aug. 31—In view of the steadily growing volume of automobile tourist traffic between Canada and the United States, and vice versa, it is thought by local customs to be a fitting time for them to generally remind travelers, of the rules and regulations to which they must conform if they wish to journey without inconvenience or delay.

For Canadian-owned cars going into the United States it was explained this morning by the official in the department of the chief collector of customs, the owner thereof must first ask permission from the local customs authorities to export his car for touring purposes.

When this has been done, the car owner will be supplied with two forms which must be made out in duplicate giving name and address of owner, with the name of manufacturer of the automobile, the manufacturer's number, the number of cylinders in the car, the style, seating capacity, color, style of running gear, with what extras, glass windshield and speedometer, together with the numbers of each of the tires, back and front, etc.

One copy of the lengthy form so made out is to be given to the customs office at the last customs port on this side of the line, while the other is kept by the car owner until he returns to Canada, when it is given to the customs officers for purposes of comparison, with the duplicate in his possession.

In the case of American tourists coming into Canada not only must conditions like the aforesaid be complied with, but each car owner must deposit the sum of $25 as a mark of good faith as well as a bond representing twice the duty collectable on the car. Thus, for instance, if an American car worth $5,000 comes into Canada and on a basis of 35 per cent. is liable to pay $1,750.00 duty, the owner must take out a bond for $3,500 with some guaranteed bond company.

The bond expires and the $25 good-faith money is handed back as soon as the American car leaves this side.

If, however, an American tourist, coming into Canada, can produce two Canadians to sign a personal bond, the cash bond stipulation does not become necessary.

Over 500 automobiles, Canadian and American, have crossed the boundary line between Province and New York State since May 1 last.

Canada Has 21,920 Automobiles

Ontario Leads Provinces in Number of Cars in Use While Alberta Has Highest Population Ratio

MONTREAL, QUE., Sept. 3—The extent of the cult of the automobile in this country is clearly reflected in the following table showing the population and the number of cars now in use in each province of the Dominion:

Province	Population	No. of cars	Population per car
Nova Scotia	492,338	578	851
New Brunswick	351,889	592	594
Quebec	2,002,712	2,500	801
Ontario	2,523,208	7,338	344
Manitoba	455,614	3,000	152
Saskatchewan	492,432	2,537	194
Alberta	374,663	3,000	125
British Columbia	392,480	2,375	165

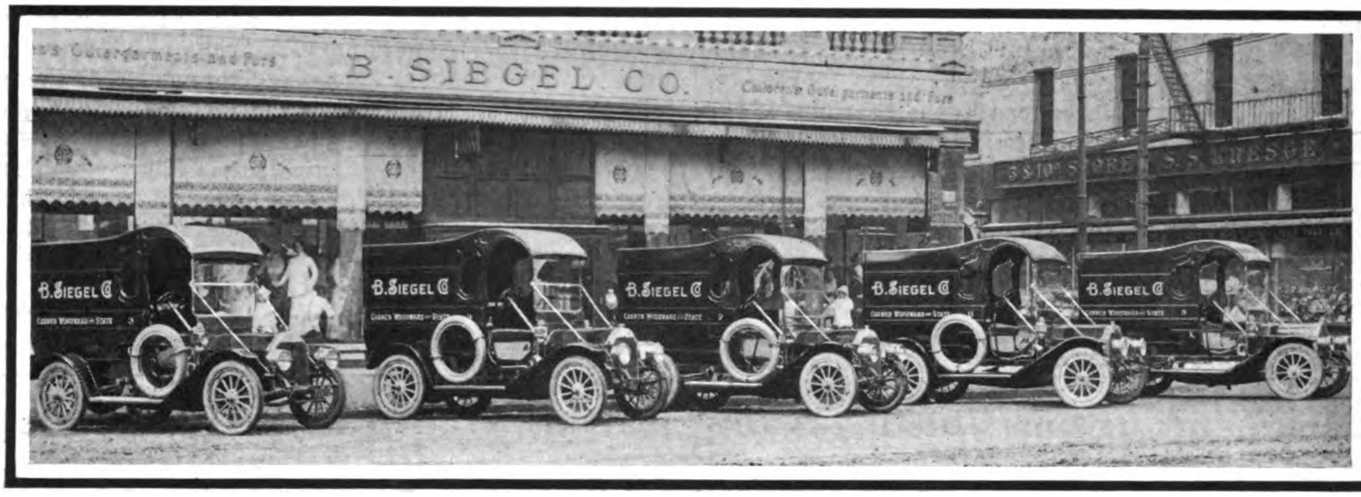
In comparison to population Alberta has the greatest number of cars. Last year 700 licenses were issued in Calgary and about 350 in Edmonton. Manitoba comes next with one auto to every 152 people in the province, and British Columbia third with one auto to every 165 persons. Nova Scotia has the smallest number of cars, and the ratio of autos to population here is the lowest. Ontario leads in the number of machines in use and has one car to each 344 of population. Western Canada generally is a far larger buyer than the East.

In addition to the licenses to residents of Ontario, 4,001 licenses were granted to tourists. In Manitoba cars transient through the province are not registered and have 30 days for touring that part of the country. After that time they are considered resident and have to take out a license.

Prince Edward Island is the only province which prohibits the use of motor vehicles on its highways and public places. This was thought necessary in the interest and for the safety of the traveling public. The penalty for breaking this law is $500 or 6 months in jail.

The following is a comparative statement of automobiles imported into Canada from the United States during 1909 to 1911, as compiled by the Department of Commerce and Labor:

Year.	No.		Value.	
1909	1,230		$1,457,129	
1910	3,102		3,340,326	
1911	4,687		5,057,927	
		9,019		$9,845,382
Value automobile parts:				
1909			$2,230,509	
1910			1,023,386	
1911			1,726,842	
				2,980,737
Total valuation of automobiles and parts				$12,826,119



The B. Siegel Company, Detroit, Mich., now has five Cartercar trucks which displace fifteen horses in the delivery department

SIEGEL Company's Five Cartercars—The above photograph shows the five Cartercars used by the B. Siegel Company, Detroit, Mich., in place of fifteen horses, which were formerly required to accomplish the deliveries. Located as this firm is, right in the very heart of the most congested business district, they could not possibly continue the old style delivery system without sacrificing considerable business.

Studebaker Declares Dividends—The Studebaker Corporation, Detroit, Mich., has declared its regular quarterly dividend of 1¾ per cent.

Halcomb Opens N. Y. Salesrooms—The Halcomb Steel Company, Syracuse, N. Y., has opened a sales office at 95 Liberty street, New York City, in order to give more efficient service to its customers.

Mitchell Joins Republic Tire—G. L. Mitchell has resigned managership of the Toronto, Ont., branch of the Diamond Rubber Company to become partner in the Republic Rubber Company, Detroit, Mich.

Eastern Canada Leads in Sales—Statistics just issued by a Canadian financial paper indicate that more automobiles are sold in western Canada than in the eastern section proportionately to the population.

Reo Divides Yearly Profits—The Reo Motor Car Company, Lansing, Mich., has announced its third distribution of profits this year amounting to about $200,000, which is 10.9 per cent. on its capital of $2,000,000.

Detroit Automobile College Opened—Wolverine Automobile College has been opened at 942 Jefferson Avenue, Detroit, Mich. Chester Arthur, formerly with the Automobile School of America, is chief instructor.

Baillargeon, President Peerless Tire—J. W. Baillargeon, president of the Autobus Company, Montreal, Que., has been chosen president of the Peerless Tire Company, organized to manufacture and market a leather tread steel-studded tire.

Lumbach with Studebaker Corporation—Henry Lumbach, assistant engineer of the R-C-H Corporation, has resigned to accept a position with the Studebaker Corporation as chief tool maker. His resignation will take effect September 1.

Arnold Enters Smith Company—E. A. Arnold, chief engineer and sales manager of the Metal Products Company, Detroit, Mich., resigned August 1, to enter the employ of the A. O. Smith Company, Milwaukee, Wis., as consulting engineer.

Muntz President Consolidated Motors—Gerard Muntz, director of Schacht Motor Car Co.., of Hamilton, has been chosen president of Consolidated Motors, Limited, Toronto, Ont., which has located its new establishment at 112-116 Richmond Street West.

Hamilton Club's Membership Campaign—The Hamilton, Ont., Automobile Club, largest of the affiliated clubs in the Ontario Motor League, is planning a big membership campaign and Secretary J. Overell and Main Johnson are arranging details and planning the organization.

Moyer Pathfinder All-Iowa Tour—W. E. Moyer, president of the Iowa Automobile Association, Des Moines, Iowa, left in a Hudson on September 1 to blaze the way for the All-Iowa tour which is to be held late in September. The tour will have entries from all parts of the state.

Truck Displaces Four Horses—A 2-ton motor truck has displaced two teams of horses in the service of the New York Central Railroad at West Albany, N. Y. The truck was placed in service hauling supplies and material from the city to the various departments of the railroad company.

Beedee Manager Wilcox Branch—R. E. Beedee, Davenport, Ia., has accepted the position of assistant general manager of the St. Louis, Mo., branch of the Wilcox Motor Car Company, Minneapolis. Mr. Wilcox has been for the last three years assistant manager of the Western Flour Mills Company, the largest milling company in Iowa.

Prince Edward Island Automobiless—Prince Edward Island is the only province in Canada that prohibits the use of automobiles on its highways and in public places. The penalty for violating this law, which was enacted because it was thought to be necessary to public interest and for the safety of the traveling public, is a fine of $500.00 or 6 months in jail.

New Agencies Established During the Week

Place	Car	Agent
Akron, Ind.	R-C-H	Karl B. Gast & A. A. Gast
Alexandria, La.	R-C-H	W. H. Ratcliffe
Albuquerque, N. Mex.	R-C-H	E. L. Bradford
Baltimore, Md.	Keeton	Baltimore Garage Co.
Baltimore, Md.	Lozier	The Schall-Crouch Auto Co.
Baltimore, Md.	Paige-Detroit	The Schall-Crouch Auto Co.
Batavia, N. Y.	R-C-H	Robert L. Hiller
Bayonne, N. J.	R-C-H	W. H Dykeman
Bay Ridge, N. Y.	Henderson	Chas. Frederick
Bordentown, N. J.	R-C-H	Samuel F. Garrison
Boston	Paige-Detroit	Lozier Motor Car Co.
Boston	Marmon	F. E. Wing Motor Car Co.
Bristol, Tenn.	R-C-H	Cannon Elect. Co.
Cambridge, Md.	Detroiter	F. J. Brannock
Canton, Ill.	Henderson	Meade McCatchey
Carlsbad, N. Mex.	R-C-H	Carlsbad Auto Co.
Charleston, S. C.	R-C-H	Automobile & Marine Motor Co.
Chattanooga, Tenn.	Packard	Bill Jones Auto Co
Chestertown, Md.	Detroiter	J. W. Russell
Chicago, Ill.	Henderson	I. G. Tennant & Co.
Chicago, Ill.	R-C-H	F. Ebann
Chicago, Ill.	R-C-H	W. C. Sporleder
Dallas, Tex.	American	Sacksteder-Potter Co.
Dallas, Tex.	Marion	Sacksteder-Potter Co.
Davenport, Ia.	White	Davenport Auto Truck Co.
Decatur, Ill.	R-C-H	G. F. Wisegarver
Deming, N. Mex.	R-C-H	Crescent Garage
Des Moines, Ia.	Everitt	Brown Corley Motors Co.
Des Moines, Ia.	Marion	Ryan Motors Co.
East Orange, N. J.	Henderson	Harold C. Slater
Edmonton, Alberta, Can.	Henderson	Standard Motor Car Co., Ltd.

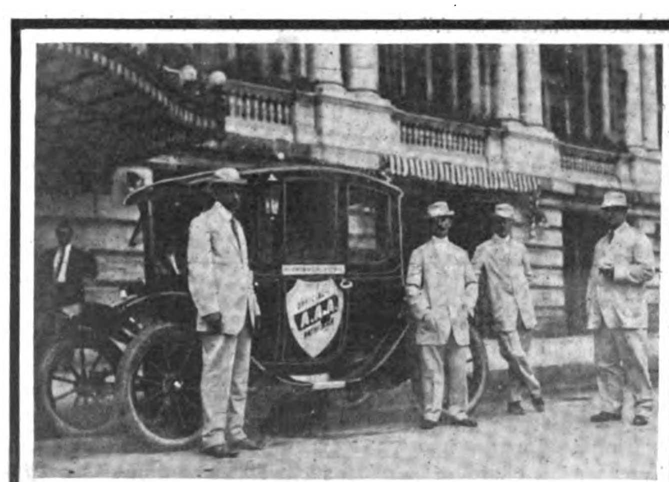
Washington, D. C.	Lauth-Juergens	Warren Motor Sales Co.
Winnipeg, Can.	Mack	Canadian Fairbanks Morse Co.

Tampa-Mitchell Agency Fails—The Mitchell automobile agency, Tampa, Fla., has failed. Marvin O. Hubbell, the agent, has left for parts unknown, although no criminal action is alleged.

Curtiss District Manager Chase—Royal B. Curtiss, of Stepney, Conn., has been appointed district manager of the Chase Motor Truck Company, Syracuse, N. Y., succeeding C. W. Moody, who resigned.

De Lisser Homeward Bound—Horace de Lisser, chairman of the Board of Directors of the Ajax-Grieb Rubber Company, sails for home August 31, on the steamer France. His mission was to establish Ajax agencies throughout Europe.

Flanders Electric Ends Trip—The Flanders Colonial Electric Pathfinding car of the American Automobile Association finished its long trip of over 1,721 miles from Detroit, Mich., to New Orleans, La., last Wednesday. The car was the center of an admiring throng which voiced its appreciation of the car's consistent performance under trying conditions.



The A. A. A. Flanders Colonial electric pathfinder and its crew

Pierce 5-ton truck which participated in Connecticut maneuvers

Colby Builds Branch—The Colby Motor Company, Minneapolis, Minn., branch is building a two-story structure 50 by 150 feet which is to be completed in 3 months.

Hadley Joins Lenox Company—W. K. Hadley will shortly join the Lenox Motor Car Company, Boston, Mass., as general sales manager and purchasing agent.

Jonas Company's New Building—The Jonas Automobile Company, Milwaukee, Wis., will on October 15 take possession of the new Cadillac Building now being erected for the firm.

Auto-Jack Marmon Equipment—The Marmon company, Indianapolis, Ind., announces the Hartford Auto-Jack as well as the Truffault-Hartford shock absorber as regular factory equipment.

Ford Has No 1913 Announcement—Adopting the 1908 Model T as a standard, as heretofore, the Ford Motor Company, Detroit, Mich., has no car announcement for 1913 to make to the trade.

Brown Resigns from Mais—Will H. Brown has resigned from the Mais Motor Car Company, Indianapolis, Ind. He will devote his attention to the Brown Commercial Car Company, Peru, Ind., which he organized.

Number Plate Contract Awarded—The Ohio Automobile department, Columbus, O., has awarded the contract to supply 75,000 sets of number plates for the year 1913 to the Scioto Sign Company, of Kenton, O., at its bid of 22 1-4 cents per set.

T. C. A. in Syracuse—Frederick H. Elliott, secretary of the Touring Club of America, which has previously been located with headquarters at Albany, announces that his organization will shortly open headquarters at the Onondaga Hotel in Syracuse, N. Y.

Seattle Club's Run—The third annual run of the Automobile Club of Seattle, Wash., will be to Cohasset Beach, Wash., August 30-31. The total distance from Seattle to Cohasset Beach is 171 miles. The route has been well marked to the beach.

State Fair's Automobile Show—An automobile show is being held at the Indiana State Fair, Indianapolis, Ind. This is the first time there has been any elaborate display of automobiles at the fair. There are nearly a dozen firms represented.

Establish Canadian Mack Agencies—An agreement between the Canadian Fairbanks-Morse Company and the International Motor Company, New York City, for the establishment of a chain of service stations throughout Canada, was recently put through. The principal stations will be at Montreal, Toronto, Winnipeg, and Regina.

Cars May Displace Mules—The experiment of towing canal-boats by automobiles was made last Tuesday at Pendleton, N. Y., by William Gleasner, superintendent of the Great Lakes Company, barge-canal contractors. With a 30-horsepower automobile he towed a canal-boat loaded with lumber for a distance of 3 miles at the rate of 6 miles an hour.

California's Sales Decrease—July showed a decided falling off in the number of new automobiles purchased in California as compared with the records of several preceding months. The report for July shows that 2,327 automobiles were licensed during the month, an average for each working day of eighty-six. During the 4 months preceding July the daily average was over 100, and in June reached 109.

Pierce-Arrow in War Maneuvers—The Pierce-Arrow 5-ton truck made a fine record in the recent army maneuvers. This truck hauled the Fourth Brigade baggage and supplies from Buffalo to New Haven, Conn., then participated in the army maneuvers and returned overland to Buffalo with its original load. The accompanying photograph shows the truck as it was, just ready to leave the armory of the Sixty-fifth Regiment, N. Y. N. G., for the scene of the maneuvers.

Automobile Incorporations

AUTOMOBILES AND PARTS

Augusta, Maine.—United Motor Equipment Company; capital, $1,000,000; to manufacture motors. Incorporator: E. M. Leavitt.

Buffalo, N. Y.—A. W. Haile Motor Company; capital, $25,000; to deal in automobiles. Incorporators: Arthur W. Haile, Bradley H. Phillips, E. C. Schlenker.

Chicago, Ill.—Parker Motor Company; capital, $5,000; to manufacture motors. Incorporators: Hugo W. Schnetzky, Frederick D. Parker, Archie E. Cole.

Elizabeth, N. J.—Franklin Automobile Company; capital, $25,000; to manufacture motors. Incorporators: W. H. Reynold, M. Gordon, L. Koplan.

Flint, Mich.—Sterling Motor Company; capital, $300,000; to manufacture motors. Incorporator: W. C. Durant.

Hamilton, O.—Hamilton Vehicle Company; capital, $50,000; to manufacture automobiles. Incorporators: A. A. Dornbush, Louis J. Brenig, William Kloeb.

Indianapolis, Ind.—Hydraulic Transmission Company; capital, $200,000; to manufacture hydraulic transmissions. Incorporators: Wm. F. Ernest, Paul Millholland.

Indianapolis, Ind.—W. K. Millholland Machine Company; capital, $50,000; to manufacture motor car parts. Incorporators: W. K. Millholland, Paul Millholland, A. M. Millholland.

Montreal, Que.—Drednot Motor Truck Company; capital, $50,000; to manufacture motor trucks. Incorporators: W. L. Haskell, H. S. Rose, John S. Rigby, V. S. Rose, L. C. Haskell, J. E. Merritt, D. S. Whittall.

New York City, N. Y.—Triple Action Carbureter Company; capital, $200,000; to manufacture carbureters. Incorporators: Mathias Weiwoda, Frederick Hooschar, Edmund F. Driggs.

New York City, N. Y.—Viking Manufacturing Company, of Manhattan; capital, $25,000; to manufacture automobiles. Incorporators: A. R. Bangs, R. Condon, A. O. Briggs.

New York City, N. Y.—Roulements E. DeBois Ball Bearing Company; capital, $25,000; to manufacture ball-bearings. Incorporators: John S. Sherman, W. W. Sherman, H. T. Sherman.

Pittsburgh, Pa.—Universal Shoe & Forge Company; capital, $50,000; to manufacture automobile parts. Incorporators: J. H. Wall, P. A. K. Black.

Pontiac, Mich.—Pontiac Automobile Castings Company; capital, $15,000; to manufacture motor parts.

Racine, Wis.—Wadewitz Machinery Company; capital, $50,000; to manufacture motors.

Stillwater, Minn.—Republic Motor Company; capital, $10,000; to manufacture automobiles. Incorporators: G. H. Sullivan, L. L. Manvering, Paul H. Guilford.

Troy, N. Y.—Pinoeer Motor Car Company; capital, $10,000; to manufacture automobiles. Incorporators: H. J. Richardson, N. R. Holmes, G. N. Nay.

Union, N. Y.—Clifton Automobile Company; capital, $10,000; to manufacture automobiles. Incorporators: Benjamin F. Krom, Walter Sakuette.

GARAGES AND ACCESSORIES

Albany, N.Y.—Fiat Motor Sales Company; capital, $300,000; to deal in motors, engines and machinery for automobiles. Incorporator: Charles L. A. Whitney.

Birmingham, Ala.—Robertson Tire & Automobile Company; capital, $2,000; to deal in supplies. Incorporators: J. E. Vandergriff, E. R. Minhinette, Jr., W. W. Robertson.

Boston, Mass.—Fenway Garage Company; capital, $250,000; to carry on a garage business. Incorporators: Josiah C. Cannon, Chester W. Engel.

Boston, Mass.—Motor Monitor Company; capital, $20,000; to deal in supplies. Incorporators: Howard P. Soule, Gardner W. Chase, Richard S. True.

Boston, Mass.—Standard Automobile Supply Company; capital, $100,000; to deal in supplies. Incorporators: Michael F. Culliney, Edith W. Shepherd.

Charlotte, N. C.—Model Garage; capital, $25,000; to carry on a garage business. Incorporators: R. F. Price, E. T. James, R. B. Cochrane.

Chicago, Ill.—Chicago Cyclecar Company; capital, $2,500; to deal in motors, automobiles. Incorporators: Franklin A. Dean, Jr.; Harris Carman, Lufkin Dwight P. Green.

Yeoman Becomes Ames Manager—Mr. George W. Yeoman has become general manager of the Ames Motor Car Company, Owensboro, Ky.

May Raise Insurance Rates—Insurance companies in Baltimore, Md., are raising the rates of accident premiums on automobiles in consequence of the steady increase in mishaps.

Winning Cars Rayfield Equipped—De Palma, in a Rayfield equipped Mercedes, won the Elgin National Race. Mulford, driving Knox, also equipped with a Rayfield carbureter, came in second.

Goodyear's Baltimore Building—The Goodyear Tire and Rubber Company, Baltimore, Md., is erecting a handsome new building at the corner of Cathedral and Preston streets. Frank M. Olmstead is manager.

Bromwell with Nebraska Cartercar—Tom Bromwell, who for several years has been sales manager for the H. E. Fredrickson Company, has resigned to accept a like position with the Nebraska Cartercar Company, Omaha, Neb.

Braender Tire Brooklyn Branch—The Braender Rubber & Tire Company, New York City, with factory at Rutherford, N. J., has established a branch office and salesroom at 1211 Bedford avenue, Brooklyn, N. Y. S. W. Smith is manager.

Automobile Incorporations

CHIPLEY, FLA.—Punctureless Tire Company; capital, $12,500; to make tires. Incorporators: L. W. Crow, J. S. McCreachy, C. B. Dunn.

CINCINNATI, O.—J. C. Hopkins Manufacturing Company; capital, $10,000; to manufacture automobile gloves. Incorporator: John C. Hopkins.

DILLON, S. C.—Roach & Carmichael Company; capital, $3,850; to deal in automobiles. Incorporators: C. A. Roach, H. H. Carmichael.

HIGHLAND PARK, N. Y.—Walter Williamson Automobile Company; capital, $10,000; to deal in automobiles. Incorporators: W. M. Williamson, Watson Whitlesey, Vernon J. Miller.

HULL, QUE.—Hull & Ottawa Garage Company; capital, $40,000; to carry on a garage business. Incorporators: V. P. Leduc, Jos. Gravelle, J. Fortin, Chas. Leduc, L. A. Leduc, E. Morin.

INDIANAPOLIS, IND.—McLellen Automobile Shop; capital, $1,000; to deal in supplies. Incorporators: F. P. McLellen, F. E. Barrett, J. M. Miles.

KANSAS CITY, MO.—Packard Kansas City Motor Company; capital, $2,000; to deal in automobiles. Incorporators: Joseph B. Renshaw, Robert Sloan, R. J. Ingraham.

MEDINA, O.—Medina Machine Company; capital, $25,000; to deal in repairing all kinds of machinery. Incorporators: F. W. Woods, F. M. Branch, C. R. Warner, C. V. Neumeyer, W. T. Kennedy.

MILWAUKEE, WIS.—Badger Oil & Specialty Company; capital, $25,000; to deal in supplies. Incorporators: Benjamin Margeles, W. A. Nash, R. M. McKay.

MILWAUKEE, WIS.—Lozier Livery Company; capital, $25,000; to operate a motor livery service. Incorporators: Richard H. Knowles, R. P. Druecker, F. W. Loomis.

MINNEAPOLIS, MINN.—Dahl Punctureless Tire Company; capital, $6,000,000; to manufacture tires. Incorporators: I. Seery, Russell N. Stewart, Homer St. Denehy, Thomas A. Callahan, Thomas C. McNamee.

NASHVILLE, TENN.—Cumberland Motor Company; capital, $10,000; to deal in automobiles. Incorporators: W. D. Caldwell, J. H. Cheek, J. O. Cheek, Jr.; D. M. Bayer.

NEW YORK CITY, N. Y.—Trevent Tire Company; capital, $100,000; to manufacture tires. Incorporators: N. A. Sterling, M. Rachmil, S. King.

NEW YORK CITY, N. Y.—Ideal Automobile and Garage Company; capital, $10,000; to carry on a garage business. Incorporators: John W. Colloph, Reginald H. Smith, Alfred P. Morewood.

NEW YORK CITY, N. Y.—North River Garage; capital, $20,000; to carry on a garage business. Incorporators: W. E. Lockwood, Leonard E. Jelly, Robert E. Shaw.

PORTLAND, ORE.—Automobile Air-Rotar Company; capital, $15,000; to deal in machines and automobiles. Incorporators: Albert F. Jones, T. L. Corteau, James E. Manter.

SAN ANTONIO, TEX.—Guarantee Motor Car Company; capital, $10,000; to deal in automobiles. Incorporators: J. F. Hagan, H. J. Smith, C. W. Voss.

ST. JOSEPH, MO.—Ardery Holliday Motor Car Company; capital, $10,000; to deal in automobiles. Incorporators: J. W. Ardery, J. W. Holliday, W. S. Thomson, Charles Ardery, W. H. Watson.

TROY, N. Y.—Troy Motor Company; capital, $10,000; to deal in automobiles. Incorporators: Fred S. Snyder, Frank A. Snyder, John B. Wood, J. A. Wendell, Richard G. Thornmeyer, H. P. Schoenmaker, C. R. Kilmer.

WILMINGTON, DEL.—Overman Tire Company; capital, $3,000,000; to manufacture tires. Incorporator: Herbert E. Latter.

VANCOUVER, CAN.—Pacific Automobile Company; capital, $500,000; to carry on a taxicab business. Incorporators: Noel Humphreys, G. M. Gibbs, A. S. French, J. L. Langan.

CHANGES OF NAME AND CAPITAL

CHICAGO, ILL.—Keith Car Company; increase of capital from $30,000 to $100,000.

CLEVELAND, O.—Marathon Tire & Rubber Company; increase of capital from $10,000 to $100,000.

COLUMBUS, O.—E. M. F. and Flanders Sales Company; change of name to G. E. Thomas Company.

ST. LOUIS, MO.—St. Louis Motor Truck Company; increase of capital from $17,500 to $22,500.

Cavalry in the maneuvers as seen from the tonneau of a Thomas

Guests of Oakland Manager—The district manager, retail sales force and service department men of the Atlanta branch of the Oakland Motor Company were the guests of Manager L. F. Smith at a banquet recently in the banquet hall of the M. & M. Club, Atlanta, Ga.

Has Its Own Transportation—The Pence Automobile Company, Minneapolis, Minn., will commission its own exclusive automobile freight train to travel all winter between Flint, Mich., and Minneapolis, Minn., to haul 2,500 Buick cars from the factory to the Northwestern distributing agency.

Office Opened at Springfield—The Essenkay Company of Chicago, that recently opened a place in Boston, has done so well that salesrooms for the product have been opened now at Springfield, Mass., at the corner of Fort and Water streets. It is known as the Western Massachusetts Essenkay Company.

Carter Car in Minnesota—The Minnesota Carter Car Company has been organized with A. R. Workman, formerly of Ainsworth, Neb., as president. A factory branch of the Carter Car Company, with Minnesota, Montana, the Dakotas and northern Wisconsin as the distributing territory, will be established.

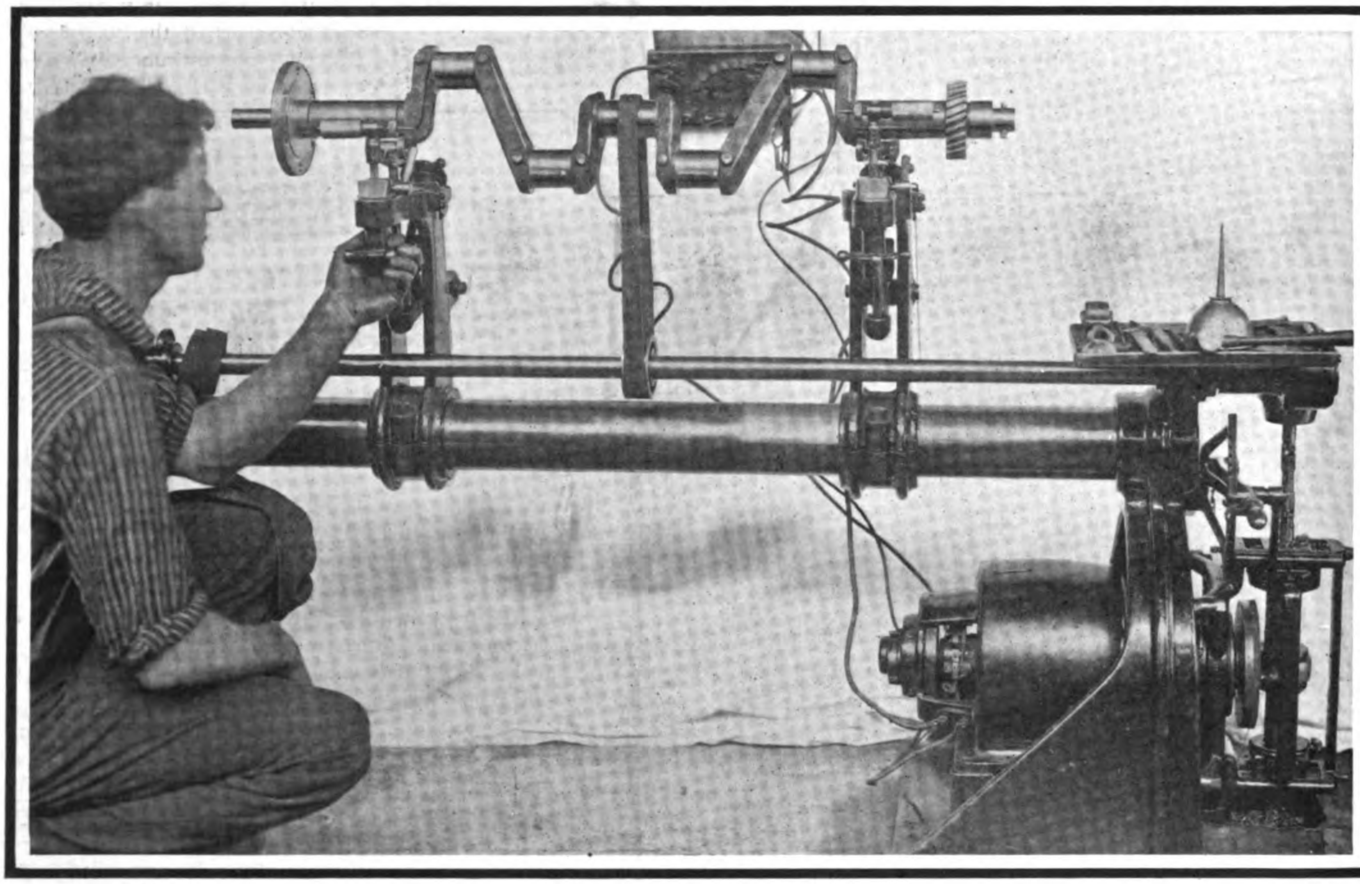
Texas Automobile Sales Increase—The sales of automobiles in Texas for the past few weeks show a remarkable increase owing to the harvest of an abundant wheat and oat yield, the prospects for a great corn and cotton crop and many other favorable conditions. Dallas dealers declare that the demand for machines is greater than the supply.

Berkeley Motor Car Company Formed—The Berkeley Motor Car Company has just been formed in Boston by J. H. Freeman, formerly with the Cadillac, as manager, and George Tollman, of the Chalmers, to deal exclusively in used cars, the new company announcing that it gives a guarantee that if anything goes wrong within a year on a car, due to the car itself, it will make good the loss.

Grossman Offers Milwaukee Prizes—The Emil Grossman Company, New York City, manufacturers of automobile accessories, are offering the following prizes to participants in the Milwaukee races, providing they use Red Head spark-plugs: To the winner of the grand prize, $500; to the winner of the Vanderbilt Cup, $500; to the winner of the Pabst Trophy, $100, and to the winner of the Wisconsin Challenge, $100.

Slupecki Making Carbureter—Lawedig Slupecki, inventor of an auxiliary carburetion device for gasoline motors, now being manufactured and marketed by the American Compensated Valve Company, of Manitowoc, Wis., is making exhaustive tests of a new type of carbureter which permits of the use of the heavier distillates of petroleum instead of gasoline. The device is being tried on a powerful motor boat built by Mr. Slupecki for use on Lake Michigan.

Factory Miscellany



Machine which is used in the plant of the Haynes Automobile Company, Kokomo, Ind., for balancing crankshafts accurately

The object of this machine is to obtain the kinetic balance of the rotating parts of the motor. The static balance of the part is secured by merely trying the parts to determine if they can remain stationary at any point when supported at the axis. This machine gives the running balance of the parts with great accuracy, thus tending to reduce vibration when the motor is running. When measured mathematically the balance of a machine can never be perfectly determined because both primary and secondary forces and moments are involved, and although the first may be reduced to zero the secondaries can rarely, if ever, be nullified.

MORROW'S Elmira Factory—The Morrow Manufacturing Company, Elmira, N. Y., makes all the small parts for the Overland cars, manufactured by the Willys-Overland Company, of Indianapolis, Ind., and Toledo, O. The accompanying photograph shows the Morrow plant.

Gibney Remodeling Lee Plant—The James L. Gibney Company, Philadelphia, Pa., is remodeling the J. Ellwood Lee plant at Conshohocken for the manufacture of truck tires.

Dean Horns for Studebaker—The Studebaker Corporation of Detroit, has placed an order with the Dean Electric Company, of Elyria, O., for 45,000 "Rexo" electric horns to be delivered during the coming year.

Stegeman's New Milwaukee Factory—The Stegeman Motor Car Company, of Milwaukee, Wis., has just finished moving into its new plant with general office quarters at 606 Linus street. Their new factory will increase the present capacity and give them an annual output of 500 trucks.

No New Rambler Factory—Officials of the Thomas B. Jeffery Company, of Kenosha, Wis., state that the company does not contemplate the erection of any new buildings on the 9-acre tract adjoining its present works, recently purchased, for the present. The additional land is to take care of the future needs of the Rambler works as they may develop.

Chase Company's Model M—The Chase Motor Truck Company, Syracuse, N. Y., announces to the trade a new model express truck of 500 pounds capacity. It is to be known as "Model M" and has a 12-horsepower, two-cylinder motor, planetary transmission with two speeds forward and reverse and chain drive. The wheelbase is 84 inches and the weight 1,500 pounds.

Wadewitz Company's Experimental Shop—The Wadewitz Machinery Company, of Racine, Wis., incorporated a few weeks ago with $50,000 capital, is establishing an experimental shop at Racine for the practice of motor car engineering and the manufacture of devices for the general mechanical engineering field. One of the principal devices already perfected, and to be manufactured without delay, is a spring starter for motor car engines, which has proven successful in exhaustive tests made by motor car manufacturers at Racine.

Canton Spring Company's Factory—A building permit has been issued for the erection of a $10,000 plant on Dueber avenue, Canton, O., for the Cleveland-Canton Spring Company, which will make all kinds of vehicle springs.

Smith Automobile Plant Sold—The Smith automobile plant was purchased at bankrupt sale by C. E. Gault and J. D. Mulvane, who will maintain the parts and do a general repair business, but have discontinued the manufacture of cars.

Big Addition to Plant—The General Vehicle Company, Long Island City, N. Y., manufacturer of electric trucks, will make a six-story addition to its present plant here. Plans for the foundation only estimate the cost at $50,000. The building will be located on Starr avenue, Long Island City.

Imperial Rubber Company's Factory—Residents of Tilbury, Ont., carried a by-law last week to grant a loan of $5,000 to the Imperial Rubber Company for immediate construction of their factory in which to manufacture rubberized cloth for automobiles. The loan is repayable in 10 years without interest.

Guarding Against Gas Explosions—As a precaution against gas explosions in the mammoth plant of the A. G. Smith Company, Milwaukee, Wis., manufacturing pressed steel frames, it has been decided to rebuild and relocate the welding department, blown up recently, on ground remote from the general factory buildings, the largest of which measures 345 by 1,025 feet.

Kissel Company's Shop Building—The Kissel Motor Car Company, Hartford, Wis., has broken ground for a large addition to its foundry department, the new shop building having just been completed. The latest structure measures 85 by 121 feet, two stories high. Two large new core ovens are also being constructed and much new power equipment is being placed at this time, this including a 480-horsepower electric generator and an 80-horsepower compresser. An addition to the power plant will be started at once.

Installs Truck Plant—The plant of the Stewart Iron Works, Cincinnati, O., destroyed by fire recently, and which was one of the largest ornamental and structural iron works in the country, will be rebuilt. The regular business of the company has been fence and other iron work of like character, but their new plans embrace the addition of a complete auto truck plant. This will occupy a ground space of 100 by 145 feet. It is the purpose of the company to specialize on the manufacture of 1-ton truck. This branch of the business will be under the supervision of W. M. Taylor, an automobile manufacturing expert, formerly of Toledo, O.

Ford Plant Nearly Ready—With its capacity more than doubled, the new factory of the Ford Motor Company, Detroit, Mich., within the next few months, will be ready to commence on its huge production for the coming year. The size of the foundry has been doubled, as has that of the heat-treating plants and machine shops. The big gas engine of 1,500 horsepower that has been doing duty furnishing power, the largest gas engine in the world, is soon to give way to an even larger one, an engine of 5,000 horsepower. At present about 350 cars are being built in 8 hours. When the new apparatus is in commission the Ford factory will be in a position to turn out more than twice that number of completed model T's in an 8-hour day.

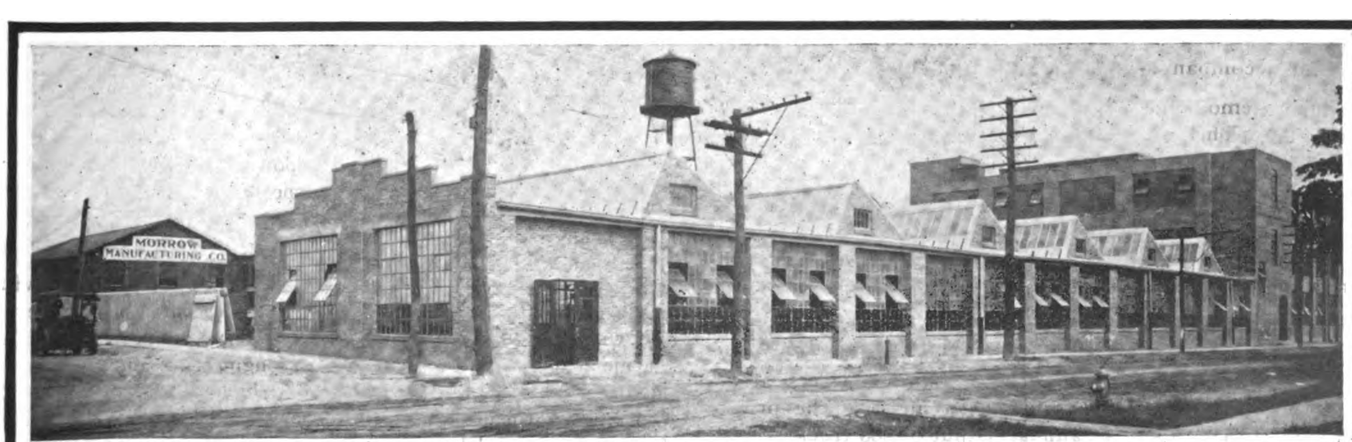
Overland's Unique Building Plan—The Willys-Overland Company, which is doubling the capacity of its plant in Toledo, O., has employed a unique method of construction in the erection of the new transformer station in the center of the big factory buildings which has created considerable interest among contractors. After signing the contracts President J. N. Willys awoke to the fact that carrying the material for the new structures through the main gates would block the factory system and more or less cripple the production of Overland cars, which cannot at best be turned out fast enough to supply the orders that are daily pouring in, as well as interfere with the testers and hold up the installation of new machinery, parts and materials. A consultation with architects and contractors followed and it was decided to have all cement, glass, dynamos and other materials carried over the tops of the three-story factory building. Derricks were raised and spouts constructed for the work. All cement is being mixed outside the main plant, hoisted above the outside factories and poured through the spouts to the site of the new building. Thus the work on the new building is progressing with all possible speed and the efficiency of the Overland production is being maintained. It costs more, but results justify the expense.

Machine Shop and Foundry Figures

WASHINGTON, D. C., Sept. 3—Census figures on the foundry and machine shop industry in the United States when the thirteenth census was completed show that there were 13,253 shop establishments in the United States, employing 615,485 perons. The employees were divided as follows:

Proprietors and firm members	9,851
Salaried officers	21,754
Male clerks	42,242
Female clerks	10,627
Average wage-earners	531,011
Total	615,485

The value of products per annum is figured at $1,228,475,148. The statistical bureau reports that the sum of $688,464,009 is added to the cost of materials by the manufacturing processes. In the industry, Pennsylvania takes first rank and New York second.



Factory of the Morrow Manufacturing Company, Elmira, N. Y., which makes all the small parts for Overland cars

Patents Gone to Issue

AUTOMOBILE Carbureter—In which the nozzle opening is altered with different throttle adjustments.

The carbureter referred to in this patent is seen in Fig. 1, where A is the air inlet of the mixing chamber, O its outlet and N the nozzle through which the gasoline enters that chamber and which is regulated by a needle valve V. The gasoline enters the carbureter at E and passes into the mixing chamber after having passed through the float chamber, where its level is regulated by the float F. The capacity of the passages A and O may be varied by two throttles, each serving one of them and attached to a shaft which extends through these passages. The throttles are regulated by a throttle lever secured to the above mentioned shaft. A clever construction L is independent of the throttle lever, but is actuated thereby for opening the fuel valve V, permitting also of adjusting the lever L without disturbing the throttles controlling A and O.

No. 1,033,886—to William M. Gentle, Greenwood, Ind. Granted July 30, 1912; filed December 1, 1910.

Exhaust Whistle—Which consists of a tube with a slit at its end and a resonant chamber with a suitably shaped, sound-producing edge.

This patent describes an exhaust horn comprising a resonant chamber having an opening through its wall, against which is placed the slit-like opening of a tube which is adapted to be connected to the exhaust pipe. This tube has its lower portion movable, so that, if this portion is moved away from the tube, the slit is widened and the exhaust gases passing through the tube are afforded an unobstructed exit therefrom.

No. 1,031,678—to Elias W. Schurman, assignor to the Randall-Faichney Company, Boston. Granted July 2, 1912; filed January 25, 1909.

Automobile Extricator—Mechanism for hauling automobiles out of mudholes in the road, etc.

In Fig. 2 is shown the device described in this patent. It consists of a frame which is formed of a U-shaped bar, the ends of which are connected by a cross-piece C. From the side bars of the frame, legs are suspended at front and rear and cross bars B are attached to the inner extensions of the legs. Extensions E pendant from the end of the frame are rearwardly inclined, and adapted to enter the road surface to form means for anchoring. A drum is mounted on the frame and to an extension of its journal a toothed wheel is secured; a pawl connected to the frame is adapted to engage the toothed wheel to prevent backward rotation of the drum. On the shaft or journal of the drum an operating lever is mounted which carries a pawl engaging the toothed wheel so as to move it by stages. A flexible connection is provided, the end portion of which is wound around the cable, and another connection is attached to it and has its end secured to the axle of the automobile, so that by rotating the shaft of the drum, the car may be moved.

No. 1,034,635—to Henry S. McCall, Ogeechee, Ga. Granted August 6, 1912; filed February 20, 1912.

Compressed-Air Engine Starter—In which a flexible connection moved by a piston rod spins a spool on the crankshaft.

This patent refers to a starter mechanism, Fig. 3, consisting of a compressed-air motor cylinder C in which a piston P is reciprocated by the pressure of air entering at the side of the cylinder. The piston has a piston rod R secured to it; to the end of the latter a flexible connection F is secured which is laid around suitable idler sheaves and around a spool S connected with the crankshaft by a clutch mechanism. The piston rod also carries means for controlling the inlet and exhaust of compressed air to and from the starter cylinder.

No. 1,035,091—to George Hartwell Kelley, Gainesville, Fla. Granted August 6, 1912; filed July 21, 1911.

Automobile Self-Starter—Composed of a gas reservoir in communication with an engine cylinder and charged through a valve from the latter.

The starter referred to in this patent is seen in Fig. 4. It consists of a reservoir chamber connected with one of the engine cylinders, an automatic valve being interposed between these two parts. There is also a valve which serves to provide communication between cylinder and reservoir to allow of charging the latter. This valve has a cam surface and the automatic valve has a part which is in the range of action of the automatic valve and adapted to be lifted thereby.

No. 1,034,274—to George E. Miller, Oakland, Cal. Granted July 30, 1912; filed November 9, 1911.

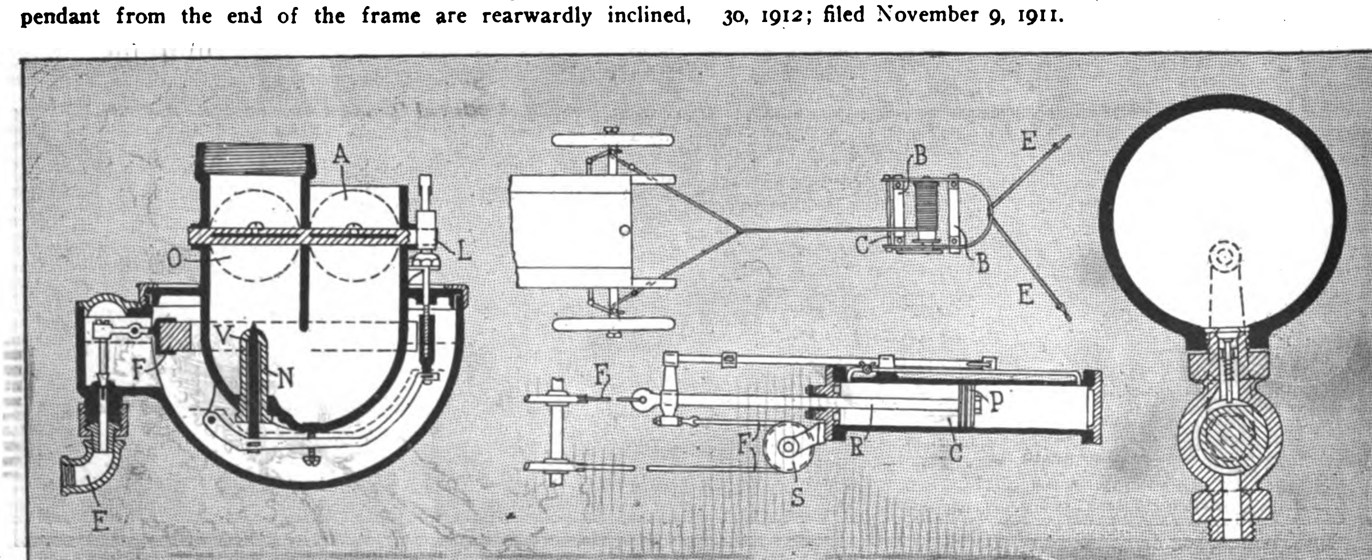


Fig. 1—Gentle carbureter. Fig. 2—McCall extricator. Fig. 3—Kelley compressed air starter. Fig. 4—Miller reservior self-starter

VOL. XXVII NEW YORK—THURSDAY, SEPTEMBER 12, 1912—CHICAGO No. 11

The AUTOMOBILE

Old Trails National Highway New York to San Francisco

Tale of Interesting Trip Following Famous Historic Santa Fé, Boons-Lick and Cumberland Pike Trails

Cross and Cairn Where a Pioneer Fell

In Arizona, Traveling Was Often Hard

Money Subscribed Along Route to Improve Local Sections — Activity General Across Entire Country

By BERT C. SMITH

THREE-thousand three hundred and fifty-nine miles, the shortest route ever found from the Pacific to the Atlantic, has been completed by an automobile and the route for the proposed national highway has been crosen. Over a road stretching through fifteen states a four-cylinder, 60-horsepower machine was driven in 60 days. This route is the one selected by the Good Roads convention at Phoenix, Ariz., and later by the convention in Kansas City, Mo.

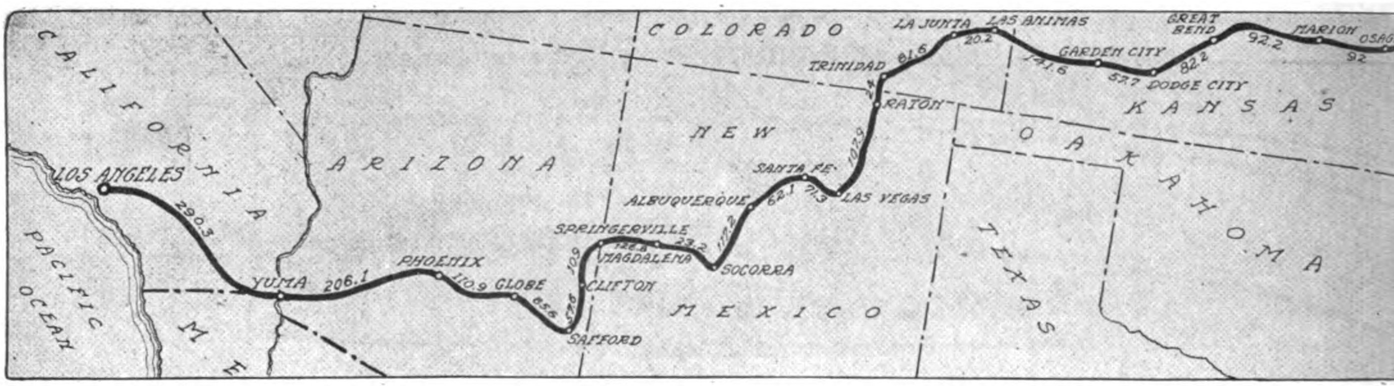
It is one thing to select a transcontinental course and entirely another to drive an automobile over the roads chosen. In order to make the ocean-to-ocean tour a success, it was necessary to cover every foot of the route. On the morning of May 15 the machine was driven out of Los Angeles, Cal., for the ocean-to-ocean tour. Many thought it would be foolish to try and cover the direct route of the Santa Fé trail, the Boons-Lick road and the Cumberland Pike.

The first day's run was through the orange groves of southern California with a night stop at the Glenwood Inn. Here Frank Miller was host. He is one of the greatest good roads boosters in California and before the Times Special left the Mission Inn, Mr. Miller secured two bronze bears which were mounted on the big headlights. He also gave a Mission bell, which was placed on the cowl of the machine.

When the bears were hammered into place they were fixed as an ornament. As the road-scarred machine was driven across the country, however, these became distinctive signs of California and proved as interesting to the highway boosters along the route as any part of the equipment of the car.

Equipped with oversize 37 by 5 1-2-inch tires, the car attracted attention in every village and hamlet. These tires were used in preparation for a fight with the desert sands, but this fight was only a joke as the roads on the Arizona desert are far better than those we found in Maryland.

Our real sand fight, however, came in the Mammoth Wash in



Map showing shortest automobile route yet discovered between the Atlantic and Pacific oceans.—It is 3359 miles and crosses nine distinct

California. Here it was low-gear work for 5 miles and we were forced to deflate our tires. They were not pumped up until we were 20 miles from Yuma. We rolled into the Colorado River city at dusk and were greeted with red fires in the streets and with a band. Here we found the people more than anxious to do their part to help build a national highway. Though there are only a few machines in the city of Yuma, the farmers and merchants there raised $1,000 to begin work at once on the highway through their section.

Water Bottles Indispensable

Leaving Yuma at 5 o'clock in the morning we started a drive of 206 miles over an arid country having no water to speak of. The equipment for this trip consisted of two immense African water bottles and it was well that we carried these. The heat was terrific. It registered at one place on the desert 132 degrees. This does not mean in the shade, of course, as there is no shade.

Soon after leaving Deep Wells, a place that is misnamed, as the wells are dry, we saw an object on the sands that looked much like a coyote. Preparing to run the animal down, John Zak, the driver, was asked to send the car as fast as possible toward the brute. As we neared the object we could see it was not a coyote, but a man on his hands and knees. Opening the throttle, we reached him and found A. E. Weeks, of Whittier, Cal., almost delirious from exposure and lack of water.

Weeks had undertaken to ride a motorcycle across the desert ahead of our car. Seeing the attention the start of the ocean-to-ocean tour had been given by the newspapers, Weeks thought it would be a good stunt to ride a machine across the sands. When we found him he was 80 miles from the nearest water and would have died, according to physicians, had he not been rescued. We carried rim to Phoenix, but were forced to leave his machine on the sands of the lonely desert.

Governor Hunt of Arizona welcomed us in Phoenix, and there we found the sentiment strongly in favor of a national boulevard from the Pacific to the Atlantic. The men of the city raised $2,000 and promised $5,000 additional and plans were made to sign the desert and to put the roads in shape for touring. Here was started a movement which should mean that the highway will be tourable from New York to San Francisco at least a year before the opening of the World's Fair in the Bay City.

From Phoenix, our route took us out to the Roosevelt Dam country by way of Mesa and Tempe. The roads here are excellent. It is an easy matter to drive from Arizona to Roosevelt and then on to Globe, a distance of 109 miles. Though the country is hilly, the grades are not severe or dangerous and the scenery is grand. This part of the tour is most interesting.

From Globe we drove to Safford, a town in the fertile section of Arizona, where the good roads movement is such that the people of Thatcher, a city 6 miles away, journeyed into Safford for an evening meeting and expressed a desire to begin work at once on a national highway. This sentiment was so strong that several automobilists agreed to pilot us on into Clifton, the home of Col. Dell M. Potter, national organizer for the Ocean-to-Ocean Highway Association, under whose auspices the tour was made. Colonel Potter made the transcontinental trip and organized divisions of the Ocean-to-Ocean Highway Association in each of the larger cities.

At Clifton, the townspeople turned out to greet us and a meeting was called at once. This rock-ribbed city is perched on the side of the high hills which have enough copper in them to make the mine owners certain of running treir smelters for another 100 years. This country is sorely in need of roads and at the town of Morenci, a city without a main street, the people again raised $2,000 to help stir up interest in a national highway from sea to sea.

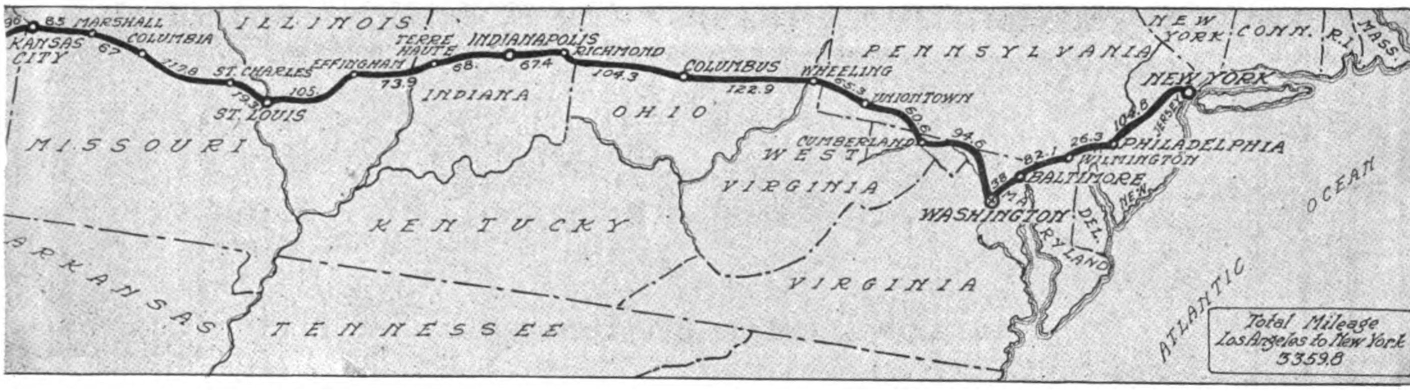
Though we were warned to leave all hope behind as we struck off into the Rocky Mountains to find the shortest route to Springerville, we started without many misgivings. We did examine our brakes, but what followed proved we were not careful enough. This transcontinental journey was to become epoch-making, but we were content to make it in easy stages. Forcing the car toward the high hills we started for the White River Indian reservation.

Indians Dislike Open Exhaust

At the San Carlos River we took observations. The roads are not good, but can be toured over easily. We visited the Apache Indian school and found the young bucks willing to approach the car, but the old warriors refused to approach the machine. The open exhaust was too much for them, though they did not even show surprise as the motor barked angrily. The red men, however, especially the younger ones, showed a keen interest in the preparation for improving the roads and several volunteered to work on the road graders which have been ordered and which will be put into active use at once. In fact, one scraper had arrived and was being used to great advantage.

Leaving the lowlands we struck into the hills. The game we

On the old Cumberland Pike near Cambridge, O.



chains of mountains, two deserts and touches some of the most interesting territory in the United States.—The trip occupied 60 days

found in abundance. Many wild turkeys flew over our heads. The country abounds in deer and there are many bears. We frightened the grouse and quail, but we could not stop to hunt. We were out for a purpose and were anxious to reach a settlement at least before dark.

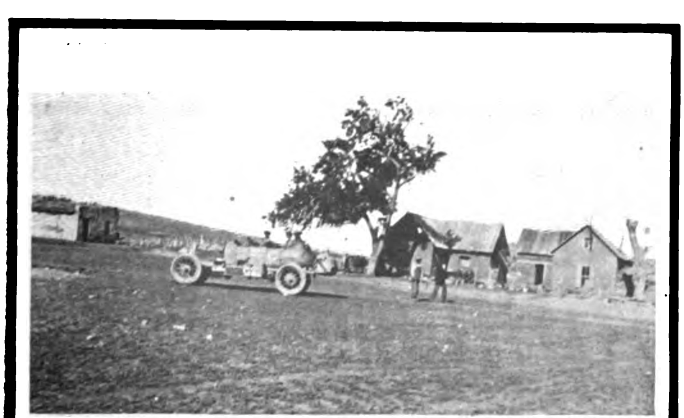
Dropping down the back of the Black Mesa hills came our first accident. We carried on the rear of our car a 30-gallon tank of gasoline. It was necessary to use the brakes constantly because the hills are particularly steep. Before we knew it the oil around the brakes had caught fire from the heat caused by the friction and flames shot up dangerously near that big gasoline tank. Instantly the crew of the car jumped into action to fight the flames.

For several minutes the battle was a losing one. The fire mounted into the tonneau and swept around the tank. The danger of explosion from the gas inside kept us all on edge. While one shoveled dirt the others poured the contents of the water bottles over the flames and finally the fire was stamped out, but the tank was still hot.

After Fire Came Water Trouble

The Black River was only a short distance and we let the machine out and rushed it into the water until it flowed over the hood. This cooled us all off, but we found that it was impossible to crank the motor. Then we trudged away to a distant ranch and told our troubles to the man in charge. He was willing to help and brought a team of mules, but the two mules could not budge the heavy car.

"I'll get my mules," said the rancher, as he started back after the long-eared fellows. It was well that he did as the four animals had a hard time to drag us from the sands of the river out to the opposite bank where we could find traction for the run to the White River. We were in the hills, many miles from a house, but our lights helped us to find our way. We drove over a country many would call dangerous, but our first mishap had taught us a lesson and we took no chances.



Typical ranch life on New Mexico plateau

Far into the night we continued to drive. We had become soaked to the skin while trying to work our car out of the river and the night was cold. It was no use to camp, so we decided to continue to drive. We chugged on and at 4 o'clock in the morning reached the White River Indian agency, where we found a storekeeper who gave us beds in his little shanty.

Gasoline is often high-priced on a trip across the continent. We reached the top-notch figure here when we paid 75 cents a gallon for the fluid. It was worth it, however, as the gasoline is carried more than 100 miles from the nearest railroad. We had been paying 40 cents and that did not seem exorbitant. The 75-cent notch looked high. At one place where the storekeeper collected 40 cents a gallon for gas he slipped 10 cents back over the counter after the bill was paid, saying he was anxious to help build a national highway. That was his contribution. It was accepted with thanks.

Our next stop was at Cooley's ranch, 10,500 feet above sea level, the highest point reached on the ocean-to-ocean tour. Here we found "Old Man" Cooley, as the boys affectionately call him, in charge of a big ranch, a part of which is snowbound for 3 months of the year. He was more than willing to meet us and gave us valuable information about the selection of a route through the government lands which will be open all the year around and which can speedily be made tourable. The land around Cooley's, however, proved hard touring, and we were forced several times to fight our way out of muddy dips in the shade of the immense pine trees.

We were piloted from Cooley's ranch to Springerville by Herman Becker, a storekeeper of Springerville, who is also one of the good-roads workers. He directed us down the side of the high hills into the little border town where a meeting was held by National Organizer Potter, who told the plan for a national highway.

Altitude 8,000 Feet on Divide

The following day we were directed across the continental divide. Here at a point about 8,000 feet up we found the waters in the western rivers flowing toward the Pacific and those of the eastern streams toward the Atlantic, separated by less than 1 mile of rolling hills. This country is not level, but the roads are excellent with the exception of high centers made by the old emigrant trailers who crossed the famous Butterfield trail after having left the Santa Fé trail. These high centers can soon be reduced and will form excellent fillers for the ruts over which the highway is to be built. This section has few habitations, and most of the money for building this part of the highway must be supplied by the government.

Our next stop was at Magdalena. When 40 miles from the little New Mexico city our pilots urged us to press on in order to reach town before dark. We did so, but after having driven at a fast clip for 20 miles we struck deep sand and this delayed us. We reached Magdalena at 11 o'clock at night, but not too late for the highway boosters, who waited for us and held a midnight meeting.

While this country looks dry, in reality it was very wet and natives had to help give the car traction

From Magdalena to Socorro, a distance of 25 miles, the roads are excellent. Entering a pass that has been chopped through the rocky hills, the road leaves the high elevation and drops to a few hundred feet above sea level, or almost to the banks of the Rio Grande. This old Spanish town is replete with incident and is quaint and interesting. It is slow, but the people there are progressive and jumped into the national highway movement with a rare vim and energy.

At the meeting 1,000 members joined the Ocean-to-Ocean Highway Association, and the work in New Mexico was given a solid boost by a proposition which looks particularly good to the leading men of the town, who propose to build a bridge over the Rio Grande and cut off 10 miles of roundabout road. Now it is necessary to take the same bridge as the railroad company. The bridge is all right, but a better one is to be built right out of Socorro, and it will be directly on the line of the proposed national highway.

We found the Rio Grande running bank full and in places it had overflowed. We refused to allow any of the motorists of Socorro to pilot us to Albuquerque, as we learned that the road was flooded and dangerous. We took a chance and started early in the morning, and soon found our way blocked by a stream nearly a mile wide. The view was beautiful, but it did not look inviting to the driver of the ocean-to-ocean car.

The water was not more than 3 feet deep in the worst places, but we found the road boggy and it was necessary to enlist the services of a mule driver, who with two mules helped us to fight the mud for several miles. We toured through an orchard, crossed an alfalfa field and then struck the railroad bridge. Our troubles were over after we had crossed the Rio Grande, at least for a time, and we toured out into the wilds of the mesa between Socorro and Albuquerque, where we struck plenty of sand, but no spots that were not tourable. Of course it was necessary to use the low gear for a number of miles, but this section will lend itself to good-road building.

Missing Lunch a Mere Detail

Mayor D. K. B. Selers met us at Albuquerque after we had lost the road and wandered in the mesa for miles. We found it necessary to retrace our path for at least 20 miles in order to route the roads exactly. While we were off the highway the pilots, who had started from Albuquerque with a fine lunch, missed us and we missed the lunch. The reception in Albuquerque was unique, the people there insisting on us remaining over 1 day for a morning meeting in the Commercial Club and prominent business men of the city pledging themselves in favor of the transcontinental highway.

From Albuquerque to Santa Fé we traveled over a road built for the most part by convicts. This phase of the road situation in New Mexico is of especial interest to those in favor of a national highway. The credit system is in force, and the men in stripes work on the highways and earn merit marks which are counted in their favor and which help to make life much more enjoyable. They are doing remarkable work and have solved some of the hard road problems by building bridges and chopping down dangerous grades. This is especially marked on the grade leading into Santa Fé, which is a model. On an easy climb a mountain is topped and the level stretch leading into the quaint old city is reached.

Here at Santa Fé we struck the beginning of the old Santa Fé trail. In this town, which the old emigrant trailers made their headquarters in the days of '49, we found the old cathedral, the old trail marker, showing where the wagons were started on the last stage of the journey to the Golden West and where the stage coaches in later years were started on the long journey toward the Pacific.

At Santa Fé we were given a chance to preach the gospel of good roads from the rostrum of the State House of Representatives. Men from many of the cities and towns of New Mexico were in attendance and the meeting was a remarkable success. Governor McDonald placed the stamp of his approval on the meeting by giving the ocean-to-ocean organizers a great send-off the following morning.

Water Scarce in Raton Desert

Over a stretch of country made famous by the old-time forty-niners we ran the day after our reception in Santa Fé. Years ago the emigrant trains, with the ox teams, labored across the country, always keeping close to water. On the plains of New Mexico between Santa Fé and Raton, however, it was necessary to dig wells, and here we found what the old pioneers had done to develop a land which has not improved much since

Emigrant train on Santa Fé Trail headed west

Near Socorro, N. M., on the Rio Grande there are some places where a National Highway is badly needed

the first team was driven over the Rockies. The run to Las Vegas is over a scenic route through red hills.

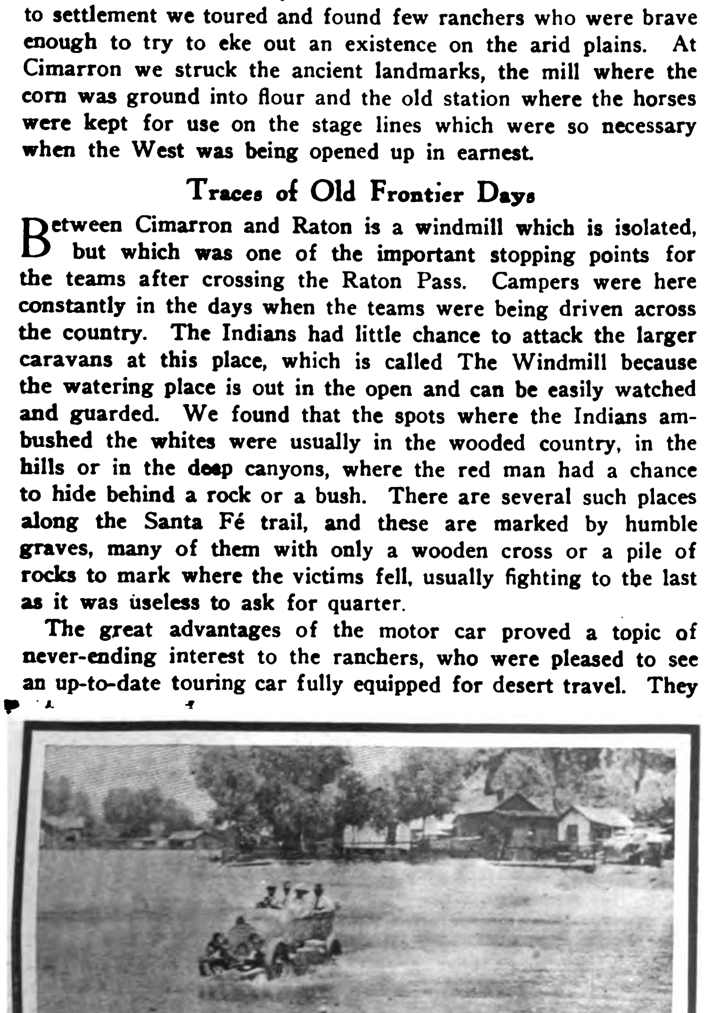
At Cimarron we struck the old Santa Fé trail with the real ruts made by the men who drove across the continent so many years ago. The automobile was driven in these old ruts and the wells located by the pioneers were found, but of course were not needed.

Traveling over the level prairies proved easy for our car, and it was not necessary to fill the radiator. From settlement to settlement we toured and found few ranchers who were brave enough to try to eke out an existence on the arid plains. At Cimarron we struck the ancient landmarks, the mill where the corn was ground into flour and the old station where the horses were kept for use on the stage lines which were so necessary when the West was being opened up in earnest.

Traces of Old Frontier Days

Between Cimarron and Raton is a windmill which is isolated, but which was one of the important stopping points for the teams after crossing the Raton Pass. Campers were here constantly in the days when the teams were being driven across the country. The Indians had little chance to attack the larger caravans at this place, which is called The Windmill because the watering place is out in the open and can be easily watched and guarded. We found that the spots where the Indians ambushed the whites were usually in the wooded country, in the hills or in the deep canyons, where the red man had a chance to hide behind a rock or a bush. There are several such places along the Santa Fé trail, and these are marked by humble graves, many of them with only a wooden cross or a pile of rocks to mark where the victims fell, usually fighting to the last as it was useless to ask for quarter.

The great advantages of the motor car proved a topic of never-ending interest to the ranchers, who were pleased to see an up-to-date touring car fully equipped for desert travel. They enjoyed making the contrast between our car and the best teams they possessed, and figured just how long it would take for their teams to make the run from Raton to Las Vegas, a trick we turned in a day, but which would take their best teams a week to cover.



Fording the San Carlos River in Arizona

Great Reception at Raton

At Raton, the Gateway of the Rockies, we were tendered a reception. Rev. Harvey M. Shields, pastor of the Episcopal church, was in charge of the demonstration, and the people there pledged $2,058, making the total for New Mexico more than $10,000 raised for the good-roads cause. The sentiment of the farmers and ranchers was such that it was determined to put the roads into tourable shape at once, and a bond issue of $5,000,000 was authorized by the state legislature, and this money will be applied to the highway through Mexico and work will be commenced on this road within 12 months.

After a night and a day at Raton we were piloted over the Raton Pass. Here the original road has been repaired, but it follows the path chosen by the pioneers. It only rises to an elevation of 9,000 feet above sea level and never mounts to more than a 9-per-cent. grade. The Raton Pass is one of the best pieces of work on the entire trip. We were warned, or at least told, that our hardest task would be in the mountains of New Mexico. This proved a joke, as the Raton Pass is one of the finest pieces of grade work that we saw on the entire trip, and it is open all the year around. This was only one of the many peculiar things told to transcontinental motorists who are about to make the journey over the southern route. The old Santa Fé trail is open from Los Angeles clear through to Kansas City, and you can start touring to-morrow if you desire to make the trip from sea to sea.

The roads of Colorado cutting the southeast corner of the state are in fine shape for touring. The highway down from the Raton Pass to Trinidad is in as good condition as the transcontinentalist can wish for, and more work is being done. At Trinidad the ocean-to-ocean highway organizers were greeted warmly, and there $5,000 was pledged toward the highway movement by men who seemed to appreciate the good the boulevard will do the entire country.

From Trinidad we toured to La Junta, where another 1,000 enthusiasts joined the movement, and then we sped on to Las Animas. From Las Animas the car was driven over the Colorado-Kansas line into Western Kansas, where the work was taken up on the plains over which the buffalo once roamed. We found thousands and thousands of acres still as wild as when the game was there in quantities, but we also found cities where the national highway sentiment is strongly in favor of the ocean-to-ocean plan. We spent part of a night in a buffalo

Traction was difficult in such spots on the way

wallow into which we had foolishly driven in the belief that we could send the car through on its own power. These wallows were formed by the animals in the hot weather pawing and stamping in the water holes which now are in such shape that a car driven into them must be hauled out by horses. We built our own road out, however, and were just in time to escape a heavy rainstorm which poured down the remainder of the night after we had found shelter.

Our next stopping place was Dodge City, and here we found thousands ready to help put the highway across the country. Here our time changed, and we began to get into Eastern time. We were 2 hours earlier than Los Angeles. We found that Dodge City people appreciate the fact that their city is directly on the route of the proposed national highway, and they turned out to greet us and to help boost. The roads around Dodge City are only in fair condition.

From Dodge City to McPherson the going was good, and we made fast time. At McPherson the entire city turned out to greet us, and in the main streets of the little city a meeting, that will long be remembered by every farmer and every merchant there, was held. In the main street of the town the people pledged $6,000 to the movement and the tour was given a big boost.

At the next stop, Olathe, Kan., another large pledge was made, and by the time the car reached Overland Park, only a few miles out of Kansas City, $43,300 had been promised for the national highway movement. From Overland Park into Kansas City macadam highways were followed all the way, and the tour was ended as far as Kansas was concerned when we struck the Missouri line. We were scarcely across the line before a tornado broke in all its fury, but we had time to reach the hotel.

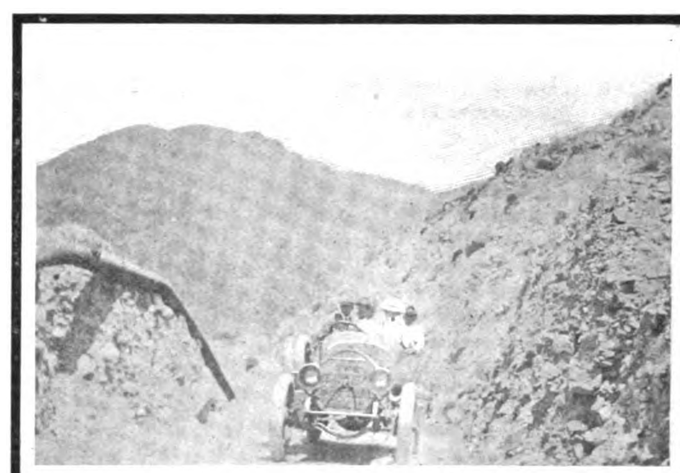
After the convention the work of organizing the Missouri division of the National Old Trails Ocean-to-Ocean Highway Association was begun, and at Independence many old soldiers helped to start the work in real earnest. A goodly company joined and the car was sent on to Columbia, where, at a meeting, another cohort of good-roads boosters was marched into line.

The roads of Missouri were not anything like we were told they would be. From all reports the tour through Missouri would be a fierce one, and we were prepared to battle with mud from the start to the finish of the cross-state run. Instead, we passed over fairly good roads, we had no trouble and we found the men of the state more than willing to listen, and the women, much like the women of Kansas, more than anxious to help the big project.

We left St. Charles late at night for the run into St. Louis, a distance of 23 miles, over good roads. Our tires by this time began to show the wear of the 2,000 miles of going, and we prepared to change the casings, though we were told that we should strike no more bad roads.

We crossed the Missouri River at St. Charles and then at St. Louis we crossed the Mississippi, and were more than halfway on our journey to the Atlantic seaboard. We entered southern Illinois with a great dread of the corduroy roads. We had no idea what we would strike, and we prepared for as fast a run as possible. All our plans were changed, however, at Highland, a town that pledged more money than any other city along the route of its size.

At a meeting held in the public park $15,000 was raised, and the men of the city started a movement which will certainly make history, as good roads are needed in Illinois, where the highways have practically no bottom. We were told that if we



Through one of the passes in California

On the National Road in eastern Ohio

Summit of the Raton Pass entering Colorado.

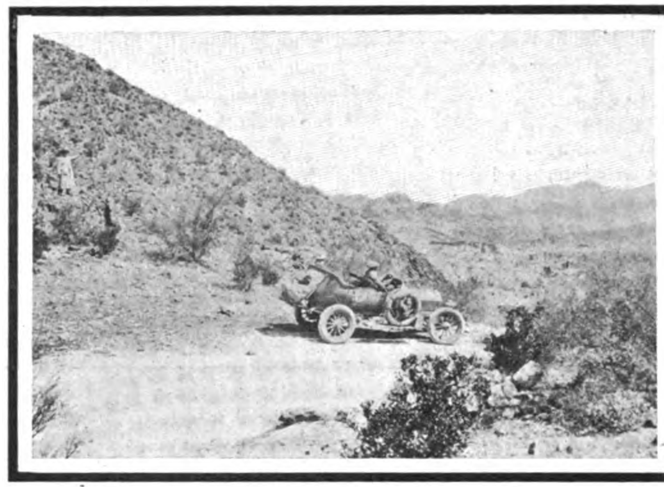
had tried to drive our car across the southern end of the state after a severe rainstorm we would have needed a team of horses every few miles. As it was, our heavy car made the journey comfortably and without mishap.

The work in Illinois was most important. The farmers there seemed to realize just what the national highway is to mean for them, and where there are now practically no roads a macadam highway is to be built. The corduroy roads are to be replaced with rock-ribbed highways. The old turnpikes, which have outlived their usefulness, will be replaced by a firm boulevard over which an automobile can be driven without trouble.

Our first stop in Indiana was at Terre Haute. There we were escorted through the public park, and in spite of the heavy rainstorm we were enabled to see the beauty spots of the beautiful city. At a meeting held there another $15,000 was promised for the ocean-to-ocean highway, and we were pleased to find many of the hard-headed business men of the city in line for the proposition.

Once in the eastern country the task of routing a national highway began to grow in magnitude. The desert wastes were left far behind. Large cities were now being toured and the route must be carefully selected. The Boons-Lick road had been followed its entire length. Now it remained to send the car over the old Cumberland pike. Through Indiana the work was pushed to Richmond, on the Indiana-Ohio line, and here the organizing car was met by Jesse Taylor, one of the good-roads workers of Ohio, and Arch Houston and James R. Marker, the latter Ohio State Engineer. This trio of good-roads boosters undertook to pilot us all the way across the Buckeye state.

At Springfield the work was given a boost. Then at Columbus a stay of 2 days put Col. Potter in touch with some of the big men of the state and a promise of 50,000 members for Ohio



Much of New Mexico looks like this picture

Picking out a road in the heart of the Rockies

was made. This means that in the state that can boast of more miles of good roads than any other section we crossed, the movement is to be pushed forward to the right kind of a finish, which will mean a macadam highway from the western to the eastern boundaries of Ohio.

At Wheeling, W. Va., our pilots, Taylor, Marker and Houston, were forced to leave us, but we had chosen the route of the old Cumberland Pike clear through to Cumberland, and the way was plain. Just outside of Wheeling we were given a real fright when on the grade built along the precipice, over which Col. McColloch leaped when pursued by Indians, our brakes gave out and our car started rapidly backward. Whirling the wheel in the right direction, driver John Zak turned the car off the bridge and directly against the face of the cliff. It was lucky that he did not lose his head, as we all might have been dashed to death had we rolled over the bank to the river 200 feet below. This was the most serious mishap of the long tour, but it turned out decidedly in our favor, and we continued on over the Alleghany mountains toward Cumberland.

The roads of Maryland over which we traveled are poor indeed. We found them in such bad shape that it was necessary to drive slowly to avoid cutting our remaining casings to pieces. The tires had done well. In one front tire we carried Los Angeles air, and we were anxious to keep it intact until we reached New York.

The people of Cumberland turned out royally for us. In the Cumberland mountains we found wild ripe red raspberries and blueberries. The scenery was delightful and easily rivals anything we saw on the entire tour. If the scenery of the Alps in Switzerland is more beautiful than the Alleghany mountains it is worth traveling halfway around the world to see. C. A. Tenney, State Engineer for Maryland, who made the trip with

Leaving Brawley, Cal., for the Arizona desert

Road machine which is at work on the big road us through Maryland, says the scenery of Maryland is grander than that of the Old World, and is more beautiful than anything he could find in Europe.

From Cumberland we drove on to Washington, D. C., where President Taft greeted us. We found the Chief Executive more than willing to listen to our story of a national highway, and he was interested in the project which will mean so much to the people of the United States. We went to the Capitol building, and there found senators and congressmen anxious to take a hand in the proposition, and we secured the pledges of 178 congressmen and twenty-eight senators in favor of a national highway from the Pacific to the Atlantic, built over the old Santa Fé trail, the Boons-Lick road and the Cumberland Pike. Our work in Washington was more than valuable, as for the first time in the history of the movement the proposition was carried right into the camp of the men we need so much to help when this matter is brought up before congress at the next session.

From Washington to Baltimore, a distance of 40 miles, we made the run over good roads, and C. Francis Jenkins, in a car which he has driven across the continent, piloted us all the way and sent us out on the last leg of our journey with the conviction that there are some of the best highway workers in the world who live in this country.

We spent the night at Wilmington, Del., another town directly on the line of the national highway. Here we once more found many who favor building a highway entirely across the United States. The roads in Delaware are in fine shape, but they could be better, and the people of the state seem to realize this fact.

Leaving Wilmington the last morning of the long tour we drove to Philadelphia for lunch and then prepared carefully for the last run into New York. We found the men of the Quaker City ready to help us. We were given a rousing send-off, and a pilot was furnished us for the remainder of the tour into Gotham.

Pouring Pacific Into Atlantic

We reached New York at 5 o'clock in the afternoon and were piloted directly to Coney Island, where we dipped the wheels of our machine in the waters of the Atlantic ocean. There the ceremony of emptying the bottle of Pacific ocean water into the Atlantic was carried out with due ceremony, and this function seemed to catch the fancy of the immense throng which had gathered on the beach.

For the first time in the history of the ocean-to-ocean highway movement water from the Pacific was carried across the continent and poured into the Atlantic, and we were ahead of the Panama canal in mixing the waters of the two great oceans.

The police in New York were more than kind. We had been arrested in Baltimore for not carrying a number. The justice there had refused to fine us after hearing the story of the tour told in the courtroom. The police of New York also were more than kind, and allowed us to tour through the city without a muffler, and helped us in every way to make the finish of the long tour a great success.

The national highway has been routed. The distance from ocean to ocean is 3,359.7 miles. The route is by way of the Santa Fé trail, the Boons-Lick road and the Cumberland Pike.

This road must be built along the lines of the least resistance. It must follow a route that is open all the year. The Santa Fé trail is ideal for such a road. The national boulevard can be made to follow a most scenic course through the lowest point of the Rocky Mountains and across fifteen states.

The eternal question is, "When will this road be built?" The answer is at least 5 years from now, if not sooner. However, it must be put in tourable shape at once. Already the people of California are at work making the Mammoth Wash, one of the worst stretches of the entire journey, tourable. This will be ready before the end of the present year. In every other state the workers there are planning to do emergency road work to get the highways into shape for the immediate use of motor cars.

The work of signing the entire highway is to be done just as soon as possible. Red, white and blue signs, it is believed, will be adopted, and these will be placed from Los Angeles along the line of the proposed national highway right through to New York. In the desert steel signs will be used, and on the state highways the telegraph poles will be painted with red, white and blue signs. In this way it will be possible to follow the Santa Fé trail, the Boons-Lick road and the Cumberland Pike. It is no longer an automobile stunt to drive across the United States.

Transcontinental Stone Road Project

Detroit and Indianapolis Car and Accessory Manufacturers Start Movement To Build Such a Highway

Plan Is to Raise $10,000,000 From the Automobile Industry Before January 1

NEW YORK, Sept. 9—One of the biggest plans for building a stone road from New York to San Francisco was made known in Indianapolis and Detroit today when it was announced that a movement has been started with the motor car and accessory makers in those cities to raise over $10,000,000 from the motor industry throughout the country to purchase crushed rock for such a roadway. The purchasing and delivering of the rock being a part played by the motor industry. The building of the road will be left to the country and state authorities with whom contracts will be made to complete the work within a certain time and according to certain instructions before the materials are turned over to them.

The plan to raise the $10,000,000 from the motor industry is one of the most practical and rational yet suggested in the good roads field. This sum has to be raised by January 1, 1913, a little over 3 months. The plan is to collect from every motor car maker, from every accessory maker, from every car dealer and from owners. With the manufacturers and dealers the plan is to collect a third of 1 per cent. each year for each year, this amount to be taken from the gross receipts of the company, which will provide a fund much in advance of $10,000,000. Cash or notes will not be collected but donation slips issued, which slips will be turned over to a bond company to hold until the permanent organization which will care for the purchasing and delivering of the material is organized.

The plan originated over 1 year ago in the fertile mind of Carl G. Fisher, of Indianapolis Speedway fame and who during the last 12 months has been accumulating data on the cost of road construction, cost of road materials, cost of cement bridges, cost of cement mile posts, etc. During that time he has talked with many manufacturers to find out if they would co-operate in such a scheme. This work started with the Indianapolis car and accessory manufacturers, all of whom agreed with the scheme and at a meeting held today the movement was launched on its practical cost by everyone of the makers agreeing on the plan outlined. A campaign will be made on the Detroit makers the end of this week and it is expected that little difficulty will be encountered and that the industry will practically be a unit on furthering this plan. After Detroit will come Cleveland, Buffalo, Toledo and many other motor centers.

In order that every subscriber to the fund will be protected no construction of any nature will be started until the entire subscription has been guaranteed, and if for any reason the plan should fail all monies will be returned to those having made payment with interest of 3 per cent. By having the required amount guaranteed by 1913 it will be possible to complete the work by 1915 so that the road may be used by motorists attending the Panama Pacific Exhibition which opens in San Francisco in the spring of 1915.

Instead of getting all of the financial assistance from the manufacturers and dealers the plan includes the incorporation of all car owners in the country. This is possible by two classes of membership, one a $5 class and the other $100 class. There is also talk of a third of a $1,000 class. Radiator emblems of different types will be issued to each member according to his class and special wall or window medals issued to all dealers who contribute a total of 1 per cent. of their gross receipts to the fund.

The plans do not call for any peculiar highway route across the states. At present there are two or more transcontinental highways and the matter of deciding whether either of these or a different is to be selected will be left to a commission of the motoring interest. All monies collected or subscribed for the road will be used in the actual purchase of material, which is to be purchased at a price covering delivery at the railroad siding when needed. Prices for material range from 90 cents to $2 per cubic yard, depending on the distance the material has to be hauled. A conception of the amount of rock required for such a highway can be gained from the fact that a roadway 9 feet wide and with rock 12 inches deep costs $1,750 a mile for material. This preposes a short haul. Although by route it is 3,300 miles from ocean to ocean little more than 2,200 miles of transcontinental highway would call for stone construction as there are approximately 900 miles of improved streets in cities, towns and villages on this course. This fact alone, considerably reduces the problem of building such a highway. The fund of $10,000,000 will give approximately $5,000 a mile for road material. and since road material represents from only 30 to 50 per cent. of the cost of building a road it means that instead of a $10,000,000 one across the country there will, in reality, be a $25,000,000 one.

The actual building of the road will be under the state and county authorities to whom the materials will be turned over. The states and counties will sign contracts to build the roads under government inspection. Mr. Fisher has discovered that some of the best rock roads in northern Indiana and northern Ohio have cost but $1,750 a mile for material. It is natural that in building a stone road in Iowa the material will cost more because of the long haulage. This will amount to not more than $800 a mile for any part of the country.

Many additional plans are being furthered in connection with this transcontinental scheme, one of which is the erection of sign posts, one for each donation of $1,000 secured on the plans outlined. Each post would carry a bronze plate containing the name of the donor. Such posts will cost $12 each.

Still another plan is that of entering into arrangements with the telephone companies whose lines are on the selected highway to secure plugging facilities on the line so that the motorist having a break down between cities can immediately get into telephone communication with his dealer, a repairman or garageman. Such a system as this is at present in operation in England and also in certain sections of southern California.

Possibilities Are Great

The possibilities of travel on a transcontinental highway of this nature are unlimited. Supposing 250,000 cars made a return trip over such a highway occupying 40 days. If each car carried four people the daily cost would be $20 or $800 for the round trip. At this same rate there would be an expenditure of $20,000,000 for the 25,000 cars. While this is a broad calculation so far as the number of cars is concerned it will, however, serve to show the value to the towns and cities passed through of such a highway.

Huber Patent May Trouble 20 Firms

Covers Three-Point Suspension—Owners Will Test Its Validity to the Limit —Trial Suit Brought

Date for Return of Temporary Injunction in Ford vs. I. A. L. Case Extended to October 1

DETROIT, Sept. 9—The Emil Huber patent No. 788,407, dated April 25, 1905, covering three-point suspension of the main frame of an automobile bids fair to make trouble for some twenty automobile concerns according to R. A. Parker, of the firm of Parker & Burton, of this city, patent attorneys for the North American Veicle Company, owner of the Huber patent.

Within the last 2 weeks the patent has assumed large proportions, and it is the intention of the owners to test its validity to the limit. Already several concerns have taken out licenses among which are the Packard Motor Car Company, the Havers Motor Car Company, and the Cass Motor Car Company.

The North American Vehicle Company, through Mr. Parker, has sued the Detroit Taxicab & Transfer Company, which concern owns a number of Kelly machines. The Kelly Motor Truck Company, of Springfield, O., is conducting the case for the Taxicab concern through its attorneys, Staley & Bowman, of Springfield, O. It is merely a test case and suit has been brought against the Detroit Taxicab & Transfer Company simply because this concern is the most convenient to get at. The North American Vehicle Company claims that the Detroit Taxicab Company is operating trucks designed along the lines of the Huber patent and in violation of this patent.

The case is now on the docket of the United States district court but it is doubtful if it will come up for consideration during the present term. Should it be lost in this lower court, Mr. Parker states that his client will carry the issue to the Court of Appeals and in that event Judge Dennison, who is an old patent practitioner, will no doubt handle the case.

Staley & Bowman, attorneys for the Taxicab company, on September 3 filed an answer to the North American Vehicle Company refuting the latter's claim.

More Time Given in Ford and I. A. L.

BUFFALO, N. Y., Sept. 9—The date for the return of the temporary injunction issued several weeks ago by Judge John R. Hazel, in United States district court here, directing the International Automobile League, of Buffalo, to show cause in the action brought against it by the Ford Motor Car Company, of Detroit, has been extended to October 1 through agreement of the respective attorneys in the case. The order was to have been returned on last Thursday. The Ford company wants a permanent injunction against the International Automobile League to restrain that concern from selling or advertising for sale Ford automobiles at less than the price fixed by the manufacturers of the Ford cars.

The Ford company in its complaint alleges that the International Automobile League advertised that any person paying $10 would be admitted to membership and would have the privilege of purchasing Ford cars at less than market price. The Ford company declares many orders for Ford cars were taken and that an attempt was made to buy the cars from the makers but the sale was refused. It is claimed that the Buffalo league secretly bought the cars from some Ford dealers and sold them to members of their organization at a 10 per cent. discount.

Trade News of the Week

Westcott and Kline Elected to Membership in the N.A.A.M.—Sales Managers Dates Set

Feps Carbureter Activity—General Motors Promotes Day —Morrow Doubles Capital

THE Westcott Motor Car Company, represented by H. L. Ashly and the Kline Motor Car Corporation, J. A. Kline, have been elected to membership in the National Association of Automobile Manufacturers. The membership of the Metzger Motor Car Company was transferred to the Flanders Motor Company and that of the Rapid Motor Vehicle Company to the General Motors Truck Company.

The two first-named alterations in the membership roll are net additions to the association, but the other two are formal transfers to correspond with business changes that already have taken place. G. G. Luthy succeeds J. B. Bartholomew, for the Bartholomew Company; F. R. Benson succeeds Frank R. Fisher, of the E-M-F Company, and Hanson Robinson succeeds W. R. Innis, for the Studebaker.

The subject of a general meeting to be held in Detroit in October or November was discussed and a committee to arrange the meeting was named.

The association has renewed its agreement for financial cooperation with the American Automobile Association on similar lines to that of 1911. The agreement extends to the end of 1914.

Application for membership in the Chamber of Commerce of the United States will be made by the association.

Four More in Board of Trade

At the last meeting of the Automobile Board of Trade the membership of the United States Motor Company was divided into four heads and individual membership was granted to the Maxwell-Briscoe Motor Company, the Dayton Motor Car Company, the Alden Sampson Manufacturing Company and the Columbia Motor Car Company. Another member was also elected, but no announcement as to its name was made.

Preparations for shaping up the association for its contemplated merger with the National Association of Automobile Manufacturers is progressing and the Dyer license matter, as to the form of the licenses to be granted on application of the organization, is being worked over by the attorneys of both.

Dates Set for Sales Managers

The long heralded convention of sales managers, which was originally scheduled for last July, will be held September 30 and October 1 at the headquarters of the Automobile Board of Trade. The bare announcement of the dates has been made by Chairman Harold O. Smith and the program will be known at a later date.

It was found that the trade was too busy for the convention in July and that the purpose of the meeting would be better served by holding it between seasons.

The regular quarterly and subsidiary committee and board meetings of the Board of Trade and the N. A. A. M. are scheduled for October 2 and 3.

Schoen Takes Up Feps Carbureter

The Schoen-Jackson company, of Media, Pa., has finished the building of a complete plant in addition to the other factories of the company and will manufacture a new type of carbureter to be used on automobiles and boats. The carbureter will be known under the trade name of Feps.

According to the announcement of the company, the device is the invention of J. L. Fritz and among its special features claimed for it by the company is the fact that it has no springs, balls, cams or reeds.

Mr. Schoen learned of the device from its inventor and after some negotiations secured the exclusive right to manufacture for the Schoen-Jackson company, which hitherto has been prominent as a producer of tubing.

Mr. Schoen himself has taken out several patents on carbureters and is a pioneer in the field of automobile research. The Feps device has been given hundreds of severe road tests.

General Motors Advances Day

DETROIT, MICH., Sept. 9—President Thomas Neal, of General Motors Company, has announced the election of William L. Day, late general sales manager of the Mitchell-Lewis Motor Company, of Racine, Wis., as vice-president and general manager of General Motors Truck Company.

Gleeson Murphy, who has temporarily held the office of vice-president and general manager of General Motors Truck Company in connection with his other work at the executive offices of General Motors Company, at Detroit, will in future devote himself exclusively to his regular duties of assistant to the president of General Motors Company.

Morrow Company Doubles Capital

ELMIRA, N. Y., Sept. 9—At the annual meeting here last Thursday of the Morrow Manufacturing Company, manufacturers of transmissions, small parts and automatic screw ma-

Automobile Securities Quotations

Save for the highly speculative issues and those listed upon the New York Stock Exchange, trade in automobile securities during the past week has been dull. Goodrich was the strongest feature of the list, advancing to 80 bid on what appeared to be investment buying. General Motors and Studebaker were also firm. United States Motor Company stock of both issues was very weak on the curb. The 90-day extension granted to the company by the banking and merchandise creditors, expires by limitation on Friday and the weakness of the stock is construed favorably by the street as foreshadowing reorganization.

*Old. †New.

chinery for Overland automobiles, it was voted to increase the capital stock of that organization from $500,000 to $1,000,000. The papers making formal application for the increase have been completed by Attorney Royal Scott, of the Willys-Overland Company, and rushed to Secretary of State Lazansky at Albany.

Of course, action by the state officials in matters of this kind is merely formality. The increase was made necessary to cover investments already made in the local Morrow factory. The $500,000 increase already is actually covered by money put into the business in the way of equipment, buildings and stock. At the meeting election of officers also was held. A. P. Morrow, Elmira, was re-elected president. Other officers re-elected were: Vice-president, John N. Willys; treasurer, Walter B. Stewart; secretary, Edwin A. Morrow.

Big Registration Gain in State

ALBANY, N. Y., Sept. 9—Secretary of State Lazansky reports that the receipts of his office for the registration of automobiles and licensing of chauffeurs up to and including August 31, 1912, for the 7 months of the fiscal year beginning February 1, are $1,000,844.25. The sources of this revenue follow:

Pleasure vehicles, 90,186	$796,670.00
Commercial vehicles, 8,636	42,370.00
Chauffeurs' licenses, 41,406	116,685.00
Dealers' licenses, 1,665	24,975.00
Dealers' extra numbers	10,831.00
Miscellaneous receipts	9,313.25
Total	$1,000,844.25

The total number of licenses issued for the 7 months has been 100,700, compared to 85,301 for the 12 months ending January 31, 1912. The number of chauffeurs' licenses up to August 31 is 41,406, compared to 35,900 for the entire fiscal year previous.

Market Changes of the Week

The most important feature of the week's market was the advance in the price of Bessemer and open-hearth steel. The advance on each was $1.50 a ton, on Monday, as a result of the great activity in the industry. Lead advanced $.22 1-2 per 100 pounds, rising gradually throughout the week, closing on Tuesday at $5.10.

Hupp Increases Capital

Issues $2,500,000 Common to Balance Earnings Diverted to Company—Big Stock Dividend

E. R. Hollander Heads Fiat Sales Company Which Will Market Factory Product in East

DETROIT, MICH., Sept. 9—The stock of the Hupp Motor Car Company has been increased from $500,000 to $750,000, according to the papers which recently have been filed with the secretary of state. This capital increase is made possible through the transfer of $250,000 from the company's surplus to its capital account.

This disposition of its surplus was voted at a recent meeting of the stockholders of the Hupp company, at which it was also voted to allow a 50 per cent. stock dividend on account of the capital increase.

The Hupp company reports prosperous conditions, and has planned to make about 9,000 machines for the coming season.

Hollander Heads Fiat Sales

ALBANY, N. Y., Sept. 11—At special meeting of the directors of the Fiat Motor Sales Company, the $300,000 corporation just organized at Manhattan, these officers were elected: President, E. R. Hollander, New York; vice-president, Henry M. Sage, Albany; secretary, R. D. Willard, New York; treasurer, Chas. L. A. Whitney, Albany.

The new concern will handle the Fiat in New York, Albany, Boston, Providence and New England.

Rate Boost Delayed for Month

Final action on the part of the railroads to advance the classification of automobiles as outlined in previous issues of this publication, has not been taken and the matter has gone over until the October meeting of the Southern Classification Committee.

Under the proposed change, the car-load rate from New York and New England common points to the Pacific Coast would be raised from $3 to $3.30 per 100 pounds; from Buffalo-Cleveland-Pittsburgh common points, $3.20 in place of $3 and from Detroit common point of $3.10 instead of $3.

The change was contested by the National Association of Automobile Manufacturers.

Rubber Market Awaits Auction

Crude rubber sagged again last week under trading of smaller volume. The trade is awaiting the London auction which will dispose of from 900 to 1,000 tons of plantations, considerably more than has been offered at one of the fortnightly sales this year. Receipts at Para during August amounted to 1,655 tons, according to bulletins from that port. South American rubber shares are reported active and on the verge of a boom. The present price level is on a basis of $1.17 1-2 per pound for upriver fine.

Sedwick to Manage Speedway

INDIANAPOLIS, IND., Sept. 10—Charles W. Sedwick has been appointed manager and Homer McKee, publicity director of the Indianapolis Motor Speedway. Neither will give up his other business. McKee is advertising director of the Cole Motor Car Company. Plans are to start at once preparing for the 500-mile Memorial Day race.

U. S. Motor Co. Fails

Creditors Apply for Receivers When Agreement as to Reorganization Falls Through After Many Efforts

Liabilities Estimated at $12,250,000 with Nominal Assets of $15,300,000

INVOLUNTARY bankruptcy proceedings of a friendly character were entered against the United States Motor Company late tonight, in the United States District Court before Judge Charles M. Hough, of the Southern District of New York. The petitioning creditor is the Brown & Sharp Manufacturing Company. The parties to the suit are the United States Motor Company, Alden-Sampson Manufacturing Company, Brush Runabout Company, Columbia Motor Car Company, Dayton Motor Car Company and the Maxwell-Briscoe Motor Company.

Judge Hough forthwith named W. E. Strong, of the Central Trust Company, and Roberts Walker, formerly head of the Rock Island System, as receivers under bond of $150,000. The bond was originally placed at $75,000, but owing to the fact that ancillary proceedings will be instituted immediately in Indiana, Ohio, Michigan, New Jersey, Connecticut, Rhode Island and Massachusetts the amount of the tentative bond was doubled.

The liabilities of the company are estimated at $12,250,000 and the assets, consisting of cash, bills receivable and securities of subsidiary and other corporations, are valued at $15,300,000. The assets are largely embraced by the factory plants of the subsidiary companies, which are scheduled at $6,250,000, against which there is a secured indebtedness of $200,000. The quick assets, as of July 31, amounted to $9,250,000. Factory inventories, which represent an item of $4,000,000, are included in the foregoing item as also is the amount of $2,500,000 which represents all the cash on hand and bills receivable.

The liabilities of the company consist of $6,000,000 of debenture bonds, while the remainder, amounting to $6,250,000, consists largely of the merchandise and banking claims against the company.

Does Not Mean End of Company

Appeal to the courts, according to practically everybody interested in the matter, does not mean that the end of the company is at hand. On the contrary, they say that under the receivership much aggravating delay and expense can be saved by having the federal court take jurisdiction. It is also pointed out that when the time comes for reorganization some plan to assess the stock or wipe it out can be accomplished with more dispatch than such an end could be accomplished without a receivership.

The date to which the extension goes is Friday and the sudden determination to file the proceedings was taken in order to forestall legal proceedings in the state courts and elsewhere.

The whole trouble with the company is lack of ready money. Several of the subsidiaries are in excellent shape individually, particularly the Maxwell-Briscoe Motor Company, in which plant the book value of the stock is 100 per cent. of its value. But owing to the combination of circumstances the funds that must be devoted to caring for current needs, back debts and for financing the 1913 manufacturing campaign are short of the required amount.

In the bill of complaint it is stated that the receivables owned by the subsidiary companies are in many instances not immediately capable of collection in any way and that the motor company is liable upon the entire indebtedness. It is also said that through the indiscriminate issue to banks and others of promissory notes now outstanding, as aforesaid, intricate and involved questions exist as to the equities and rights of the defendant companies as between one another, which can be adjudicated only through one suit in equity wherein all such questions can be determined.

In another section of the bill the following condition is outlined:

While the motor company and the subsidiary companies have a large amount of supplies and materials on hand and there are in the hands of the selling companies for sale completed automobiles of the value of about $2,000,000 (on July 31), the conditions of the automobile industry are such that said finished product can not be sold in time to provide for the payment of the matured and maturing obligations of the said companies and neither the motor company nor the subsidiary companies have now adequate or sufficient funds, and are unable either by realizing upon their quick assets, even at a great sacrifice, or by securing further loans, or otherwise, to meet their current obligations which have already matured and will mature in the near future, and in view of the present financial condition of said company it will be impossible for any of them in the near future to raise by loans or otherwise sufficient funds to enable them to prosecute their business.

Percy Martin, head of the British Daimler Company and the Birmingham Small Arms Company and a leading exponent of the Knight motor in England, made a detailed inspection of all the plants of the United States Motor Company last summer. He stated after the inspection, which was very thorough, that the companies were in condition to produce automobiles worth from $20,000,000 to $25,000,000 annually as far as machinery and equipment were concerned.

Some of Mr. Martin's Suggestions

Quoting from Mr. Martin's report, under date of August 22, the following extract is interesting: "If a definite policy or program could be given to the various manufacturing installations and if a wise distribution of the work according to its suitability to the equipment of the various plants were dictated, I think that the economies from a manufacturing standpoint would be such that the difference between the manufacturing cost for a given article and that of the best factories in the United States will be very slight, in fact, negligible for the present scheme of reorganization."

Continuing Mr. Martin says:

"The present state of the plants, which are being practically shut down due to lack of work, is a very serious matter and is rapidly destroying the spirit of progress which apparently did prevail and certainly should prevail with all of the factory managers. The sooner a definite policy can be launched, whether such policy be in every detail correct or not, the advantages to the company will be very great."

In another place he says:

"As to the Sampson truck business, as well as the Brush plant in Detroit, I am inclined to believe that those factories could be closed to advantage and the very good supply of machinery and plant at present located there profitably distributed among the other factories."

The chief plans of reorganization that are being discussed include a proposition to assess both classes of stock $22.50 per share. Another is to obtain an agreement among the creditors to accept stock issues in the reorganized company for their claims, dividing the claims into classes and settling them according to their class.

The matter is returnable before Judge Hough on the third Monday in October. Rosenberg & Levis have been named attorneys for the receivers; Joline, Larkin & Rathbone will represent the Central Trust Company and the banking creditors to the amount of $5,000,000. Parks & McKinstry will be associated as counsel. Sidney S. Meyers, who is a member of the creditors' committee, will act for the merchandise creditors.

How to Paint a Roadster

Requires Different Treatment From the Touring Car or Limousine—Paint Suffers More From Vibration

For Color Scheme, Dark, Rich Red Tones Are to Be Preferred—Other Attractive Hues

A READER of THE AUTOMOBILE suggests that information be given for painting a roadster. The roadster type of car, in not a few respects, must be treated somewhat differently than the touring car or cars of even a larger build. Usually it is more difficult to keep paint and varnish solid and intact on these light, jolting, quick-moving cars, than upon the cars holding firmer to the earth by reason of their greater weight. These light cars suffer from vibration, against which it is hard for the most elastic paint to prevail.

Choice of colors is not an easy selection to make for the roadster. Colors which upon the larger field of the bigger cars appear to splendid advantage are often entirely unsuited for display. upon the restricted space of the roadster. The roadster is a type of car that needs attention. By virtue of its small size it is rather a wretched looking car under even the mildest form of neglect. To appear the genteel and jaunty car that it really is it must be kept constantly under a good raiment of varnish, and as often as the color becomes worn and dingy, and perhaps takes on the spots of the leopard, it should be put through the paint shop for expert treatment.

When it makes entry to the shop the first move on the part of the painter should be to mark all the furnishings belonging to the car and put them away in the racks designed for such things. Give the car a sharp look over and determine the amount and extent of painting repairs necessary, granting, of course, that the owner has not stipulated precisely the requirements he is prepared to pay for. Anyhow, get the car upon strong supports to a height that will permit the cleaners to prowl under the car and clean up the mechanism. If anything, these small cars get more badly stuck up with thick grease, road dirt, etc., than the larger machines. A good plan in cleaning is to first saturate the mechanism and cleanable parts with a mixture of one part crude oil and three parts turpentine, and let stand for several hours, at the expiration of which time give the parts a fresh supply of the oil turpentine mixture following with knife scraping and dry wiping with burlap cut into 5-inch strips. Plenty of oil and grease will likely be found on the body of the car, and upon the chassis, which it will be necessary to remove with small pieces of waste or clean rags saturated with turpentine.

Touching Up Defective Places

Having the surface and parts below the body line clean, go go over the body with No. 1 1-2 sandpaper. Any chipped or defective places upon the surface of either the body or chassis should be touched up with an oil pigment mixed, so as to dry in at least 24 hours. When dry, such defects should be draw-puttied to fetch them out level with the surrounding surface. Use a hard drying putty, and after 24 hours rub these splotches of hard pigment down level with the remaining surface, using for the purpose a small rubbing brick dipped in turpentine, or gasoline, if the insurance people will allow it.

Sandpaper the chassis down to a smooth and solid foundation, making sure with respect to both body and chassis that the surface is clean and fine.

If there are no deep surface checks the color may now be put on directly over this old paint foundation. If checks appear which the color and the varnish are not certain to eliminate, it is advisable to apply a coat of lead paint mixed with enough turpentine to flat down without any glass. Beat up some oil-ground lead in turpentine and add enough of some color corresponding in shade to the final color selection to give it the right appearance.

This coat will dry in 24 hours fit to lightly sandpaper with No. ½ paper. In either event the surface is now ready for the color coat, or the ground coat used to support the color coat in case a semi-transparent color or lake coat is to be used.

All colors, or practically all colors, used upon automobiles at the present time are ground in japan and in preparation for use require only to be thinned with turpentine. For every seven parts of turpentine use one part raw linseed oil as a binder for the pigment. For the second coat of color use ten parts turpentine and one part raw linseed oil. This proportion of oil does not materially delay the drying of the color, and it gives it a gripping power and an elastic property which are vital to its durability.

Apply the color with a 2 1-2-inch camel's hair flat brush. If a lake pigment is to be used the second coat of flat color may be omitted and a coat of the flat lake—that is, lake beaten up with turpentine to dry without gloss—applied. Over this use a glazing of lake made by first breaking the lake up with turpentine to a brushing consistency and then adding the rubbing varnish in sufficient quantity to give a mixture consisting of 1 ounce of color to a full pint of rubbing varnish. Apply this varnish color or glaze coat in the same manner that you would flow on the varnish coat. Knock the gloss from this coat in due time by rubbing it with a soft sponge dipped first in water and then in pumice stone flour. Stripe and ornament on this surface and apply a coat of clear rubbing varnish. Give this coat, at the proper time, a solid rubbing with water and pumice stone flour, and finish with a hard-drying varnish specially designed for automobile work. Such in a rather brief outline is the way to get the painting and finishing operations along in proper order.

Possible Color Selections

In color for the roadster, dark, rich reds, like aurora red, automobile red, No. 40 carmine and twentieth century red, deep shade, are to be preferred. Deep-toned maroon is another effective red in connection with which may be mentioned English scarlet lake, Munich lake, English or American crimson lake, and purple lake. This latter, it will be noted, is an exceedingly popular color just now and withal very beautiful. Richelieu blue and ultramarine blue, both magnificent colors, with a wealth of effects in them, are popular roadster pigments. Napier and thistle green are enticing colors for the small car. Automobile and battleship gray, picked out with black and gold lines, show the roadster to the very finest advantage.

One important consideration in this matter of color selection for the roadster, or for any other small type of car, is that, generally speaking, a single color, fitly chosen, is in the main more effective and serves best to display the charm of outline and figure than a combination of two or more colors. Neat, effective striping, executed in quiet colors of strong individuality, and cast with artistic precision upon the surface, serves best to accentuate the graceful lines and the choice color display cast over the car.

The quantity of material required to repaint the roadster as above directed will be found approximately as follows:

Body

Lead, mixed ready for use	1 quart
Hard-drying putty	1 pound
Sandpaper	6 sheets
Color, per coat	¾ pint
Varnish color, 2 coats	1 quart
Clear rubbing varnish	1 pint
Finishing varnish	1¼ pints

Chassis

Lead, mixed ready for use	¾ quart
Hard-drying putty	½ pound
Sandpaper	4 sheets
Color, per coat	1 pint
Varnish color, one coat	1¼ pints
Clear rubbing varnish	1¼ pints
Finishing varnish	1½ pints

Array of Test Data of Many Touring Car Motors Showing Need of New Formulas for Power Ratings—Pointers from Berlin on Safe Construction of Garages—Dr. Riedler's Scientific Valuation of Cars

POWER of Modern Motors—In 1906 the Automobile Club of France adopted the formula $P = 0.0028 D_3$ for estimating the power developed in each of the cylinders of an automobile motor. For taxation purposes the French government adopted a variation of this formula indicating a horsepower about 17 per cent. smaller. Since that time many different formulas have been proposed in which not only the diameter of the cylinder D but also the stroke L is considered. The Imperial German Automobile Club states that the formula used for taxation purposes in Germany is $P = 0.3 nD^2L$, or for a four-cylinder motor $P = 1.2 D^2L$, but that this is meant to indicate the power available at the rims of the driving wheels. The Royal Automobile Club of London used for some time the formula $P = 0.4 nD^2$, in which the bore is in inches, while in the German and French notations it is in millimeters. Following laboratory experiments and the widely adopted lengthening of the stroke, the English formula was changed to $P = 0.464\, n(D + L)\ (D - 1.18)$.

Now the French Automobile Club proposes to divide the motors into four classes according to their piston speeds and to include the number of revolutions *w* among the factors considered (see account in these columns, THE AUTOMOBILE, August 8), and pleasure cars constitute two of these classes. In the first class the piston speed is up to 6 meters per second, and in the second class it is above this figure.

As 6 meters per second corresponds to 1,178 feet per minute, while the basis for the American formula is 1,000 feet per minute, the power ratings arrived at according to the proposed French formula would for this reason alone exceed the current American ratings by nearly 20 per cent. if the number of revolutions *w* of the motor were not specifically considered.

The proposed formula for motors in the first class—which are those which afford a comparison with the motors used in American cars—is $P = (n \div 2)\ (D^2Lw \div 10^8)$, or for a 4-cylinder motor $P = 2D^2Lw \div 10^8$.

Transposing this formula into inch measurement, but without considering the small difference between French and American horsepower, it becomes $P = 2D^2Lw \div 6{,}102$, as 1 inch equals 25.4 millimeters and the millimeters in bore and stroke are cubed in the French notation, so that the divisor 10^8 should be divided by the cube of 25.4 which is 16,387. For comparison a 4-cylinder motor of 4-inch bore and 5-inch stroke gives according to the French formula 31.5 horsepowers at 1,200 revolutions per minute and 25.6 horsepowers according to the standard American formula, and, as 1,200 revolutions per minute gives a piston speed of 1,000 feet per minute with a stroke of 5 inches, the two ratings are comparable. It is thus seen that the new method of rating allows a horsepower nearly one-fourth higher than the customary American formula, even where the motor dimensions are conservative, and in the case of a long stroke motor the difference becomes more pronounced.

The basis from which the French formula was evolved is found in actual bench tests of a large number of different motors used in French touring cars of 1911 manufacture. The bench data relating to these motors are given in the appended tables, Nos. 1 and 2. It is noted that many among the motors listed in the tables have a piston speed in excess of 6 meters per second and these are in the second class for which the French formula is written with a divisor of 1.9 instead of 2. For comparison, the last column in the tables gives the rating which the motor in each case would have under the standard American formula $P = nD^2 \div 2.5$.

For truck and omnibus motors in which the average piston pressure is higher than the average in touring car motors, it is found that the French formula should be figured with a divisor of 1.8 instead of 2, and this conclusion is based on the test data obtained with the truck, omnibus and delivery vehicle motors listed in Table No. 3 (see page 527).—From *Bulletin Officiel*, June.

TABLE NO. 2—BENCH DATA OF FRENCH 1911 TOURING CAR MOTORS WITH 1, 2, 6 OR 8 CYLINDERS

Bore in m/m D	Stroke in m/m L	Revolutions per Minute W	Horsepower P	Piston Speed in Meters per Second	Mean Piston Pressure in Kg cm2	American Rating in Horsepower

REGULATIONS for Garages—In Berlin the police supervise the observance of rules relating to buildings and fire risks, and this year new rules have been promulgated for garages which are found to have a bearing on the most desirable architecture of dwellings as well as business buildings in any country. They are rendered practically in full in the following, and are applicable in all cases where the total capacity of the fuel tanks in automobiles stored in one room amounts to more than 15 kilograms.

Whenever possible motor vehicles are to be stored in closed rooms and in special buildings.

The use of basements is admissible in the following cases:

(1) Private Garages—When the basement rooms are accessory to dwelling rooms on the same plot and the vehicles serve for the personal use of the resident, and then under the following special conditions: (a) At most two cars must be placed in each car compartment; (b) the walls and roofs of each compartment must be fireproof; (c) automatic ventilation of the floor must be provided; (d) the car compartments must not be connected with other basement rooms; (e) they must be accessible by means of an inclined driveway or an elevator; if by an elevator, there must be a specially secured rear exit to the open air, and this may also be demanded if the entrance is by driveway; (f) more than 8 cars must not be placed in the basement rooms of one building.

(2) Business Garages—(a) If the storage rooms are placed under yards or under buildings which preferably are used for automobile traffic and at all events only for business; (b) they must not be connected with the upper stories; (c) they must have two entrance driveways in different directions and in addition be provided with a sufficient number of rear exits to the open air.

Walls, roofs and windows—(a) The outer walls of garage rooms must be solid. (b) Each room must have fireproof ceiling and fireproof, unbroken partition walls at least 10 centimeters thick. (c) Windows and skylights must be made of fireproof glass (for example Siemens-Drahtglas, Electroglas, Mechanoglas, Solfacglas, Galvanoglas) in iron frames.

An exception is allowed for special single-story garage buildings whose outer walls are at least 6 meters from doors and windows in other buildings and if no dwelling rooms are arranged over the storage rooms. These need not be fireproof or equipped with special glass, but if these buildings are more than 20 meters long a fire wall must extend above the roof for every 20 meters of length.

Repair shops must be separated from storage rooms by unbroken fireproof walls of at least 10 centimeters thickness.

Number of cars stored—As a rule not more than 3 cars must be stored in the same compartment; in the special cases above mentioned only 2.

Floors—The floor must be incombustible and must not absorb oil. It must in each compartment drain toward a pit-like depression under the stand of the car and must slope upward toward the entrance.

Doors—(a) Doors in front walls must open outwardly. (b) The wall over doors and windows and underneath dwelling rooms must be fireproof and unbroken to a height of 1.1 meter, and, if this is not possible, protection must be provided by means of an incombustible shutter in the door or window frame capable of being raised on hinges, or a roof 1.1 meter broad must be placed over the opening on the outside of the building, so arranged that it may easily be clapped down. The special glasses mentioned may be used for these purposes.

Heating—Fireplaces must not be used in storage rooms. Heating by saturated steam or hot water is permitted, but the radiators and pipes must be protected by wire netting or perforated sheet iron at a suitable distance.

Lighting—(a) The lighting of the premises must be effected by incandescent lamps operating without access of air and inclosed in tight-fitting globes which also inclose the bulb frames; or else it must be effected by means placed outside of the storage room and securely separated from it. In other features the rules of the Society of German Electrotechnicians are to be followed. (b) Where push-contact lamps cannot be dispensed with for business reasons, such lamps are admissible if placed at least 1.5 meter above the floor and of the construction especially permitted by the police. (The permitted constructions are the Eicken, the Southwest Electric company's and the Bergmann Electric company's types). (c) The car storage room must be entered only with electric or Davy safety lamps. (d) The lighting of fire or light, lighting or extinguishing of vehicle lamps and also smoking are prohibited, and this must be made known conspicuously at entrance doors.

Ventilation—Ample provision must be made for carrying into the open all gases which may settle along the floors.

Storage of fuel—The ordinary police regulations relating to the storage of mineral oils are ruling, and in the storage rooms and repair shops neither full nor empty gasoline or similar cans nor oil-soaked rags must be stored.

Storage above the ground floor—When motor vehicles are stored above the ground floor the following additional demands are made: (a) Elevators for motor cars must be outside of the building. (b) The ceilings of each floor must be unbroken. (c) All exits are to be provided with ground-joists of incombustible and impervious material and of sufficient height. (d) The storage rooms must have a sufficient number of exits and at least two, as far one from the other as possible and leading to difficult conditions, the police reserve the right to make special rooms must have exits to special stairways.

Large plants—In the case of large establishments or difficult conditions, the police reserves the right to make special demands.

TABLE NO. 1—BENCH DATA OF FRENCH 1911 4-CYLINDER TOURING CAR MOTORS

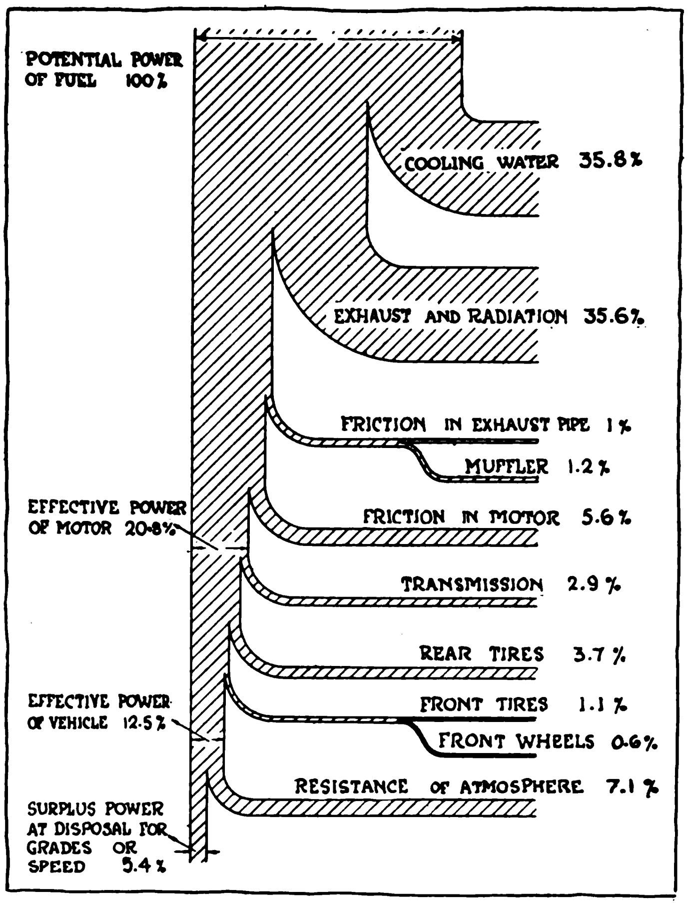

Fig. 1—Wastes and frictions in 30-horsepower car going at 60 kilometers per hour

Fire Extinguishers—The provision of fire extinguishers, such as chemical preparations, sand and hydrants, is recommended for small plants and required of medium and large establishments.

Sewerage—A special permit must be obtained from the police sanctioning the drainage system.—From *Zeitschrift des Mitteleuropäischen Motorwagen Vereins*, middle of August.

DIAGRAMS of Wastes and Frictions—Among attempted scientific investigations of automobile values on a basis of tests of materials, motors and complete vehicles, none have attracted so much attention or given rise to so many dissenting opinions as the work of Professor Dr. Riedler conducted largely at the Royal Technical Highschool of Berlin and accounted for in a book called *Wissenschaftliche Automobil-Wertung* (Scientific Automobile Valuation), which has also been translated into French. The accompanying diagrams, Figs. 1 and 2, are taken from a review of this book and may be assumed to represent the thermal wastes and different forms of friction which occur in a car at two widely varying speeds as accurately as these important factors may be determined.

In Fig. 1 the heat units contained in the fuel are taken as a basis, and it is shown what becomes of them in a car of 30 horsepower operated at a speed of 60 kilometers per hour. The enormous percentages which go to waste in the cooling-water, by way of the radiator, and in the exhaust gases point the way for the very ambitious inventors who may eventually succeed in producing an internal combustion motor which, like the steam engine, may be protected against the loss of heat instead of being purposely exposed to it. The transmission, on the other hand, is found to consume only about 3 per cent. of the fuel's power value, on direct drive, but this is equal to about 15 per cent. of the effective motor power, since the motor does not transform more than 20.8 per cent. of the fuel into work. In another instance Dr. Riedler found, however, that 27 per cent. was utilized, but that was the maximum. The value of 5.6 per cent. for friction in the motor, which means largely piston friction, equals a waste at this point amounting to about 28 per cent. of the effective motor power. If it were reduced to one-half, as might perhaps be accomplished by a different piston design or material, by improved lubrication and by offsetting of the crankshaft, the effective motor power should thus be increased 14 per cent. at ordinary fast traveling speeds. It is stated that in the case represented in Fig. 2 the loss due to friction in the motor, which is not shown in the diagram, amounted to 18.5 horsepower, and this figure is not proportionately larger than the figure taken from Fig. 1, while the vehicle in this case is a 75-horsepower Adler racing car going at 114 kilometers per hour and with a motor turning at 2200 revolutions per minute. From this it would seem either that friction in the motor does not increase with motor speed and power, or else that the racing motor in question was distinctly superior on the point of friction to the 30-horsepower motor in the other car.

In Fig. 2 the losses are not traced back to the fuel, but only to the effective motor power. If it is assumed that the latter also in this case is only one-fifth of the fuel power, the percentages of the mechanical losses and of the air resistance are proportionately five times higher than in the first case and should be divided by 5, if the losses in the two cases are to be compared. The form of the diagram shows that it represents top speed. There is no power to spare for grades unless the speed is first reduced. The 48 per cent. air resistance is the last factor in holding the car back. It might be expected to be nearly 4 times as great as the air resistance scheduled on Fig. 1, as the car speed is nearly double, but the powers at work are also very different, while the shape of the racing car is the more favorable of the two, and consequently the actual increase in the air resistance by passing from 60 to 114 kilometers per hour—in two different cars—is found by Dr. Riedler's test to amount to little more than 33 per cent. of the utilized horsepower. That the tires on the rear wheels consume about 18.5 per cent. of the available power in one case and 26.7 per cent. in the other case may seem astonishing, but these figures include the bearing friction and the air resistance to the rotation of the wheels.

Calculation of Centrifugal Pump Throw—An analysis of the unknown factors in the fire engine work that may be accomplished by the use of centrifugal pumps, involving also a criticism of existing constructions, is presented in a book by Prof. H. C. A. Ludewig published by M. Krayn, Berlin. The work is based on tests.—From *Die Turbine*, August 20.

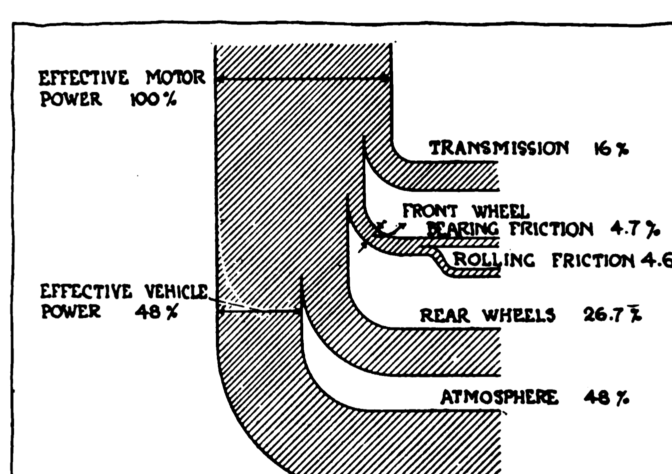

Fig. 2—Diagram of motor power utilization in 75-horsepower car at 114 kilometers per hour

Discuss Metric System

Several Engineers Prominent in the Automobile Industry Give Their Views on the Measurement Situation

One Considers English System Just as Good, While Others Think the Change Impossible

SINCE publishing the two articles on the Metric and English systems of measurements in The Automobile for August 22 and 29, several letters have come in from eminent automobile engineers discussing the two systems, the practicability of their adoption, and various phases of the situation. Four of the most interesting of these communications are given herewith.

V. A. Longaker, of the American Motors Company, believes our present system as good as the metric. He says: "Notwithstanding the fact that the United States Government legalized the metric system in 1866, it has not made very great strides. I realize that the system is very strongly recommended abroad, but going into the matter thoroughly and viewing it from every standpoint it would appear that while it has some advantages over the English system, at the same time it has its disadvantages as well in that it has not eliminated the multiples of three or reduced the necessity of prime numbers.

"It would appear that in this country the growing practice of subdividing the inch by thousandths gives us as good a basis of measurement as the metric system, and avoids the necessity of throwing out of service millions of dollars' worth of tools that are now in the hands of workmen that would be valueless if the metric system was to go into full recognition.

"Our shop superintendent is of the opinion that the crying need at the present time is the abolishment of many thread sheet metal and wire gauge standards now in general use. If these could be standardized it would be a step in the right direction. My personal opinion is that the thing for us to do is to work out the evils that are of crying need and let the metric standard force itself upon us gradually."

All Industries Must Agree

A. **Schimpff, of the engineering department of the Schacht Company,** believes a change would be difficult. A part of his statement is as follows: "The metric system must be acknowledged the simplest and easiest method of calculation, inasmuch as its denominations increase or decrease decimally by the factor of 10 with enumerations defining their respective worth, thereby eliminating fractions and various terms used in our present method. If adopted in America and put to general use, other methods being abolished, the metric system would in our opinion be a success, although it would cause years of labor and expense on account of new machinery, tools, etc., that would be required. For one industry alone to take up this system would add to it extra work, as it would still have to maintain its present method in order to interchange with like industries that have not taken up the metric system.

"As far as foreign export of automobiles is concerned it would seem the most reasonable to us to have required data and measurements converted into the metric system just as you would translate one language into another. For instance, when medicine concerns put directions in packages for export they give the directions in four or five different languages. In short, it would be as serious a change as when the Big Bull Moose recently tried to change our spelling. It would cause no little amount of trouble among those who are thoroughly familiar with our present system and knowing nothing of the metric, it certainly seems useless to make a change just now. Of course one could debate on this subject for days, but just at the present time we believe the disadvantages would outweigh the advantages."

David Ferguson, of the Pierce Arrow engineering staff, believes an attempt to change would mean the loss of thousands of dollars. He says: "We think that there are no two opinions as to the advantages of the metric system were it not for the fact that all existing factories have had the latter in use so long that they would look upon a change now almost with dread. We, ourselves, have been engaged in the automobile industry for 11 years and during that time have made a great many models, all of which are still running, and there is a vast amount of work required in making up new parts for these, so that if we were to adopt the metric system in the near future we would still have to work to the old system for repairs. This would cause endless confusion for everyone concerned.

Change Would Involve Too Much

We have thousands of dollars invested in tools, jigs, gauges, etc., on the old system so that the idea of a change appears appalling. We think that all manufacturers in a country should adopt that country's system of measurements, and we do not think it advisable for a few firms either individually or collectively to deviate from this until such time as the country at large adopts a new standard. There are too many systems at present, and the A. L. A. M. did a splendid work when it standardized bolts, nuts and screws.

"The owners of foreign cars in this country often have great difficulty in replacing a worn or a broken part because of its metric measurements, and it would place owners of a domestic machine in the same position, especially in out-of-the-way places, until such time as this system came into very extended use."

Howard Marmon, of the Nordyke & Marmon Company, does not believe it would be possible to make the change for the following reasons:

"I do not believe there is any argument possible concerning the intrinsic merits of the metric system, as compared with the system we have now in use, but, practically, do not believe that it would be possible to adopt the metric system in any factories now running on the inch and foot and pound methods because of the immense number of tools, jigs, drawings, etc., that would immediately become valueless, as in my opinion it would not be sufficient to simply transpose inch measurements to the metric equivalent.

(See Text on page 524)

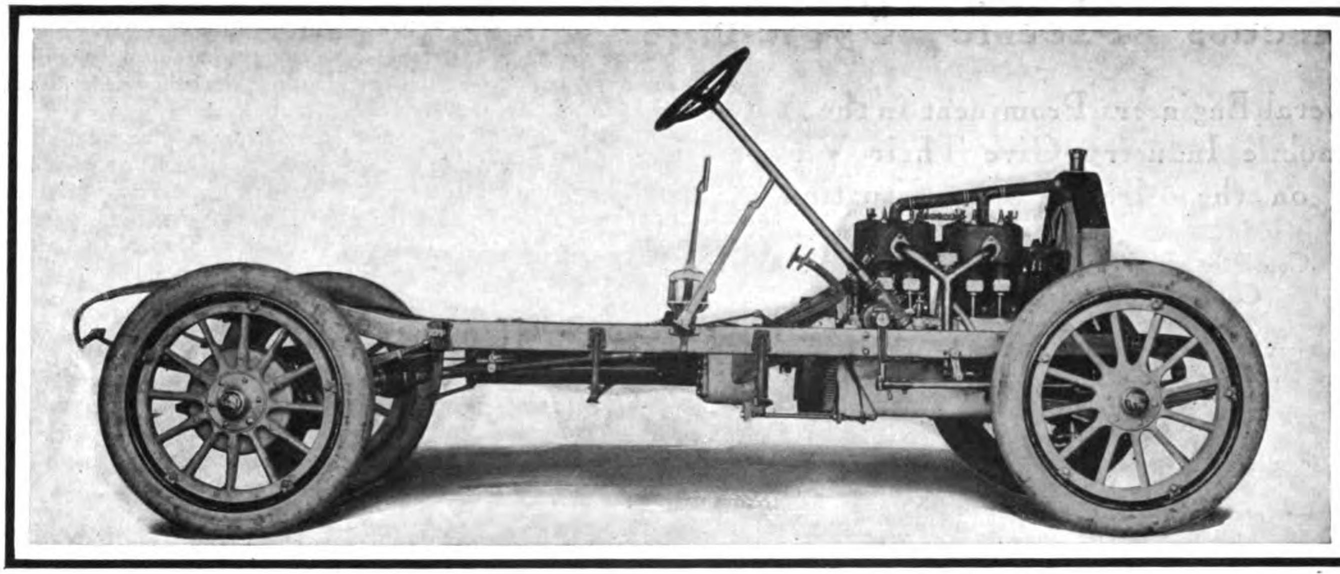

Fig. 1—Stripped chassis of the Haynes car. Note teeth on the flywheel for starting system

Haynes Has Starter

Model 22 for 1913 Has Few Changes, Modification of the Suspension Being Among the Most Important

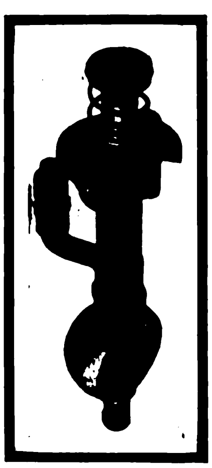

Fig. 2—Part sectional view of the oil pump

FOR the season of 1913 the Haynes Automobile Company, Kokomo, Ind., will put on the market its first car equipped with a self-starter. For a long time the engineering staff has been experimenting with starters and, although it has been known that eventually the Haynes cars would be so equipped, it remained for the model 22 to bring out the system in all its detail. That they have the courage of their convictions is shown by the fact that the car is not equipped with a starting crank. The new car is a continuation of the model 21 with many added refinements of a minor nature. The oiling system has been changed slightly, the oil pump now being located at the top and outside of the crankcase, instead of within it at the bottom. This gives a little better arrangement as regards accessibility. The rear spring suspension is also changed, the modification being the attachment of the spring hanger bracket to the end of the frame, Fig. 11. The three lower spring leaves in the upper set have been continued back of the clip for a distance of 3 1-2 inches to act as a stop by striking on a rubber bumper located at the center of the lower half of the spring. The spring suspension at the front end has also a minor change, the frame end being dropped 2 inches lower than in the model 21.

In the model 22, the motor is of the T-head type. The four cylinders are cast in pairs and are spaced to give a three-bearing crankshaft. The bore of the motor is 4 1-2 inches and the stroke 5 1-2 inches. The cylinders are gray iron castings with open spaces between the lower ends and are designed with a view of distributing the waterjacketing over every part exposed to the heat of the motor. A feature of the waterjackets which is peculiar to Haynes practice, and which is continued in model 22,

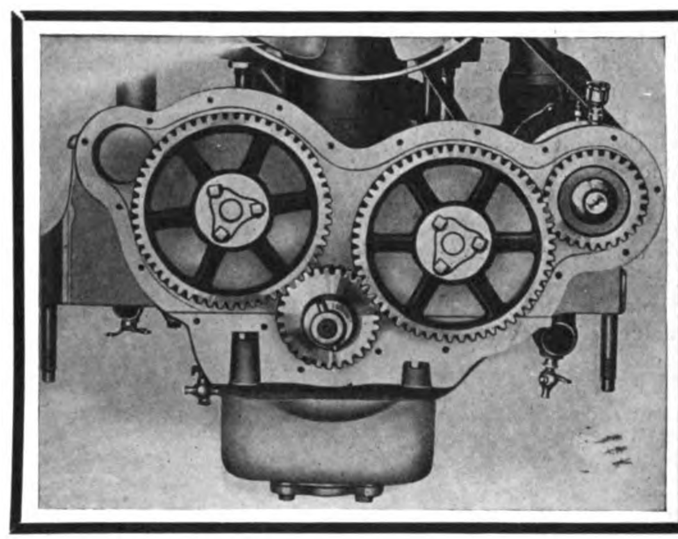

Fig. 3—The timing gear train of the T-head Haynes car for 1913

is that the sections over the cylinders are removable and integral with the cylinder branches of the water manifolds. This renders it possible to clean out the waterjacketing at any time by simply removing the stud bolts which pass through the waterjackets and into bosses on the top of the combustion spaces of the cylinders. This arrangement gives a water circulating space which is unusually free from obstructions, allowing a clear passage of water through the jackets. The jacketing around the valves is particularly noticeable on account of its great sectional area and the fact that the stems are cooled nearly to the head of the valve.

The valves are all of the same diameter, this dimension being 2 1-4 inches. The lift of all the valves is 5-16 inch. The valve action is housed within a cylindrical casing, as may be seen in Fig. 5. A removable cover plate permits of the adjustment of the valves, however, so that wear may be compensated for by virtually lengthening the stem of the valve. The latter adjustment is made by turning the nuts shown in the right view of the power plant, Fig. 5. A feature of the valve action, outside of the large capacity of the waterjackets mentioned above, is the length of the guides. These extend to the point where the curvature of the valve head commences and tend to materially reduce any warping action that the intense heat of combustion would exert on the exposed metal.

The pistons are of the same material as the cylinders, being gray iron castings. They have four 1-4-inch rings, all of which are located above the wristpin. The wristpin passes through the piston, being held in the usual manner by bosses cast in the latter. A difference in the method of supporting the wristpin may be noted, however. That is, instead of preventing the pin from oscillating with the connecting-rod by a stud bolt or a pin through one of the bosses, there is a stud with a nut and lock nut through each piston boss, giving a double assurance against the wristpin working loose and developing trouble. The wristpin is hollow and provides a wide bearing space with ample clearance between the bearing itself and the piston bushings. The vertical plane of the wristpin is offset 1-2 inch from the plane of the crankshaft to secure a maximum of turning effort at the beginning of combustion in the motor cylinder.

The connecting-rods are of I-beam section, the upper bearing being 2 1-4 inches in width and the lower or crankpin bearing 3 inches in length. The dimensions of the main bearings are as follows: Front, 4 1-2 inches; center, 3 inches; rear, 5 inches. The diameter of the crankshaft is 2 inches.

The crankcase is in two parts. The upper part forms the foundation for the cylinders and also carries the four supports by which the motor is held. In view of this, the aluminum casting has been thickened locally to take care of the strains it is called upon to bear. The ribs on this casting are also numerous as it has to sustain the weight and vibrations of the motor besides the strains falling upon the supports when traversing rough roads. The upper halves of the crankshaft bearings are carried in bridges in this casting. The lower half of the crankcase carries the bottom halves of the crankshaft bearings and also the oil reservoir and splash troughs, which will be touched upon later. This part of the crankcase is also of aluminum and is shown in Fig. 4.

The splash system of lubrication is used entirely as the oil is not forced to any bearing. The oil is carried in the crankcase reservoir and is lifted from there by the pump which is shown in Fig. 2. This pump carries the oil to the longitudinal pipe illustrated in Fig. 4, where the entire lubricating system is shown in detail. The pump is a plunger attached directly over the intake valve camshaft and is operated by an eccentric from this shaft. The spring which will be noted in the view of the pump is for the purpose of keeping the plunger seated against the eccentric so that the drive will be positive and there will be no noise. This spring, it will be observed, works on an inner wall of the pump casting and does not touch the plunger so that there is no danger of the latter becoming scratched through the action of the spring. The plunger casing is also protected by this arrangement and the danger of marring the walls of this housing is eliminated so that the pump cannot become leaky due to the scoring of the walls.

Returning to the longitudinal pipe into which the oil is forced after leaving the crankcase, it will be seen that the latter is pierced at four points in its length by circular holes through which the oil is free to pour. These holes are arranged so that there is one below each cylinder and through each hole flows the oil which supplies the particular cylinder beneath which it is located. The bottom part of the crankcase is divided into two parts by a horizontal tray, which is shown in sectional view in Fig. 4. This tray has a wavy contour which forms a set of troughs, one below each cylinder. In each trough there is a standpipe which allows the oil to flow back from the trough to the reservoir beneath the horizontal tray. Each standpipe is located directly beneath the throw of a connecting-rod.

The oil from the longitudinal pipe will fill the trough below each cylinder up to the level of the top of the overflow standpipe. When this point is reached the oil will drop back into the reservoir below and thus automatically keep the oil level constant. There are two scoops on each connecting-rod so arranged that one scoop will pass to either side of the overflow standpipe. As the connecting-rods sweep around, these tubular scoops pass through the oil in the troughs and churn the oil into a spray which is thrown about the entire crankcase and which lubricates the cylinders as well as all the bearings contained in the crankcase. In order that the lubrication of the crankshaft bearings be as positive as they can possibly be made, oil ducts have been cut into the bearing bushings to permit the oil to flow by gravity directly into the bearings. These oil ducts, or passages, are clearly shown in Fig. 4.

The oil returning to the reservoir is cleansed to remove any possible impurities before again being passed through the pump. This is effected by a screen placed around the suction end of the pump. A refinement in the pump itself is the placing of a reservoir in the upper part of the pump which catches the oil and holds it under pressure, thereby giving a constant flow. The oil reservoir is equipped with a float gauge which tells the

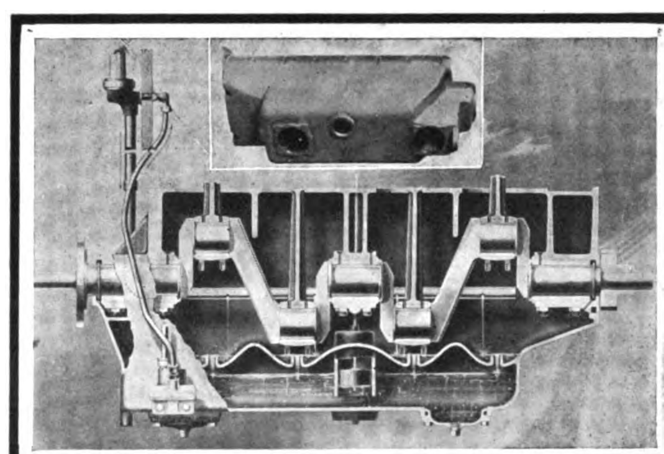

Fig. 4—Two views of the crankcase, showing the oiling system in operation

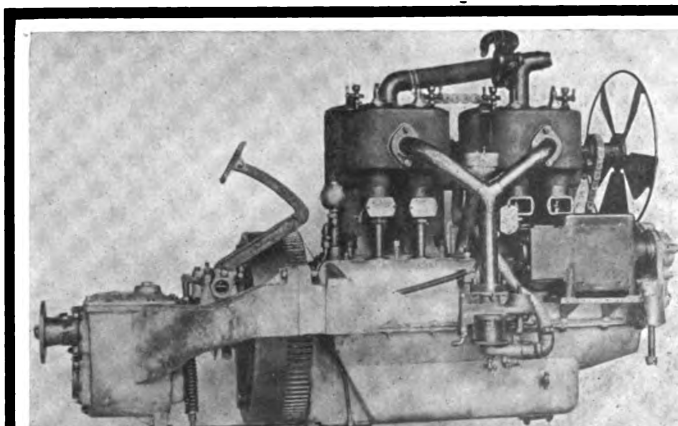

Fig. 5—Right side of motor with valve cover removed.

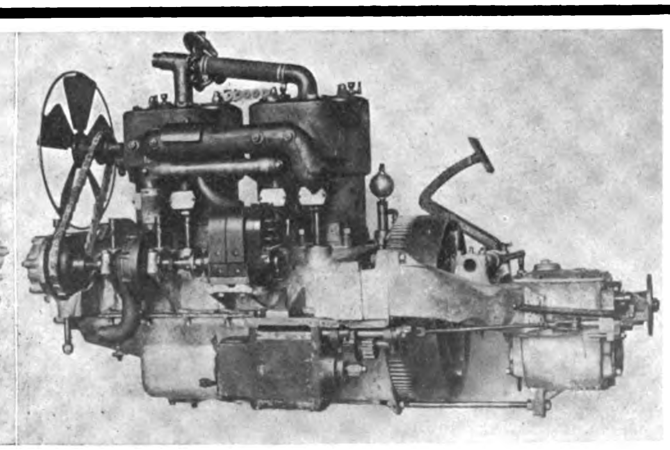

Fig. 6—Left side of motor, showing mounting of starter

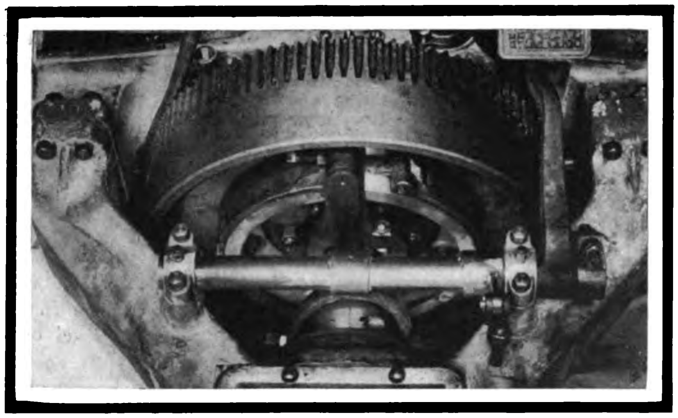

Fig. 7—View of the flywheel operated by the starting motor gears

operator at all times the amount of oil in the crankcase. The gauge consists in a cork float located in the crankcase and held in a cylindrical chamber with a rod extending through the chamber and up through the crankcase to a position between the two cylinder blocks. The gauge may be seen in the views of the oiling system and also in Fig. 5, which shows the right side of the motor.

To prevent the leakage of the oil past the crankshaft at the ends of the crankcase an oil ring is fixed upon the crankshaft turning with it. These rings are located very near to the points on the shaft where it leaves the crankcase and they turn in grooves cut into the crankcase. When the oil works its way out to these rings it is thrown off by centrifugal force and flows back through a small duct to the crankcase. Besides the regular drain plugs in the crankcase through which all the oil may be removed when desired, there are two handholes of large diameter located one at each end of the crankcase. A large plug beneath the float permits the gauge to be taken down when necessary.

The carbureter used on the Haynes model 22 is the 1 3-8-inch Stromberg, model B. This is of the concentric float type without waterjackets. It has separate adjustments for low and high speed and is fitted with a hot-air horn for taking the heated air

Fig. 8—Front view of the Haynes model 22 with full equipment

from around the exhaust pipe and also has a means of closing the air valves to secure a rich mixture for starting. The gasoline feed to the carbureter is by gravity, the tank being located under the front seat with a direct flow to the carbureter.

The ignition system employs the Eisemann dual magneto with storage battery for starting. Only one set of spark-plugs is used. The balance of the electric equipment, which includes the lighting and starting system, is of the highest interest as it marks another step in the self-starter field, where a conservative concern is first going over to the self-starter after having refused to furnish one as regular equipment on its previous cars. The system is entirely a Haynes product, being designed at the Kokomo plant by the Haynes engineers. Two views of it are shown in the accompanying illustrations, Figs. 7 and 9. It consists of three parts, a generator, a motor and a storage battery. The operation of the starter is similar to the usual method by which the electric lighting and starting systems are operated. The electric starting motor is geared to the flywheel and turns this over by power derived from the storage battery. When the motor starts under its own power the starting motor is automatically disengaged. When the speed of the car ap-

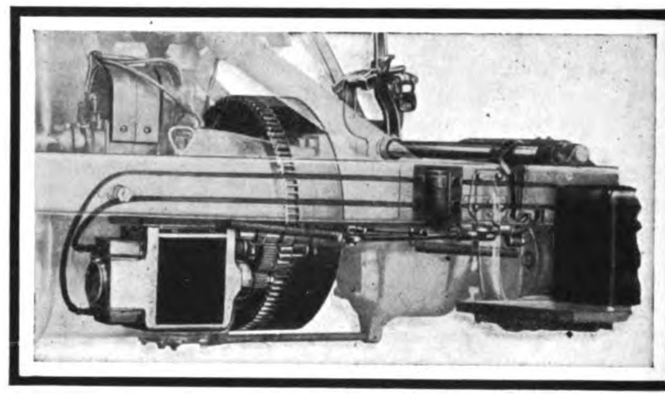

Fig. 9—Arrangement and mounting of the Haynes starting system

proaches 10 miles an hour the 12-volt generator is cut in and the storage battery commences to be recharged. So that the storage battery cannot discharge back through the generator when the car is standing idle, the automatic cut-out breaks the circuit between the generator and the storage battery. This cut-out is located in a compact box carried on the dashboard. The source of the electric lighting current is the same storage battery as is used for starting. The battery has a capacity of 100 ampere-hours. The starting system is operated from the seat of the car by first placing the switch on the battery side and then placing the right foot on the brake pedal. With the heel of the left foot a lever on the left side of the change gear quadrant is depressed and the change gear lever is then brought into the special starting slot and pushed firmly and quickly down as far as it will go. When the motor starts the handle is released and springs back into neutral position again. There is a mixture control located on the dash by means of which the required rich mixture for starting in cold weather can be furnished. The gearshift quadrant is fitted with a lock by means of which the lever is held in neutral so that it is impossible to operate the car without possessing the key.

As in the past, the Haynes clutch is of the contracting band type. This has been one of the features of Haynes construction for 15 years. It consists of a contracting steel band encircling a hardened steel drum. The latter feature is new this year as up to the present time the drum has been of bronze. The drum is bolted to the flywheel of the motor, while the steel band is keyed to the gearset shaft and drives the gears. When the clutch is engaged the band closes tightly about the drum, but while running free there is no drag at any point as the band is expanded about its entire circumference. The band is forced to contract by a wedge-shaped shipperhead which is tapered on one side only. This throws a lever one way to engage and another way to disengage the clutch.

On the 1913 model, the three-speed gearset is supported by aluminum arms on the bottom of the motor crankcase. The gearset quadrant is arranged, however, for an extra notch to take care of the starting system. The shafts of the gearset are mounted on roller bearings throughout. From the gearset, the power is transmitted through a universal joint protected by a metal cover to the propeller shaft. Another universal joint, also protected by a metal cover, is located at the rear end of the propeller shaft and transmits the drive directly to the floating Timken rear axle. The material of the propeller shaft is nickel steel and the ends are square to fit the metal-covered universal joints.

The rear construction is clearly shown in Fig. 11. In this view the axle driveshaft is removed. This can be done simply by removing the hub caps and pulling out the axle. The differential housing can be removed by taking out the bolts in the coverplate. This leaves the entire differential exposed to view and permits of adjustment to compensate for wear. The Timken axle is fully adjustable in this direction as both the drive

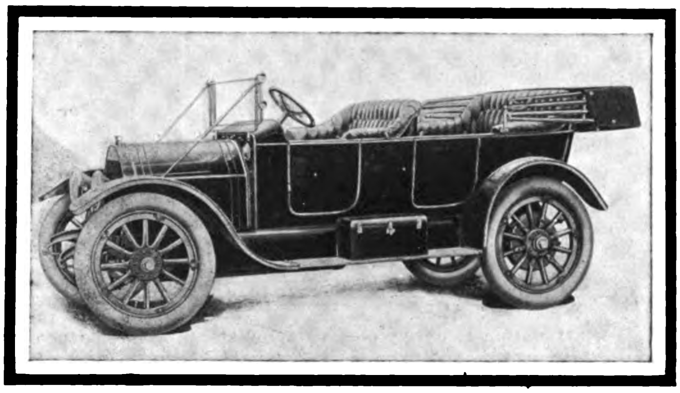

Fig. 10—Side view of the model 22, note long cowl and straight body

pinion and differential wheels can be moved so as to give perfect engagement after either has worn.

The brakes are large and consist of two entirely independent sets. These are shown in Fig. 11. The diameter of the brake drum is 14 inches and the width is 2 1-2 inches. The running set of brakes is of the external contracting type, while the emergency brake set is internal expanding. Extra heavy spiral springs are used in both sets, and which may be seen in the illustration, prevent the brakes from rattling and also eliminate any tendency to drag. The brakes are lined with Raybestos and both sets engage on the same drum, which is located between the two sets. Adjustments on the contracting brake are all external, while those on the internal brake may be made by removing the rear wheel which carries the brake drum attached to it. Other adjustments for wear on the lining or for eliminating lost motion at the levers or through the linkage can be made by means of adjustment points provided on the brake rods. A transverse equalizing bar prevents the brakes from exerting more pressure on one drum than on the other and in this way tends to prevent unequal tire wear to a great extent.

The chassis frame is of pressed steel channel section, having a depth of 4 inches and a flange width of 1 1-2 inches. The frame is toed in at the front a distance of 3 inches to allow of a decrease in the turning radius. The front axle is shown in Fig. 8, which illustrates the entire front of the car. It is of I-beam section and of drop construction. The depth of the axle is 2 inches and it is drop-forged in a single piece, the spring pads being integral. The wheel spindles are 1 5-16 inches in diameter. All bearings are of the Timken roller type.

Wheels are the same both front and rear. They are of the artillery wood type and have twelve spokes. The tires are 36 by 4 1-2 inches front and rear. The springs are semi-elliptic

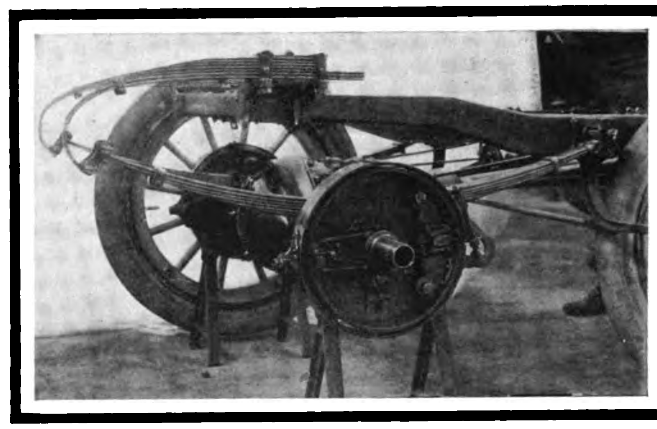

Fig. 11—View of rear system, showing suspension and brakes

in the front and three-quarter elliptic rear. The front springs are 40 inches long and 2 inches in width, while the rear springs are 48 inches long and 2 inches wide. The front springs have seven leaves, while the rear springs have six. The spring shackle bolts are all fitted with grease cups.

A worm and gear type of steering gear is used. There are no modifications in the mechanism since the improved pattern brought out in model 21. The 18-inch steering wheel also introduced in this model is continued.

The body is made throughout of sheet steel. It has foredoors. The front, side and rear views of the body are shown in Figs. 9, 11 and 13, respectively. The features which will be especially noted are the straight-line construction, the long cowl, method of carrying spare tires and the luxurious upholstery. The leather used throughout is black hand buffed. The spring backs to both seats are filled with curled hair. The body is black and is given eighteen coats of paint, all of which are hand rubbed. The metal work is black enamel and nickel.

This year's equipment includes a silk mohair top, top boot, E. & J. electric headlights, electric starter, electric horn, electric cowl light, glass front, three oil lamps, Warner autometer, bumper rail, horn, coat and foot rails, tire tools, full tool equipment and one extra Baker demountable rim.

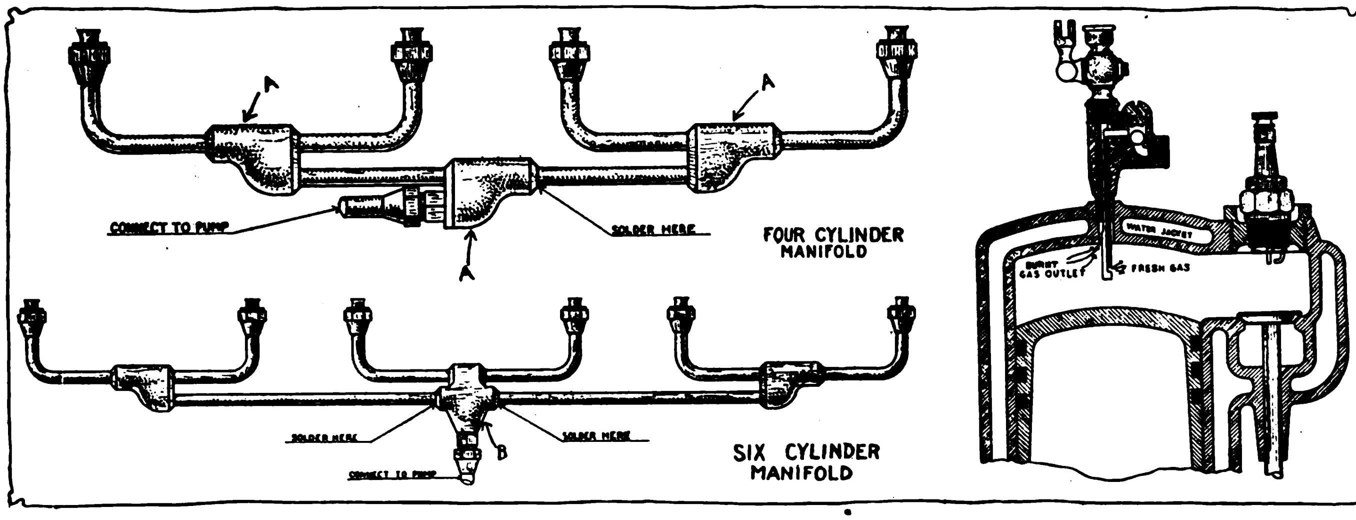

Fig. 1—Starting manifolds used in installing the Shur-Go gasoline apparatus; section through check valve

Shur-Go Starter Employs Gasoline

Consists of Carbureter, Pump and Check Valve—Carbureted Air Injected Into Cylinder Starts Motor

Pump Can Be Used in Connection with Compression Release to Scavenge Cylinders

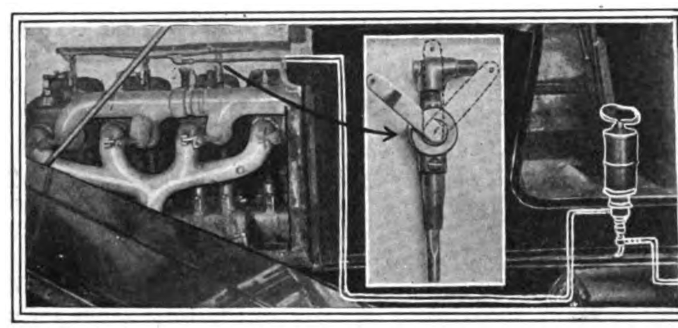

Fig. 2—Installation of device on four-cylinder car with enlargement of cylinder attachment

A STARTER which relies upon carbureted air, the natural fuel of the gasoline motor, for its operation is sure to be of uncommon interest. Such a starter is the Shur-Go, manufactured by the Shur-Go Starter Company of New York City. The installation and the component parts of this starter are shown in the accompanying illustrations. As may be seen, the apparatus consists of a small hand pump located near the driver's seat, a check valve on each cylinder, and the necessary tubing connecting these parts.

The hand pump is connected with the regular gasoline tank, which is located on the suction side of the pump. When the handle of the pump is pulled up a mixture of gasoline and air is drawn up into the barrel of the pump. A downward stroke on the pump forces this mixture into the cylinders, providing the starting charge.

The switch is then turned to the battery position and the charge in the proper cylinder is fired, starting the motor.

Pump Also Scavenges Motor

The pump may also be used as a scavenger before introducing the charge into the cylinder. This is done by opening the compression relief cocks by means of a connecting rod operated from the dash, which permits all the compression cups to be opened at once. The pump is then used to force out the dead gases through the compression relief cocks, which leaves a fresh charge in the cylinder for starting purposes. When there is a quantity of dead gas in the cylinder it will be necessary to force it out in the manner just described before starting. This operation can be done in about 30 seconds by simply opening the compression release, making four or five strokes on the pump, closing the release and then pumping another charge into the cylinders and turning on the switch.

The pipe which leads from the pump to the cylinders runs into a small manifold of special design, depending upon whether the motor is a four or six-cylinder. These two types of manifold are shown in Fig. 1. The connections at A and B must be carefully soldered at the joints so that there is absolutely no leak or the device cannot possibly work. This is a matter entirely of care in the installation, but special emphasis has been laid upon the point by the manufacturers as the device will not operate properly unless a gastight connection is made between all the parts of the manifold.

The combination check valve and compression cock used in connection with the starter is shown in section in Fig. 1 and in an exterior view in Fig. 2. The former shows the different passages for the exit of the burnt gases and the intake of the fresh gas. The ball check which prevents the burnt charge from blowing back along the pipe line to the starter pump is also seen in the sectional view.

The pump is in reality a combination pump and carbureter. The carbureter is located in the base of the pump below the stroke of the plunger. When the plunger of the hand pump is pulled up gasoline is sucked from the tank around a needle valve which is capable of adjustment in the usual manner by turning a handle located beneath the carbureter part of the pump. At the same time, air is drawn in through a separate air valve across the spray of the needle valve and an explosive mixture formed. The carburation is thus effected before the mixture ever enters the pump which sends it to the cylinders. Owing to the agitation of the gas in passing through the pump barrel and along the pipe line the mixture is perfect by the time it is forced into the cylinders.

The air valve in the carbureter may be regulated as well as the needle valve so that the mixture which reaches the cylinders is under control of the operator. The correct mixture once ascertained, however, it will not be necessary to make any changes and lock nuts are provided on both adjustments to hold them permanently in place after they are once set. In installing the device it will be unnecessary to change the factory setting.

Great Britain Has Latest One-Man Top

Rotax Is Opened and Closed by the Driver While He Remains in The Automobile

Simplicity and Practical Design Have Been Combined in Its Constructional Features

AMONG the various devices which have recently been evolved in England with the idea of increasing the comfort of the automobile driver, the Rotax top of the Rotax Motor Accessories Company, 43 Great Eastern street, London, E. C., deserves special mention, as it may be opened and closed by the efforts of a single person without leaving the car.

This object is realized by the peculiar construction of the skeleton of the top, consisting of two series of arms which are attached to the body of the car at four points. In addition to these points of suspension, the front edge of the top is held to the dash by two straps laid through eyes provided thereon.

Operation of the Rotax Top

When closed, the top presents the neat appearance shown in Fig. 1, where all the arms are shown folding upon one another, the material of the top arranging itself between the arms, due to the peculiar method of fastening it to the bows. When the top is to be put up in position, the driver first loosens the straps holding the top down to the body and then takes hold of one of the upper arms, drawing it forward. This results in the position of the top seen in Fig. 2. The end of the longest of the forearms, on each side of the top, is formed with a lateral pin or staple, projecting from the arm. This pin fits into a hook formed by the end of a short, upwardly bent metal arm which is screwed on to the automobile body, directly opposite the fore door. One of these hooks is provided on either side of the car and when the forearms are attached to these hooks, the appearance presented by the top is that seen in Fig. 3. The top is then fully opened by drawing the front forward, which is done when the two tension straps depending from the front top edge are pulled by the driver. As soon as the top is brought into the fully extended position the tension straps are secured to the eyes mentioned above, which are attached to the vertical front board of the cowled dash and in Fig. 4 are concealed by the side lamps.

The downward rear portion of the top is attached to the body by snap locks which pass through metal eyelets attached to the top material. As to the method of attaching the top fabric to the structure or skeleton, this is done by nails along four points of every bow. The bows themselves are of wood, the ends of which are reinforced by steel connections and hinges. All along the edge of the top extends a reinforcing strip of doubly laid fabric and through this are driven the tacks or nails employed to secure the latter to the bows.

The British maker claims that the Rotax top may be opened or closed within a few seconds. While this may be true and naturally present a great advantage over the top which cannot be in or out of position in less than several minutes, there are a few objections to this type. The fact that it is possible to open or close the top from the seat makes it necessary to do without a top cover, which naturally does not improve the appearance of the car. Another doubtful point is whether the average driver will be capable of manipulating the top, on a seven-passenger touring car, without spoiling the upholstery of the front seats. These two points call for improvements of the top, whereby the driver may operate it without getting on the seat, for one thing, while the whole subject of the seat-operated top would receive a considerable advance if the appearance could be brought to be on a par with that of the now conventional type of top which presents a neat and distinguished appearance if it is given suitable attention.

It will depend on whether these little refinements in top construction will be added to the sweeping changes by the makers that the seat-operated top will be more generally introduced in the near future. It stands to reason that every well-to-do automobilist will be ready to pay a slightly higher price to increase the ease of his driver to any appreciable extent, as this course would in turn result in the latter's taking better care of the automobile than if this work is a difficult one.

Record of Shop Materials

Forms Used by Metropolitan Service Departments for Drawing Parts and Materials From Stock Rooms

Methods of Recording Spare Parts Which Are Used in The Repair of Automobiles

THERE is a widely prevalent idea that the automobile repair business is bound to be a loss to anyone engaging in it. This idea is perhaps due to the fact that the repair department, or service department, as it is now most generally called, does not turn out any new products, but merely proposes to put used and injured mechanisms in workable condition again. This sort of business is naturally not as profitable as a factory, where large amounts of materials are handled in the same standardized manner day by day, so that the workmen occupied with the manufacturing operations may do their work rapidly enough for the production of an appreciable profit. In the repair department, however, every job calls for a treatment all its own and individual attention to its requirements, which naturally consumes very much time and a proportionate slice of the profit.

Nevertheless, a considerable degree of economy may be maintained, even in the repair shop, and, as its operations may hardly be standardized, the end cannot be reached except by perfectly utilizing all the time of the workmen and all the material used in the shop. To be in a position of enforcing a course of economy, the service department superintendent must be in the possession of most exact records of the labor and material used in his shop and of their distribution. A number of forms suitable for this work of recording repair shop costs are described and illustrated herewith.

Requisition Is Principal Form

Having taken up keeping records of the time used on repair jobs in the August 29 issue of THE AUTOMOBILE, we will now proceed to review a number of material-recording blanks used by the repair departments conducted in New York by a number of prominent and up-to-date automobile companies.

The present method of recording used material ordinarily embraces the use of a single form, the requisition or stock room order. Few concerns provide for the situation which arises when the stock of the repair department has to be replenished, either on the occasion of an individual repair order or when the clerk notices that his stock of any single article runs low. These concerns use a purchase requisition which is filled in by the clerk and sent to the company's main office, where a purchase order is made out and sent to the dealer, who furnishes the required part to the company.

The requisitions are filled out by the workmen requiring repair parts, are O. K.'d by the foreman and turned over to the stock room clerk, who exchanges them for the part or parts named on them. He also keeps a filing system in which the quantity of every type of part kept in stock is recorded and corrected daily, the parts being piled in bins of consecutive numbers and a card being used for the contents of each bin.

The designs of requisitions used by various companies differ, and, while one would expect that every concern would have a system fitting its needs, this is by no means true. The requisitions used by some large firms are very crude, while, on the other hand, some minor companies, so-called, often use excellent designs, which are adapted for a variety of conditions. It is very natural that the larger the business of a company, the more elaborate should be the design of its requisition. Many large companies, however, consider the repair department an unimportant branch of their business, especially if they have not conducted it for a long time, and this explains the paradoxical condition just outlined.

Simplest Types of Requisitions

Simplicity is one of the features of Form 4, used by the White Company, of New York, whose service department is located at 631 West Fifty-seventh street. It is a thin, white slip, 5½ by 3¾ inches and coming in a book, from which it is detached by tearing a perforation. All slips are numbered consecutively and filled out by the workman who requires material. The data entered on the requisition include the card number, or rather job number, of the repair work which occupies the workman, the date on which the slip is filled out, the nature and quantity of the material required. After filling out the requisition, the workman takes it to the foreman, who O. K.'s it, and then to the stock room clerk, who delivers to him the material which he needs, and files the requisition until the next morning, when he checks it off against the stock file, which he corrects at the same time. After this has been done, the requisitions are sent to the office of the company so that the material used on the various jobs may be charged to the owners of the cars being repaired.

Fully as simple is the requisition design of the Haynes Company's repair shop, 250 West Fifty-fourth street, New York City. This type of requisition, Form 5, is of the same size as

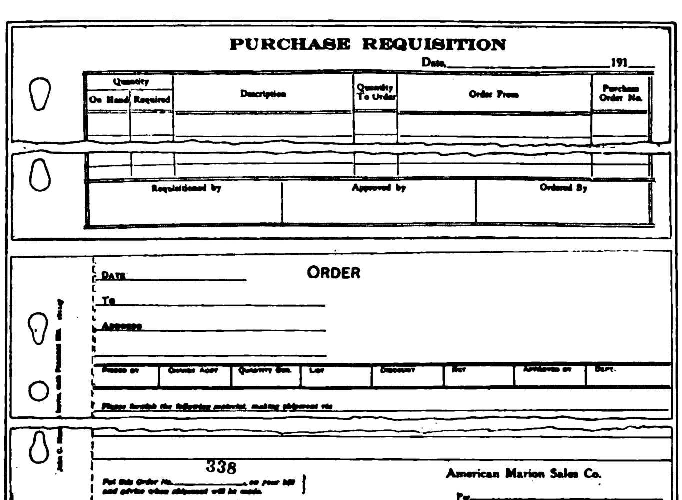

Fig. 1—Purchase requisition of American-Marion Sales Company
Fig. 2—American-Marion Sales Company's purchasing order

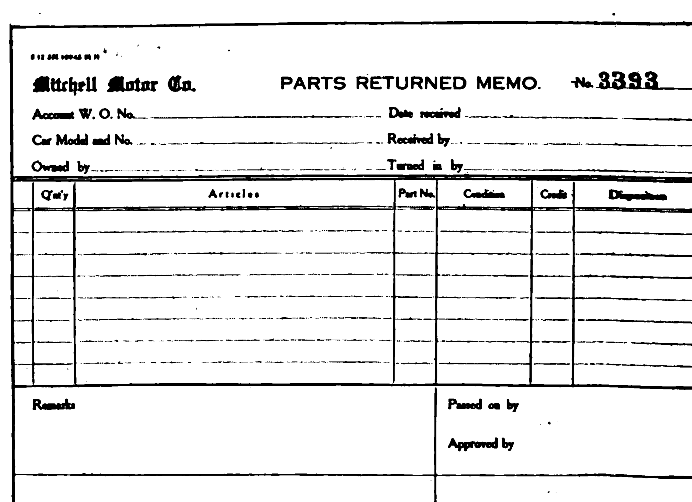

Fig. 3—Mitchell Motor Company's form used when damaged parts replaced under the guarantee are returned to the stock room

Foreman

Fig. 5—Another simple type of requisition, used for drawing parts from the stock of the Haynes Company

Form 4, being white with black printing, and provides a space for the material to be drawn from stock, the job number to which the material should be charged, and a space for the signature of the foreman. The date is put down at the top of the slip. Like Form 4, Form 5 comes in pads, and after its use is completed it goes to the office of the company's bookkeeper, who makes a notation of the material used on the account of the customer. Then the requisition is filed away with other requisitions in the order of their dates.

The degree of differentiation in form design, which progresses with the activity of a company's service department, is shown in the next type of blank, Form 10. This design is a requisition used by the Peerless Motor Car Company of New York, 1758 Broadway, whose service branch comprises four departments: Paint, trimming, body and repair, or machine shop, department, which use three distinct forms. The design of all the forms, however, is identical, and the difference lies only in the colors used by the various shops. Not only does this feature provide variety and a means of easily distinguishing the requisitions used by various departments, but, to make sure that no confusion occurs among the different requisitions of the repair departments, every requisition is made with a carbon copy. These copies are also made on slips of various colors, every set of original and copy requisitions coming in a book, from which they are detachable by a perforation. The forms in each book bear consecutive numbers. The colors used for the requisitions of the various departments are as follows: Paint department, original, light blue; copy, ochre; trimming department, copy and original, pink; machine shop, original, lemon colored; duplicate, light blue. The body department uses the same type of requisition as the trimming department, being under the management of the same department head.

All of these requisitions are 7½ by 5¼ inches and printed in black. Spaces are provided for the entries of the repair order number, the date on which the requisition is filled out, the time when the material is to be delivered to the department requiring it; also the description of the part or material to be drawn from stock, and the quantity.

Duplicate Forms Are Often Used

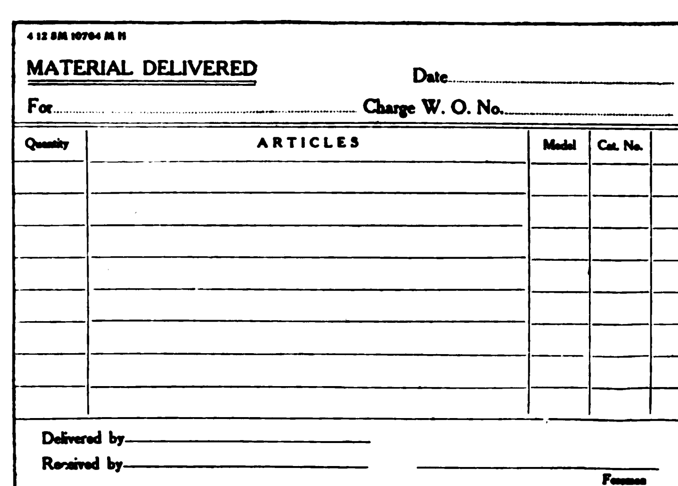
To indicate the cost and the price of parts drawn from stock, two columns marked C.P. and S.P., respectively, are provided on the requisitions. These columns, as well as the one marked Part Number, and in which is entered the number of the bin wherein the part is kept, are filled in by the stock room clerk.

In filling out these requisitions, the workman also enters the model of car for which the part is required, after which he signs his name at the bottom of the form. The latter is then O. K.'d by the foreman and sent to the stock room to be filled. The clerk filling the requisition also signs the order, and after having corrected his stock records from the requisitions which he has filled during the previous day, all these requisitions are sent to the bookkeeper's office. The process of filling the requisitions and delivering the material to the department requiring it is the same in all cases, whether the material is demanded by the paint, trimming, body or machine shop.

A very similar type of blank, Form 8, is used by the New York service department of the Oakland Motor Company. This form comes in books 8⅝ by 5½ inches and is filled out in duplicate, the original going to the stock room, while the carbon copy remains in the book. The original is printed on white paper, while the carbon copy is printed on a light sort of yellow paper. Both forms are numbered consecutively. This form differs in no essential way from Form 10, described above, and contains spaces for the quantity, bin number and nature of the material required by the shop, and two blank columns in which the cost of the material and the price at which it is to be charged are entered. Job number, date and signature of the foreman are also provided for by spaces, while the workman filling out the requisition, and the stock room clerk supplying the material, sign the form at any suitable place.

Parties Concerned Sign Blanks

A smaller type of form, including most of points covered by Forms 8 and 10, is Form 6, used by the Mitchell Motor Company, of New York, 419 West Fifty-fifth street. The blank, Form 6, used by this company, is 6 by 4¼ inches and comes in pads, each white original blank being followed by



MATERIAL DELIVERED Date

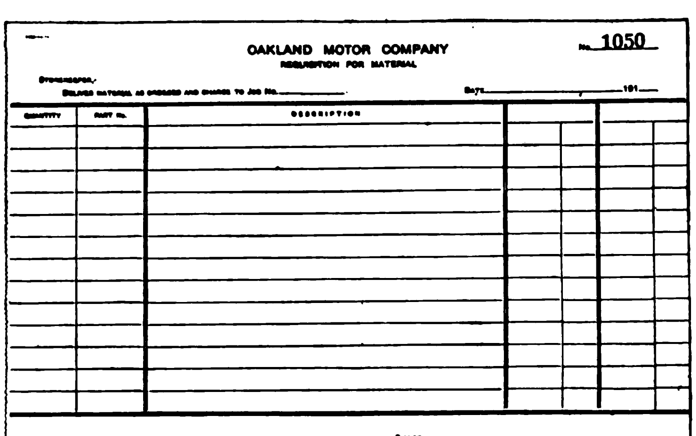
Fig. 7—Blank for recording all the materials use in connection with an individual repair job, used in the service department of the Mitchell Motor Company, New York City

a yellow duplicate blank. These forms are not numbered, and as they are filled out the original is sent to the stock room to be filled, while the carbon copy immediately goes to the office of the service department superintendent. On top of this form the date, the name of the workman ordering the material, and the number of the repair job on which it is to be used are entered. The bulk of the form is devoted to the description of the part or parts to be delivered to the workman, the model of the car for which they are required, the catalog number of the part to be drawn from stock and the quantity of the material. Before this requisition is sent to the stock room it is signed by the foreman, and after being filled by the stock room clerk and the person receiving the material, whether this is the workman himself or a boy. The latter course, that is, the use of a boy for calling on the stock room to obtain the repairs for the workmen, is an economic one applied by this company as well as several other progressives.

Cost and Charge Price Are Noted

The Mitchell Company uses another blank, Form 7. designed to be a record of all the materials used in connection with the repair work done on an individual repair job. Form 7 is 8½ by 11 inches and ruled with two groups of five columns each, which are filled with the name and quantity of the material required, a notation of whether it is to be charged to the car owner or to be carried by the company, a column for the cost and one for the sales price. This form is made out in duplicate, and while the original remains in the office of the superintendent, who fills out this blank, a carbon duplicate thereof is sent to the foreman of the shop. As the workmen doing the repair on the car use material which they receive from the stock room, they save the carbon copies of these requisitions, and, when the repair is finished, deliver them to the foreman. The latter enters all the material used in connection with the repair on the reverse side of the work order, that is, on Form 7, which is then returned to the superintendent with the complete repair job.

Another type of requisition blank, Form 9, is used by the American Marion Sales Company, 1896 Broadway, New York City. This form is made out with a duplicate on plain yellow paper which, however, is stamped with the same number as the original, Form 9. This is 5 by 8 inches and printed on white paper. It comes in book form and the blanks are numbered consecutively. Spaces provided on this blank afford an opportunity of recording the nature and quantity of the material used, the price per unit of same, the total value of the material, the date on which requisition is filled out, the name of the workman making it out and the number of the job for which the material is required. In the lower left hand corner of the blank the condition on which the part is used, that is, charge or gratis, is entered, and another space is reserved for the signature of the person receiving the goods specified on the requisition. The signature of the stock room clerk delivering the material is entered in the lower right hand corner of the blank, and after the material is disbursed and the stock records have been rectified by the clerk, he also signs the space marked Entered, near the upper right hand corner of the blank. There is also a narrow column near the right edge of the blank in which the price named on this form is checked by the superintendent or his assistant, if it is correct.



OAKLAND MOTOR COMPANY
No. 1050

Fig. 8—Oakland Motor Company's requisition, a specimen of up-to-date design in material recording blanks

A form used by the Peerless company for the recording of all the material used in connection with a certain repair job is the blank shown as Form 11. This form is made out in duplicate and one copy is sent to the repair shop with the car, while a duplicate remains in the office of the superintendent, who makes out repair order with which the car is brought in.

Forms Used with Parts Returned

This form is 10¾ by 17 inches, printed on yellow paper with red lines and black lettering. As reference to the illustration shows, its design is very elaborate and comprises columns for the recording of the following materials, as they are being used from day to day on the repair work: Regular parts of the automobile, gasoline and oil, waste and other materials which are used on every job, and, finally, whatever special material has to be bought from outside. The date on which these materials are used, the job ticket, giving the repair number of the car, and the total cost of the material and the price which is charged for the same, are all entered in one line. The left half of Form 11 is entirely devoted to this sort of records and affords space for entries on 35 working days. The right half of the form is designed with classification of the various materials used on the car, that is, for the repairs of which parts were drawn from stock. Below this portion, a space is reserved for a record of the time expended in the various departments during the repair of the car, the cost of this labor and the charges made for it. A similar short digest of all the materials used is given below the total labor record and these data serve as a basis for the bill which is sent to the customer.

Some companies make special provision for the case of repair parts or other material being out of stock by using a purchase requisition such as Form 1. This requisition is filled out by the stock room clerk when he finds that his supply of a certain part required by the shop has run low. One of the best forms in use for this condition is Form 1. It is 5 by 8 inches, of thin white paper with black print, and is filled out with a duplicate or carbon copy on plain yellow paper. Since the use of a purchase requisition is rather unfrequent, these requisitions are not numbered, but come in pad form and are punched for insertion in a binder, after being filled. On the top of the purchase requisition appears the date on which it is made out and below the same specifications of the material to be purchased for the purpose of replenishing the stock of the service department. These specifications include a description of the part or material to be bought, a statement of the quantity on hand and that required by the shop; of the quantity to be purchased for the purpose of replenishing the stock of the service or parts may be obtained. The requisition, signed in the lower left hand corner by the stock room clerk, is looked over and approved by the department superintendent and is then handed to a member of the company's office, who makes out a purchase order and signs the purchase requisition, at the same time entering the number of the purchase order on the requisition.

After the material specified on this form has been received by the company, the stock room clerk checks it off on his carbon copy, which is then sent to the company's office and filed away with the original purchase requisition to indicate the matter has been settled.

Purchase Requisitions and Orders

The order used by the American-Marion Sales Company in purchasing parts, etc., is shown in Form 2. This form is exactly the same size as the purchase requisition and is punched in the same way, permitting of filing both types of form in one binder. The original of the order is white and the duplicate blank is light red, and both are printed in dark blue. The order provides space for the date on which it is filled out, the name and address of the company which supplies the material or parts to be bought, and the terms of sale.

Ten lines are devoted to the description of the material to be furnished by the dealer to the company's service department. Every set of original and duplicate orders bears consecutive

Fig. 9—American-Marion Sales Company's requisition, designed to give information of every essential detail

numbers on the bottom of the blank. The name of the clerk who signs the order is written in the lower right hand corner of the blank.

There is another case in which material is added to the stock of the company, although only temporarily. This refers to the return of inferior and damaged parts replaced by the service department under the guarantee, and which are afterwards returned to the factory for credit. Such temporary additions to the stock are accompanied by a Parts Returned Memorandum, Form 3. This blank is used by the service department of the Mitchell Company, and is made out in duplicate, one copy remaining in the office of the superintendent, while the other goes with the parts to the stock room, being returned to the superintendent after the damaged parts have been shipped to the factory. The nature and quantity of the material, date of receipt and name of car owner who returned the part, as well as other details are entered on this blank.

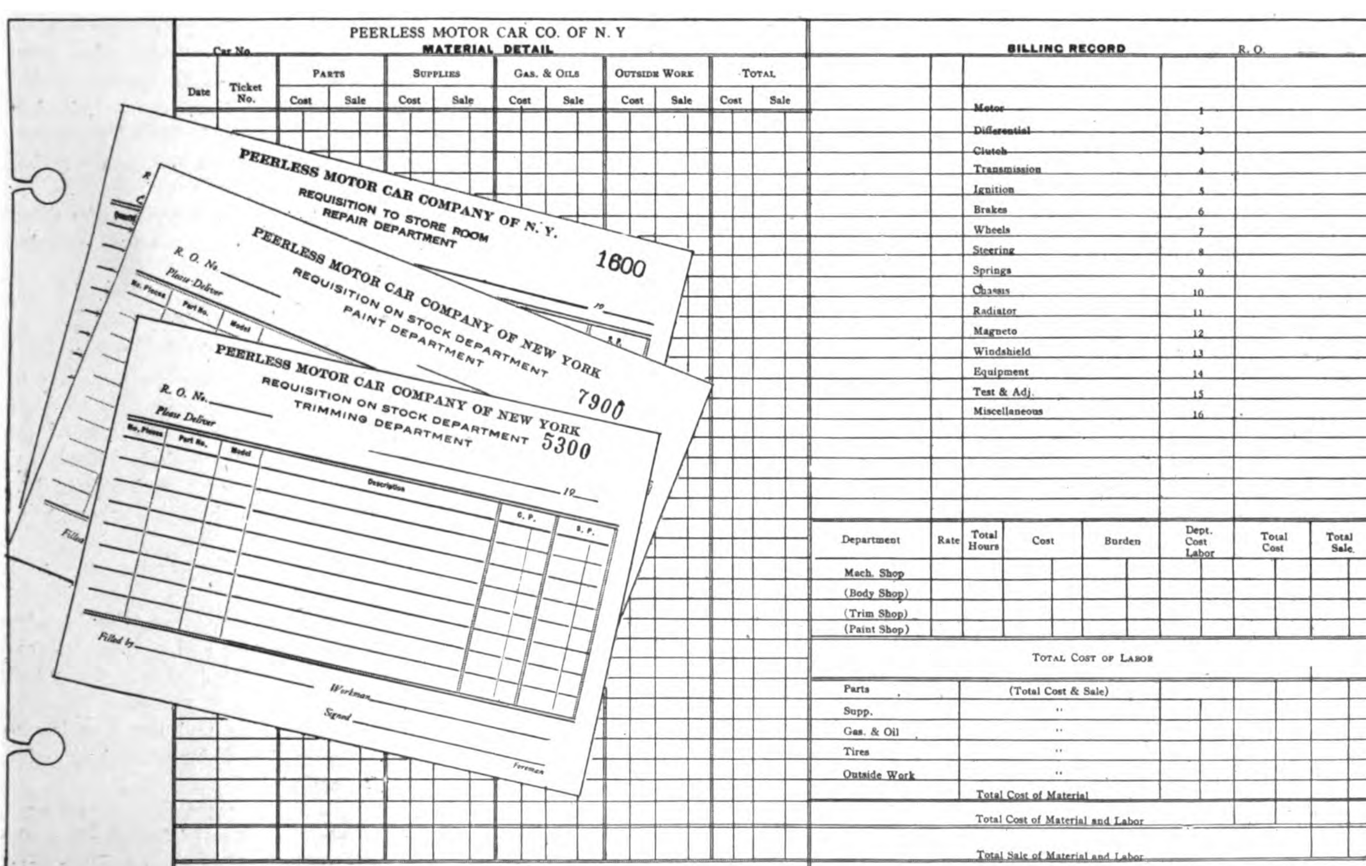

Fig. 10—Requisition blanks used by the various repaid shops of the Peerless Motor Car Company's service department. Fig. 11—Principal record sheet on which all material used on a job is noted in detail and totaled

Carbureter Performance; Differential Lock Explained; Slipping Clutch Cured; Some Questions on Motor Clearance; Points Against Metric System; Welding Job Spoiled Cylinder; Tip on Gear Changing

Points on Holley Carbureter

EDITOR THE AUTOMOBILE:—I am using a Holley carbureter and would like to know a little more about it than I do now. Kindly tell me what economy I should expect with this carbureter and let me know if there have been any *bona-fide* tests made which can be shown by curves or in tabular form. I am using the model H. What is the best method of adjusting this carbureter for use on a touring car?

Williamsbridge, New York City. R. T. CORRY.

—A section through the Holley model H carbureter is shown in Fig. 6. This carbureter as may be seen by the illustration is of the concentric float type which means that the center of the ring float is in the same perpendicular line as the center of the spray nozzle. There is but one adjustment point on the carbureter: this is the knurled needle valve screw which is shown in the sectional view of the carbureter. Start the motor and allow it to run as slowly as it will without stopping. Turn the needle valve to the left until it runs steadily and then see if the motor can be throttled still lower. When the motor idles properly, that is will run at a reasonably slow rate without missing, speed up the motor and turn the needle valve, if necessary, to the right to find if better running will result. When the best success is obtained at high speed try the low speed again to see if the motor still idles as it should. In this manner the adjustments are worked back between high and low speed until the proper mixture is obtained at both. It must be remembered that it is desirable for the sake of economy to make the mixture as lean as possible and still get good results. The mixture is made leaner by turning the needle valve to the right.

Tests have been made on this carbureter by the Holley people and they have given out a set of curves which have been published in the literature of the company and which are reproduced here. Fig. 2 shows a horsepower curve secured with a 4 by 4.5 inch motor when using the Holley carbureter. The feature of this curve is the steady rise up to 1,600 revolutions per minute. Below the horsepower curve in the same illustration is a curve showing the revolutions per minute and pounds of fuel per brake horsepower-hour of a four-cylinder 3.75 by 4-inch motor. The curves shown in Fig. 1 are taken from three separate cars and show the difference in economy at ordinary driving speeds with motors of different size and design. The upper curve is a 3.75 by 4-inch motor of four cylinders, the second a four-cylinder 4 by 4.5-inch motor and the third a 4 by 4.75-inch six-cylinder motor.

Where to Secure State Laws

Editor THE AUTOMOBILE:—Could you tell me where I could get information on the automobile laws of California? What are the requirements to get a chauffeur's license in that state? I am 17 years old.

Cottonwood, Cal. L. SAFLEY.

—Address the Secretary of State at Sacramento, Cal. The requirements to become a chauffeur, as well as full information regarding the state laws, will be furnished for the asking.

Motor Overheats After Welding

Editor THE AUTOMOBILE:—We have a 1910 Garford Studebaker four-cylinder touring car. Recently we had the cylinders welded where they had cracked on account of the water in the jackets freezing last winter. The first time it was welded, the cylinders leaked. The second time proved to be entirely satisfactory. Now, the water overheats. The radiator has been overhauled by competent repairmen and the pump works satisfactorily. The timing of the ignition is also satisfactory. We use a light cylinder oil.

My question is: Would the welding of the cylinders cause the overheating in this particular case, and if not, what would be the possible reason for this trouble?

Pittsburgh, Pa. H. A. M.

—There may be one or more causes for the overheating of the water after the welding job was completed. In the first place there is a possibility that the cylinder still has a crack which is so slight that it does not open up until submitted to the heat of combustion. When this occurs there is a marked tendency for the water to overheat. Another possible cause is that in the reboring the cylinder was cut too close to the water-jacket, leaving the metal thin at that point. The most probable cause, however, and the one to which you may ascribe your trouble is that the jacket is clogged by some metal which has become lodged in the jacket space. This prevents the free circulation of the water, and besides becoming very hot itself, permits the water to become overheated also.

If any of these explanations is the one that fits your case there will be nothing left for you to do but to buy another cylinder casting, which will cost you $62.70.

Questions as to Motor Design

Editor THE AUTOMOBILE:—Kindly answer the following:

1—What compression should a cylinder register with a bore of 5 inches and a stroke of 5 1-2 inches?

2—How much space should there be between the top of the piston and cylinder when the piston is at the highest point?

3—If the valves are 1 13-16 inch in diameter, and open 3-8 of an inch, where should the piston be when the inlet valve begins to open?

4—Where should the piston be when the exhaust opens, in inches, to get the best results?

5—If valve opens 3-8 of an inch, how much space should there be between the valve cap and valve, in inlet and exhaust valves?

6—Is it practical to replace present valve caps with longer or deeper ones, to get more compression?

7—How much space do the Packard 30 and the Simplex 50 have between the top of the piston and cylinder at highest point, and also how much pressure in pounds?

Rye, N. Y. CHESTER E. LOUNSBURY.

—1—For ordinary touring work a pressure of 65 pounds at the top of the compression stroke is very good. For racing this pressure may run up as high as 120 pounds. The first mentioned, however, is very good for all around work.

2—This depends altogether on the cylinder design and how the compression space is arranged. That is, if the motor were T-head it would have less clearance than if the motor had its valves in the head because there would not be so much volume taken up in the valve recesses in the latter model. A clearance of at least 1 inch is left in all designs.

3—The crank should be about 10 degrees on its circle past dead center. This would correspond very closely to 1 3-4 inches measured around the circumference of the flywheel.

4—The exhaust valve would open 40 degrees on the crank circle before lower dead center. This would be about 7 inches circumferentially on the flywheel. The position of the piston at this time is best figured graphically by laying out the crank circle to scale and then drawing in the desired angle of 40 degrees and projecting from the point at which the angle cuts the circumference of the crank circle over to the vertical diameter of the circle or cylinder axis produced. The distance between the point at which this projection cuts the vertical diameter of the crank circle and the intersection of the crank circle and the vertical diameter gives the distance in inches that the piston has to travel before reaching lower dead center.

5—This height is determined by the port area required to get the gases into the cylinder at the proper velocity. A longitudinal vertical section taken through the center of the valve will also pass through the center of the cap and show the area of the port. This must be at least as great as the area of the valve or the gases will be choked on entering the cylinders. It would seem that at least 1 inch clearance should be left here on a rough estimate in order that there will be no choking effect, and a greater clearance than this would be desirable. This clearance is measured above the extreme lift of the valve.

6—The gain in compression secured in this manner would be so slight that it would be innappreciable. It would not be advisable to let the lower part of the valve cap extend into the combustion space as it would not be properly cooled and the chances are that carbon trouble and preignition might develop.

7—The Packard 30 has about 1-inch clearance and a compression pressure of 60 pounds. The Simplex 50 has a clearance of about 1 1-4 inches and a compression pressure of 70 pounds.

Center Steer as a Solution

Editor The Automobile:—The right or left control controversy, now being discussed in your paper has, I am sure, been of interest to thousands of motorists, but like many other motor-car problems, will, in the writer's opinion, never be definitely settled.

The arguments, pro and con, have much to commend both systems and the question would finally resolve itself into a matter of personal choice. The motor cars of the future will, I think, be so designed as to admit of having the steering column on either side, thus giving the purchaser his choice. Another, but less logical, way out of the difficulty, would be to mount the steering column in the center, with room for a passenger on each side. Probably though, this will never be done, at least on pleasure cars, because there would be no room for the steering gear and connections.

East Canaan, Conn. D. C. Canfield.

Wants Tank Under Dash Cowl

Editor The Automobile:—My car carries the gasoline tank under the front seat and consequently the carbureter has had to be located as low as possible to get gravity feed, which, of course, has necessitated a long manifold. As I have difficulty in starting the engine, especially when cold, I am taking the liberty of asking you what effect it would have to place the gasoline tank under the cowl (which in my case is perfectly feasible) and then raise the carbureter so that the manifold would be shortened about 10 inches.

Would such a change be likely to create any unfavorable working conditions?

Lima, O. C. I. Lufkin.

—There would be nothing unfavorable in making the suggested arrangement, provided that you arranged your piping so that you would be in no danger of having trouble with air locks. Keep the piping straight and, above all, do not have any vertical bends, because it is the latter that cause air locks to the greatest extent. The greatest practical difficulty would be in the shortening of the manifold. This can be done by a competent mechanic, however, who would not interfere with the proper flow of gases from the carbureter to the cylinder by changing the general design of the manifold.

Duryea Dislikes Metric System

Editor The Automobile:—Regarding the article on the metric system in The Automobile for August 22 and 29, I wish to state:

The metric system was devised by a political favorite and theorist and not by a practical man. The meter was assumed to be a certain part of the world's circumference, which has never been measured absolutely, and changes as the years go by, most likely; and which measurement is now known to be incorrect. The author would have shown much better sense had he chosen as his meter the standard British yard. He thought, as do many others, that there is merit in the number ten, whereas, as a matter of fact, it is unfortunate that ten was made the base of our system of notation. Twelve, which we daily use when we say a dozen, or sixteen, or twenty-four, corresponding to the letters of the alphabet, would have made a much

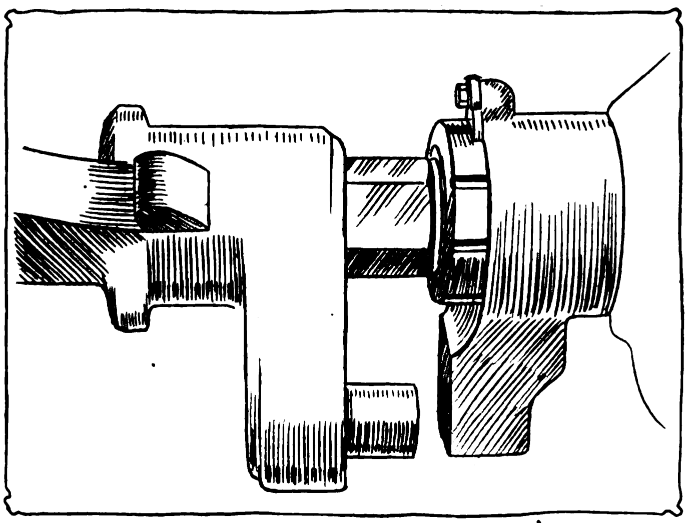

Fig. 3—Differential lock as employed on the Alco truck

better numerical base. See The New Art of Arithmetic in Nystrom's Mechanics.

But, without quarreling with the base, the system is fine for theorists, but less fine for practical people. Most people count by two and divide by two. Quite a number count three at a time, but few can count five at a time. The duodecimal system permits counting by twos, threes, fours, or sixes, and fits many jobs better than a decimal system. So long as things remain rectangular it will be easier to put twelve in a box than ten, and it is foolish to fight physical facts like this.

Further, the French themselves do not make use of the metric system, as one would expect. Where we say a tire is 30 by 3 inches, they say it is 750 by 75 millimeters, which is a mellifluous mouthful, but not so easy of comprehension by average brains nor so handy as our present method. If any one needs a decimal system we can just as well say thirty-thousand-thousandths inches to indicate the diameter of the wheel decimally, and with as good sense as the common metric reading.

The main objection, however, is that the system interferes with prevailing systems which cannot be discarded. If I wish to build an addition to my house I must cut things in feet and inches and must fit gas pipes which are threaded with inch threads. To introduce an additional system alongside of these old ones means a needless confusion. It means a loss of time and money. It offers no commensurate gain. It is much better for us to standardize a few of the present measurements and use them, rather than introduce still another. We have now, for example, three general varieties of screw threads, the V, the United States standard, and the Automobile, each with a large number of sizes, so that no one knows whether a 1-2-inch bolt has a 12, 13, 14 or 20 thread; and other sizes are equally uncertain. If we add to these the metric, we simply go from bad to worse. In the textile trades three lengths, or ells, are used, varying by some inches, and formerly based on the length of the workman's elbow.

If your readers wish to know more of the objections to the metric system I suggest that they read The Metric Fallacy, by Frederick A. Halsey, and The Metric Failure, by Samuel S. Dale, published by the D. Van Nostrand Company, New York City.

Saginaw, Mich. CHARLES E. DURYEA.

Changing Gears Without Noise

Editor THE AUTOMOBILE:—In a recent number of THE AUTOMOBILE a subscriber asks how to shift gears from high to second without grating them. I wore out two gears myself before getting on to the knack of doing it properly. Here is, I think, the only correct way to do it: First, throw out the clutch, then bring the gears to neutral and let in the clutch at the same time. Press the accelerator slightly, speeding up the engine a little, then throw out the clutch and put the gears in second speed. You may need a little practice to do it neatly but when you get the knack of it you will not make a click.

Burlington, Vt. ELMER E. GOVE.

Engine Knocks in Ascending Hill

Editor THE AUTOMOBILE:—Every time I ascend a hill there is a distinct knock in my motor. When running along level ground I never have this trouble and when I shift back into

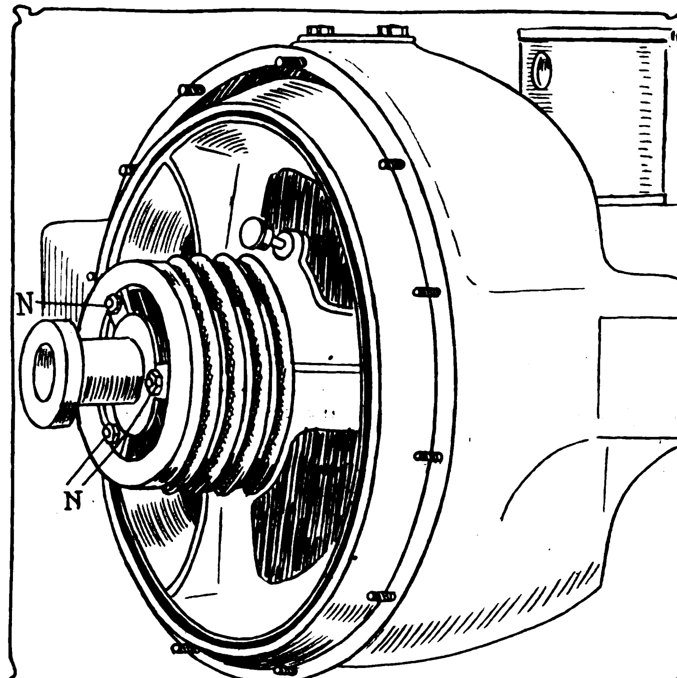

Fig. 4—Adjustment nuts, N, on Cole leather-faced cone clutch

lower gear the trouble also disappears. One hill I could readily take on high if it were not for this.

Chappaqua, N. Y. S. B. STEVENS.

—The trouble is that the spark is not retarded far enough in ascending the hill. When the motor is turning over slowly the spark occurs sooner than it should and causes the knock. Turn the timer back further on its axis in order that the spark can be made to occur earlier.

Five-Cylinder Motor Discussed

Editor THE AUTOMOBILE:—I am interested to know the whys and wherefores in regard to a five-cylinder, four-cycle motor, the cranks set at 72 degrees to fire in rotation.

I think there must be some reason why such a motor has not been brought out, as far as I have been able to learn but a very few of this design have been produced. The Adams-Farwell company makes a rotary of five cylinders and a reciprocating motor with five cylinders has been made, so I have been told, that gave the best of satisfaction, reducing vibration to the minimum. There would be a uniform torque as the power stroke of one cylinder would not be completed before the next took hold. If there are disadvantages please lay them bare, as I wish to get at the real facts in the case.

Waterbury, Conn. H. D. B.

—There is not much data at hand on the five-cylinder motor, although one was made some time ago and was said to be very successful. The opinion of the designer of that motor, Mr. H. Dock, is as follows:

"I believe the only reason why this type of engine is not built is because its merits have not been investigated, for, in my judgment, which the performance of a motor of this type will bear out, there is nothing in the line that will equal them unless it be a seven cylinder.

"In one or two instances wherein I tried to interest automobile manufacturers in this engine I was met with the argument 'that the public were satisfied with the four or six, therefore, why the use of improving?'

"In a five-cylinder engine there is nothing to invent, but I did, I believe, build the first one of its class in Philadelphia in 1901. Since then in connection with the concern which had the contract I built the government field searchlight engine and others and wherever they have been put in commission they give satisfaction.

"For automobile use they are much superior to the four or six as the shaft is in constant torque, one cylinder being always in pressure, and the machines in which I have ridden with the five cylinders are the best hill-climbers of any.

"As to balancing, this class of engine was a surprise, for while I was building the first one many interested engineers saw it and the general opinion of all was that it would be so out of balance as to be worthless.

"But, as a matter of fact, it is the quietest, smoothest engine

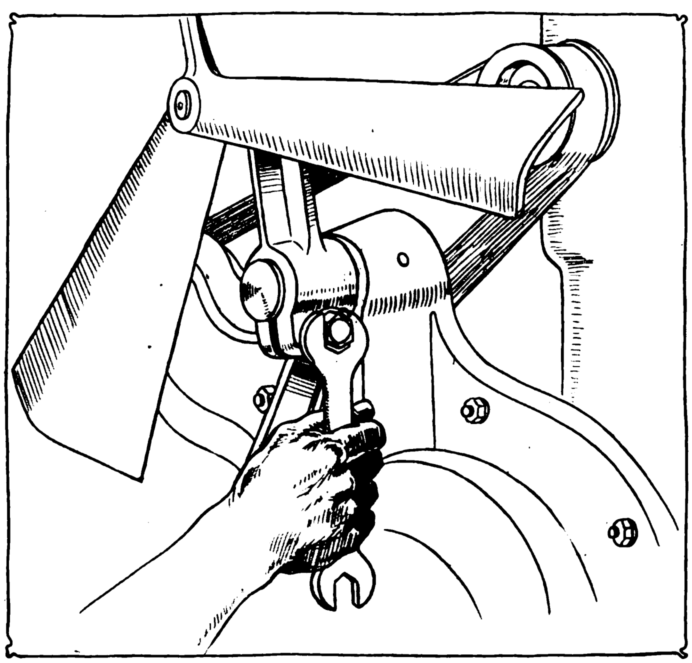

Fig. 5—Nut loosened to adjust tension on Cole fan belt

I have found and more flexible by far than its four- or six-cylinder brother.

"Finally it is my belief that whenever some enterprising manufacturers of automobiles takes up the five cylinder he will have a walkover and command the field, given that his production is always first class."

This is an interesting topic and one which could be further discussed to advantage. There is a lack of data as regards actual performances on the road and Mr. Dock does not state what cars were ever manufactured that used his motor. THE AUTOMOBILE has no record of any such.

Uses of a Differential Lock

Editor THE AUTOMOBILE:—In reading the story on the army maneuvers up in Connecticut recently I noticed the remark that some device was necessary to lock the differential of a truck so that the traction would be exerted on both wheels instead of the wheel that happend to be lodged in some slippery hole. Of what does such a device consist and what does it look like?

New Rochelle, N. Y. LIEUTENANT.

—The accompanying illustration, Fig. 3, shows the form of this device as used on the Alco trucks. The large dog slides along the hexagonal shaft shown in the illustration until the projection on the end slides into the hole opposite it. The two parts then turn as one. This locking device is placed in the rear system at a point where its engagement will cause the two driving axles to rotate as one. It is useful at any point where the action is apt to fall more heavily on one wheel than on another.

Cure of Slipping Cone Clutch

Editor THE AUTOMOBILE:—The clutch on my Cole car slips. I have been driving the car for some time in this condition but I am afraid that if I continue to do so the leather will become glazed. How do you go about preventing the slip?

(2) Will you also kindly tell me what to do to prevent the belt on my fan from slipping when I am traveling at slow speed?

White Plains, N. Y. SUBSCRIBER.

—There are three nuts on the clutch which you will be readily able to locate after a study of Fig. 4. The nuts are labeled N in the illustration and should be turned to the right four or five turns to increase the tension on the clutch spring to the desired point. This will end the trouble with the clutch unless it be that the leather is soaked with oil, a situation, however, which is not probable in the Cole car. If you find oil on the surface of the leather, block the clutch out of engagement by placing a prop against the pedal and against the seats or some other point in the car and wash off the leather with gasoline. When this is dry apply a thin coating of neat's foot oil.

(2) To adjust the fan bracket so that the belt will not slip at low speeds, it is necessary to loosen the nut shown in Fig. 5. Swing the bracket up so as to increase the tension on the belt and then tighten the nut again.

Credit to Reference Work

THE AUTOMOBILE takes great pleasure in acknowledging its indebtedness to "Our Weights and Measures," by H. J. Chaney, for the assistance rendered in compiling the recent series of articles on the English and metric systems of measurements.

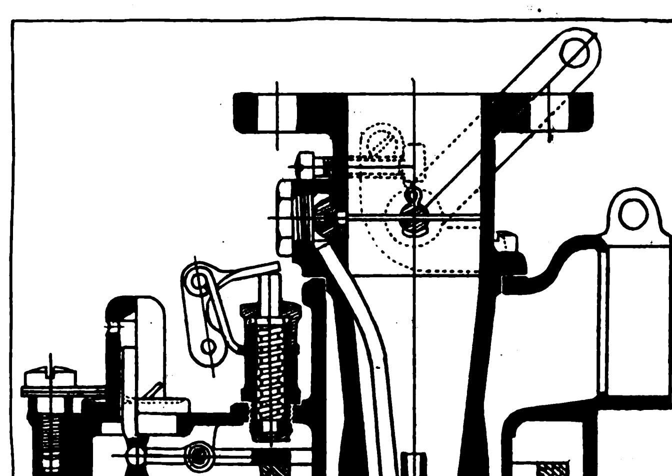

Fig. 6—Section of Holley carbureter showing single adjustment point

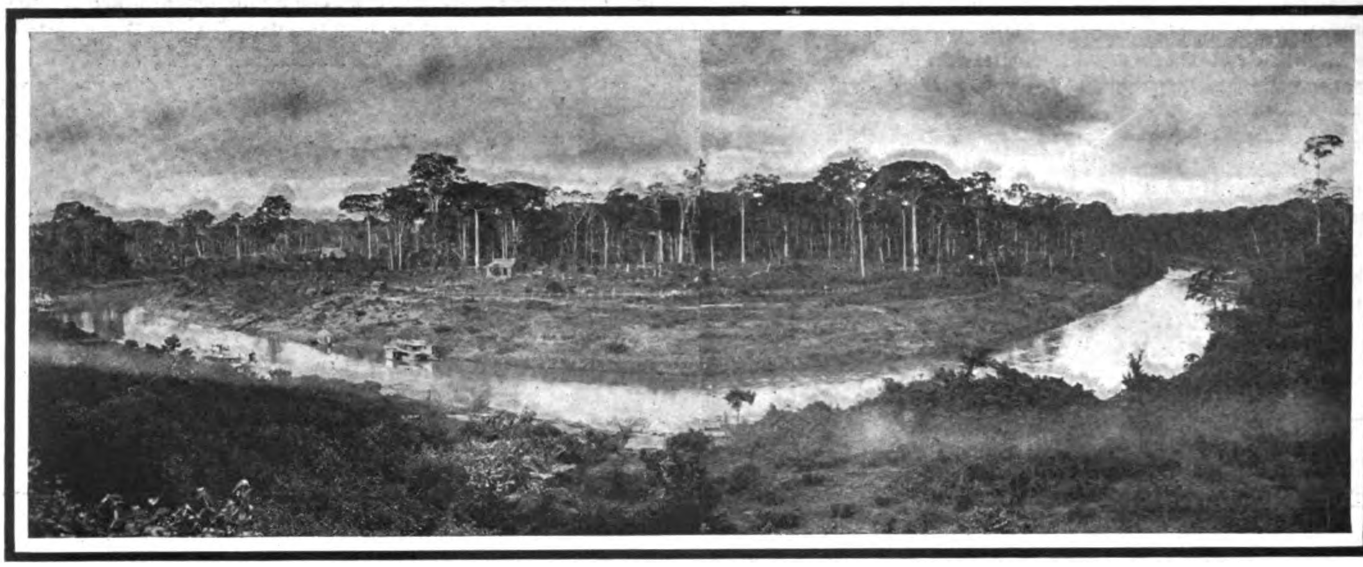


The Acre Valley viewed from Cobija on the frontier of Bolivia in the heart of the rubber country

Brazil Plans Big Increase In Rubber Yield

New Law Provides Remissions of Duties to Encourage Industry, Bonuses for Planting and Subventions for Factories Estimated at $15,000,000 a Year in Effort to Bring Annual Crop to 60,000 Long Tons

INDIGENOUS rubber produced in the great Amazon Valley will reach a total of approximately 40,000 long tons during 1912, according to the opinion of experts, delegates and officials assigned by the Brazilian government to be present at the forthcoming international rubber exposition which opens at the Grand Central Palace Monday, September 23.

Already several of the Brazilian leaders have arrived in New York City and are busy with the installation of the exhibits and they are enthusiastic with regard to the prospects for the years to come.

The reason for their enthusiasm is that the federal government of Brazil has passed a series of laws this year aimed to increase the production of rubber along scientific lines. They can foresee a time in the near future when the total production will be from 25 to 40 per cent. higher than it is at present and a valuable improvement in quality of the gum raised.

Statute Is Wide in Its Terms

The new law, decree 2,543A, was approved January 5 and the regulations to put it into effect April 17. The law exempts all utensils and material intended to be used in the culture of seringueira, castilloa or caucho, manicoba and mangabeira from customs and petty administrative charges. Secondly, it provides for bonuses for planting or replanting fields and orchards of the trees mentioned. For planting 12 hectares the planter may claim 2,500 milreis, or about $800. A hectare is, roughly speaking, 2 1-2 acres. The bonus of $800 is for planting seringueira, but the other varieties also entitle him to lesser sums. These bonuses are due 1 year before the first harvest. The size of the bonus may be increased 5 per cent. if the planter shows that he has raised food plants on the cultivated portion of his plantation.

The government will have sixteen experimental stations.

For the establishment of the first refinery for the seringa, which shall reduce the various qualities to one uniform grade for exportation, the government offers as much as $128,000 in the form of a bonus. In order to be eligible the factory must invest at least four times the value of the bonus.

Immigrant inns, hospitals, and small agricultural colonies are specified and promised by the government and various narrow-gauge railroads to tap the rubber country, improved waterways and betterments in transportation otherwise are encouraged by relaxation of customs duties on materials and by subventions.

Bonuses for Food Production

In order to encourage planters to produce food stuffs, bonuses are offered in the way of payments and remission of duties on materials. These subventions cover not only grain, vegetables and pasturage, but also meat and lacteal products, fish and other food elements for man and beast.

Once in 3 years the government will promote an exhibition at Rio de Janeiro embracing the rubber industry at which large prizes will be offered for improvements in cultivation and production methods.

Reduction of the export duties levied by the states of Amazonas, Parana and Matto Grosso by agreement between the federal government and those of the states is authorized and complete exemption of seringa rubber for 25 years is outlined. This provision depends upon affirmation of the three states mentioned.

Estimating the results of this new law in a financial sense as it affects the government, involves two financial factors. First, the loss of revenue due to the relaxation of customs duties, and, second, the payment of the direct bonuses authorized. Both factors will depend upon the extent of the increase in production and preparation for such production. The government of Brazil has authorized the opening of a bureau of credits to have jurisdiction over the project and under the law an annual accounting must be made to the legislative branch of the government.

The regulations of April 17 cover the provisions of the foregoing law under eight headings as outlined in the original decree.

Under the heading covering bonuses for new cultivation, it is provided that 250 trees per hectare of seringueira or castilloa, or about 100 trees to the acre, is the minimum for which bonuses will be paid. With regard to manicoba and mangabeira 400 trees per hectare are specified.

A special bonus of $150,000 in specie is offered for factories wherein the native rubber may be turned into articles of commerce such as at present form a material item of importation.

The immigrant inns are to be established at Belem, Manaos and in the Acre and will be large enough to accommodate 3,500 persons and will be operated under governmental auspices.

In a word, the law contemplates increasing the production of Brazilian rubber and is by far the greatest bit of paternalistic legislation that ever found its way into the statute books of a nation.

In case any considerable amount of territory is brought under cultivation by reason of the law, and if the manufacturers and shippers and producers are stimulated to build the factories, railroads and other elements of the problem, it is conceivable that the remissions, subventions and bonuses may reach $15,000,000 a year.

In case such a result is accomplished, it is estimated that the production of crude rubber in Brazil alone will approximate 60,000 long tons, while the agricultural wealth will increase by at least $50,000,000 annually, entirely aside from rubber.

The Amazon valley covers all the land drained by the Amazon River and its tributaries. This includes practically all the rubber country of Brazil and Bolivia and much of Peru and the states lying along the northeast coast of South America. But it does not include territory outside the watershed of the Amazon.

The chief branches of the Amazon are the Tocantins, Xingu. Madeira, Negro, and there are probably twenty lesser streams which drain territories little known at present. Most of the country is a primeval jungle, only the most superficial effort at trade exploitation having been made to bring it into commercial bearing.

Contractors Profit Largely

For one reason, the supply of rubber from the jungles that are in communication with the world has proved sufficient to take all the attention of those engaged in the work so far. Difficulties of transportation are the main causes for the lack of rapid extension of the explored field.

The most widely known grade of rubber produced in the Amazon valley is designated as up-river fine Para. This grade comes to commercial attention in the shape of elongated balls weighing from 60 to 120 pounds and even more or less than those figures, depending upon the conditions under which it was smoked. The work is done by the men who gather the latex from the forests where the Hevea Brasiliensis grows.

These men are recruited from among the Indian natives, cross-breeds and variously mixed classes, only a small percentage of the seringueiros, or rubber gatherers, being of pure or approximately pure white blood.

They are installed in semi-permanent camps and each is assigned to a certain route covering about 100 trees, which may be scattered for a mile or more. Generally each man has at least two routes to cover on alternate days or less frequently.

The regular process is to start at dawn, armed with a small tapping axe such as is shown in the initial illustration herewith, and several hundred small tin cups. The seringueiro covers in succession each of the trees in his route for the day, hacking them in promising spots and attaching a cup below each of the wounds inflicted on the bark of the tree.

By mid-forenoon he can finish such work on the average route and then follows the collection of the latex. The gatherer goes first to the tree he tapped earliest and thence proceeds throughout the route. The latex is collected in tin vessels, as a rule, such as 5-gallon oil cans.

How the Rubber is Collected

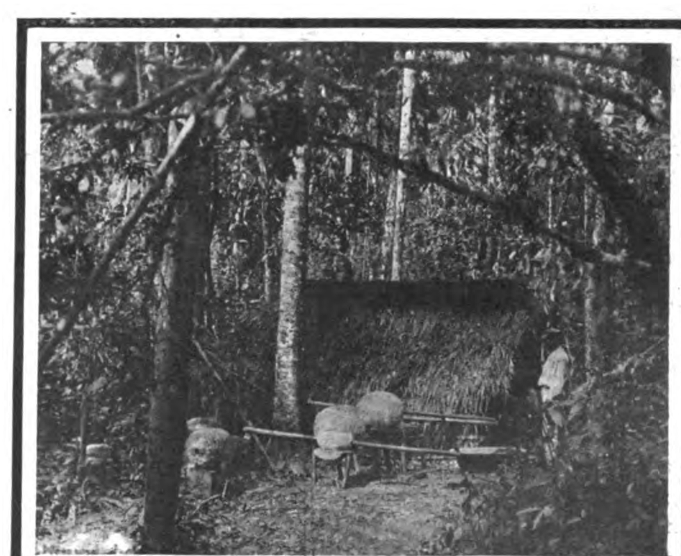
Having collected the rubber milk he returns to camp and proceeds to smoke his store of juice by building a fire and burning in it the nuts of the urucuri palm, which produces a rich, oily smoke. In this smoke the seringueiro holds a wooden paddle which has been dipped in the latex. As each layer dries, more latex is added until a great ball is produced. Having smoked his rubber, the seringueiro has nothing to do until tomorrow.

The next day he works his alternate route and continues thus until Saturday.

While much of the labor is handled according to the plan outlined above, there is another plan that was formerly very popular and which still obtains to a large extent. This is the contract system by which the producer credits the seringueiro with about half the market price of the rubber he brings into the producer's warehouse and will take all he can collect, providing the seringueiro agrees to buy his supplies at the company store. The contractor does not aim to make much actual profit on the rubber, but it has been shown that the bulk of his profits come from the sale of supplies to the workman.

Under this plan, the seringueiro reports at the company warehouse on Saturday with his week's production. He may have as much as 300 pounds of first grade rubber, but the gen-

Settlement near Monte Mo., showing house used by rubber workers



Hut of a seringueiro where smoking and collecting keep him busy

Specimen of hevea over 16 feet in circumference

eral run is much less than that amount. Ordinarily a man can collect from 10 pounds to 60 pounds of latex in a day and the average yield of rubber is only from one-third to one-half of the volume of the latex. On an average probably 25 pounds would be conservative. This would make the average weekly production per man range from 50 to 75 pounds.

After being credited with, say, $30, or its equivalent, he buys his supplies for the next week at good round figures and goes back to his work.

The season is from May to December, during the low stage of the Amazon and its tributaries. During the other months tapping is discontinued.

The methods used in the collection of rubber are commensurate with the class of labor employed. The supply of hevea trees is much greater than has been supposed and the utmost lavishness has been used in tapping those under production. As a general thing, the method used in tapping is simply for the seringueiro to whack his hatchet into the tree wherever there appears to be a promising bit of bark. Some of them wipe off the surface to remove moss and lichens before tapping, but the rule is to tap hard and often and wherever convenient.

In some of the estates an entirely different method is in vogue. There, the workmen use the most advanced procedure and the tapping is done by fishbone, excission and incision methods, using tools of the highest efficiency. The difference in yield is materially in favor of the latter system. This is counterbalanced to some extent by the time saved owing to the less detailed care required under the former method of collection.

But whatever the method used in producing and collection, the next step is to market the product. The crude rubber is inspected at the first warehouse. Sometimes the balls are cut open to prove their integrity. This procedure was forced upon the contractors after some of them had credited up good round sums for the rubber turned in by certain seringueiros only to find that it contained a material percentage of sand, earth, hardwood and even small animals and vegetation. These extraneous substances added to the credited weight, but did not bring in any revenue to the contractor because the ultimate consumer always had to be shown that he was getting rubber according to grade and a 7-pound rock in a ball sold as pure up-river fine Para was never paid for at rubber prices.

Having satisfied himself that he was crediting up to the seringueiros only what was due, the contractor proceeds to ship his rubber down the river to Manaos or Para (Belem). If the territory in which he is engaged is located, for instance, on one of the branches of the Madeira River or equally remote place, the first stage may be by raft or flatboat to the first of the numerous falls and rapids to be found in the upper reaches of all Brazilian streams. Sometimes the rubber is portaged around the falls and reshipped on other rafts and flatboats to the next stage. When the navigable portion of the stream is reached, a transfer is made to one of the small flat-bottomed steamers and the rest of the long journey is accomplished in that manner.

Sea-going vessels reach Manaos and Para is a regular seaport for ships of almost any size.

Rubber goes from the Brazilian ports all over the world, but the bulk of it finds its way to the United States, largely by way of England. The reason for the roundabout route is that there is a lack of direct transportation facilities between Para and New York.

Advances in the old systems of coagulation met with little favor in Brazil until recently, although much ingenuity and money were spent in attempting to introduce progressive ideas. Heat coagulation without smoking is now attracting some attention, while various mechanical devices to apply the smoke by other than the wasteful methods now in use are being tried out. Chemical coagulation is a subject which is now centering the eyes of scientific Brazil and some other countries upon the production of rubber.

At the forthcoming show in New York a special booth will be devoted to the manufacture of rubber according to various processes. The latex will be taken as it came from the trees and will be subjected to all the manufacturing processes in common use and to the experimental practice of the chemists that may come into use at a future date.

Under present conditions it is necessary to macerate and

Castilloa trees close to seringueiro's quarters reduce even the best grades of Para to a fine pulp and then to wash the pulp until it has been divested of all grit and foreign substances. This is a preliminary step toward manufacture and the rubber loses approximately 20 per cent. by weight of its original volume in washing.

The whole process of washing might be obviated if the rubber shipped as crude contained none of the impurities that are removed by washing. In the plantation type of crude this end has received more attention than it has in Brazil. The production of plantations therefore more nearly represents a net yield than does Para.

Special attention will be paid to this phase of the question at the show. It is estimated that the introduction of scientific methods in coagulation will add not only to the quality and value of the indigenous rubber, but will actually result in a greater tonnage through the saving of what now goes to waste during the process of smoking.

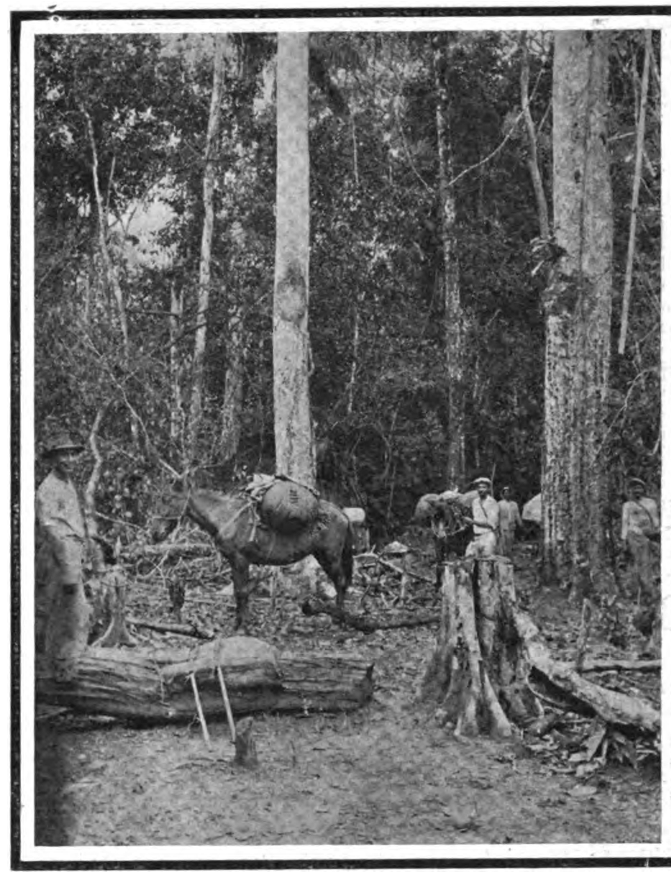
Dr. Eugenio Dahne, representative of the agricultural department of the Brazilian national government to the United States, denied that the new law passed by his government was to be the basis of another valorization scheme. In discussing this phase of the matter Dr. Dahne said:

"Brazil is not trying to valorize rubber. It is seeking to increase production by remitting duties, paying bonuses for planting, so that the yield may be increased under scientific conditions; paying rewards to planters who raise the necessities of life for their employees and others, much of which must be imported at present; by subventions and bonuses to manufacturers and railroad companies and steamer lines.

"It is not a valorization scheme—emphatically not."

According to Henry C. Pearson, a leader in the rubber industry of the world, the existence of speculation in crude rubber is both affirmed and denied by those interested. In the Amazon country when rubber is low in price in the markets of the world, the producers claim that speculators are at work and, on the other hand, the traders, particularly the consumers, claim that the price level is the result of the operation of the law of supply and demand.

When prices are high the rubber producers lay it to supply and demand, while the consumers complain of manipulation. Thus showing that both branches of the rubber industry are moved by exactly the same arguments as apply in all other lines.



One method of shipping rubber to navigable waterways

Castilloa trees felled in the forest are easy tapping

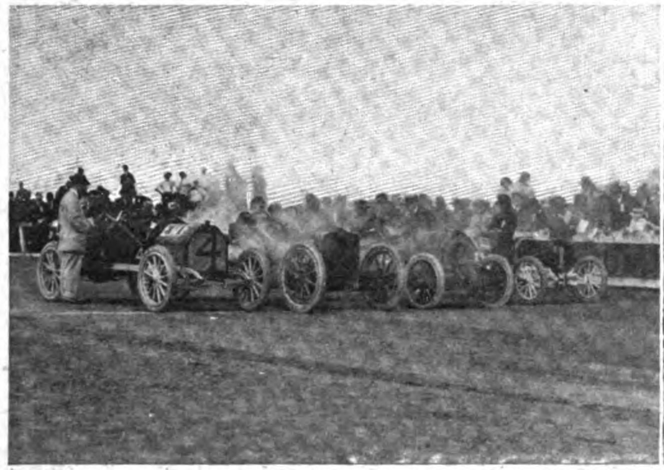
Mr. Pearson says that the whole business is speculative. There is no absolute standard as to grade. The crop yield of even a single country is exceedingly difficult to forecast. The consumers can rarely say what amount of rubber will be required in any given industry for a year ahead. The rate of exchange is also an element of uncertainty as it varies within certain limits almost day by day.

The practice of buying for future delivery is followed pretty generally by consumers.

Heretofore it has been a rather easy matter to cause wild fluctuations in the rubber market because the value of the product itself and the comparative smallness of the yield lent themselves to the purposes of outside speculation. Nowadays the branches of the Banco de Brasil, located in various places in the rubber country, are authorized to advance substantial amounts to producers. This is the plan that has been referred to as an adaptation of the coffee valorization scheme. Its effect is to make the market steadier by protecting supplies in weak financial hands. Otherwise the price level would be subject to a wild market whenever a buyer started bidding at a time when the supply was small, or a producer tried to sell a big shipment when the demands had been satisfied.

Baron Gondoriz, who nearly cornered the market four separate times, once wrote the following arraignment of the United States for the awkward commercial procedure as far as Brazil was concerned. The letter, of course, was written long ago.

"If North America really desires more reciprocal trade relations with Brazil they might be secured through the agency of a carefully managed bank at Para, based upon American capital. The monthly business there in agricultural products of the Amazon Valley amounts to $2,500,000. Fully two-thirds of this material goes to the United States and the rubber men of the United States pay American gold for it through the English banks, and the rubber producer supplies the demand in merchandise, thus providing for a heavy profit to the middleman."



Start of one of the races held at Winnipeg, Canada

Bob Burman Breaks Record

Clips More Than 3-4 Second From Circular Dirt Track Mark in 300-Horsepower Jumbo Benz

CLIPPING a shade more than 3-4 second from the mile circular dirt track record, the Jumbo Benz, rated at 300 horsepower and driven by Bob Burman at Brighton Beach Saturday, made a new mark for the speed brigade to shoot at.

The new record was made in a special event staged for the purpose of showing the car under ideal speed conditions. The start was impressive, following an easy circuit of the track to the head of the stretch where Burman turned loose his motor and whisked over the line at spectacular speed. He swerved to the rail at the stand and then cut across the track to the clubhouse turn, shaving the inner circle and going far out on the track at the back stretch. The straightaway is rather long and the Benz covered it at the rate of nearly 100 miles an hour, cutting in close at the stable-turn and turning into the stretch with a roar came down to the line at brilliant speed.

The timers announced the new record as 47.85 seconds. The former mark was 48.62 seconds, which was made by the Blitzen Benz with Burman driving, last year. The speed attained was at the rate of a little less than 75.24 miles an hour.

The summary of the other events follows:

UNDER 300 CUBIC INCHES, 5 MILES, NON-STOCK

Car	Driver	Position	Time
Mercer	Ainsley	1	5:13
E-M-F	Burke	2	

UNDER 600 CUBIC INCHES, NON-STOCK, 5 MILES

Oldfield the Star at Winnipeg

Big Program Run Off Before an Enthusiastic Crowd of 10.000 Without a Single Mishap

WINNIPEG, MAN., Sept. 6—The Ninth Annual Race Meet of the Winnipeg Automobile Club was the most successful meet ever carried out in western Canada. Barney Oldfield and the other two members of his team, Lew Heinemann and Bill Fritsch, proved a great attraction in addition to the usual club events on the big program which totalled eleven events in all.

The track record for 1 mile, previously held by W. C. Power, in a Buick car, was reduced by Oldfield in the Christie to 54 seconds flat. Oldfield also set a new track record of 1 minute, 50 seconds for the 2 miles.

The chief event of the day for local drivers was the 25-mile race for the Dunlop trophy, and was again won by Billy Rogers in a Ford car in 25 minutes, 32 seconds.

The big crowd of 10,000 people, the largest ever in attendance at a race meet in Canada, evinced the greatest enthusiasm over all events, and Rogers came in for a wonderful reception at the end of the Dunlop trophy race.

Rogers also won the mile against time in 60 seconds flat, for the Gas Power Age trophy, the Goodrich trophy, and the Club purse of $100, which in addition to the $300 first prize money in the Dunlop trophy race gave him practically a clean sweep in the local events.

The meeting was under the auspices of the Winnipeg Automobile Club, and was managed by A. C. Emmett, the club's racing manager, and not a single mishap of any nature marred the success of the meet. The meet was so successful in every respect that already negotiations for another series of races to be held next year have been started.

The following is a summary of events:

1 MILE AGAINST TIME FOR GAS POWER AGE TROPHY

Car	Driver	Time
American	W. Rogers	1:02
Firestone	Ben Davies	1:03⅘
E-M-F	W. Masters	1:09

1 MILE AGAINST TIME

5-MILE HANDICAP

American	Ben Davies	5:50
Cino	W. Fritsch	

Alco Climbing Over Sierras

AUSTIN, NEV., Sept. 9—With 3,560 miles of its coast-to-coast trip finished, the Alco truck of Charles W. Young & Company, which is hauling the first consignment of goods from manufacturer to customer at opposite ends of the country, reported here on its way from Philadelphia to Petaluma, Cal.

The last few days of the journey have been in the nature of almost continuous mountain climbing. Checking in at Eureka, the truck left the road beside the railroad and cut its way across untraveled trails for 70 miles to Austin.

For the second time in its long journey the vehicle has encountered a blinding snowstorm that it plodded through for a whole day.

Between Elko, Nev., and Eureka the truck had to climb 5 miles over the crest of the Humboldt Mountains on a new road that was fresh plowed out of the mountain side when the old road had been washed away by recent heavy rains.

RENO, NEV., Sept. 10—*Special Telegram*—The Alco Transcontinental Truck is in this city, it having covered to date 3,753 miles. The last part of the trip from the Rocky Mountains to this point has been characterized by sand traveling which has been almost impossible in places. The sand changes its positions with every wind storm and during the last few days the truck has traveled over 3 feet of sand in places under which was the original road. From this point to San Francisco, the road is practically boulevard, so that so far as the trials of the truck are concerned, they are practically over.

Great Crowds at Hamline

More Than 100,000 Spectators Watch Annual Automobile Races at the Minnesota State Fair

MINNEAPOLIS, MINN., Sept. 9—More than 100,000 persons saw the Minnesota state fair automobile races Saturday afternoon, September 7, on the Hamline track midway between the Twin Cities. The immense grandstand was filled with 75,000, and the crowd stood in the paddock, in the infield, and on Machinery hill, overlooking the track from a distance.

The races were under direction of Dr. C. E. Dutton, state representative of the A. A. A., and were electrically timed by a Warner instrument. Rain late in the day shortened the program and prevented running off a dead heat in the first event between Oldfield in a Cino car and Ulbrecht in a White Streak. Wonderlich was barred, owing to notice of disqualification by taking part in an unsanctioned meet. G. L. Moore drove the Marquette-Buick instead. Heineman was let in on last year's record and application for license as driver in 1912. The summaries follow:

CLASS E, NON-STOCK, 5-MILE

Car	Driver	Time
Cino	Barney Oldfield	5:05
	White-Ulbrecht, second; Case Disbrow, third.	

CLASS C, NON-STOCK, 5-MILE, 301 TO 450 CU. IN. DIS.

Benz	Barney Oldfield	5:17 2-5
	Case-Endicott, second; Jackson-Wilson, third

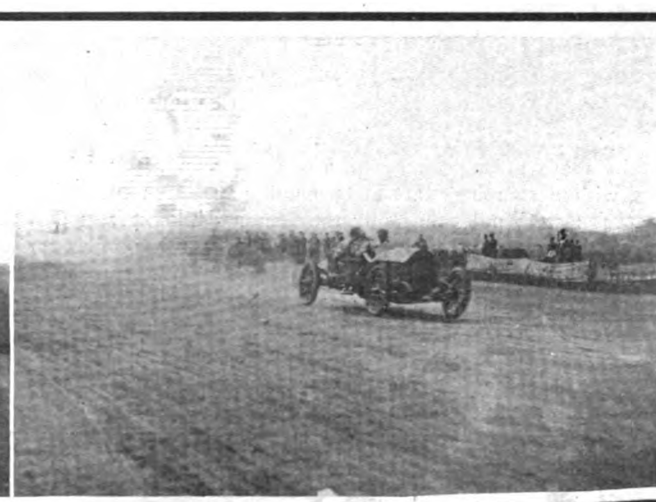
Burman's Jumbo Benz breaking the record at Brighton



Ainslee's Mercer leading Burke's E-M-F at Brighton

Peugeot First In Sarthe Grand Prix

Goux Drives Winner To An Easy Victory—Lion-Peugeot In Front at the Finish of 2-Liter Race

Average of 101.53 Miles An Hour Made By Boillot in 7-Kilometer Race at Boulogne-sur-Mer

PARIS, Sept. 9—Special to THE AUTOMOBILE—Jules Goux, driver of the Peugeot, was an easy victor in the Sarthe Grand Prix, covering 402 miles in 5:31:54. His team-mate, Boillot, after 5 laps marked by considerable tire trouble, while in second position, had leaky water connection allowing water to escape into the crank chamber. The motor seized. The Fiat failed to start. Crespelle, in S.P.A., in the big section, was never dangerous. The 3-liter race, uniting fourteen starters, was won by Zuccarelli in a Lion-Peugeot. Thomas, in a Peugeot, set the pace, but was unable to maintain it long. Duray then took it up, running his Alcyon in the lead for awhile, then held back, due to lubrication troubles. Halen distanced Zuccarelli, going ahead, followed hard by Barriaux and Duray in Alcyons, Champoiseau and Croquet, in Schneiders, after 10 or 12 laps. Goux was easily first with Zuccarelli, Barriaux, Champoiseau and Molon closely bunched. In the last lap, 5 miles from home, the steering gear of Barriaux's Alcyon was broken while the car was only 1 minute behind the winning Peugeot. Nicodemi was held up in the traffic along the course. He started 15 minutes late, later did fast work. Guyot stopped at the starting line with clutch troubles, later, after taking on gasoline, his car was burned. The results were:

SARTHE GRAND PRIX
THREE-LITER RACE

Car	Driver	Time
Peugeot	Goux	5:31:54
S.P.A.	Leduc	6:55:15
Lion	Zuccarelli	6:12:25
Schneider	Champoiseau	6:30:36
Vinot	Molon	6:31:31
Schneider	Croquet	7:33:00
Vinot	Junior	7:16:13
Schneider	Nicodemi	7:71:36
Cote	Dever	7:41:35
Hispano	Riviere	7:50:00
Alcyon	Duray	

Boillott Stars at Boulogne

Sets Many Record Marks

PARIS, FRANCE, Aug. 30—Seven kilometers over give and take roads at an average of 101.53 miles an hour; 3 kilometers with a standing start at 86.9 miles an hour; the flying kilometer at 77.66 miles an hour; the standing kilometer at 64.6 miles an hour; the mile standing hill-climb at 58.44 miles an hour, and 300 meters standing start on a 14 per cent. gradient at 44 miles an hour—such was the star performance of Georges Boillot on the 4.3 by 7.8 Peugeot with which he won the Grand Prix race. The records were put up in connection with the annual 4-day meeting at Boulogne-sur-Mer, when Boillot was the fastest in all the events in which he competed. Undoubtedly the best performance was the 7-kilometer race at the average of 101.53 miles an hour. This was run over a moderately-surfaced road comprising a kilometer length with a gradient of 8 per cent. The previous record over this distance was held by the 200-horsepower Darracq, having a cylinder volume double that of the Peugeot, and averaging 85 miles an hour. In this run Boillot easily defeated his fastest kilometer on a perfectly straight and level road in the grand prix at Dieppe. On that occasion his time was 99.86 miles an hour. Bruce Brown's speed over the same measured kilometer was 101.67 miles an hour. It should be noted that under the Boulogne rules the cars had to take part in all the races, from the 14 per cent hill-climb to the flying kilometer without a change of gear ratio. So far as Boillot was concerned there was no attempt to increase speed by the adoption of a stream line body, the only change from his Dieppe racing equipment being the absence of mud guards. The car was fitted with Rudge-Whitworth wire wheels shod with Continental tires.

In the 3-kilometer event, standing start, the grand prix Peugeot was alone in its class. The second best time was made by a Crespelle having a single-cylinder De Dion Bouton motor of 4 by 7.8 inches bore and stroke, which was timed in 1 minute 51 2-5 seconds, being at the rate of 60.2 miles an hour. Riviere on a four-cylinder Hispano-Suiza of 2.5 by 7.8 inches bore and stroke put up 2 minutes 6 2-5 seconds; Ramet's Gregoire occupied 2 minutes 10 1-5 seconds, and the one-lunger Cohendet 3 minutes 16 4-5 seconds. In the touring car class Joerns' Opel was the fastest with 1 minute 38 4-5 seconds, being at the rate of 67.8 miles an hour. Derny, on a 3.1 by 7-inch Hispano-Suiza, was clocked in 1:57 1-5, the other winners in their respective classes being: Leduc on S. P. A., 2:10 4-5; Rigal on 3-liter Sunbeam, 2:25 2-5; Jean Crouy, on 3.1 by 5.1 Hispano-Suiza 2:34 1-5; Morel on Motobloc, 3:56 2-5; Manfait on Delage, 4:19 2-5, and Violet on single-cylinder Violette, 4:08.

Flying Trial Shows Slower Time

For the 7 kilometers, flying start, the nearest approach to Boillot's record performance of 101.53 miles an hour, was by Guyot in 4:17 2-5, being equal to 60.7 miles an hour. The car was a 3-liter model weighing fully equipped 1,700 pounds, which had been built by Guyot and Picker to the order of a leading French factory, but which was not completed in time to take part in the Grand Prix; this was its first appearance in public. Ramel on Gregoire put up 4:55 3-5 and Antony on Cohendet 7:13. Among the tourists, Joerns was again the fastest with 3:24 3-5 for the 7 kilometers, this equalling 76.5 miles an hour. He was followed by Derny on the two-seater standard Hispano-Suiza in 4:08 3-5, the other class winners being Leduc on S. P. A., 4:40 4-5; Rigal on Sunbeam 5:18; Jean Crouy on Hispano-Suiza, 6:19 3-5; Lavie on S. P. A., 6:22 1-5; Morel on Motobloc, 9:38 4-5; Manfait on Delage, 9:23 2-5; Violet on Violette, 10:09 2-5.

The mile hill-climb at Baincthum, with an average gradient of 10 per cent., was romped up by Boillot, from a standing start, at 58.44 miles an hour; Guyot came second in the racing section with an average of 36.3 miles an hour, his time being faster than that of the cars in the higher class. Crespelle's one-lunger went up in 1:39 4-5 and Ramel's Gregoire in 2:15 4-5.

As the result of the various races Derny on Hispano-Suiza won the Franchomme Cup with 257 points, being followed by Joerns on Opel with 177 points; the same driver also won the Caraman-Chimay cup, with Joerns as his second; Joerns won the Imperial Pavillion cup outright, and Rigal on Sunbeam won the Crespel cup with 73 points, followed by Jean Crouy on Hispano-Suiza with 59 points and Jouglet on Hispano-Suiza with 41 points.

Panhard Wins Prize for Style

The meeting closed with a 500 meters race, standing start and finish, when Joerns and Rigal showed the greatest amount of skill. The time at the finish was not taken until the car was standing on the line. In most cases it was necessary to use the reverse gear in order to come to a stop on the line, but a few adopted the plan of applying all brakes and swinging round facing the direction of the starting line. The results of the elegance competition gave first place to a closed Panhard.

Electric Vehicle Association Formed

New York Dealers Combine to Foster and Stimulate Trade in That Branch of the Industry

Suitable Building, Centrally Located, Has Been Selected to House All Members of the Society

THERE are 1,800 electric vehicles in service in New York, divided on the lines of pleasure and commercial cars as follows: Pleasure cars, 400; commercials, 1,400. The growth of the pleasure car industry is measured by a very few years, while that represented by the trucks and delivery wagons is as old as the industry itself.

New York, up to the present, has never been regarded as a first rate market for electric pleasure vehicles. Only ten out of a score of manufacturers are represented in the metropolis by agencies or branch houses, while the makers of business wagons having New York representation number thirteen out of a possible eighteen.

The pleasure vehicles range from light runabouts to the most massive and impressive styles of limousines and the commercials run from wagons having a carrying capacity of 1,000 pounds to big trucks in brewery and similar service which carry rated loads of 7 1-2 tons.

The pleasure cars are largely of the enclosed type, including broughams, coupé, and a few limousines and landaulets, making up fully 80 per cent. of the total.

Heretofore, save for the efforts of about three concerns, the marketing of electric pleasure cars has been unsystematic, fitful and periodic, but despite that condition the total sale in New York has reached material figures.

In Philadelphia there are more electrics in use proportionate to population than there are in New York. In Chicago and St. Louis there are many more pleasure vehicles driven by electric power than there are in New York, but the truck figures are smaller.

The New York dealers have reached the conclusion that the time is ripe for extending the business locally and with that idea in view they completed an organizatiton last Thursday that is entirely unique in the industry.

Includes Both Trade Branches

Including both branches of the trade, the local representatives came together on Thursday and formed a corporation to be known as the New York Electric Vehicle Association, which has for its avowed objects not only the usual declared intention of fostering and stimulating the trade and for protection of its members in all the usual ways, but also the definite intention of the association is to secure a building which will house many, if not all, of the local representation.

Announcement has been made that a suitable building for the purpose has been found and that the owners have agreed to enter into a lease on a 5 per cent. basis of rental. This building is several stories high, centrally located and according to the intention of the association it will be divided among the trade as follows:

The first, or ground, floor will be used as a co-operative garage, where electric cars of all descriptions will be cared for at moderate rates. The second floor will be used as a showroom; third as a salesroom and the upper floors as offices for the various companies.

The deal is still open, but it is understood that options have been given to insure its consummation at the convenience of the new association. The project of a motor mart and co-operative garage has been long considered and the idea has been worked out to some extent in the past, but until now the auspices have never appeared to be so favorable.

The list includes the following: Anderson Electric Car Company, Detroit Electric, passenger and commercial; Atlantic Vehicle Company, commercial; Babcock Electric, passenger; Baker Vehicle Company, passenger and commercial; Champion Electric Vehicle Company, commercial; Commercial Truck Company of America, commercial; Couple Gear Company, commercial; Electric Omnibus Corporation, commercial; Flanders Manufacturing Company, passenger: General Motors Truck Company, commercial; General Vehicle Company, commercial; Healey and Company, passenger; Hupp-Yeats Electric Company, passenger and commercial; International Fritchle Company, passenger; Lansden and Company, commercial; Rauch and Lang, passenger; Studebaker Brothers Company, of New York, passenger and commercial; Walker Vehicle Company, commercial and Ward Motor Vehicle Company, commercial.

The following officers were selected to perfect the organization on a permanent basis and to start it under auspicious circumstances: Arthur Williams, president; William P. Kennedy, vice-president. The secretary and treasurer were not chosen at the meeting as it is intended to combine the offices and place their administration in the hands of a paid official of wide experience. The selection will be made by the president or executive committee.

The following board of directors was selected: E. W. Curtis, Jr., General Vehicle Company; S. W. Menefee, Anderson Electric Car Company; Nathaniel Platt, Baker Vehicle Company; C. Y. Kenworthy, Rauch and Lang; M. G. Macdonald, Hupp-Yeats; W. R. Chandler, Flanders; George H. Phelps, Studebaker; V. A. Villar, Champion; John H. Kennard, Couple Gear; W. L. Case, Lansden; Charles A. Ward, Ward, and A. B. Roeder, International Fritchle.

The executive committee consists of the following: Nathaniel Platt, C. Y. Kenworthy, S. W. Menefee and V. A. Villar.

Calendar of Coming Events

Shows, Conventions, Etc.

Sept. 5-15........San Jose, Cal., Automobile Show, San Jose Automobile Dealers' Association.
Sept. 14-21.......Chicago, Ill., Annual Fall Festival and Show, Chicago Automobile Trade Association.
Sept. 17-20.......Denver, Col., Convention International Association of Fire Engineers.
Sept. 23-Oct. 3....New York City, Rubber Show, Grand Central Palace.
Dec. 7-22.........Paris, France, Paris Automobile Show, Grand Palais.
Jan. 4-11.........Cleveland, O., Annual Automobile Show.
Jan. 11-25........New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25........Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1.....Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Jan. 27-Feb. 1.....Scranton, Pa., Annual Automobile Show, Automobile Association of Scranton.
Feb. 1-8..........Chicago, Ill., Annual Automobile Show.
Feb. 10-15........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22........Kansas City, Kan., Annual Automobile Show.
Feb. 24-Mar. 1.....Omaha, Neb. Annual Automobile Show.
Feb. 24-Mar. 1.....St. Louis, Mo., Annual Automobile Show.
March 3-8.........Pittsburgh, Pa., Annual Automobile Show.
March 8-15........Boston, Mass., Annual Automobile Show.
March 17-22.......Buffalo, N. Y., Annual Automobile Show.
March 19-26.......Boston, Mass., Annual Truck Show.
March 24-29.......Indianapolis, Ind., Annual Automobile Show.

Race Meets, Runs, Hill Climbs, Etc.

Sept. 11-14.......Buffalo, N. Y., Third Annual Reliability Tour, Automobile Club of Buffalo.
Sept. 17..........Milwaukee, Wis., Grand Prize Race.
Sept. 20..........Milwaukee, Wis., Wisconsin Challenge and Pabst Trophy Races.
Sept. 21..........Milwaukee, Wis., Vanderbilt Cup Race.
Sept. 29-30.......St. Louis, Mo., Track Races, Universal Exposition Company.
Sept. ....Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-20.........Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 21...........National Tour American Automobile Association.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Decreasing Accidents

THE fatal grade crossing has claimed over a score of victims during the past week. Whole parties have been hurled into eternity, in other cases one or two have been spared from a load to disclose the sorrowful tale of failure to hear the whistle, failure to hear any warning, or inadequate roadside warning of the concealed crossing. **So numerous are automobiles becoming that the ringing bell by day and the bell and red light by night are becoming imperative in many places.** The conventional railroad crossing sign erected by the railroad company but a few feet from the track is hopelessly inadequate as a warning to automobiles.

Modern inventions and improvements call for modern guardian factors, and while the present railroad sign a few feet from the metal rails was sufficient in the days of horse vehicles it is not sufficient today, and the legislatures or the federal government should insist on railroad companies putting up crossing signs that are adequate for the modern means of locomotion.

It is not to be expected that railroad companies will without request, without persuasion or perhaps without legislation go ahead with these necessary improvements, and it is imperative that the motorists band together and properly present their demands and secure the desired legislation. In the end the railroads would find it cheaper.

A Transcontinental Road

Discarding Swaddling Garments

AMERICA has become accustomed to the automobile people doing things. The spirit of the century is reflected in the activities of the industry. Factories have been built, equipped and started within a few short months; concerns have grown from a capacity of a few hundred cars per year to as many thousands per annum within a 3-year span; other factories have started in the thousand scale and have mounted rapidly. Selling organizations have been developed and spread over the entire country in a few months; and so throughout the industry it has been that spirit of progress that has characterized every department of the automobile field.

There remains one great field in which the automobile is vitally concerned and one in which despatch is imperative, and while this field will by some be only indirectly connected with the industry, yet to him who lifts the veil and beholds the real factors that are propelling them industry onwards with such phenomenal strides, good roads are placed high.

The plea for good roads is very much of a threadbare argument: This subject suggests the old-time convention, the table-pounding, cross-roads orator and the sleeping auditors. **Never before has the time been more opportune for road improvement than today. Where improvements have been made cars have sold as a direct result.** A new stretch of road in Florida along the east coast was directly responsible, according to local authorities, for the sale of over 100 cars. What happened in Florida has happened in Iowa and will happen in Texas, in New Mexico, in Oregon and in the Dakotas.

The good-roads movement needs more than anything else today the spirit of "Do something. Stop talking and act." Robert G. Ingersoll once remarked: "The hands that help are better far than lips that pray." The helping hand is needed more today than ever before. Every month a car starts out surveying a new transcontinental highway; the daily papers carry despatches of going through bridges; getting lost on the desert; being held up by bridge washouts; being delayed by rain on the gumbo roads, and a score of other delays, but we never read of actual road improvements, although undoubtedly local enterprise along the line of route must be operating, yet these local activities have not yet been united into a tangible whole. Help is what is needed.

There have been enough of routes, enough of getting lost, enough of delays, but not enough actual work. What is needed is stone—crushed stone, along the roadside so that it can be put on the road. Stone is needed from the Atlantic to the Pacific, and if the automobile world expects to get this ribbon of stone from ocean to ocean within the next decade it is imperative that it take up the white man's burden and provide the stone.

Already an embryonic movement in this direction has been started, but it is yet uncertain as to the actual materialization of the scheme. **Conceived in In-**

diana is the plan of raising $10,000,000 from the automobile makers, dealers, owners and accessory manufacturers. Each maker and dealer is asked to give one-third of one per cent. of his gross receipts each year for 3 successive years. An owner may give $5, $100, $1,000 or any other sum. **In this way over $10,000,000 can be raised. This is enough money to buy crushed rock to cover a 3,300-mile road from New York to San Francisco and to deliver this rock at the railroad siding nearest to the point of use.** This is all that is proposed to be done by automobilists. The counties and states must sign contracts to do the road building under engineering supervision. The money is to be raised in 3 years and the road completed in that length of time.

This is one of the best good roads suggestions that has occurred. It is to be hoped that it goes through. It will, if the automobile manufacturers are awake to the signs of the times and if the men at the helms of of the big industries realize, and have properly weighed, the big factors that go to make up the successes of the industry.

If a stone road could be built from ocean to ocean in 3 years on these lines it would be the greatest incentive to good roads that America ever witnessed. It would advertise the automobile industry as no other movement has done since the inception of the industry. It would interest the farmer in the motor car and would bring home to him the value of good roads to such an extent that other transcontinental routes would be started, feeders to these lines would be opened, etc. In a word, road building would throw off its swaddling garments and take on the attributes of an adult.

Country's Crops Show Big Gain

Wheat Is Expected to Total Over 700,000,000 Bushels While Corn Will Certainly Make 3,000,000,000

THERE will be over a bushel of potatoes, more than there was last year for every man, woman and child in the United States, according to the September crop report issued by the government covering, not only potatoes, but all other crops.

Final figures will probably show a gain over the official figures, as ideal crop weather has been enjoyed since the tabulations were made. Corn will certainly go over the 3,000,000,000 bushel mark, and, while wheat is made as a harvest, it is expected that the official figures of 690,000,000 bushels will be raised to a full, round 700,000,000 by the fine threshing weather and its tendency to keep down waste.

It was estimated in THE AUTOMOBILE last month that the total revenue of the farmers this season would be $1,200,000,000 greater that it was in 1911. **These figures are below the mark** indicated by the latest report. Based upon current prices, the increase over last year should be in the neighborhood of $1,500,000,000. The figures are as follows:

	Sept., 1912.	1911.
Winter Wheat—		
Bushels	390,000,000	430,656,000
Acreage	25,744,000	29,162,000
Spring Wheat—		
Bushels	300,000,000	190,682,000
Acreage	19,201,000	20,381,000
Total Wheat—		
Bushels	690,000,000	621,338,000
Acreage	44,945,000	49,543,000
Corn—		
Bushels	2,995,000,000	2,531,488,000
Acreage	108,110,000	105,825,000
Oats—		
Bushels	1,290,000,000	922,298,000
Acreage	37,844,000	37,763,000
Rye—		
Bushels	36,000,000	33,119,000
Acreage	2,097,000	2,127,000
Barley—		
Bushels	209,000,000	160,240,000
Acreage	7,754,000	7,627,000
Buckwheat—		
Bushels	18,000,000	17,549,000
Acreage	835,000	833,000
Potatoes—		
Bushels	398,000,000	292,737,000
Acreage	3,689,000	3,619,000
Tobacco—		
Pounds	976,000,000	905,109,000
Acreage	1,194,200	1,012,000
Flaxseed—		
Bushels	29,000,000	19,370,000
Acreage	2,992,000	2,757,000
Rice—		
Bushels	23,000,000	22,934,000
Acreage	710,000	696,000
Hay—		
Tons	72,000,000	55,000,000
Acreage	49,209,000	43,017,000

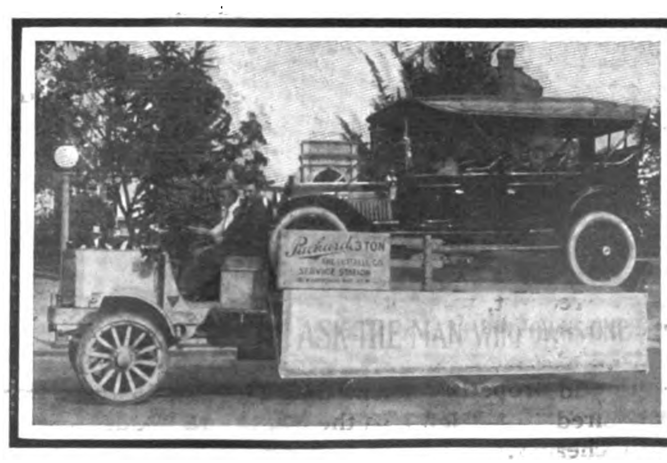
Washington Has Truck Parade

More Than 300 Cars Were in Line—Great Enthusiam Was Displayed By the Large Crowds of Spectators

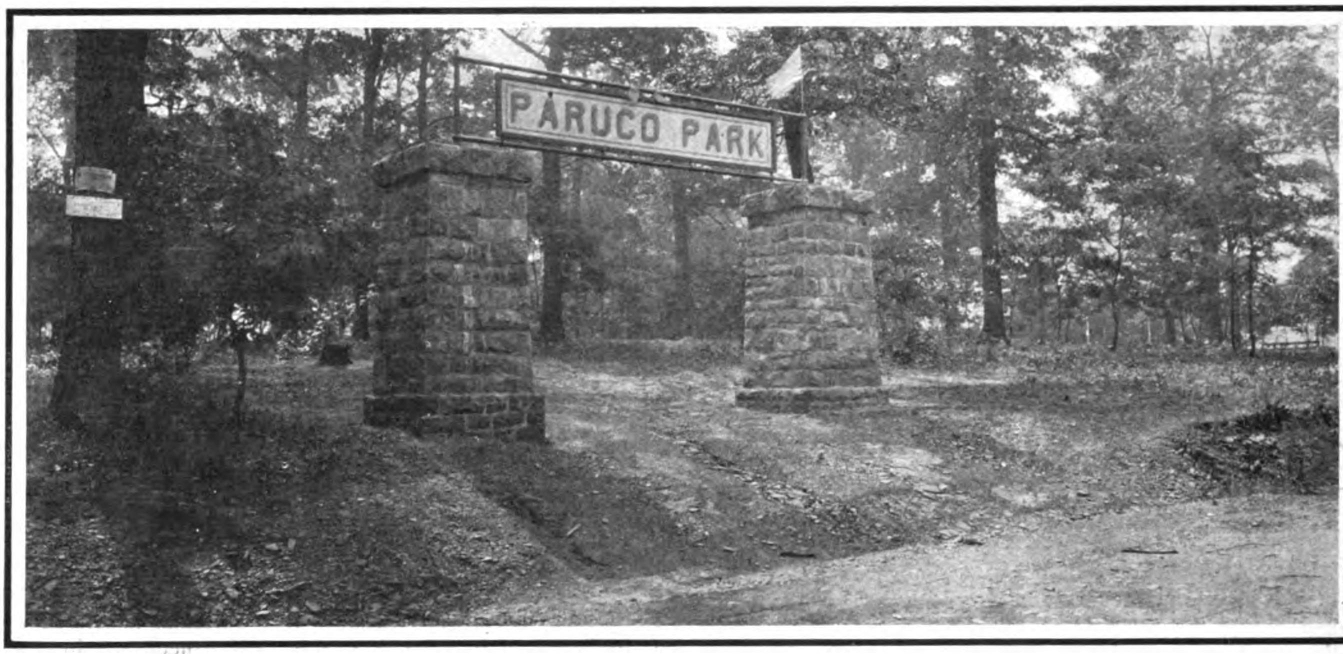
WASHINGTON, D. C., Sept. 7—Washington Labor Day in automobile circles was made conspicuous by the truck parade given under the auspices of the automobile department of the Washington *Post*, which brought out such an array of machines as has seldom, if ever, been seen in the East. The streets of Washington were crowded with on-lookers before the parade started and as the procession wound its way along the route selected, the enthusiasm was contagious. In local motoring circles the pageant was given the heartiest possible indorsement. More than 300 cars formed the line of the parade and the decorations were of such a character as to indicate much trouble and expense on the part of the participants. Prizes had been offered for two classes, one for the decorated division, the other for the non-decorated division. S. S. Grogan acted as official scorer and there were five judges.

Practically all the manufacturing companies were represented by one or more cars in line. The Wilcox Trux Company won a handsome silver loving cup offered by the Washington *Post* to the company having the greatest number of cars in line. The Wilcox people entered thirty-seven machines.

The Studebaker Corporation of America was second, with twenty-one cars in line. The Ford people had sixteen entries, coming third.



Packard display in Washington truck parade



Entrance to Paruco Park, pleasure ground recently opened for the use of employees of the Pennsylvania Rubber Company, Jeannette, Pa.

PENNSYLVANIA Rubber's Park Opened—Paruco Park, the pleasure ground for the employees of the Pennsylvania Rubber Company, Jeannette, Pa. Over 1,000 of the rubber company's men and their friends were present to inspect the new park and listen to the entertainments of the afternoon. The above photograph gives a view of entrance to Paruco Park.

Ferguson with Carter Car—Don Ferguson has severed his connection with the Studebaker Corporation to accept the position of chief engineer with the Carter Car Company of Pontiac, Mich.

Betts on Buffalo Club's Board—C. Walter Betts has been elected member of the board of directors of the Automobile Club of Buffalo, Buffalo, N. Y., succeeding E. R. Thomas, who has resigned.

Currier Joins American—R. B. Currier, who was formerly connected with the Interstate Sales Agency of Columbus, O. has accepted the position of chief inspector for the American Motor Car Company, Indianapolis, Ind.

Outdoor Show at St. Louis—There are in St. Louis eighty-three automobile manufacturers and dealers and all but two of these will have exhibits at the out-door show which will be held here at one of the summer gardens the week of October 7.

Stockfisch with Texas Oil—John M. Stockfisch, formerly with the Havoline Oil Company as New York division manager, has resigned to accept a position in a like capacity with the Texas Oil Company, 17 Battery Place, New York City, manufacturers of Texaco Oils.

Lu Lu Sociability Run—The second annual sociability run of the Lu Lu Temple Automobile Club, a motor car organization born in July of last year, will be held on September 21 to Atlantic City, N. J. Sterling silver prizes will be awarded the four participants finishing nearest the secretly computed time.

Chauffeur Tax Amounts to $1,000,000—According to statistics just made public by Secretary of State Lazansky, of Albany, N. Y., the tax levied on chauffeurs and motor vehicles for the fiscal year ending on September 30 will total $1,000,000 The greatest gain in any one year in the tax receipts was last year owing to introduction of motor trucks into business but last year's figures will be surpassed by this year's tax.

Atlanta Show Space Taken—At a meeting of the Atlanta Automobile and Accessory Association, Atlanta, Ga., held recently 19,850 square feet of floor space in the Atlanta Automobile show of November 16-23, was engaged and checks for 25 per cent. of the amount due were paid in. This means that more space has already been subscribed for than was used last year and that the financial success of the show is assured.

Advocates Motor Truck Service—Delegated by Mayor Blankenburg of Philadelphia, Pa., to study the high cost of living problem and make suggestions for amelioration of present conditions, Professor Clyde L. King, of the University of Pennsylvania, advocated the encouragement of motor truck service between the source of supply and consumer as one of the avenues of economy, high transportation charges figuring as one of the chief items of expense.

Chase at N. Y. State Fair—At the New York State Fair at Syracuse, N. Y., the Chase Motor Truck Company will have an exhibit of its machines and will also entertain its district managers that week, including F. B. Porter of New York, C. K. Thomas of St. Louis, E. F. Howell of Philadelphia and E. B. Curtiss of Cleveland. W. C. Van Sant, for several years western salesman, has been made district manager for the Pacific Coast with headquarters in Los Angeles.

New Agencies Established During the Week

COMMERCIAL VEHICLES

Place	Car	Agent
Syracuse, N. Y.	Federal	A. J. Jackson
Toledo, O.	Moore	Fred Kopf

Has Stutz Cleveland Branch—Harry S. Moore has been appointed special factory representative and general manager of the Stutz Motor Car Company, Indianapolis, Ind., in Cleveland, O.

Locomobile Makes New Record—The Locomobile broke the record for an automobile trip from Denver to Chicago, a distance of over 1,200 miles, Leo Galitzke driving. The actual running time was only 39 hours and 25 minutes.

Champion Manager Louisville Diamond—Henry Champion is the new manager of the Louisville, Ky., office of the Diamond Rubber Company. He succeeds L. G. Haskell, who has joined the sales force of the Leyman Motor Company.

Zilio Agency in Louisville—The Zilio Sales Company, Louisville, Ky., has acquired the general agency for the Zilio tire filler in Kentucky, Southern Indiana and North and South Carolina. This concern has opened an office in the Courier-Journal building in Louisville.

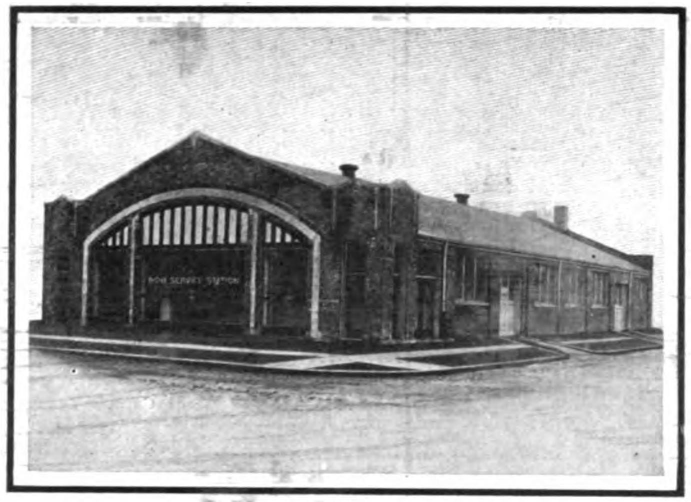
Hunting in Africa with an R-C-H—Big game tracking over the brush grown veldt of Africa is an exhilarating sport according to D. C. Morrison of the Rewika Ranch, Kyambu, British East Africa. The accompanying photograph shows him hunting in almost shoulder high grass with his R-C-H.

Tennant to Enter Own Business—W. G. Tennant, a pioneer in Gotham automobile circles and well known as head of the Peerless Motor Car Company of New York City, has resigned to assume active management of the Tennant Motor Limited, Chicago, Ill., distributors of The Henderson.

Henshaw Resigns from Thomas—It is announced that C. S. Henshaw has resigned as manager of the Thomas Motor Company of New York to take effect in the near future. It is not known at the present time what course Mr. Henshaw is to follow. He has been prominently identified with the automobile industry since the very inception, his name having been linked with well-known concerns, particularly the Thomas, for years. His permanent residence is Belmont, Mass.

Wolverine Club After Members—President Porter of the Wolverine Automobile Club states that the taking in of the club by the Automobile Association of America is assured. The latter body has made the Wolverine Club a proposition which will be voted on and accepted at the latter's next meeting the last Thursday in the present month. The new club house proposition is also assuming a favorable aspect. To date 560 members have been enrolled under the new arrangement which exacts that each take $100 worth of stock in the new house. From now on a systematic canvass for members will be instituted and the club members feel assured that by the first of the year the necessary 1,500 membership will have been secured. Many representative figures here in the industry have already been added to the membership list.

D. C. Morrison, of the Rewika Ranch, Kyambu, British East Africa, uses his R-C-H runabout for hunting big game



R-C-H service station recently opened in Detroit, Mich.

R-C-H Detroit Service Station—The new service station of the R-C-H Corporation, Detroit, Mich., is shown in the accompanying photograph. It will be used to supply replacements and the storing of cars on order. Each district manager will have his headquarters in the service building and from this point the road men will make trips through the territory.

VortKamp Sales Manager Mayer—Mr. H. F. VortKamp has joined the Mayer Carbureter Company, Buffalo, N. Y., in the capacity of sales manager. His offices will be in Detroit, Mich.

Oakland Philadelphia Branch—The Oakland Motor Car Company, Pontiac, Mich., will establish a branch in Philadelphia to succeed the Oakland Company of Pennsylvania. The branch will be in charge of Edward K. Leech.

Ruckert Spokane Goodyear Manager—W. C. Ruckert has been appointed Spokane, Wash., manager of the Goodyear Tire & Rubber Company, succeeding C. B. Clement, who has joined the Studebaker agency in Portland, Ore.

Abbott-Detroit's Heavy Load—An Abbott-Detroit recently in Byers, Tex., pulled three heavy farm wagons, a surrey and two buggies linked together. In the vehicles were 78 persons. The total weight pulled was nearly 14,000 pounds.

Jurgewitz Is Portland Manager—H. A. Jurgewitz has been appointed Portland, Ore., manager of the Goodyear Tire Company. He succeeds W. T. Powell, who has been made Pacific Coast district manager for the Goodyear people with headquarters in San Francisco.

Indiana State Fair's Show—The automobile show held in connection with the Indiana State Fair in Indianapolis, September 2 to 6, proved quite successful, a satisfactory number of sales being reported. About 140,000 people visited the fair during the week.

Wilkie to Manage Buick—Edward Wilkie has been appointed manager of the Buick Motor Company's branch in Washington, D. C., succeeding T. S. Johnston, who resigned to accept the position of Southern sales manager for the Republic Motor Company.

Many Cars Entered—The Portland-Astoria-Gearhart automobile tour of September 1-2, the official run of the Portland Automobile Club to boost the proposed Portland to the Sea highway is attracting much attention and upwards of 100 machines have signed for the run.

Gibbons Consulting Engineer—Mr. N. B. Gibbons, A.M.I. Mechanical Engineer, has commenced business on his own account as consulting engineer in Montreal, Canada. In addition to engineering practice Mr. Gibbons will specialize in automoble and motor boat work.

Wilmington Patrol Economical—An interesting statement was issued recently showing where the police department of Wilmington, Del., saved $655.20 during the past year in its patrol operation due to the substitution of an automobile for two horse-drawn vehicles and four horses.

Willman Sales Manager Warren—G. L. Willman has been promoted to the office of sales manager for the Warren Motor Car Company, Detroit, Mich. He succeeds George D. Wilson, who has gone to New York City as eastern representative of the Warren Company.

Bull Moose Squadron Starts—A flying squadron of automobiles equipped with a street piano, a printing press and other novel features, started from the Progressive State Headquarters in New York City recently for Syracuse, N. Y., where the State Bull Moose Convention is to be held in the Arena.

Forms Owners' League—The Automobile Owners' Protective League is the name of an organization now being formed in Dallas, Tex. More than 400 automobile owners have already joined the organization. The object of this league as outlined by O. H. Bettes, manager, will be co-operative.

New British Truck Company—The British Business Motors, Ltd., Coventry, England, has just been formed to manufacture the Cunard commercial vehicles. Mr. H. G. Burford is managing director and his co-directors are S. F. Edge and H. T. Vane, general manager of S. F. Edge, Ltd.

Taxpayers Want Good Roads—Taxpayers of Baltimore county filed a bill in the Circuit Court of Towson against the Maryland State Roads Commission asking that the commission be required to expend in Baltimore county $300,000 of the $3,170,000 road loan authorized by the last Legislature.

Want to Build Cars—Joseph E. and August J. Hoffweber, of La Crosse, Wis., are negotiating with capital in several industrial centers of Wisconsin for the financing of a company which has been incorporated under the style of Hoff Motor Car Company, capital $500,000, to manufacture a line of pleasure cars.

Moorhead Run Success—Nineteen automobiles participated in the annual sociability run of the Moorhead, Minn., Automobile Club recently. The run was from Moorhead, south along the Minnesota side of the Red River of the North to Breckenridge and then to Wahpeton, N. D. The roads encountered on the trip were excellent.

Automobile Incorporations

AUTOMOBILES AND PARTS

BALDWIN, N. Y.—Acme Motor Rental Company; capital $5,000; to conduct an automobile livery business. Incorporators: George Wintjen, Adam Weiselbach, Allen C. Ewing.

BUFFALO, N. Y.—International Motor League, Inc.; capital, $1,000; to deal in motorcycles, automobiles, motor vehicles. Incorporators: Julius J. Eyring, Frederick A. Hipp, Henry C. Aman.

COLUMBUS, OHIO.—The Pharis Tire & Rubber Company; capital, $25,000; to manufacture and sell automobile and motorcycle tires. Incorporators: Carl Pharis, Roy W. Pharis, Emma W. Pharis, Mabel A. Pharis, Clara Weiler.

DUNKIRK, N. Y.—Dunkirk Specialty Company; capital, $5,000; to manufacture and sell gasoline, oil tools, implements, etc. Incorporators: P. C. Candee, Seth B. Culver, Justus M. Henderson.

FORT WORTH, TEX.—Tire Filler Company; capital, $110,000; to manufacture tire filling material. Incorporators: J. A. Reynolds, N. M. Pressley, H. B. Lyne.

SKANEATELES, N. Y.—The Skaneateles Garage Company; capital, $6,000: to carry on a garage business. Incorporators: George D. Cuddeback, Edward J. Scott, Florence K. Scott.

NEW YORK CITY, N. Y.—United Tire Sales Company; capital, $500; to sell tires. Incorporators: A. G. Thaantım, Joseph T. Weed, Max Greenberg.

NEW YORK CITY, N. Y.—S. Whyle Merritt Company; capital, $10,000; to deal in motors, engines, etc. Incorporators: S. W. Merritt, Clyde V. Morse, Paul Thamm.

PORT CHESTER, N. Y.—Lowden & Flint's City Garage, Inc.; capital, $3,000; to carry on a garage business. Incorporators: Clifford H. Flint, Grace M. Flint, Arthur B. Lowden.

Dahl Tire's New Headquarters—The Dahl Punctureless Tire Company of America will, on or about September 1, have its headquarters at 246 West Fifty-ninth street, New York City.

Franklin Taxicabs in Texas—A fleet of four Franklin taxicabs has just been purchased by the Franklin Taxicab Company, San Antonio, Texas, and will be put into active service within the next two weeks.

Too Many Road Signs—The Motor Club of Harrisburg will shortly take up the question of having certain signs along different highways eliminated. In the opinion of many autoists there are too many signs in some sections.

Ford Quick Lunch Counter—Zack Benn of Anacortes, Wash., has recently transformed his Ford touring car into a traveling quick lunch counter, and has equipped it with electric lights, refrigerator and all other necessaries.

Road Improvement in Maryland—Contractors have begun work on improvement of the Frederick road from Irvington to Bishop's Lane, Catonsville, Md., the improvements to be of macadam. This stretch of road is three miles and will cost $20,000.

Odd Use of Studebaker Car—The accompanying picture shows a Studebaker car used by J. W. Kain of Chicago, Ill., who is in the saw filing business. Though very novel in design, still it is very practicable as it covers more than twice the amount of territory of a horse.

Dallas Leading Texan Automobile City—The four thousandth automobile license to be issued from Dallas, Texas, will be given out next week. This ranks Dallas as the leading automobile city in the state, and gives over a thousand licenses more than any other city in Texas.

Denby with Federal Motor Truck Company—Garvin Denby, brother of Senator Edwin Denby, has resigned his position as assistant to the president of the Solvay Process Company to assume the position of sales manager of the Federal Motor Truck Company, Detroit, Mich.

Ford Company Buys Block—The Ford Motor Car Company of Chicago, Ill., has completed the purchase of an entire block of land in that city. The company will build a five-story building on this site, which will be used as a warehouse, garage and assembling plant and will contain the show and salesrooms.

New Dahl Tire Company—The Dahl Punctureless Tire Company of America has been incorporated under the laws of South Dakota. It will take over the business which has been established and organized by the Dahl Punctureless

J. W. Kain, of Chicago, uses his Studebaker in business

Tire Company of Minnesota and will carry on and extend the business throughout the world.

Wilby on Across-Canada Tour—Thomas W. Wilby recently started from Halifax, N. S., on an auto trip which he plans to end at the western coast of Vancouver Island. In making this across-Canada trip Mr. Wilby aims to demonstrate the feasibility of a Canadian highway. He is traveling under the auspices of the Canadian Highway Association.

San Francisco Garage Opened—The Pioneer Automobile Company of San Francisco opened its new branch in Oakland during the past week. The new building is a spacious structure with a large frontage on Twenty-fourth street, well lighted and affording plenty of room for service department. C. A. Penfield is manager of the Oakland branch.

Cutting Pathfinder Chicago Tour—A Cutting, 1913 model, has been selected as the pathfinding car for the Chicago reliability run, which will start October 7 and end October 11. The car left Chicago Wednesday, September 4, and has 1,000 miles of northern Illinois and eastern Iowa to cover. L. J. De Broux, of the Dan Dodge Company, distributors for Cutting cars in Illinois, is driving the pathfinder.

British Columbia's Large Registration—Figures supplied by the provincial police of Vancouver, B. C., who handle automobile licenses for the province, show that 3,568 machines have been registered in British Columbia. Of these it is estimated that about 1,800, or a little more than half, are issued from the Vancouver office, covering the city of Vancouver, New Westminster, North and South Vancouver and all the adjoining municipalities.

Franklin Sales Increase—The record of Franklin dealers during the past selling year which closed on August 31 shows a steady increase according to a report from the office of the Franklin Automobile Company. For January, 1912, sales were 86 per cent. over sales for the corresponding month last year; for February 100 per cent., etc. July and August, the dull summer months showed an increase of 435 per cent. and 330 per cent. respectively.

A Mighty Michigan's California Branch—The distribution of the Mighty Michigan cars for 1913 in California, Nevada, the Hawaiian Islands and the Orient will be made by the Michigan Motor Car Company's California branch, a $1,000,000 corporation just organized. The organization and its big enterprise is the result of a visit to the East by C. P. Kiel. The following officers were elected for the new concern: V. L. Palmer, president; F. B. Lay, Jr., first vice-president; W. H. Cameron, second vice-president; G. H. Daugherty, third vice-president; C. P. Kiel, treasurer and general manager; C. C. Boob, secretary. The above with the son of C. P. Kiel constitute the board of directors.

Automobile Incorporations

RICHMOND HILL, N. Y.—Dillman-Melin Motor Company; capital, $20,000; to manufacture motors. Incorporators: William C. Dillman, Richard A. Dillman, Bero W. Melin, W. J. Bissell, Fred J. Hoerlein.

VANCOUVER, B. C.—Pacific Auto Company; capital, $500,000; to engage in the taxicab business. Incorporators: Noel Humphreys, G. M. Gibbs, A. S. French, J. L. Langan.

ACCESSORIES AND GARAGES

BUFFALO, N. Y.—Continental Motors Corporation; capital, $100,000; to manufacture motors. Incorporators: Gordon F. Matthews, Frank V. Whyland, Allen E. Choate.

CINCINNATI, O.—The Ideal Steel Wheel Company; capital, $500,000; to manufacture a patented automobile wheel. Incorporators: J. B. Fitch, E. H. Maffey.

FORT WAYNE, IND.—Drage-Harris Motor Truck Sales Company; capital, $10,000; to manufacture motors. Incorporators: Frank A. Drage, D. H. Harris, Herbert L. Somers.

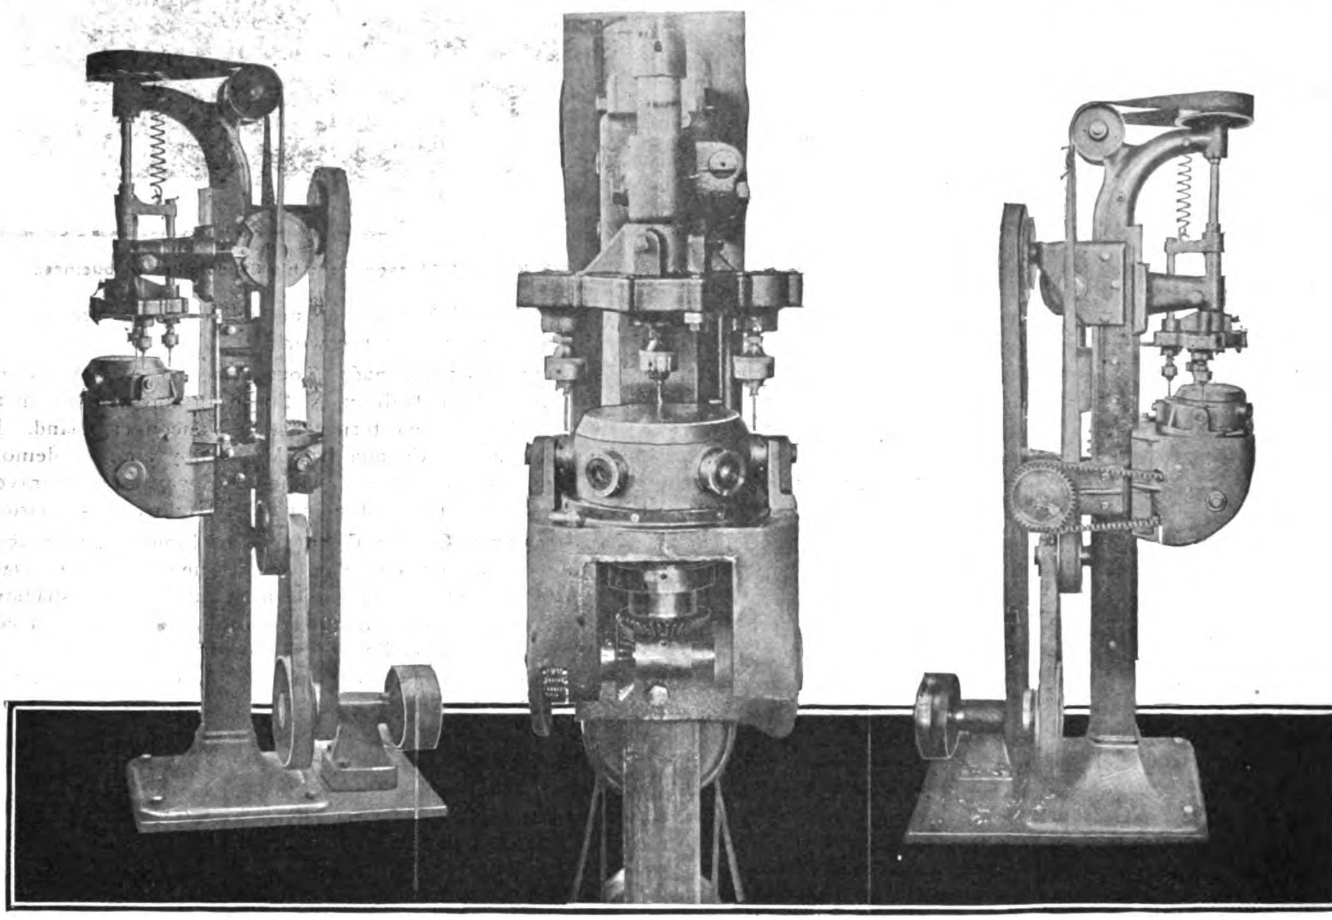
LA CROSSE, WIS.—Hoff Motor Car Company; capital, $500,000; to manufacture automobiles and motor vehicles. Incorporators: Joseph E. and August J. Hoffweber.

NEW YORK CITY, N. Y.—The Salvini Electrical Horn Manufacturing Company; capital, $50,000; to manufacture automobile horns and supplies. Incorporators: Edwin Salomon, Godfrey S. Salomon, Salvatore Salvini.

SOUTH BEND, IND.—Manufacturers' Plant & Power Company; capital, $20,000; to manufacture auto bodies. Incorporators: S. W. Nicholson, J. C. Paxson, V. E. Paxson.

CHICAGO, ILL.—The German American Car Company; increase of capital from $500,000 to $700,000.

Factory Miscellany



Automobile cap screw drilling machine recently perfected by the H. H. Franklin Manufacturing Company, Syracuse, N. Y.

The above illustration shows a machine that allows one man to do the work of four. Its purpose is to drill holes in cap screws and it can drill 2,000 of these in a working day. The machine was designed and constructed entirely within the Franklin company's tool department. Formerly it took four machines to drill a cap screw. Each of these machines drilled but one hole at a time and it took 2 minutes to drill the holes in one cap screw. The new machine drills three cap screws at one time and will turn out more than three in a minute. This one machine is capable of taking care of all the cap screw drilling for the entire Franklin output. The turret holding the cap screws which is plainly shown in the illustration is capable of holding five at one time. There are three drills and each one drills a hole through the cap screw. After the hole has been drilled, the drill is automatically drawn out, the turret turns, bringing the cap screw into position for the next hole to be drilled. In this way the cap screw finally has a hole drilled by each of the three drills. After the third drill has been used the turret again turns and the cap screw is ejected automatically from the machine. All that the man who attends to the machine has to do is to insert a new cap screw in the hole after each one has been ejected. The turret revolves through an arc of 72 degrees each time to bring the cap screw into the correct position for the next drill. The cap screw itself turns through an arc of 120 degrees around its own axis as the three holes are spaced equally about its circumference. The turret is turned about by a cam which gives an entirely automatic motion to both the turret and to the cap screw. The ejection of the finished piece is effected by an automatic spring plunger. At the back of the turret there is a guide which holds the three cap screws in position.

CHALMERS Factory Addition—The cut on page 557 shows the site of the new Chalmers building, which will be a four-story reinforced structure. This building, which will take care of the inspection department and part of the final assembly, was commenced on August 1. It is expected that it will be ready for occupancy by November 15. It will have a floor space of 55,000 square feet.

American Capital Foreign Knight—American enterprise, capital, designs and manufacturing details, combined with foreign financial support, are to be big factors in the production of a new Knight-engined automobile in a modernly equipped factory at Turin, Italy. With cylinders cast en bloc, worm-driven rear axle, wire wheels, chain-driven gear box, electric lighting and electric self-starting systems, the Knight car made in Turin will feature innovations that are expected to make a big stir abroad.

New R-C-H Coupé Announced—The R-C-H Corporation announces a new coupé, built to accommodate three persons, the body being very roomy and handsomely finished. The standard R-C-H color scheme, red and black, is continued in the exterior finish, while the interior upholstering is a dark gray whipcord. Each window is provded with silk shades to match the upholstering. The body is mounted on the regular R-C-H 110-inch wheelbase chassis as in the touring car and long wheelbase roadster. The equipment includes five electric lights with 100-ampere hour Exide storage battery, 32 by 3½ non-skid tires, all around, Warner Autometer and demountable rims. On the rear deck is mounted a 26-gallon gasoline tank and a large trunk with a slip cover. With each car a patented locking tire holder and extra demountable rim is also furnished. Taken all in all, the new model is a car which, for both finish and performance, can be relied upon to give consistent service and distinguished appearance under all sorts of conditions.

Canadian Top Manufacturer—Richiss & Paterson have commenced the manufacture of automobile tops at Saskatoon, Canada.

Rubber Company Builds Addition—The American Hard Rubber Co., College Point, N. Y., contemplates erection to its plant of a three-story brick addition costing $30,000.

To Manufacture Parts—The Columbus Auto Parts Company has located in Columbus, Ind. The purpose of the company is to manufacture automobile parts. Its capital is $250,000 and the principal members are F. H. Penfield, F. Goodwell, B. S. Dean and J. I. Handley.

Niagara Now Ready to Move—The Niagara Gasoline Motor Company has raised the remaining $4,000 which were necessary last week to provide the amount of $50,000 needed by the company for removing its plant. The factory is at present at Buffalo, but will soon be transferred to Dunkirk, N. Y.

New St. John Factory—A St. John, Canada, factory may be turning out automobiles by March 1. The Maritime Car Company has awarded the contract for the erection of the three large concrete buildings which will comprise this factory at Coldbrook, and the work is to be completed by the first of next February.

Detroit Steel Company's Addition—The Detroit Pressed Steel Company will soon commence operations on an addition to its plant, which is to be one story in height and measure 100 by 200 feet. The increased factory space will allow the concern to triple its output, which is said to be necessary, due to the rapidly increasing business.

Castings Company Erects Foundries—The erection of a foundry has been begun at Pontiac, Mich., by the Pontiac Auto Castings Company, composed of men from Detroit and Muncie, Ind. The company will engage in the manufacture of brass castings for automobiles and later iron and aluminum work will be added to the output. The company is capitalized at $15,000.

Indianapolis Improving Roads to Plant—In keeping with a promise made the company some time ago, the city of Indianapolis is improving the Crawfordsville road from Indiana avenue to the Emrichsville bridge across Fall Creek in order to provide a passable highway for the Prest-O-Lite Company on the way to the company's new plant near the Indianapolis Motor Speedway.

Jackson Canadian Factory Branch—The Jackson Automobile Company, Jackson, Mich., is reported to be considering the location of a Canadian branch of its factory in Bartonville, Ont. Peter Christopher, the Jackson agent in Hamilton, states he has heard talk of the possibility of this firm locating in Bartonville, but has had nothing definite from the company at Jackson, Mich.

Addition to Fire Engine Company—Plans have been completed and work is to begin at once on the new addition to the American-LaFrance Fire Engine Company, Elmira, N. Y. The annex is to be 100 feet long by 25 feet in width, total cost to be $10,000. Contract for the structure has been awarded the Johnson Concrete Co., Sayre, Pa. Orders have been issued to rush work on the building and have it completed in 60 days from date.

Sterling Automobile Company Organized—The Sterling Automobile Company, Pontiac, Mich., has been organized to manufacture six-cylinder automobile engines. The initial output will be taken by the Little Motor Car Company of Pontiac, Mich., which is preparing to place a six-cylinder machine upon the market next January. The new plant will be equipped with modern machinery made especially for the company. Local capital is invested in the enterprise and W. C. Durant is heavily interested. It is expected the company will be able to begin operations before the close of the present year.

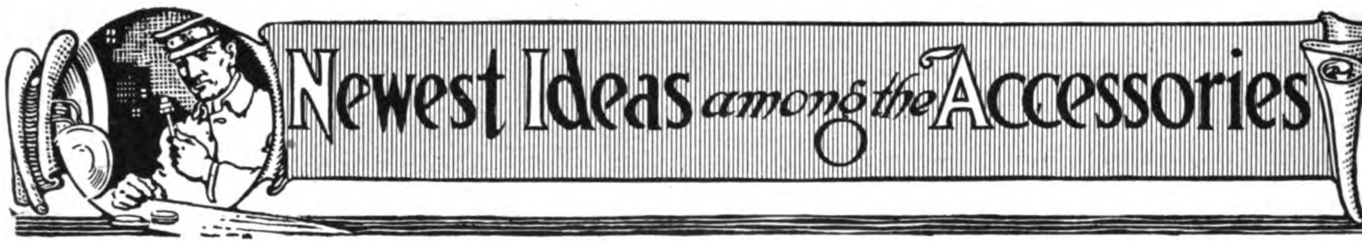
Spring Company's Factory Additions—The Hess-Pontiac Spring & Axle Company, Pontiac, Mich., is constructing additions to its factory which will double the output. It is expected ultimately to arrange the factory so that the steel may come into it at one end and emerge as finished product at the other. At present the company enjoys the distinction of being probably the greatest manufacturer of automobile springs exclusively in the world.

Nine-Hour Working Day—The Aluminum Castings Co.'s two local plants in Niagara street and Elmwood avenue, Buffalo, N. Y., commencing on October 1 will put its entire business on a 9-hour basis. The original intention of the concern, according to Manager Adams, was to put the nine-hour day into effect on May 1, but the strike of the molders and coremakers in the plants prevented this. The company will continue to maintain a strictly open shop, as the officials believe this is the ideal way to pay high wages, thus giving every man opportunity to be remunerated according to ability and not to be paid stipulated salaries.

Overland's Fire Alarm System—What is claimed by fire insurance underwriters to be the most complete fire alarm system to be found in any manufacturing plant in this country is that recently installed throughout the Willys-Overland plant at Toledo, O. The installation of this system cost the organization $12,000. There are 82 alarm stations throughout the factory and offices. Over 25,000 feet of copper wire was necessary to complete the system and all of the wire was run through conduits. In connection with the fire alarm system is a well trained fire brigade composed of employees of the company. The headquarters of the system is in the new transformer building recently constructed inside the plant and by colored incandescent lights the location of any fire is immediately flashed on the lighting board.

Stegeman in New Plant—The Stegeman Motor Car Company, Milwaukee, Wis., manufacturing a line of commercial vehicles in 1 to 6-ton sizes, is now comfortably located in its new works in Bay View, Milwaukee. The general offices are at 606 Linus street. The new works give the company an annual capacity of 500 trucks, including motor fire and police apparatus, in which line the company has made remarkable progress. A campaign for new agencies has been started by President Oscar Stegeman. The company has been in business 3 years and until now was located at 1148-1172 Holton street.

Recent addition to the Chalmers factory in Detroit



Wear-Compensating Casing; Small and Very Useful Tool; New Toilet Case for Tourists; Construction of Klaxet; Double Insulation Plug; Oil Gauge for Fords; Applas Curtains

M and M Tire Casing

ANTICIPATING the wear a casing is bound to undergo, the M and M Tire Company, Inc., Trenton, N. J., has designed a casing, Fig. 1, in which the inner surface section of the tread portion is shaped convex. This form of the casing compensates for the wear in the following manner: As the tread wears off, the convex section is pressed outward by the inflated inner tube and gradually assumes a flat and then a concave surface. The convex side portions of the casing are so designed in order to counteract flexure, which is very great along the side of the casing. The tire casing is made, according to its manufacturer, of the best grades of rubber and cotton fabric, and is guaranteed to last and serve for from 5,000 to 8,000 miles.

Morgan Combination Tool

B. Morgan, Newport, R. I., has devised a combination utility tool which is as simple in construction as it is manifold in possibilities of application. It consists of few, strong parts; a foot, an upright secured to it, a nut turning on the latter and located within a yoke which is a part of a movable clamp. This clamp and the foot are slotted. The nut is operated by a ratchet lever which works within an arc of 240 degrees. All parts except the nut, which is of brass, are made of hard steel. Among the numerous applications to which this tool may be put are those of a hand vise, drill jig, vulcanizing clamp, valve lifter, wrench or light jack. It is being manufactured in two sizes to fit the toolboxes on various cars.

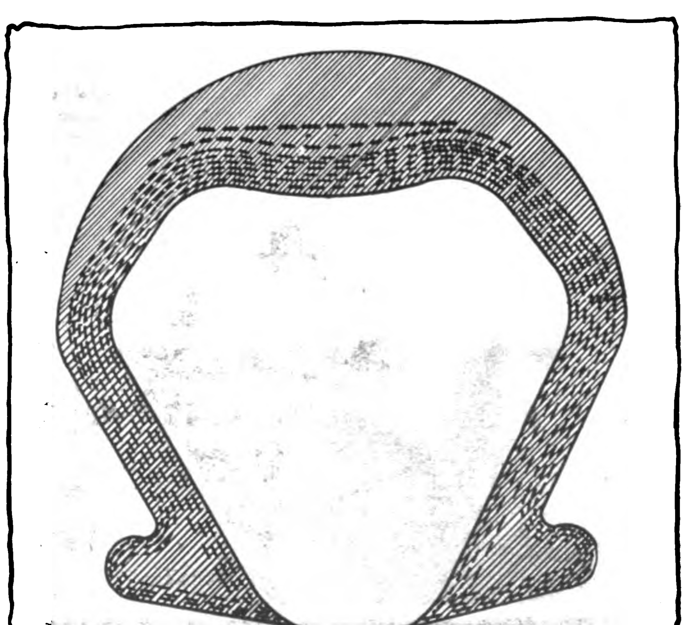


Fig. 1—Sectional view of wear-compensating casing

Bussert Automobile Toilet Case

To provide increased comfort for automobile tourists, T. J. Bussert, 5433 Russell avenue, Los Angeles, Cal., has constructed a portable toilet case, Fig. 4, which is attached to the running board of the automobile and contains whatever small articles are required by automobilists going on a tour lasting for several days. The case is a box which has a door hinged to one side of it, and when this door is opened a mirror hinged to the top front edge of the case becomes available. The latter may be locked in place by a screw moving in a guide. The back wall of the box has two interior extensions dividing it into three compartments, the upper and lower of which provide spaces for useful small accessories. The middle compartment is filled by a water tank W from which the water is taken through a small cock. To the wall of the lower compartment a board is so hinged that it may be put in place horizontally to provide a base for the washbasin B which, when the case is not in use, is secured to the tank by hooks.

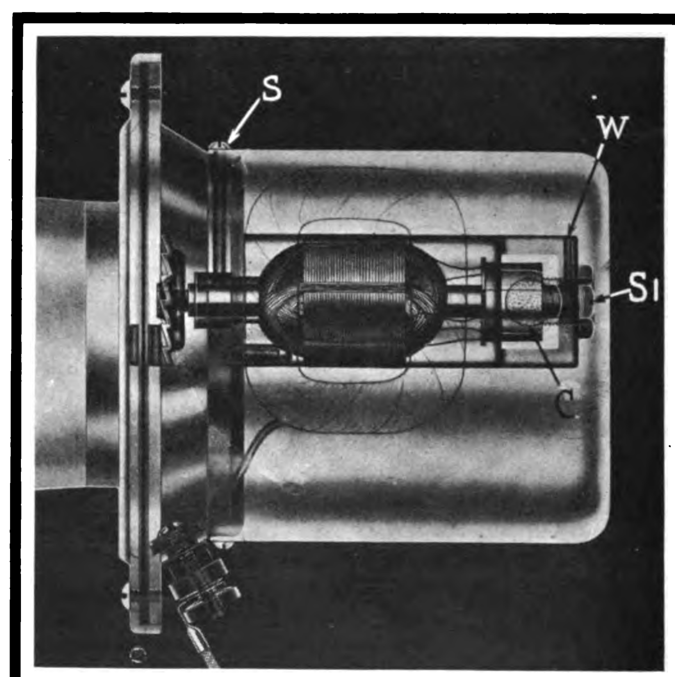

Fig. 2—Phantom view of new Klaxet electric signal

Details of Klaxet Horn

In the July 4 issue of THE AUTOMOBILE we announced the latest type of electric horn of the Lovell-McConnell Manufacturing Company, Newark, N. J., which has since been named the Klaxet, to indicate its relationship to Klaxon and Klaxonet. The Klaxet is somewhat smaller than either of these horns, but works on the same principle, viz., the motor-driven ratchet wheel striking a steel button while rotating at high speed. The accompanying ghost view of the Klaxet, Fig. 2, brings out the principal points of difference between it and the other types. The motor is practically identical with that of the Klaxonet, but while in the latter it is mounted under an angle of 30 degrees to the horizontal, the Klaxet motor has its axis disposed horizontally in the casing, which is thereby made lower. The other changes are minor and along the line of simplification, a number of details and refinements of the larger types having been modified to that extent. In Fig. 2 C is the motor commutator and S1 the screws by means of which the pitch of the sound is adjusted. The oil wells for lubricating the mechanism are shown at W, Fig. 2, and the shell at S. The

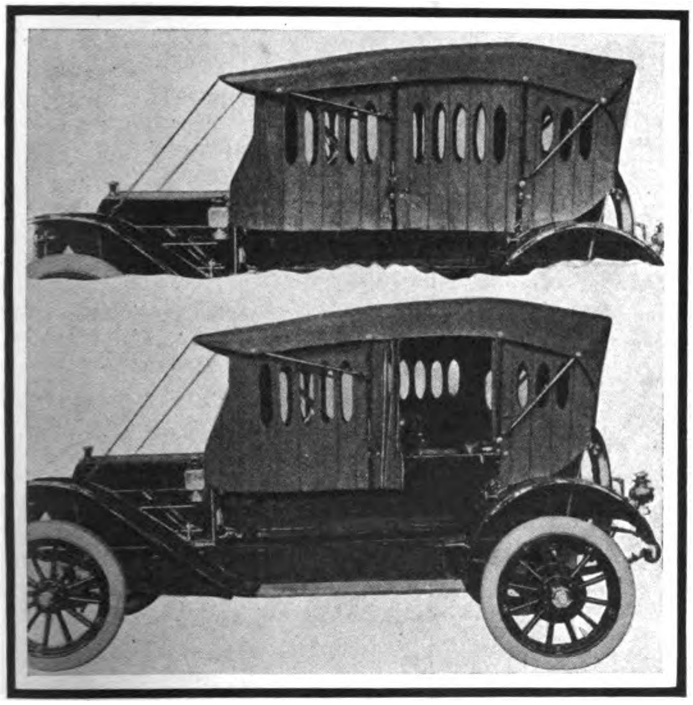

Fig. 3—Applas automobile curtain operated from inside

casing is attached to the collar surrounding the diaphragm by a series of screws indicated in white in the illustration. The binding posts are also shown in the figure.

Short-Circuit-Proof Plug

The H. W. Johns-Manville Company, Madison avenue and Forty-first street, New York City, has just brought out a new spark-plug which, judging from its construction, appears to be absolutely proof against short-circuits. It is the J-M plug, which consists of a sheet-steel shell, a platinum-iridium alloy electrode and a double insulation. Around the electrode seven sheets of mica are arranged and these again are encased in a layer of porcelain to insure double insulation. To provide non-leaking joints asbestos rings are used for packings.

Eclipse Gauge for Ford Cars

Owners of Ford cars who desire to install a glass gauge on the crankcases of their cars, to enable them to tell at a glance the level of the oil in the base chamber, can now obtain an accessory suited to their requirements. This device is the Eclipse gauge of the Emil Grossman Company, 250 West Fifty-fourth street, New York City, shown in Fig. 5. It is 3 1-2 inches long and 1 inch thick and consists of a thick glass tube held in a brass cup at each end. The lower cup is threaded for 1-4-inch pipe at two diagonally opposite points; the upper cup is bored with a small vent and both cups are held together by a long screw. In installing the gauge the lower petcock is removed from the crankcase and a short piece of 1-4-inch

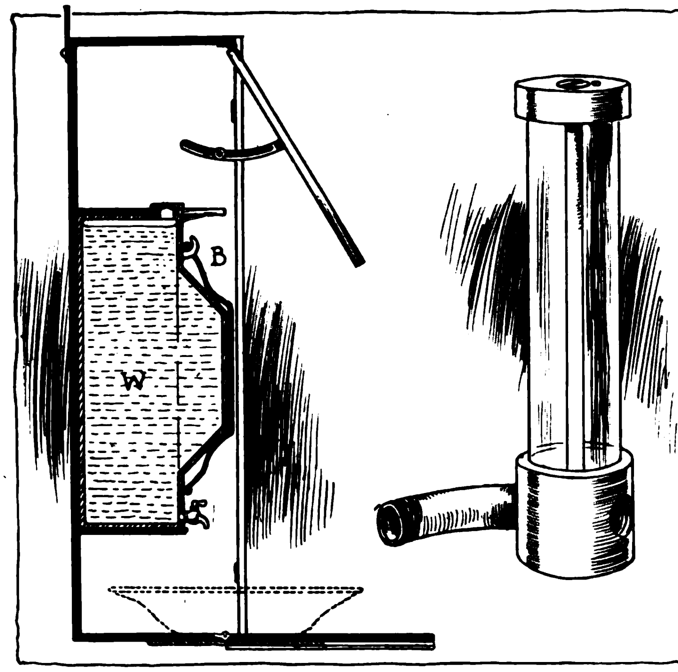

Fig. 4—Bussert automobile tourists' toilet case. Fig. 5—Eclipse oil gauge for Ford car crankcases

pipe, which is furnished with the gauge, is inserted in its place, while the petcock is screwed into the opposite thread of the lower cup which in turn is screwed onto the short piece of pipe. The level of the oil in the crankcase should be such that the lubricant stands 1 inch high in the gauge.

Applas Automobile Curtains

A new type of side curtain which may be opened and closed from inside the car while it is running is the design made by the Applas Curtain Company, 601 Ford Building, Detroit, Mich. This curtain consists of a series of accordion pleats of waterproof material, each of which is provided with a vertical celluloid window. The tops of these pleats slide on nickel-plated rods, one of which is fastened to each side of the top, and when the curtains are to be put out of use the pleats are shoved together, the rods are snapped to them and the whole equipment is attached under the flat portion of the bow of the car top. The bottom ends of the curtain pleats are secured to the inside of the body by knobs.

Electro Auto Duster

Under the name of Electro Dust-Absorbing Duster the Consolidated Sales Company, of Glens Falls, N. Y., sells a fabric which is said to be adapted for cleaning the surface of the automobile of dust and like impurities as quickly as it is brought in touch with them. The duster consists of a fine grade of cloth impregnated with a dust-absorbing chemical not only collecting but also holding the dust, so that in using this cloth one need not dirty one's hands as when an ordinary dust-cloth is used. The same cloth may be used for cleaning all portions of the car, although the maker recommends that one cloth be applied in cleaning the body and another for the very dirty parts, such as the wheels, mudguards, etc.

Auto Vacuum Suction Cleaner

The Auto Vacuum Cleaner Company, Milwaukee, Wis., has devised a very practical device for cleaning the upholstery, etc., of the automobile with the exertion of any power. The apparatus is a vacuum cleaner which consists of a suction nozzle adapted to be clamped to the muffler. The pressure of the gases rushing out of the muffler and passing through the nozzle produces a suction and exhaust the air surrounding it, which in turn exhausts a hose through which the dust from the upholstery is ejected.

AUTOMOBILE Tire Tread Grip—Being of the anti-skid chain type.

This patent relates to a tire grip. Fig. 1, which is composed of two parallel chains encircling the tread and supporting its two sides. The chain links are twisted to the right and left sides, respectively, and spaced by rigid links connecting opposite chain links. The length of the chains is adjustable by lengthening or shortening the sectional side chains which are arranged on the sides of the tire to hold the grip chains.

No. 1,035,586—to Carlton L. Hoff, York, Pa. Granted August 13, 1912; filed June 15, 1910.

Sleeve-Valve Two-Cycle Motor—In which a rotating sleeve opens and closes the cylinder ports.

The subject matter of this patent a two-cycle sleeve valve motor, is shown in Fig. 2. It consists of a cylinder C, bolted to a crankcase C1, and forming with the latter a gastight chamber which may be made to communicate with the interior of the cylinder through the passage P. The cylinder has ports Q1 and Q2 for inlet and exhaust, respectively, which may be placed in or out of communication with the combustion chamber by the sleeve valve S. The latter is carried inside the cylinder and does not move up or down, but it is rotated by a worm W carried by the piston P1 and engaging a nut member formed on the sleeve.

No. 1,035,600—to Charles C. Keyser, Pensacola, Pa. Granted August 13, 1912; filed December 22, 1911.

Process of Making Artificial Rubber—Which consists in heating certain organic compounds in the presence of inorganic condensing agents.

This patent describes a process for making artificial rubber by heating a drying oil, for instance, wood oil, with amido derivatives of aromatic hydrocarbons together with a condensing agent, such as chloride of zinc.

No. 1,037,158—to Leon Lilienfeld, Vienna, Austria. Granted August 27, 1912; filed June 17, 1910.

Transmission Mechanism—In which the driving gears are carried by sleeve which may be locked on or left out of engagement with the shaft on which it is mounted.

In the transmission, Fig. 3, the gears are carried by a driving shaft D and a driven shaft D1 and incased in a housing C. The driving gears are carried by a sleeve S, slideable on the shaft and capable of frictionally engaging the same by the operation of a clutch C1. The driven gears may be selectively brought to mesh with the driving ones. Shifting of gears as well as engagement and disengagement of the clutch are brought about by the operation of a set of rocker arms.

No. 1,035,152—to Leon J. Campbell, Chicago, Ill. Granted August 13, 1912; filed January 23, 1911.

Automobile Suspension Design—By means of which extremely low placing of the center of gravity may be obtained.

In this patent an automobile, Fig. 4, comprises a body and running gear. The lower portion of the body has sills S, secured to it, each of which carries a pair of upright guides U, between which the axle A is adapted to travel, the uprights having their upper ends connected to the upper series of a set of elliptic springs S1. Near its end the axle is fitted with clamps supporting rods; the ends of the rods carry rollers which contact with the inner, opposing faces of uprights U and permit the axle to vertically reciprocate between them and remaining in alignment with the guides.

No. 1,035,461—to Alva Montel, Claypool, Ind. Granted August 31, 1912; filed March 21, 1912.

Tire Carrying Device—In which open annular brackets are revolubly mounted on supports.

This patent relates to a tire holder, Fig. 5, which consists of two depending members D, which are mounted on a supporting frame and in which adjustable brackets B are carried. The latter are provided with tubular portions which horizontally project from it and through which arc-shaped members A extend; the latter are revoluble in the tubular projections so that they may carry the tire not in alignment with the brackets B, but at an angle thereto.

No. 1,036,020—to Andreas M. Sonnichsen, Milwaukee, assignor to Auto Parts Manufacturing Company, Milwaukee, Wis. Granted August 20 1912; filed August 31, 1911.

Correction—In the July 18 issue of THE AUTOMOBILE, the address of Elmo L. Wright and Thomas M. Biossat, inventors of the differential gearing described in patent No. 1,032,261 was given as Lafayette, Ind., due to an error. The correct address is Lafayette, La.

How a typical 2-year old plantation of hevea rubber trees appears in the Straits Settlements where a vast acreage is cultivated

America's First Rubber Show

Entire Industry on View

Brazil Is By Far the World's Heaviest Producer of Automobile Crude Rubber

MOST complete in the history of the rubber industry will be the Third International Exhibition of Rubber and the Allied Trades, which will be formally opened next Monday at the Grand Central Palace.

There will be shown samples and stocks of crude rubber of every commercial grade representing all the rubber-producing countries of the world and several in which rubber raising is still in the experimental stages.

There will be a whole floor devoted to crude rubber, another to chemical processes, reclaiming and other secondary subjects and still another to machinery, appliances, manufacturing and tools used in all branches of the industry.

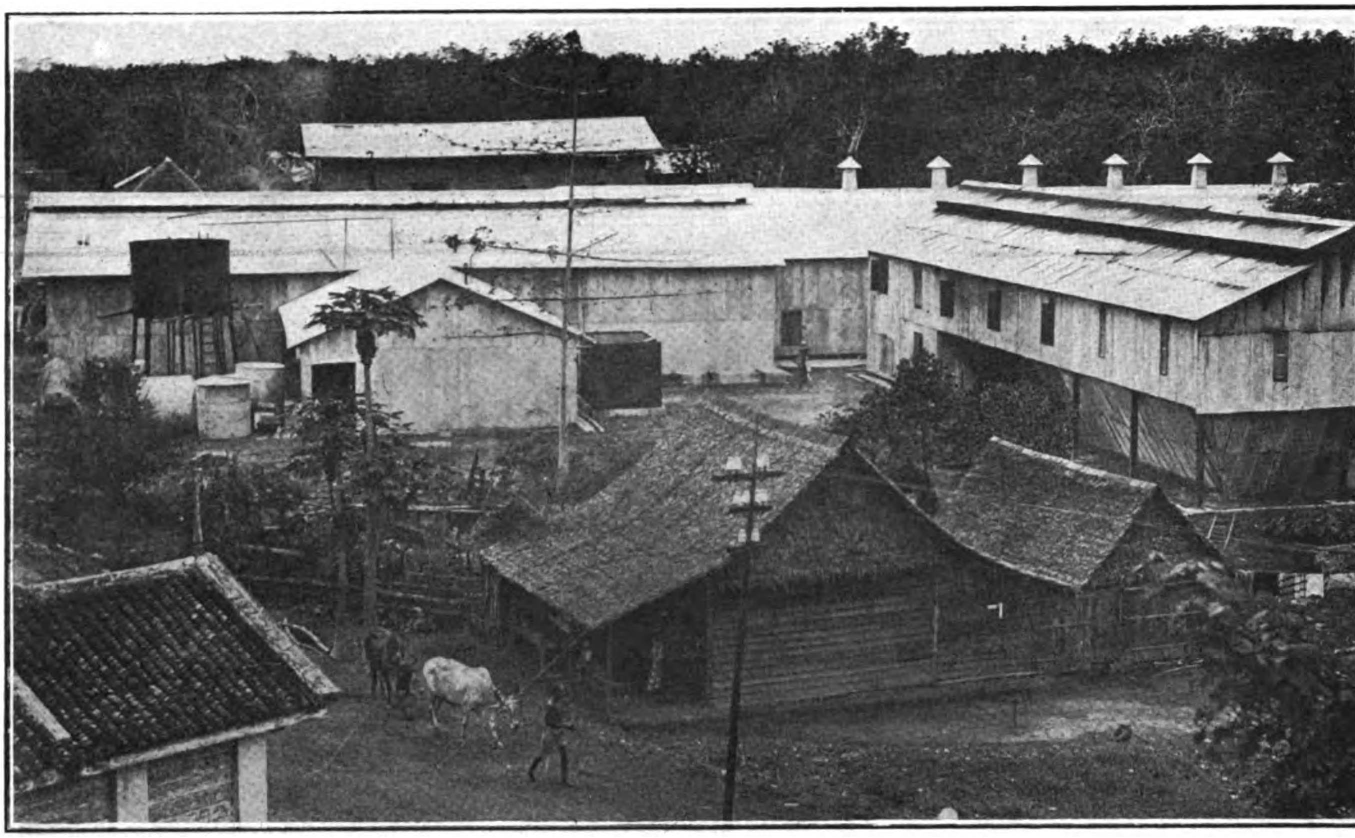
During the exhibition, which will extend from September 23 to October 3, a formal conference of the allied trades with the representatives of the rubber industry will be held.

To the general public the show of crude rubber will probably prove the most attractive section of the exhibition. This is housed on the balcony floor of the building, designated as the third floor. There are two grand divisions, geographically, that produce rubber from the automobile viewpoint. South America and the Amazon Valley is first and the East Indies and Southern Asia, second. Roughly speaking, the bulk of the indigenous rubber comes from the Amazon valley and the bulk of the cultivated rubber from Malaya, Ceylon, and the Asiatic countries. Africa and Central America also raise some of both kinds. There is some cultivated rubber marketed from Brazil and some indigenous varieties produced in the East.

Brazil, by all odds, is the heaviest producer of crude rubber at present. In consequence, its show space is impressive and the exhibits go into much detail. The Brazilian show occupies nearly half of the floor. Malaya, Ceylon, Hawaii and a score of other producing sections are represented with magnificent exhibits. All told it is estimated that there are in the neighborhood 190 varieties and grades of crude rubber shown, the whole mass weighing over 150 long tons and worth probably $350,000.

The setting of the Brazilian exhibit is artistic and effective. On the walls surrounding the displays of the various states are mural paintings showing in panorama scenes along the Amazon from its mouth to the Peruvian Andes and the Bolivian frontier. They depict in pictorial form the country where the rubber grows, and spread out before the pictures are great heaps of the actual rubber that was grown in the territory shown in the pictures.

One pile of rubber from Manaos, representing the product of the State of Amazonas and shown on the north side of the



Type of factory for making rubber for shipment to market of the type conducted in British Malaya by hundreds of great estates

hall, weighs 30 long tons. The most striking element of the exhibit is one biscuit that was specially made for the exposition, weighing 1,450 pounds.

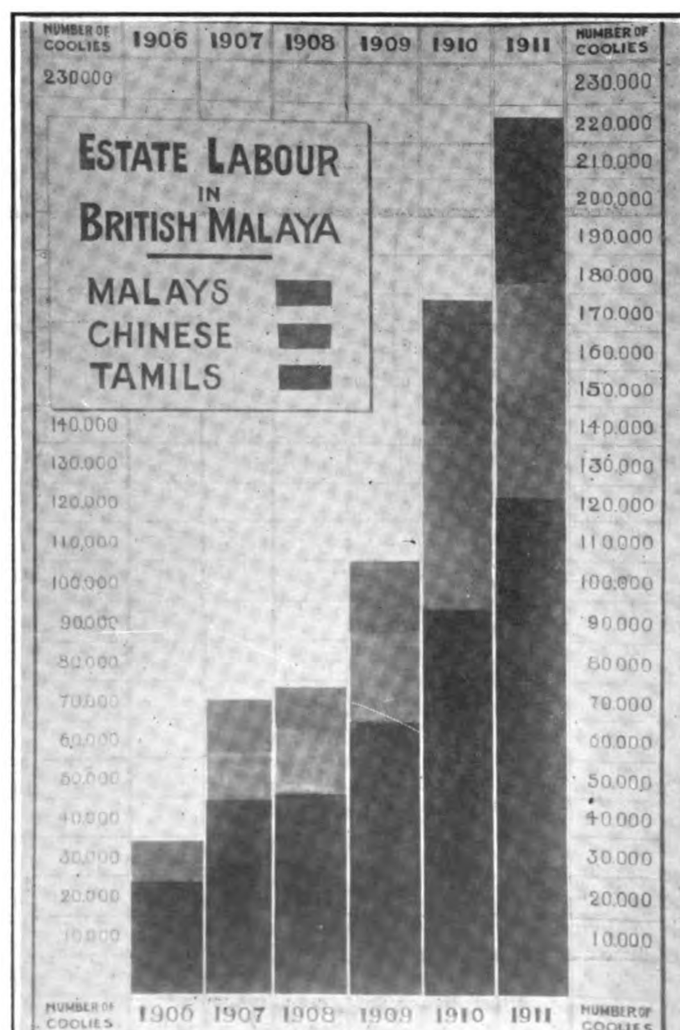
The Brazilian exhibit is under the special patronage of the Minister of Agriculture, Pedro de Toledo, and the government is represented by Rear Admiral José Carlos de Carvallos, Count Candido Mendes de Almeida, Dr. Eugenio Dahne, representative of Dr. de Toledo's department in the United States; Manoel Lebato, delegate from Amazonas; Argollo Fillio, delegate from Bahia; Oscar S. Moraes, Commercial Museum, Rio de Janeiro, and a number of others.

The chief elements shown in the Brazilian exhibit are lots of up-river fine, which in reality comes in large units; up-river coarse, which is mostly in smaller parcels; islands fine, and islands coarse, in flattened pieces that look something like a muskmelon that has been stepped on by an elephant; Caucho, the product of the castilloa tree, in slabs and balls; Madeira, in large biscuits and diversified forms, and numerous other types of crude.

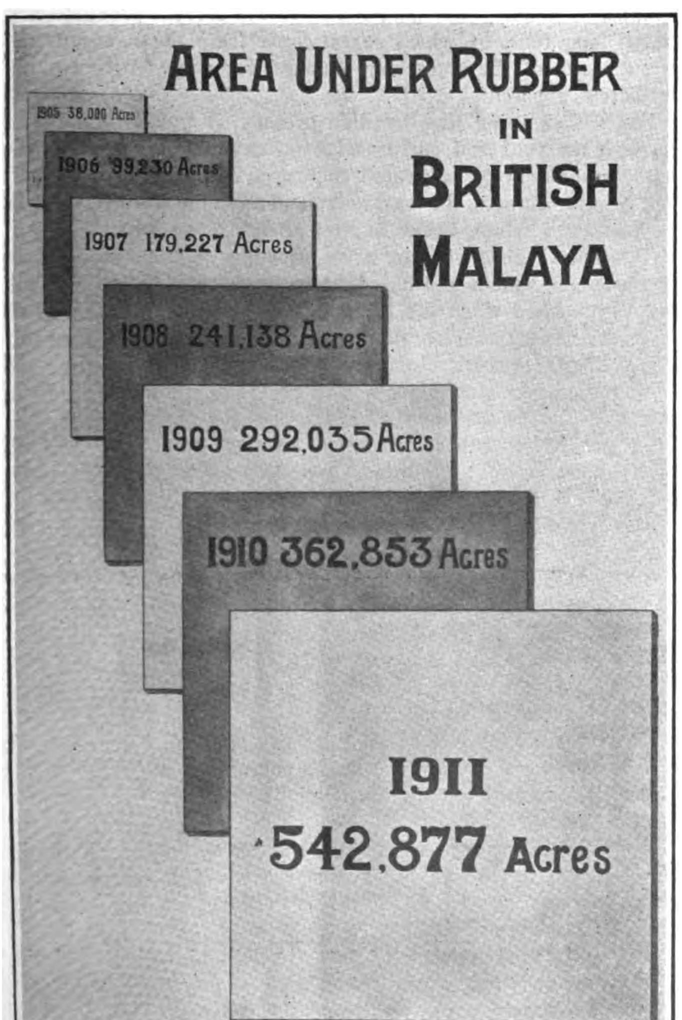
There will be seen a rubber forest and specimens of trees of all the important types of rubber producers. Tapping, gathering, coagulating and smoking by all the processes in use will be displayed. Dr. Chequeira Pinto, inventor of the Pinto process of coagulating without smoke, will show the details of his system and its possible effect upon the future of the industry.

In the section devoted to cultivated rubber, the exhibits of Malaya, or the Federated Malay States on the Siam peninsula, and those of Ceylon are the largest and most important. The product of these two countries is marketed in London under the general trade designation of Ceylons. The rubber men of Malaya protest against this practice and state that there is a considerable difference between their rubber and that grown in Ceylon. They hold that the rubber of Malaya is better than that of Ceylon and the Ceylon growers take an obviously opposite view.

The recent fortnightly auction at London disposed of 1,000 long tons of plantation rubber, setting a new mark for activity that will surely be excelled long before the first of the year as



Packing the crepe according to method used in Perak—Note the difference between this plan and the crudeness of the jungle method



shipments are constantly growing heavier. Last year Malaya produced 23,914,263 pounds of rubber for export, which is about twenty-three times the amount exported in 1906. For 1912 it is estimated that the export total will reach 40,000,000 pounds. This, of course, includes wild rubber as well as the plantation grades.

The stock from which the cultivated Malaya rubber is grown is identical with that in which the Ceylon product had its source. All the cultivated rubber of the Asiatic fields originated from the seeds secretly taken from Brazil by Mr. Wickham nearly 40 years ago.

The main difference between the indigenous and the plantation rubbers may be found in the method of preparing them for market. The wild rubber of Brazil from which up-river fine Para is produced is smoked over fires in which palm nuts are burned. This imparts certain qualities to the Para rubbers that makes them different from the latex treated in any other way.

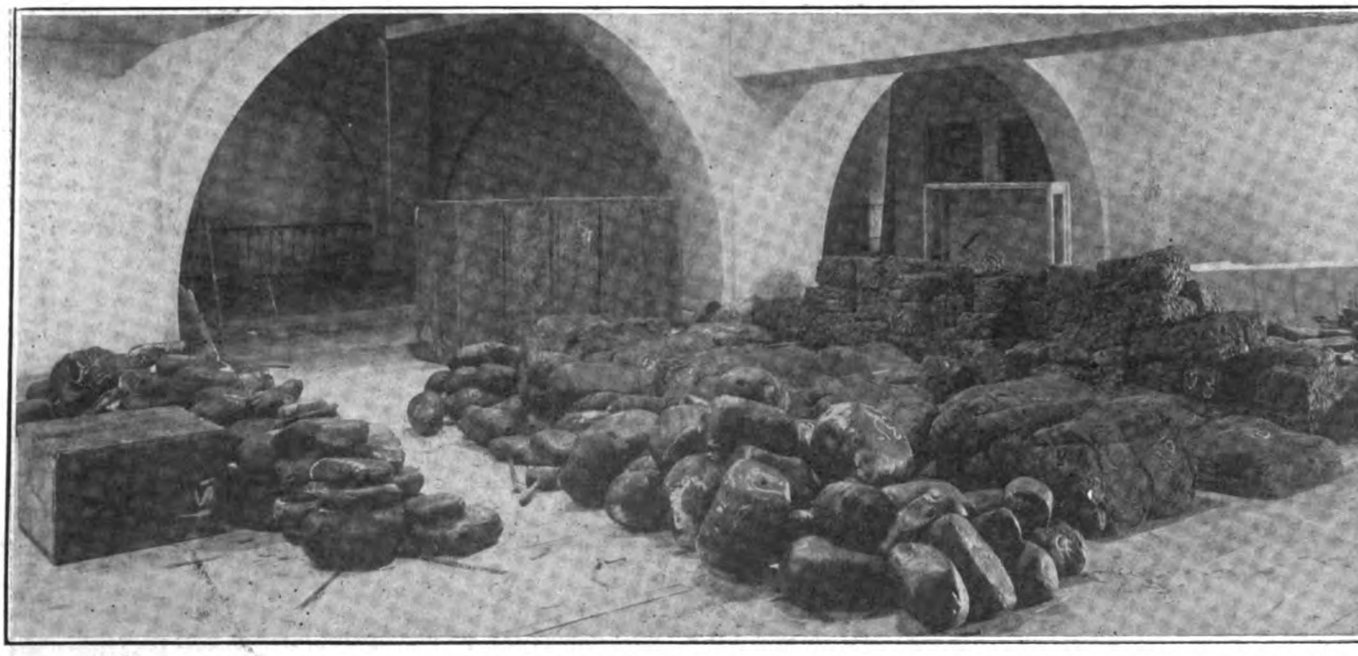
The plantation rubber is not smoked in biscuit form. The regular process involves smoking, but it is different in many respects from that followed by the seringueiros of Brazil. After coagulation, which is produced by chemical action in many cases, the crepe is hung on racks and smoke from almost any kind of green wood is used to give it the finishing touches.

Opinions differ radically as to details in the methods to be used in producing plantation rubbers and to that fact alone may be charged the lack of uniformity in the product itself. But good progress is being made each season to reach such a stage of production that the grades of plantation rubber will be uniform.

At the forthcoming conference this subject is scheduled for intimate discussion.

As it affects the automobile industry, the rubber trade is of prime importance.

Tires form the chief element of expense in motor car operation. If the price level of the market should reach a basis of $5 a pound for up-river fine, which would mean at least that amount for pale crepe from the plantations, the cost of auto-



In the foreground are heaps of up-river fine, which is coarse, and in the background heaps of up-river coarse, which is fine

mobile tires would boom. If there is an average of 7 pounds of first-grade rubber in an automobile tire, the cost of the tire to the public would advance tremendously and might reach an average of $75 per tire, including tube.

This would mean an inevitable and crushing check on the use of automobiles, as the cost of operation would then run up to 8 cents a mile for tires alone.

Such an eventuality as $5 a pound for rubber seems improbable in the present view of things, but it should be remembered that in the spring of 1910 the price stood for a time at $3.10 a pound and the situation was exceedingly tense.

The heads of the various big plantation exhibits claim that the introduction of the plantation factor in the rubber industry has saved the automobile business as a broad, general and commercial element in civilization. Their reasoning is as follows:

Leaving aside the question as to how much plantation rubber is used for tire making, the mere fact that the supply of plantation rubber is available for many of the purposes to which Para was formerly put releases a big demand from the Amazon rubber.

Prior to the time the plantations came into commercial bearing on a large scale, the price of rubber advanced under the insistent demand from the automobile industry. Today that demand is represented by the annual consumption of 70,000,000 pounds, or about 31,000 long tons. If the current production is 90,000 long tons, of which 40,000 come from the Amazon valley, the size of the automobile demand for rubber becomes immediately apparent.

Exerted alone on the Brazilian product, it would send prices through the roof and put a period on automobile use. But the immense amount of cultivated rubber now coming on the market counterbalances the extra demand and the result is to be seen in Para selling below $1.20 a pound.

Plantation rubber is increasing steadily at the rate of 100 per cent. per annum and has done so since 1906. The limit will only be reached when the labor supply is fully employed to its economic capacity. Plantation men state that this will probably happen in the measurable future, but that in the meantime the system of checks and balances born of the plantations will force the price of rubber somewhat lower than the current level.

They state that rubber can be grown at 50 cents a pound with profit under present conditions and that when the labor problem is ultimately solved, the cost will only advance a trifle.

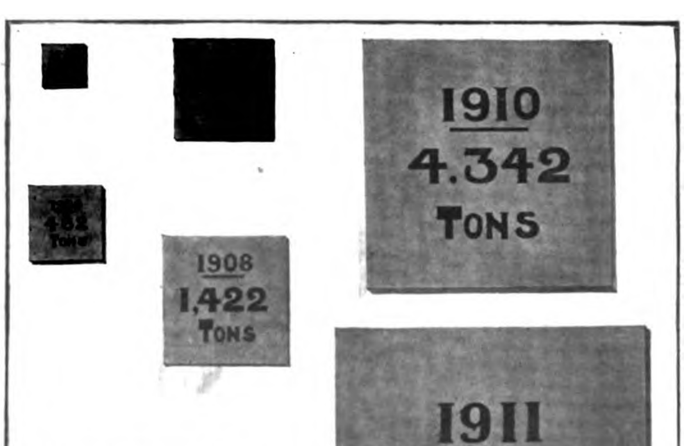
In the meantime the Brazilian government is working vigorously to increase production by cultivating the different varieties of rubber trees and by a gigantic system of subsidies. Mexico, already a factor in the world's problem of rubber, will certainly swell the total stock; Central America is being exploited in this regard also and in the tropical forests of Africa the brains and energy of nations are centered in the single object of increased production.

The cumulative effect of all this energy, pointed at one goal, will be a tremendous advance in the amount of rubber grown.

In that view of the situation it might seem that the price was due for a severe fall.

Right there, however, enters still another element of the problem. If the world's rubber production reached 200,000 tons a year, the new uses to which rubber will be put will keep the price steady, even if it be at a lower level.

Rubber is used universally by all civilized nations and the only reason it is not in use in hundreds of new ways at present is that the supply is too small and the price too high for economic service.



How the shipments of Malaya have increased

If the supply becomes greater and the price lower, the uses will spread like a prairie fire.

This must have the effect of steadying prices and make for a broad general market.

From the viewpoint of the automobile industry the aspect of rubber is reassuring.

While exact figures are exceedingly difficult to get, the approximate production of the world in 1912 may be estimated about as follows:

	Long tons
Amazon valley	40,000
Elsewhere in South America	2,000
Central America	5,000
Africa	10,000
Plantations	20,000
Elsewhere	5,000
Miscellaneous, low grades	8,000
Total	90,000

The American tire industry alone accounts for over 16,000 tons this year.

Among the most interesting things to be seen in the crude rubber exhibit is the pictorial display. Each section has a wealth of photographic beauty and utility. In the Brazilian section, aside from the mural paintings, there are hundreds of photographs to show conditions in the jungle, at the collecting centers, shipping points and at various stages from the wilderness to civilization.

In the Malaya and Ceylon exhibits it is safe to say that next to the remarkable showing of the cultivated rubber in all stages, the display of pictures will be most attractive. Leonard Wray, who is in charge of the Malaya exhibit, shipped in sixteen big packing boxes of photographs showing every imaginable phase of the rubber industry in his country. Many of the accompanying pictures for this article were reproduced from the originals that hang in the section over which Mr. Wray presides.

As will be seen from this article, they are different from other tropical pictures. They seem to carry with them the mysterious air of the Straits Settlements, but they are all new, having been taken only a short time before shipment, and show actual conditions in that wonderful land.

According to official reports of 1911 there were 542,000 acres in Malaya devoted to the raising of rubber. This year it is expected that the total acreage in cultivated rubber will be about 1,000 square miles. As the trees average rather more than 200 to the acre, the total number of trees in Malaya would be in excess of 14,000,000. When those trees are all in mature bearing, the product of Malaya will reach a stupendous figure, even without additional acreage.

Exhibits of crude rubber in one of the Brazilian Sections

In the pictures an idea is conveyed of selected phases of the industry, showing the young plantations, the jungle, road conditions, mature fields and many other interesting points.

As far as Africa, Mexico and Central America are concerned, the showing at the exposition is representative, although these countries are not so important from the automobile viewpoint.

Dr. Walter Strong presides over the Hawaiian and Philippine exhibits. Rubber cultivation in Hawaii is of recent date, but it is said that conditions are ideal for it in a considerable territory of the archipelago. The trees planted in Hawaii are of Brazilian stock and the crude rubber exhibited is similar in structure to the specimens shown from Malaya and Ceylon. The form of the product is different, as the crepe is pressed into

United States Motor Company Awaits Action of Its Creditors

Court Has Adjudicated Parent and Constitutent Companies as Bankrupts—No Court Action Against Sales Offices

Factories Continue Operating as During the Past 90 Days—Brush and Thomas Units Closed—Many Bankers Among Creditors—$5,000,000 Cash Required to Rehabilitate the Company

SINCE the establishment of the receivership of the United States Motor Company the affairs of the concern appear about as follows: No plan of reorganization has been formulated and adopted so far. Until such a plan is agreed upon there will be nothing to present to any underwriter. The terms of the agreement will be arranged as quickly as possible, as all the factors in the problem realize that if anything is to be done it must be done without loss of time.

While the total indebtedness of the company is $12,200,000, nobody in trade circles looks for the dissolution of the company piecemeal as a result of the present action. To continue the business of the company will require additional capital to the amount of $5,000,000, to be raised by either assessment on the stock or by the issue of additional securities. The alternative is a sale under the order of the court.

All of the manufacturing units, with the exception of the Brush company, are continuing in operation practically the same as they have been for the last 90 days and the various retail selling organizations throughout the different cities are also continuing in operation, although the question of ancillary receiverships for them is being considered.

Indebtedness Exceeds $12,000,000

The situation so far as reorganization is concerned is developing slowly. There are two classes of creditors and each class is susceptible to division into several subordinate headings. The real question of reorganization will undoubtedly turn on the agreement or disagreement of the creditors as to participation. Summarized, the liabilities of the company may be divided as follows:

Due to banks	$4,200,000
Due to merchants	2,000,000
Due on debentures	6,000,000
Total	$12,200,000

The total indebtedness is divided into two classes, the first of which is represented by commercial paper bearing two indorsements. The other class has paper with only one indorsement. As an instance, it may be cited that the debentures bear only the signature of the parent company. Another example of the one-signature paper is where one of the constituent companies of the United States Motor Company issued a note to secure payment for money advanced or goods purchased for its use.

The two-signature paper consists of notes issued by the parent company and indorsed by one of the constituent units, or that issued by the constituent company and indorsed by the parent organization.

Practically all of the claims of the merchandise creditors are based upon more or less of the one-signature paper.

In case agreement among the interested parties cannot be reached as to the status of the different grades of paper, the matter will undoubtedly come within the view of the court for definite construction of the claims of each side. At present the single major question that must be settled is with regard to agreement among the creditors themselves.

Under the receivership action there are two courses open to the company. The first is reorganization under some plan that will take care of the creditors and allow the company sufficient working capital to manufacture and sell its product. The other is a sale under order of the court.

Regarding the first course it may be said that the company requires about $5,000,000 additional capital with which to satisfy the claims and to furnish working capital. This may be raised in two ways, the one by assessment of the present stock and the other by the sale of additional securities either to the present creditors in payment of their claims or on the open market. In the latter case the proceeds could be used to take up the paper.

The committee which is formulating plans for reorganization has not finished its drafting of the proposed plan. Anything that has been said so far about the amount of the assessment or the method proposed for levying it is branded as premature by the committee, nevertheless, the report has been circulated throughout the industry and in the financial district that the favored plan is for an assessment of from $20 to $25 a share.

According to recent statements coming from the United States Motor Company and the brokers who have made a specialty of handling its stock issues in the market, fully half of the stock of the company is alleged to be held by the following list of stockholders:

Anthony N. Brady, James C. Brady, J. S. Bache, Caroline W. Astor, Benjamin Briscoe, Samuel P. Colt, Frank Briscoe, H. Holbrook Curtis, Eugene Meyers, Jr., Thomas F. Ryan, Herbert L. Satterlee, Harry Payne Whitney, Richard Irvin, John Jacob Astor's estate and Charles G. Stoddard.

If the holdings of this group represents half the outstanding stock they would be required to put up $2,300,000 on a basis of $20 a share. The complete amount that could be raised would be about $4,600,000. If the rate of assessment were $25 a share the total proceeds would be $5,750,000. The latter amount would be sufficient, in the opinion of those most intimately connected with the company, to place it on a sound footing. Naturally, there may be some difficulty in executing such a plan as was prematurely announced.

The alternative proposition of issuing new securities for sale on the market or in payment of creditors involves a court adjustment as a condition precedent, or a continuance of the company as at present, depending upon the terms of the ultimate agreement.

The holders of the two-signature paper feel that they have some claim to seniority, but that claim is sharply at issue with the position taken by the holders of the one-signature paper. They insist that if there is to be another stock issue that a certain proportion of cash shall be paid to them. The smaller faction among the creditors is unwilling to take that view of the situation unless the same terms apply to them as well.

If no agreement is reached before the court sale, there are still several plans that may be followed to reach a reorganization. The assets may be bid in by a purchaser at auction; composition of the debts might be accomplished on a variety of bases, or in the last analysis, the individual assets of the company might be disposed of on the block.

Some form of reorganization is the only result that is seriously considered, but what it will be depends on a multitude of factors.

W. E. S. Strong and Robert Walker, who were named receivers, have also been named as ancillary receivers in each of the states where the company operated manufacturing plants. There are about forty retail selling companies, located in various cities and states, all of which belong to the parent company by stock ownership or otherwise and the question of ancillary receiverships in all those states is being considered at the present time.

The Providence Engine Company, manufacturer of steam engines and automobile parts, specifically running gears, crankshafts and machined parts, has been petitioned in involuntary bankruptcy on behalf of local creditors at Providence. The company is owned through its stock issues by the United States Motor Company. The preliminary hearing of the matter is set for September 18 in the United States District Court at Providence and if the matter takes its usual course Messrs. Strong and Walker will be named as receivers. As an individual corporation, the Providence company is said to be in excellent financial shape.

Except the Brush Runabout Company all the manufacturing plants of the United States Motor Company continue in operation to about the extent that they have for the past 90 days. The receivers obtained an order of court to advance money for the payrolls of the various plants from the general funds of the company and to make provision for administration. There is little activity, however, in any of the plants and there has been much less since the last of the 1912 product was completed and marketed.

In last week's issue of THE AUTOMOBILE a citation from the report made by Percy Martin on the various companies stated that in Mr. Martin's opinion the greatest necessity prevailed for active operation of the plants, so that their organizations might be retained and preserved. Now, it is stated by those most closely allied with the project of reorganization, that the arrangements will have to be made with the utmost speed in order to protect all the interests. They are united on the proposition that if reorganization is to be effected on favorable terms it must be made within 90 days.

The relations of the United States Motor Company with the E. R. Thomas Motor Company, of Buffalo, have been shrouded in more or less mystery for over a year. The facts in the case are that the United States Motor Company acquired practically the whole of the Thomas stock about a year ago, exchanging its own securities for the certificates of the Buffalo company and furnishing some other consideration.

The ownership of the Thomas company was kept a sort of state secret and officially it was denied repeatedly by officers of the United States Motor Company during the past year.

The Thomas company went into the hands of a receiver last month after F. R. Humpage, president at that time, failed to exercise an option to purchase the company from the United States Motor Company. The reason for the failure of Mr. Humpage to take over the Thomas was that he was unable to float his new securities in the condition of the money market or could not obtain the services of an underwriting house to handle the transaction.

The capitalization of the Thomas company is $2,400,000, of which $400,000 is 7 per cent. cumulative preferred. The remainder is common. There is no bonded debt. It is understood that Mr. Humpage succeeded in getting all the support required except $400,000.

As the Thomas company is now in bankruptcy court, the matter of considering it as in any way affecting the affairs of the United States Motor Company has not been pressed.

E. R. Thomas, founder of the company, is a creditor to a material amount.

At the time Judge Charles M. Hough received the bill of complaint filed on behalf of the Brown & Sharpe Manufacturing Company which resulted in the receivership, he noted the fact that the main questions involved in the bankruptcy action would require the utmost care in unraveling.

The court commented on the fact that the problems presented in the bill of complaint were exceedingly complex and charged the receivers to use great pains in reaching the exact facts. Hence, all the official statements made to the public have been couched in what might be termed glittering generalities.

No schedules of assets and liabilities have been filed so far, but work is being done on their preparation. The banking debts of the embarrassed company amount to about $4,200,000, and, as is well known, the Central Trust Company figures as the heaviest creditor. But the mere fact that it heads the list with claims of about $1,400,000 does not mean that it stands to lose that amount because each of the aggregate amounts owing to the various creditors may represent a large proportion of paper bearing two signatures, worth approximately its face value. Thus, the lists of creditors that have been published fail to tell the real story because they do not show the equities applying to any case.

In the specific case of the Central Trust Company, the proportion of two-signature paper involved is very high and the same might be said for other banking creditors who require the indorsement of one of the solvent constituent companies on the paper of the parent company, or vice versa, before entertaining it as a discount proposition.

The largest merchandise creditors also adopted this precaution to a considerable extent, and while the concerns that head the list appear to be involved for material sums, the actual fact is that they are protected almost as well as the bankers.

Complete Order of Court

The formal action of the court is outlined in the appended order which declares that the companies are bankrupt, in that that they are unable to meet their maturing obligations. The order authorizes the receivers to proceed on broad lines to conserve the property and make detailed report to the court.

The following order has been entered in the United States District Court, Southern District of New York, by Judge Hough:

And now, on this 12th day of September, 1912, this cause came on to be heard upon the bill of complaint and the answer of the defendants this day filed, admitting the allegations of the said bill, and joining in the prayer thereof; upon consideration whereof,

Now, upon motion of the solicitors for the complainant, and the defendants by their solicitors consenting thereto, it is

Adjudged and decreed that the defendant companies and all of them are now unable to meet their respective maturing indebtedness and that none of the said defendants are or will be able to meet same or any substantial part thereof at the maturity of the said indebtedness, or for a considerable time thereafter; that the complainant and the other creditors of the defendants are without adequate remedy at law and that said complainant is now entitled to the relief granted hereby, and that it is necessary for the protection and preservation of the respective rights and equities of the complainant and all other creditors of the defendants and each of them that the properties and business of all of the said defendants should be administered as an entirety in this suit through receivers to be appointed by this Court, in order that the rights and equities of all of the said creditors may be preserved, determined and adjudicated in this suit and the property of said defendants and each of them applied to the payment of the claims and equities of their respective creditors, pursuant to such adjudication as may hereafter be made herein; and that it is necessary that receivers of all of the defendants herein and of their respective properties should be appointed forthwith, with the powers herein granted. It is further

ORDERED, ADJUDGED AND DECREED AS FOLLOWS:

That William E. S. Strong and Roberts Walker be and they hereby are appointed receivers of the defendants, United States Motor Company, Alden-Sampson Manufacturing Company, Brush Runabout Company, Columbia Motor Car Company, Dayton Motor Car Company, and Maxwell-Briscoe Motor Company, and each of them, and of all of the properties owned or controlled by or in which the said defendants or any of them have any ownership or interest whether such property be real, personal, or mixed, of whatsoever kind and description and wheresoever situated, including all lands, real estate, buildings, premises, property and appurtenances owned, controlled, leased or operated by the said defendants or any of them, and all offices, furniture, fixtures, materials and supplies, finished product and product in the course of manufacture, books of account, records and other books, papers and accounts, cash on hand or in bank or on deposit, things in action, credits, stocks, bonds, securities, shares of stock in the corporations described in said bill of complaint as "selling companies" and all shares of stock, certificates of equitable interest and other certificates representing any interest in any property and all other securities of whatsoever character owned by the defendant companies or any of them on or in which they or any of them have any interest or which they or any of them control directly or in directly, deeds, leases, contracts, muniments of title, bills and accounts receivable, rents, issues, profits, tolls and income accruing and to accrue, as well as all interest, easements, privileges, franchises and appurtenances, and all assets and property of every kind, character and description whatsoever; with full authority immediately to take possession of and, until the further order of this Court, to carry on, manage and operate the said properties and to continue the business of the said defendant companies, in their discretion, until the further order of this Court, and to exercise the authority and franchises of the said defendants, to preserve and protect their properties in proper condition and repair, and to perfect the title and possession in and to said properties, and in their discretion to employ and discharge and fix the compensation of all such officers, managers, agents and employees as may be necessary for the proper discharge of their duties as such receivers and to make such payments and disbursements as may be needful or proper in so doing; to purchase, for cash or credit, such supplies, materials or other property as may be necessary or advisable in connection with the administration of the property and assets of the defendant companies; to sell the product or properties of the defendant companies either for cash or on credit, as may be usual or advisable in the business of the said companies or otherwise; to collect and receive rents, income, tolls and profits of the property of all the defendant companies; to make, subject to and upon the granting of further orders of this Court, such appropriate payments for and on account of accruing taxes, assessments, interest on mortgages, insurance, ground rents or other necessary charges as may be expedient or requisite to preserve the properties and assets of the defendant companies or any of them, and subject to and upon the granting of such orders, to pay and discharge any current obligations for labor and like charges as may be decreed by this Court to be entitled to priority. It is further

Ordered that said receivers be and they hereby are authorized and empowered to institute and prosecute, defend, compromise or adjust, intervene in or become parties to such suits, actions and proceedings, at law or in equity, including ancillary proceedings in state or federal courts, as may in their judgment be necessary or proper for the protection, maintenance and preservation of the property and assets of the defendant companies, and likewise to defend all suits, actions and proceedings instituted against them as receivers or against said companies or any of them, and also to appear in and conduct the prosecution or defense of any suits or adjust or compromise actions or proceedings now pending in any court by or against the said defendants or any of them, the prosecution, compromise or defense of which will in the judgment of said receivers be advisable and proper for the protection of the property placed in their charge or of the interests and rights of creditors and stockholders connected therewith; and generally to do all acts and things necessary or proper to be done to protect, maintain and preserve the properties of which they are hereby appointed receivers for the benefit of the creditors and stockholders of the defendant companies, with leave to apply from time to time, whenever necessary and as they may be advised, for further orders from this Court touching all and singular their rights and duties in the premises. Said receivers are further authorized to settle with, compromise or adjust, collect from or make allowance to debtors of the defendant companies and generally to do such things and enter into such arrangements, compositions, extensions or otherwise with debtors of the defendants as they, the said receivers, may deem advisable. And said receivers are authorized to enter into such arrangements with or take any such action in reference to the affairs of the companies described in the bill of complaint as "selling companies" as they, the said receivers, may deem advisable, including the power to said receivers to bring actions at law or in equity, whether original or ancillary, or otherwise against such "selling companies," and further including the power to said receivers to continue to operate or liquidate such "selling companies" in whole or in part and generally to incur such expenses, make such disbursements and do such actions in connection with said "selling companies" as they may deem advisable. It is further

Ordered that the said receivers keep and maintain all the properties and assets of each and every of the defendant companies separate and distinct from those of the other defendant companies, and to do such things and preserve and keep such records as shall maintain and preserve separately at all times the identities of the respective properties of the respective defendant companies and to open and keep separate books of account and records for each and every of the defendant companies so as to show at all times the separate business transactions of the separate defendant companies, and to take and preserve proper vouchers for all payments made by them in connection with the discharge of their duties as such receivers. It is further

Ordered, that the several bonds of each of the said receivers in the sum of one hundred and fifty thousand ($150,000.00) dollars, conditioned that he will well and truly perform the duties of his office and duly account for all moneys and property which may come into his hands, and abide by and perform all things which they shall be directed to do, with sufficient sureties to be approved by a Judge of this Court, be forthwith filed with the Clerk of this Court. It is further

Ordered and Decreed, that each and every of the defendant companies and each and every of their officers, directors, agents and employees, and all other persons, including creditors and stockholders of any of the defendent companies be and they hereby are required and commanded forthwith upon demand of the said receivers, or their duly authorized agent or agents, to turn over and deliver, to said receivers, or their duly constituted representatives, any and all books of aocount, vouchers, papers, deeds, leases, contracts, bills, notes, accounts, moneys and all other properties of or controlled by any of the defendant companies, real or personal, in his or their possession or control. It is further.

Ordered and Decreed, that the said defendant companies and each and every of them and each and every of their officers, directors, agents and employees, and all other persons claiming to act by, through, under or for said defendants, or any of them, and all other persons, firms and corporations, including creditors and stockholders of each and all of the defendant companies and including all sheriffs, marshals, constables and their agents and deputies, and all other officers are hereby adjoined and restrained from removing, transferring, disposing of or attempting in any way to remove, transfer or dispose of or in any way interfere with any of the properties, assets or effects owned by or in the possession of any of the said defendants, and all said persons, firms and corporations are hereby enjoined from doing any act whatsoever to interfere with the possession and management by said receivers of any of the properties of any of the said defendants or from in any way interfering with said receivers in the discharge of their duties or from doing any act to interfere with the administration and disposition in this proceeding of the affairs and assets of the defendants or any of them, and all creditors and stockholders of each and every of the said defendant companies, and all other persons, firms and corporations are hereby adjoined from instituting or prosecuting or continuing the prosecution of any pending actions, suits or proceedings at law or in equity against any of the said defendant companies and from levying any attachments, executions or other process upon or against any of the properties of any of said defendant companies, or from taking or attempting to take into their possession any of the said properties of any of the said defendant companies, and from issuing or causing the execution or issuance out of any court of any writ, process, summons, replevin or any other proceedings for the purpose of impounding or taking possession of any of the property of any of the said defendant companies. It is further

Ordered that the said receivers be and they hereby are directed within ten days from the date hereof, to mail to each and every creditor and stockholder of the defendant companies as the same may appear upon the books of the said defendant companies, a copy of this order and of the bill of complaint herein; such mailing to be in a securely sealed envelope, postage prepaid, and to be addressed to the said stockholders and creditors of the defendant companies at the last post office address known to said receivers and such service by mail is hereby decreed to be due, timely, sufficient and complete service of notice of this proceeding upon all such creditors and stockholders for all purposes. And it is further

Ordered that all such creditors of the said defendant companies and each and every of them be and they hereby are directed to file with the receivers at their office and place of business, Broadway and Sixty-first street, Manhattan, New York City, within sixty days from the date of this order, a duly sworn statement of all and any such claims they may have or assert against the defendant companies or any of them. Such statement shall be verified before any officer authorized to administer oaths by the law of the state where said claim is verified, and such statement of claim shall, where the same is evidenced by any written instrument, have the same attached to it. And it is further

Ordered that the said receivers shall on the 28th day of October, 1912, at 11 o'clock in the forenoon report in the Post Office Building, Borough of Manhattan, City of New York, to the undersigned Judge of this Court as to the affairs, assets, debts and business of the defendants and at such hearing all and any such matters as to the administration, disposition and sale of the assets and the affairs of the defendants, or any of them, and as to the continuance of the receivership, and as to the continuance of the business of the defendants and as to all or any of the matters alleged and as to any of the relief prayed for in said bill of complaint as may be presented by any parties in interest will be considered, and such further orders will be made in respect to any of the said matters, at such hearing or any adjournments thereof, as to this Court shall seem proper and equitable.

St. Louis Tire Factory

J. A. Swinehart Interested with St. Louis Capitalists in $500,000 Concern to Make Automobile Tires

Stock of the Company Is Entirely Subscribed and Factory Arrangements Practically Completed

ST. LOUIS, MO., Sept. 16—A factory and distributing station for automobile tires is to be established in this city. The capital of $500,000 for the new enterprise was raised among St. Louisans, except that supplied by J. A. Swinehart, of Akron, O. The stock is completely subscribed and the company will probably be incorporated sometime this week. It is stated that arrangements practically have been completed for a building in the central part of the city near to automobile row.

The value of the annual output of the new factory is to be $1,000,000, according to the promoters who also stated that raw materials can be brought to St. Louis as cheaply as they could to Akron and that when the Panama Canal is opened St. Louis will enjoy an advantage over any eastern location. Rubber comes from South America for the most part and Africa and with the opening of the canal could be laid down in St. Louis on attractive terms. The new company will feature two products, besides making the full line of solid and pneumatic tires and inner tubes. The Krots, a solid tire for light delivery wagons and electric broughams, will be one of the tires featured. The other feature is a new method of making pneumatic tires on a hollow car mold, instead of solid car mold with an internal expansion of steam to make every thread of the fabric receive the same uniform tension. The new St. Louis factory will be the sixth to manufacture solid tires in the United States.

Favor Truck Warranty

Fourteen Members of N. A. A. M. Formally Adopt 90-Day Guarantee—Few to Accept Stipulations

1 Year Considered Too Long—Defects Will Show Themselves in the Course of 3 Months

WHEN the uniform truck warranty was framed last spring and presented to the trade for acceptance, modification or denial, it was expected that the response would be immediate and practically unanimous in favor of adopting it as a whole. As has been outlined, the chief provision of the warranty was the specification that its terms covered only 90 days of service, or 90 days of ownership in the hands of purchasers.

There has been some delay on the part of the industry to take up the proposition and according to an announcement made public last week by the National Association of Automobile Manufacturers, fourteen of its members have actually adopted the standard warranty. There are thirty-three members of the association devoted to automobile truck making, thus leaving nineteen to take affirmative action.

Of the nineteen, five companies have declined to adopt the form as recommended, alleging that they do not consider it sufficiently liberal in its terms. A few companies want the limit taken off as far as time is concerned.

Outside the association the standard warranty has met with a good reception. Fourteen companies have adopted it and nine have agreed to adopt it in case a majority favor it.

The opinion of those who want the 90-day guarantee is that 1 year is too long, because if proper material or workmanship is lacking in a particular truck the defects will show within 90 days and that they should be protected from ignorant and careless operation.

The following tabulation shows the companies that favor the warranty as presented:

Members N. A. A. M.	Non-members
Baker Motor Vehicle Co.	Auglaize Motor Car Co.
Federal Motor Truck Co.	Brown Commercial Car Co.
Gramm Motor Truck Co.	Chase Motor Truck Co.
Kelly Motor Truck Co.	Champion Wagon Co.
Knox Automobile Co.	Dorris Motor Car Co.
Locomobile Co. of America.	Geneva Wagon Co.
Packard Motor Car Co.	Gramm-Bernstein Co.
Peerless Motor Car Co.	Harwood-Barley Mfg. Co.
Pope Mfg. Co.	Hatfield Auto Truck Co.
Reo Motor Car Co.	Kearns Motor Car Co.
Selden Motor Vehicle Co.	Sanford Motor Truck Co.
United States Motor Co.	Stewart Motor Corp.
The Waverley Co.	U. S. Motor Truck Co.
The White Company	Veerac Motor Truck Co.

In addition to these twenty-eight companies there are four members and nine non-members who approve the warranty just as it is written and will adopt it if a majority of truck makers do so. They are:

Members	Non-members
Nordyke & Marmon Co.	C. L. Barker
Ohio Electric Car Co.	Bowling Green Motor Car Co.
Walter Motor Truck Co.	Chicago Pneumatic Tool Co.
Willys-Overland Co.	Dayton Auto Truck Co.
	Marathon Motor Works
	Moreland Motor Truck Co.
	Poss Motor Co.
	Sandusky Auto Parts & Motor Truck Co.
	H. E. Wilcox Motor Car Co.

Only Motors Shown to Fire Chiefs

DENVER, COLO., Sept. 18—That gasoline and electric motors have almost supplanted the horse as means of propulsion for fire-fighting equipment is emphasized more strongly than ever at the fortieth annual convention of the International Association of Fire Engineers, which opened here yesterday. For the first time in history of fire apparatus exhibitions held in connection with these conventions, there is not one single piece of horse-drawn apparatus shown at exhibit at auditorium.

Motor equipment has crowded out the horse. Of the $100,000 worth of motor apparatus on exhibition most interest among 500 fire chiefs was created by the monster Gorham pump shown by the Seagrave company. It is claimed that it will deliver 1,000 gallons per minute at 20 pounds pump pressure. It has a multiple stage centrifugal turbine pump with 165-horsepower, six-cylinder motor, Ahrens-Fox combined steam and electric pump regulator, steamer on battery front truck. The American La France 65-foot aerial gasoline electric four-wheel drive. The Webb aerial truck raises the ladder in 4 seconds. It is a four-wheel drive gas-electric.

ALBANY, N. Y., Sept. 16—According to an opinion rendered here by Attorney-General Carmody, justices of the peace throughout the state must turn over to the state treasurer the full amount of fines collected for criminal violations of the law in relation to the use of public highways by motor vehicles.

The question was raised by State Treasurer Kennedy, who received the residue of a fine, after deduction had been made for statutory fees by Justice Isaac Allen, of Southport, Chemung County.

Canadians to Make Tires

MONTREAL, QUE., Sept. 16—So great has been the growth of the automobile tire market that it is now stated on good authority that the Canadian Rubber Company contemplates erecting a large factory for the exclusive manufacture of tires. The factory, which, according to the report, is to be built across the border, will be equipped with all the modern improvements for the manufacture of rubber tires of all sizes.

The factory of the Canadian Rubber Company in Montreal has been found insufficient to supply the demand, and for a short time has not been turning out tires in such large quantities as formerly. However, with the erection of a fine new plant on the American side, the Canadian Rubber Company intend to make a special line of automobile tires and market them in the United States.

Nyberg Seeks Hoosier Site

INDIANAPOLIS, IND., Sept. 16—Henry Nyberg, president of the Nyberg Motor Works, Anderson, has confirmed a report that the company is negotiating for a factory site in this city, with a view to moving its manufacturing plant to Indianapolis. The company manufactures the Nyberg line of pleasure and commercial cars.

Since locating in Anderson some time ago, the company has found the need for expansion, not possible in its present location. For several days negotiations have been under way for a site here. It is understood several prospective sites have been visited and are under consideration.

Bankrupt Wins Agency Suit

ELMIRA, N. Y., Sept. 16—In the action of the Foreman Brothers Electric Company, of Paducah, Ky., which concern recently went into bankruptcy, against the American Motor Sales Company, of Elmira, N. Y., for $25,000 damages for alleged breach of contract in that the Elmira motor concern refused to allow the Kentucky company to handle its automobiles after the insolvent condition of the latter was ascertained, Judge John R. Hazel in United States District Court convening in Canandaigua, N. Y., last Saturday, directed the jury to return a verdict of $1,250 for the Kentucky corporation, which amount was deposited at the time the arrangement was made. The Elmira automobile firm consented that judgment against it be made for the amount of the deposit.

Trade News of the Week

Sales and Advertising Convention Plans Are Being Formulated for Big Session at Indianapolis

Crude Rubber Lower as Result of Heavy Offerings at Recent Auction—Other News of the Industry

INDIANAPOLIS, IND., Sept. 16—The convention of salesmen and advertising men to be held here October 8-9 will attract a big attendance, according to all indications. The movement has been endorsed by the manufacturers and arrangements are being shaped up for the affair on a major scale.

A tentative program was outlined at a meeting at the Columbia Club, of a committee composed of Homer McKee, advertising manager of the Cole Motor Car Company; Paul Richie, representing the Marmon; D. B. Williams, advertising manager of the American Motor Car Company, and Guy Simon, vice-president of the Pathfinder company.

Representatives from each of the automobile factories in Indianapolis are meeting every night at the Columbia Club to appoint permanent committees and to perfect arrangements for the convention.

W. D. Nesbit, of Chicago, will preside over the convention as permanent chairman, according to present plans. An address of welcome will be delivered by Charles A. Bookwalter. Among the prominent advertising men who will make addresses on salesmanship will be Elbert Hubbard, of East Aurora, President Sheldon, of the Sheldon School of Salesmanship, John Lee Mahin, of the Mahin Advertising Company, Leroy Pelletier, Detroit, director of advertising for the Flanders; Martin Kelley, of the Fuller Advertising Agency, General Manager Deeds, of the National Cash Register Company, and General Manager Laskar, of Lord & Thomas.

Those who are promoting the convention believe that 1,000 automobile salesmen will attend.

Harry L. Archey, of the Archey-Atkins Company will have charge of the automobile parade to be held on Tuesday morning, October 8. The addresses by the several speakers on the science of salesmanship will be delivered at the afternoon sessions of the convention. A "Speedway" dinner, to be served in "laps," will be held Tuesday evening. The Wednesday morning program will be given at the Indianapolis Motor Speedway. A novelty will be an automobile masquerade, the machines being disguised with floral decorations. Demonstrations in skillful driving will be given on the Speedway track by representatives of local factories.

Crude Rubber Trifle Lower

Crude rubber sagged again during the past week, the movement being of small proportions. The immense amount of rubber marketed at the last fortnightly auction was offered at a time when the demand was a trifle slacker than it has been and the result was a small decline all along the line. Since then the receipts have been up to the average and the whole list has followed the downward trend of plantations. Locally the trade was quiet but of good size. Manufacturers bought little at first hand. The current level is on a basis of $1.16 a pound for upriver fine.

Jonz-Advance Merger Planned

LOUISVILLE, KY., Sept. 16—At a meeting of the stockholders of the American Automobile Corporation, of New Albany, Ind., which recently took over the plant of the American Automobile Manufacturing Company, a proposition to merge with the Advance Power Company, an automobile manufacturing concern of Chicago, was considered this week. The board of directors was authorized to do what it thinks best. It is understood that the merger will be consummated within the next month and the capital stock will be increased from $150,000 to $1,000,000.

The new concern will be known as the Advance Motor Car Company. It is planned to move the Chicago concern to New Albany where a 1,000-pound truck with a double friction drive to sell for about $400 will be manufactured. A salesroom will be maintained at Chicago. It is understood that C. D. Morris, of Chicago, president of the Advance Power Company, will hold the same position in the new concern.

At the meeting J. W. Baxter, of New Albany, Ind., was elected director in the American Automobile Company, to succeed L. A. Boli, Jr., retired.

Gotham's Motor Fire Apparatus

Fire Commissioner Joseph Johnson, of the New York Fire Department, includes in his tentative budget for 1913, an item of $46,504, for maintenance of the motor equipment of the department. He notes the fact that the department now has fifty-nine motor vehicles in service and that eighty-seven more will be installed early in 1913.

The motorization of the New York department so far exceeds that of any other city in the world and its completion to the last fire-fighting unit will ultimately be accomplished according to the commissioner.

Oakland Host to Its Managers

DETROIT, Sept. 16—The Oakland Motor Car Company entertained 125 branch managers, distributors and representatives at

Automobile Securities Quotations

Movements in the market for automobile and accessory securities were irregular during the past week. The feature of course was the sharp drop in the prices of U. S. Motor common and preferred just before and after the receivership was announced. The common broke down under small offerings to 50 cents a share bid but little stock changed hands at the bottom. The preferred sold for $2 a share for a few minutes. Since then, there has been a gradual improvement in both issues. The standard shares moved within a limited range, the general tone being steady. General Motors yielded a fraction in each issue.

Price as Bar to Synthetic Rubber

Dr. Carl Duisberg, director general of the Farbenfabriken Company, of Elberfeld, was one of the principal speakers at the session of the Eighth International Congress of Applied Chemistry in New York, Monday, and in treating the subject of synthetic rubber, stated that in his opinion while the production of synthetic rubber has been attained from the viewpoint of chemistry, it is still a long way in the future as a commercial possibility.

He has used automobile tires made of the substance and said that he had traveled 4,000 miles upon them. Price and other factors as well are the main reasons for the delay in synthetic rubber reaching a commercial level, according to Dr. Duisberg.

Market Changes for the Week

Few materials changed their prices during the past week despite the fact that a satisfactory degree of activity prevailed throughout the market. Tin rose $.12 per 100 pounds. Steel, copper and lead remained at their old quotations, that of beams and channels being nominal during the latter half of the week. Cottonseed oil declined $.20, gradually decreasing in price throughout the week and closing at $6.16. Up-river declined during the week $.02 owing to lack of trade.

Britons Planning Reprisals

Consider $25,000,000 Company to Check American Invasion of England and a Protective Tariff

Alco Truck Scales Sierras and is Now on Last Leg of Tour to Pacific Under Capacity Load

LONDON, Sept. 18—Representatives of nearly a score of British motor car makers determined at a meeting held here to form a manufacturing company capitalized at $25,000,000 to manufacture low-priced cars in the United Kingdom to compete with the present cars of American manufacture. S. F. Edge, Lord Montagu, of Beaulieu, and the Duke of Westminster took leading parts in the discussion which grew out of the invasion of British territory by the American manufacturers.

The concrete purpose of the company will be to make cars that can be sold for from $1,000 to $1,250 that will compare with present American cars of like prices in service and appearance.

In addition, the manufacturers under the leadership of the Duke of Westminster will ask the British government to impose a prohibitive tariff on American automobiles.

In urging protective action, Lord Montagu said that he could not denounce the American cars as cheap and bad, because he knew them to be cheap and good.

The conclusions of the meeting were that the formation of a great British company might check the sale of American cars in Britain and that the right kind of a tariff would stop importation.

Alco Truck Mounts Sierras

SACRAMENTO, CAL., Sept. 18—The Alco transcontinental truck, bearing a 3-ton load from Philadelphia to a consignee at Petaluma, arrived at the capital of California yesterday after crossing the crest of the Sierra-Nevada mountains. The final climb over the continental backbone required the surmounting of a grade that averaged 20 per cent. for over 2 miles. The crew presented a letter from the Governor of Pennsylvania to Governor Johnson and the arrival in Sacramento was marked by numerous official functions and celebrations.

The schedule calls for the truck to make the run to San Francisco today and the final stage of the journey to Petaluma, which lies north of that city and across the Golden Gate will be made on Friday.

At San Francisco a big demonstration has been prepared and the crew will be tendered a typical San Francisco welcome. The detailed facts and figures covering the whole run are to be prepared immediately showing, in addition to the usual facts, the cost per motion minute of operation from end to end.

Ward Bids $40,000 for King Assets

According to announcement made by Sidney S. Meyers, attorney for the merchandise creditors of the King Motor Car Company, of Detroit, Artemus Ward, one of the heaviest creditors of the embarrassed concern; has made a formal offer of $40,000 for the property of the company. Mr. Meyers says that he will recommend that the offer be accepted. In case such a basis of settlement is reached the dividend to the creditors will amount to about 17 per cent.

Should the deal be consummated on the basis of Mr. Ward's offer, it is not certain about the future activities of the company. It has been suggested that the work undertaken by the factory shall be continued under the new order of things as heretofore conducted.

Milwaukee's New Course

Promoters Have Had to Rush Preparations for the Big Races But Track Is Rapidly Rounding Into Shape

Compares Very Favorably With the Savannah Course on Which the Contests Were Staged Last Year

MILWAUKEE, WIS., Sept. 16—For the first time away from their native heaths, the grand prix of the Automobile Club of American and the William K. Vanderbilt, J., cup will be contested for in the Middle West next week over a brand new 8-mile road circuit in the town of Wauwatosa, Milwaukee County, Wis., provided by the Milwaukee Automobile Dealers' Association. In keeping with custom, the M. A. D. A. has hung up two additional trophies which are bound to become of international note, the Col. Gustave Pabst trophy and the Wisconsin Challenge cup, deeded by Milwaukeeans for the light and medium car events. The program of this great cup competition will be:

Friday, September 20—The first race for the Col. Gustave Pabst trophy at a distance of approximately 205 miles, and the first race for the Wisconsin Challenge trophy at a distance of 164 miles.

Saturday, September 21—The eighth annual competition for the William K. Vanderbilt, Jr., cup at a distance of 287 miles.

Monday, September 23—The fourth race for the Automobile Club of America's gold cup, the grand prix, at a distance of 402 miles.

For this, the first international racing competition in the very heart of the American continent, as convenient of approach from the Pacific as of the Atlantic Coast and intervening territory, the promoter, the M. A. D. A., has hung up $20,250 in gold coin to supplement the valuable gold cups as prizes. The grand prix alone will be accompanied by a purse of $10,000 in gold, one-half of this going to the winner. The winning of the Vanderbilt will bring to the victorious car and driver a purse of $3,000, given by the association, while $1,000 is offered to the winner of both Pabst and Wisconsin Challenge cups. The M. A. D. A. has gone previous promoters one better by offering a fourth cash prize in every event, and has in addition tacked a fifth prize in the grand prix competition.

Unlimited Speed Possibilities

Approximately $25,000 has been distributed over a little more than 8 miles of the finest country highways to be found in the vicinity of Milwaukee, forming a cup race course which, although entirely new, should have unlimited possibilities of speed, at the same time offering opportunity for spectacular work to satiate the hunger of the thousands of newly-made road racing enthusiasts whose knowledge of cup competition has been gained from reading the accounts of the Long Island and Savannah races of past years.

Friday was set as the day for the opening of the course to the drivers for first practice. This leaves but four days of practice running, but the crack pilots already here believe this sufficient, as all who run in the last three events will have two additional days for tuning up.

The M. A. D. A. was obliged to go at break-neck speed to complete the course in the desired shape by Friday of last week.

The measures of protection and safeguarding are better than at any previous road racing carnival. Thirteen companies of militia, taken from the First, Second and Third Wisconsin Infantry, National Guard, will alternate in police duties on the 3 days of racing. Sheriff Arnold, in whose police jurisdiction the town of Wauwatosa lies, will be on hand with 100 special sworn deputies, while Chief of Police John T. Janssen, of Milwaukee, has provided a squad of 100 uniformed policemen taken from the regular city patrol force. The militiamen will be clothed and equipped as for actual warfare, and will bivouac on the infield of the course during the period from Friday until Tuesday. They will number 1,050 men, divided into three squads, one for each day.

There will be accommodations for all who come, even if the crowds outnumber 150,000. The Milwaukee Automobile Club, which will act in one of the principal rôles of entertainers, is prepared to provide board and room for several thousand visitors on its 4-acre clubhouse grounds, 4 miles from the center of the city. Invitations have been issued to every member of the A. A. A. to partake of its hospitality during race week.

Construction of the grandstands, judges' stands, press tower, bleachers, the pit sections, and other building work was begun Sunday morning. The start and finish line is on Burleigh street, midway between the North and South Fond du Lac roads. The grandstands will be on the south side of the homestretch, the pits being directly in front of the box sections, on the right-hand side of the drivers. The judges', press and administration buildings will be on the north side.

Four Straightaways Form Course

The Wauwatosa course, on which the races will be run, is a quadrangle lying within the township of Wauwatosa, Milwaukee County, Wis. Four straightaways, each pair approximately parallel, all of them as straight as an arrow, have been selected to form the cup course. While most of the road racing courses of America and Europe have either touched or passed through a town or city, the Milwaukee course is the first which actually touches, at any point, the city limits of a large metropolis, such as Milwaukee is with its 410,000 inhabitants.

The course runs due northwest from City Limits turn for a distance of approximately 3 miles along North Fond du Lac road, an old military trail which formed the principal exit from the settlement of Milwaukee 75 years ago.

The turn from Town Line into South Fondy is a hairpin, the inside of the round before it was touched being a bare 45 degrees. This was considerably increased by cutting away a triangle of 45 feet, but with the improvement it will form the most difficult curve of all to be negotiated.

In comparison with the Savannah course, over which the grand prix has been run several times, and the Vanderbilt cup for the first time on Thanksgiving Day of 1911, the Milwaukee course looks very good. It is only one-half as long, or 8 miles against 17. Instead of winding about in a tortuous circuit, as the Savannah course does, Milwaukee has a four-legged speedway that is almost a parallelogram, all sides of which are straight. The famous Waters road straightaway at Savannah offers nothing better than the North Fond du Lac road stretch at Milwaukee.

In reconstructing the roads used for the Vanderbilt course the Milwaukee Automobile Dealers' Association called upon the Wisconsin State Highway Commission for the services of its engineering staff and experts. In this manner it has been possible to build approximately 8 miles of uniform highway—uniform as to width and uniform as to construction. The two long straightaways have been good macadam roads for years. The two short stretches were plain dirt roads.

The Milwaukee course was constructed with a view to the holding of the international road races upon it for a period of 3 years, beginning with 1912. The contracts between the property owners and the M. A. D. A. are for that length of time.

CHICAGO, Sept. 16—The Chicago Motor Club has undertaken the promotion of the most sensational reliability ever carded in this country—a trip around Lake Michigan, a journey which has been made only by a few cars and which is expected to produce interesting results. Part of the way is through almost virgin territory, and especially in the wilds of Michigan and the northern part of Wisconsin the going will be far from easy.

Painting the 1913 Car

Improved Systems of Putting Machines Through the Shop More Quickly—New Colors in Vogue

Drying Room Is Now An Important Factor in the Up-to-date Automobile Paint Shop

UNLESS all signs fail, the automobile painter is to be the man of the hour during the coming year. His importance as a factor in the automobile industry has of late increased enormously. His services have become indispensable. He is recognized as both an artist and as an artisan. In handling the new styles and designs of automobiles which the coming year promises to disclose, his work will be more critically examined and studied than ever before.

Finer colors are to be employed in larger variety. New surface treatment, therefore, must follow. A higher grade of finishing will be called for. Other details scarcely less important will demand attention, so that, taken all in all, the selling value of the 1913 car is largely in the hands of the painter.

Quicker systems of putting the car through the paint shop—speaking now of both new and old work—are now in vogue. Pure raw linseed oil and white lead were for many years pronounced the invincible mediums through which the best and finest class of painting could be developed. Oil was pronounced by no less an authority than Dr. Dudley, late chemist of the Pennsylvania Railroad, as the life of the paint. It is largely, and with reason, so regarded today. But there has been a readjustment of the quantity used. A new order of pigment and oil combination has come into being. It has been found that with a reduced quantity of both oil and lead, the demand for quicker results, without sacrificing a necessary measure of durability, may be well satisfied.

Less Oil Is Used As a Binder

The use of metal bodies for automobiles has served to develop quick ways of painting and finishing such surfaces. Less oil as a binder for the primary coatings is one of the time-saving items connected with the painting of the aluminum or sheet steel body. The oven, or drying room, which is coming to be an important adjunct of the automobile paint shop, is also serving to facilitate and quicken the system of painting. These rooms need not be classed as ovens or hot rooms. Correctly they are drying rooms. They are, first, close rooms from which, except during periods of ventilation, the outside air is excluded, and into which it is possible to introduce a volume of dry, hot air sufficient to hasten the drying of all paint and varnish mediums. This is the main mission of the drying room. There are heating or drying ovens in use which at a temperature varying from 125 degrees to 300 degrees practically bake the paints and varnishes onto the surface.

With the simple heating or drying room, conditions and results are so modified that no doubt need be entertained as to the outcome of the work produced by the quicker method The drying room merely expels the major portion of the naturally prevailing moisture through the introduction of the dry, warm air, making it possible to get any part of a coat of paint or varnish dry in a comparatively short time.

In the automobile paint shop efficiency has been increased and will doubtless be further increased by making specialists of the men employed. In other words, a certain man or number of men do the varnishing of the car bodies; still other men attend to the chassis; certain men put on color and create color combinations; others work up the surface, putting on the rough coats, sandpapering, rubbing roughstuff, etc. By thus specializing a given amount of work is produced at less cost. Of course, this specializing plan can only be worked out where the business is large enough to employ several men and to permit of a systematic and uniform daily output of work.

For roadsters and the lighter-weight touring cars the lakes of dark, rich shades are to be popular. What may be known as Manhattan red promises to be a favorite. It is a vivid but beautiful red and is produced by first mixing 2 parts Indian red with one part English vermilion, reducing with pure turpentine, and applying to the surface. Over this ground apply two coats of No. 40 carmine, using for the second coat 1-2 ounce of carmine in a full pint of elastic rubbing varnish. Empire State red is produced by mixing one part No. 40 carmine with two parts English vermilion. Lay this combination over a peachblow color. For the second coat of the red mix 3-4 ounce of the pigment in one pint of varnish. Either one of the above colors appear to fine advantage if striped with lines of gold and black, or simply with lines of black.

Motor car red may be made by glazing the Empire State red with No. 40 carmine, which heightens and intensifies the effect. Of the lakes pure and simple, there are three or four which are about certain to get the popular vote. These are purple, scarlet, crimson and Munich lake. They require fine surfaces and perfect ground or preparatory colors.

Colors Should All Be Durable

Car buyers and owners who are particular about the colors employed should get assurance from the builder or painter as to the quality of the colors, both preparatory and final, used. These wonderfully handsome lakes are of little value unless durable. The scarlet lake is seen best over a ground of English vermilion. Munich lake may be used over a deep wine color, and crimson lake needs a deep red ground color. A plain black ground is about right for purple lake. All the lakes require a delicacy of treatment not usually applied to the less transparent pigments. Surfaces cannot well be too nice for them, and the greatest care must be exercised in bringing the colors along until they are finally safe under varnish.

Deep, rich greens and blues are to lead during the coming year as panel colors for the heavier type of car. In this prolific family of colors the old favorites remain sure and steadfast in the affections of the car users. Brewster, Merrimac, Quaker and olive green are really as beautiful as any of the greens can well be. They are strong and permanent colors and under attractive striping colors, such as gold, black, ivory white and carmine, they are unsurpassed. Automobile buyers at the coming New York shows may with profit, and a promise of future satisfaction, give these dark, noble green colors due consideration. Likewise the blues are to be seen in all their glory during next winter and the season following.

Ultramarine blue, transparent, but rich in color, requires a very good ground for best display. Dark brown or plain black are, in fact, exceedingly good colors over which to coat the ultramarine blue. Blues are colors hard to develop in the full purity of their original shade. Clear rubbing varnish applied over blue practically ruins its color purity. Over the blue, as developed on the surface, apply two coats of rubbing varnish, for good work, using a couple of ounces of blue to each pint of varnish. By this practice the tone and purity of the color are maintained. Rub these coats with flour pumicestone and water and put the finishing coat of varnish directly over this. In this way magnificent blue surfaces have been turned out of New York, Philadelphia and Boston paint shops for some time past.

Automobile buyers may also with profit study the charms of Richelieu, automobile, Twentieth Century, and cobalt and royal blue. Russian body blue offers something unusually fine for touring car panels.

Then there are the grays—automobile, battleship, cadet, Howard and Hudson gray—all strikingly handsome and all cool and clean and remarkably effective.

Advanced Type of Hydraulic Drive, With Important Improvements, When Applied To a Motor Truck By Noted Designer Results in Radical Departures Exemplifying Practical Difficulties—German Automobile Finance

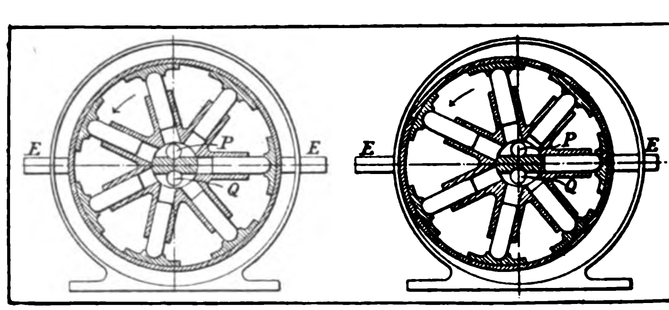
HYDRAULIC Motor Truck Transmission—Dr. Hele-Shaw, of England, well known from his connection with the development of British steam trucks and gasoline motor trucks since the inception of the industry relating to this class of vehicles and more widely known as identified with the multiple disk clutch bearing his name, has devised an hydraulic transmission mechanism which has been used successfully for operating the steering gear of ships, particularly in the case of the Diesel motor ship Selandia, and also for actuating the working elements in cranes, presses and machine tools with intermittent action. For training guns on shipboard this mechanism has also been found useful. It has been applied to the driving of motor trucks, and for this purpose the relations between its various parts have taken the forms shown in the accompanying illustrations which are reproduced after *Engineering* of London.

The principal elements are (1) a pump transforming the rotation of the gasoline motor shaft into a movement of fluid under pressure in one channel and a return movement of fluid under suction in another channel; (2) conduits taking the fluid to the driving wheels of the vehicle and back to the pump; (3) an hydraulic motor in each of the driving wheels transforming fluid pressure into rotation of the wheel and sending the fluid back to the pump; (4) a system comprising an oil tank, pipes and valves and an auxiliary pump for gathering the fluid which leaks from the mechanism and returning it to the latter and (5) a control mechanism for varying the pump stroke and thereby starting, reversing, braking the vehicle, or changing the gear ratio of the transmission.

Figs. 1 and 2 are diagrams indicating the principle of the pump. A disk-like body with seven radial cylinder bores can be rotated directly from the motor shaft and turns upon a fixed shaft which is placed in continuation of the motor shaft and is formed with two lengthwise bores P and Q connecting with an upper and a lower port cut crosswise into the shaft just in line with the middle of the cylinder disk where short ducts lead to the bottoms of the cylinder bores. Pistons for the cylinders are pivoted each in a so-called slipper block, all of which blocks are formed with relatively long curved sliding surfaces and placed in a ring-shaped guide, spaced apart in this ring by the pistons being held in alignment with their respective cylinders. The guide ring itself is free to revolve, being mounted upon roller bearings in a frame, and the frame can be moved horizontally to either side within the casing which encloses the whole mechanism, being mounted between parallel guide bars formed upon the interior walls of this casing. The diagrams, Figs. 1 and 2, do not show the roller bearings or the sliding frame, but the handles EE symbolize the horizontal lateral motion which can be given to the ring-shaped guide. When the latter is held concentrically with the cylinder disk, as in Fig. 1, it is evident that cylinders, pistons and guide ring can all be revolved together without causing the pistons to move in the cylinders, and the fluid in the bottom portions of the cylinders, as well as in the ports and the conduits P and Q, remains at rest. This is thus the neutral position of the gear. But, when the ring-shaped guide is pushed to one side, as in Fig. 2, some of the pistons are pulled outward in their cylinders while others are pushed in. When now the cylinder disk is rotated in the direction of the arrow, the cylinders will draw fluid from conduit P while they are filling up and will force fluid into conduit Q while they are discharging. They will be drawing when passing above the line EE and discharging below this line, and it is evident that the cylinders must be in connection with the upper port in the fixed shaft all the time while they are causing suction, as well as with the lower port when expelling the fluid, and both these ports must, therefore, be large enough to be in connection at the same time with one-half of the total number of cylinders. As the cylinders are not free to work while passing the bridge of metal separating the two ports, and a certain excess resistance is set up under this condition, an odd number of cylinders is preferable to an even number which would bring two cylinders opposite the bridge at the same time.

It is notable that the pumping action remains the same whether the ring-shaped guide revolves in its roller bearings or the blocks in which the ends of the pistons are pivoted revolve slidingly in the ring-shaped guide. Tests of the efficiency of the mechanism in two different forms have shown, however, that the freedom of the guide ring to revolve greatly assists the blocks to move with those speed variations which are forced upon them by the equable speed of the cylinders in conjunction with the eccentric arrangement of the piston pivots. In other words, in practice, the guide ring revolves and the blocks move a little forward and then a little backward in the guide ring at each revolution.

The exact arrangement of the mechanical parts mentioned is shown in Fig. 3, which represents a vertical cross-section through the axis of the motor shaft, and of the fixed shaft as well. The sliding frame shows only at TTTT. RR and RR are the two roller bearings mounted in it and in which in turn is mounted the ring-shaped guide U marked in full black. It will be noticed that this guide is made in two halves bolted together, and is provided with flanges affording complete guidance for the blocks S in which the piston pivot pins D are journaled. The motor shaft A, it is seen, is coupled to one end of the hub of the cylinder



Figs. 1 and 2—Diagrams of the general working principle in Hele-Shaw rotary pump body C by a conical joint secured by a nut and is separated by a small interval, which is utilized as a lubrication channel, from the fixed shaft, with the bores P and Q, which is hardened and ground to a close tunning fit in the rest of the hub of the cylinder body.

It is also noticed that the cylinder body is formed with extensions between the cylinder bores, as indicated in the lower part of the drawing, and that these extensions serve to limit the possible motion of the blocks S, so that after all in the practical construction provision is made for compelling the guide ring to revolve in its roller bearings rather than having the blocks free to slide around in the guide ring. Two slots in the outer portion of cylinder walls, in conjunction with suitable shaping of the blocks S allow the pivot pins to get nearer to the center of the mechanism than would be possible without them, thus making for compact design as well as improved guidance of the blocks in the guide ring.

The rear of the exterior casing is screwed upon the fixed shaft, with a simple washer separating it from the cylinder body, and at its front the casing is formed to receive a ball-bearing G in which the hub of the cylinder body revolves, and protection against leakage of fluid from this ball-bearing is sought by means of a conical flange clasping the motor shaft in a packed joint, which seems to be the only joint of this kind in the pump mechanism.

When the sliding frame is pushed over to one of the side walls

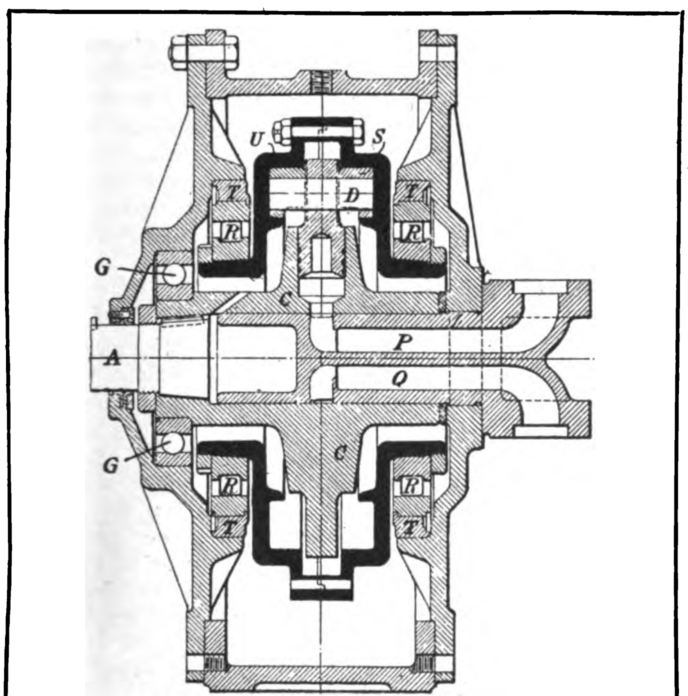


Fig. 3—Axial cross-section of a Hele-Shaw rotary pump as applied to the driving of motor trucks

of the casing, giving the guide ring its maximum of eccentricity, the pump will of course be in adjustment for working with full stroke. Any intermediate position of the sliding frame gives a shortened stroke and therefore a slower circulation of the fluid and a lower gear ratio. By pushing the sliding frame across to the other side of the casing, the direction of the fluid movement is reversed. Q becomes the suction channel and P the pressure channel. The pump is then in adjustment for reverse driving. In practice the reverse is limited to a low gear ratio by limiting the movement of the control lever, Fig. 7.

It has been found that when a pump of this construction works at high speed and full stroke a noise is produced which is caused by hydraulic shock taking place each time a cylinder is put in communication with the discharge port at the beginning of the inward stroke of the piston. The sudden variation in pressure, especially if air is entrained with the oil used as fluid, is likely

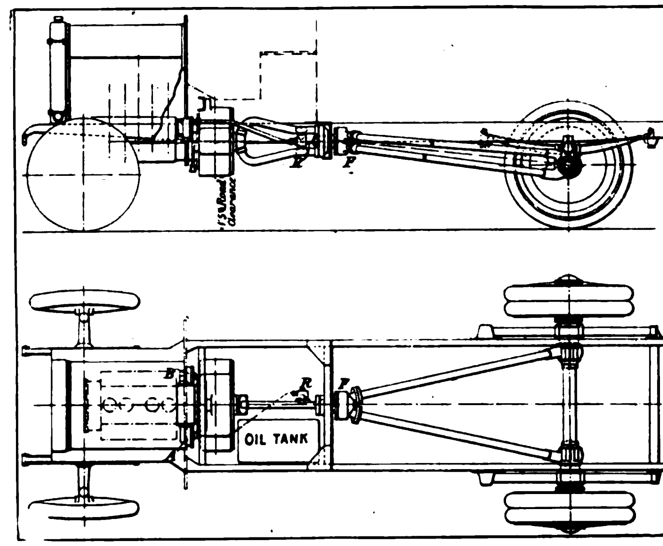

Fig. 4 and 5—Side and top views of truck chassis equipped with Hele-Shaw hydraulic drive

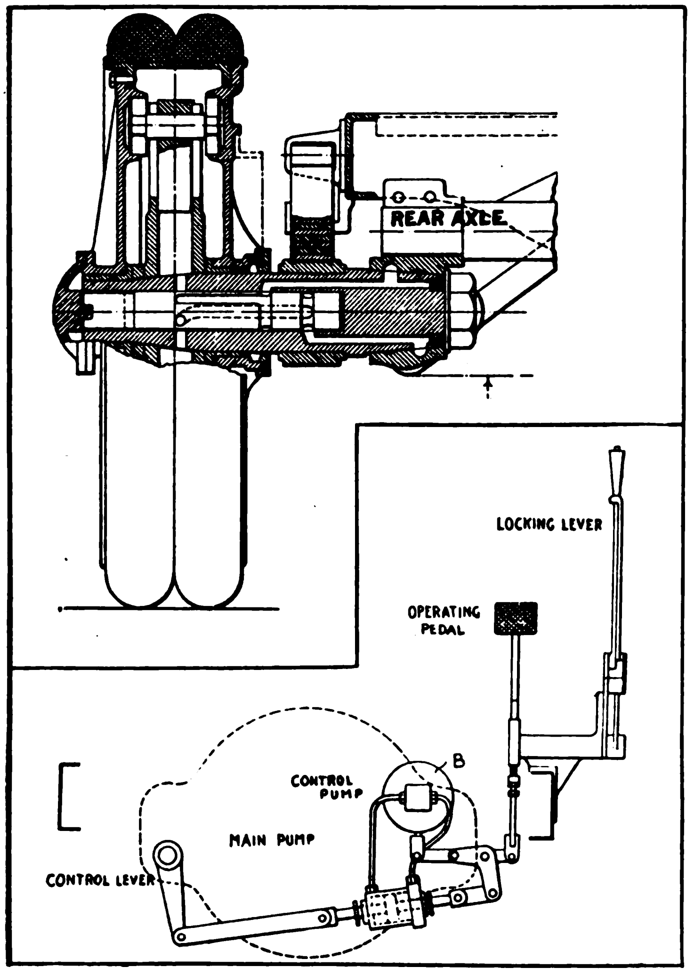
to cause an inrush from the pressure channel into the cylinder, with the result referred to. To remedy this evil, the bridge of metal separating the two ports is increased in thickness, so as to raise the pressure in the incoming cylinder while it passes the bridge and before it is put in communication with the discharge conduit, and to limit the pressure so created a small auxiliary port is formed in the extended portion of the bridge and this port is provided with a relief valve, and in addition a small hole is bored from the auxiliary to the main port admitting of a gradual equalizing of pressures.

These difficulties, though overcome in this instance, as it seems, illustrate the intricacies incidental to hydraulic transmissions, and they seem to have something to do with the choice of cylinders of increased length rather than increased diameter at the driven end of the Hele-Shaw mechanism—a choice which in turn may have dictated the use of the rear vehicle wheels as casings for the hydraulic motors at this point despite the mechanical and commercial complications which such a use of vehicle wheels necessarily involves. In this respect and also with regard to the strength and durability of the tubular connections from the pump to the fluid channels in the rear axle of the vehicle, the construction seems to be still in the experimental stage, viewed as part and parcel of motor truck construction.

Figs. 4 and 5 show the main features of the fluid conducts leading to the rear from the channels P and Q of the pump. The fluid is first taken in two pipes to a universal pipe joint F, which is rigidly suspended from the chassis, and in this joint suitable ports are provided for connecting the oil circuit from the pump to two pairs of pipes, each pair comprising a pressure and a suction channel and leading to a driven motor in one of the driving wheels by way of two bores in each end portion of the rear axle, which is of special design, as shown in Fig. 6. The two pairs of pipes also serve as torsion rods and the oil flow distributes itself automatically between the two pairs according to the driving resistance at the two wheel rims, so that the arrangement takes the place of the differential gear in gear-driven motor vehicles.

The motors in the rear wheels are similar to the pump, operating on the same general principle. But the guide ring has a fixed eccentricity, and is formed in the wheel sides, making the piston stroke and the gear reduction at this end a constant factor, and the cylinders are relatively long, having a larger capacity than those in the pump, thereby giving a gear reduction corresponding to that obtained by driving a large bevel gear crown from a small bevel gear pinion. While in the pump the rotation of the cylinder body drives the oil, the oil flow drives the cylinder body in the rear wheels. The valve shaft which corresponds to the fixed shaft in the pump is inserted in the bored-out axle and is ro-



Figs. 6 and 7—One of the driving wheels and part of the rear axle with hydraulic motor built into the wheel—Below, rear view of control mechanism for Hele-Shaw hydraulic transmission for trucks

tated from the hub cap of the wheel, receiving the oil from the conduits farther back in the rear axle by means of two ports extending around the circumference of the valve shaft, one connecting with the pressure conduit in this shaft and the other with the suction conduit. The cylinder body is fixed upon the axle, and the wheel, or motor casing, revolves upon gun metal bearings upon the axle, being rotated by the alternating pressure and suction on the pistons produced by the rotating valve shaft.

The method by which leakage of the fluid and the lubrication of the working parts is taken care of is more practically interesting. In the case of the wheel motor the casing constituting the wheel body is oiltight, and oil leaking from the interior of the cylinders past the pistons is drawn from the circumference of the casing by means of a pipe projecting radially from the cylinder body and connected by a circumferential groove on the axle with an auxiliary passage in the latter whence it is piped to the universal joint F, Figs. 4 and 5. From this joint, it is stated, a pipe is taken to an auxiliary pump, A in Fig. 5, which is driven from the camshaft of the gasoline motor and drives the oil back to the main oil system through the relief valves R. This motor also takes care of the leakage from the pump. In both cases a closed oil tank, shown in Fig. 5, is the intermediate link. It receives the drainage from the pump casing, after it has served to lubricate the guide ring, and the auxiliary pump creates a pressure in the tank, driving the surplus oil contained in it at any given time back to the main pressure and suction conduits through pipes fitted with non-return valves. The description is not explicit upon the details, as applied to the motor truck construction.

In connection with the speed control a second auxiliary pump is used, as indicated at B in Fig. 7. The necessity for using a pump to operate the adjustment of the sliding frame in the main pump seems to arise from the fact that such adjustment, when going from low to high speed, meets with considerable resistance, since it involves the turning of the cylinder body to some extent and consequently the creation of pressure and suction in the cylinders. On the other hand, this peculiarity seems to be utilized in the little control pump, as no other means are indicated for operating it than pressure of the foot on the control pedal. It is stated that "the pedal is connected with the floating ring of this auxiliary pump by a system of levers, so that by raising or depressing the pedal the flow of oil can be regulated as desired," and all the flow required is a sufficient displacement of the oil to drive the double-acting plunger, shown in Fig. 7, to one side or the other, this movement actuating the control lever of the main pump. When the plunger has traveled to the position giving the desired adjustment, the floating ring of the auxiliary pump is replaced in its neutral position and remains in that position until a further operation of the pedal occurs, and this automatic action is said to be effected by the "overtaking gear" indicated in Fig. 7. Probably the action is one locking the oil in the plunger cylinder, and in the two small pipes leading to it by separating it from that in the auxiliary pump, supplemented by passing the latter and by a spring action returning the pedal to its neutral position.

The locking lever is ingeniously arranged to operate a cam which maintains the pedal in its neutral position when the car is at rest and which also controls the amount of movement which can be given to the pedal in either direction.

Efficiency tests with this hydraulic transmission have naturally shown that the losses in its operation are much greater at half and quarter stroke adjustment than when full stroke is used. Working pressures of 1,000 pounds per square inch and higher are used with it. In connection with an experimental motor vehicle with a 15-horsepower engine a transmission efficiency of up to 75 per cent. is recorded and this is said to have been bettered in another vehicle equipped with a 30-horsepower engine. —From illustrated description in *Engineering*, June 21.

GERMAN Automobile Finance—According to the latest public accounting giving the commercial status of Benz & Company, of Mannheim, Germany, which firm is said to possess now the largest automobile works in Europe, the business year ending April 30, 1912, has been one of increasing prosperity. After writing off about $500,000 for the regular sinking fund and about $300,000 to special sinking fund or depreciation, $20,000 to workingmen's aid society and carrying forward to next year's account $250,000 (as against $45,000 under this item at the beginning of the year) a dividend of $300,000, or 10 per cent. on the capital stock, was declared, subject to the approval of the stockholders at the annual meeting. The receipts from the sale of goods during the year are given as $3,000,000 and the combined cost of production and sale as about $1,400,000, the net profits being consequently $1,600,000. These figures practically double those of the previous year, though with a slight proportionate increase in the cost of handling the business. The cost of production for the year 1910-1911 was given as $250,000 and the cost of the business department as $425,000. The tool and machine tool account has been charged with $167,000 for new purchases during the past year, which is the same amount as for the previous year, and after writing off for depreciation the sum of $140,000 on this account it remains charged in the books with more than $250,000. After the taking over of the Gaggenay motor truck works, the liabilities of the concern reach about $5,000,000, while the assets include $3,500,000 on bills receivable, $585,000 on note account, $2,350,000 estimated value of finished and half-finished goods on hand, $1,480,000 in raw material, $620,000 in goods on consignment; in all about $8,550,000 assets, counting furniture and cash on hand. The business of the concern comprises the making of pleasure cars at its old and new factories, of motor trucks at the Gaggenay works and the building of Diesel ship motors under Hesselmann patents. In addition the building of aviation motors has been resumed.—From *Automobil-Welt*, August 11.

Detroit S. A. E. Meets

Besides Routine Business, Two Papers Were Read, One Treating of a Special Type of Lamp and the Other of Pressed Steel Bodies

DETROIT, MICH., Sept. 14—The Detroit section of the Society of Automobile Engineers held its monthly meeting recently at which two papers were presented, one by Mr. Parkinson, of the Esterline company, on Golden Glow Lamps, the other by Mr. Millington, Western representative of the E. G. Budd Manufacturing Company, on pressed steel bodies, in addition to the ordinary routine business.

Mr. Parkinson stated that this new lamp, although of inestimable value, would not create a new era in the lamp industry, nor would it put any lamp companies out of business. There has been a big demand for an artificial light that would contain an element of sunlight and that would appear almost as a natural light.

The Glow Worm lamp gives this much desired result by using a reflection of special design and composition. The material used is a plate glass, the formula of which is a secret possessed by the glass company which makes the reflectors. The composition is such that the reflected light has the same spectrum as sunlight.

The design of the reflection is in general a parabola. This may be varied to suit a number of conditions. The thickness of the reflection is practically the same all over. The surfaces are highly polished and the back is silvered. The peculiar property of light given out by a Golden Glow lamp is that of fog penetration. By actual experiment a 16-candlepower Golden Glow light can be seen 2,300 feet through a fog where a 2,000-candlepower arc light was invisible at 200 to 300 feet only.

When used on automobiles, the usual glare of the headlights is not found. Holes and bumps appear in the natural state and even colors can be very distinctly seen. Mr. Parkinson stated that the Detroit United Railways has ordered Golden Glow lamps for all new cars and all replacements. These lamps are not now on the market to the automobile trade but will be by fall.

The paper was then open for discussion by members of the society.

Mr. Hinkley: Can you see 2,300 feet by this light?

Mr. Parkinson: It cannot be used as a searchlight. It may be seen very readily at 2,300 feet but will not illuminate an object at that distance.

Mr. Cox: How far will it illuminate by actual experiment?

Mr. Parkinson: We have not made any accurate experiments as yet. The Detroit United Railways found that a 16-candlepower lamp would show up the track for about 610 feet in a fog, where the ordinary lamps were of no avail. After a few more questions, Mr. Parkinson volunteered to supply the society with a set of lamps for experimental purposes, if the society would do the experimenting. His offer was accepted.

The second paper of the evening was read by Mr. Millington. It ran as follows:

Buyers Are Discriminating

The automobile buying public is now very discriminating and demands style, comfort and luxurious equipment and at the same time popular prices. These conditions force the car builder to look around for a body that has the desired qualities and at a cost to him that will be allowable. The old style of heavy wood frame construction and wooden panels is practically obsolete; the panels are hard to obtain and the time allowed for finishing is too short to permit of turning out a job that will stand up. The wooden frame construction with metal panels is now fairly popular and certainly has many good points, but a new body era is awakening, the era of the all-steel, rivetless and jointless body. This type of body is made with a great degree of accuracy. All parts are die-made and jig-assembled. Panels are made in one piece and gas-welded together. The whole is then spot-welded to the pressed-steel frame. All doors are die-made, jig-assembled and are consequently absolutely interchangeable. They are even painted before being placed on the bodies.

The cost of an all-steel body constructed along the above pattern is high unless made in very large quantities. The several distinct advantages claimed for this style of body may be summed up as follows:

1—Greater strength for the same weight, being a jointless, rivetless, and solderless unit.

2—It is more flexible.

3—It holds the joint much better than any other type as the paint is baked on; three or four coats exclusive of the varnish coats thus applied will give as good a finish as the usual fifteen coats, varnish coats or finishing coats excepted.

4—It can be produced cheaper than the other types, provided sufficient quantities are ordered.

5—It is impervious to atmosphere changes.

6—It is absolutely silent and will not rumble nor squeak.

British Fear American Invasion

AUTOMOBILE invasion of Great Britain and more particularly of Great Britain's colonies by the American industry, is seriously on the nerves of the British press and public and repeated calls are being made on the commercial organizations of Great Britain to stem the tide toward American automobiles by building cars that will be able to compete with the imported machines on a basis of price as well as service and quality.

It was recently stated by Lord Montagu that the American factories having enormous outputs and being operated with economy on the basis of quantity production would redouble their efforts to submerge the British market in 1913.

When the low-priced American automobile was put on the English market for the first time the general public was very skeptical as to the quality of its material and workmanship, but now this prejudice has entirely worn away and the American car sells on its merits.

In the low-price class the American cars are almost as popular in England as they are at home and it is admitted by numerous correspondents of the London *Express* that the situation is serious from the British point of view.

The main question that rises before the eyes of Great Britain is this: "If the American manufacturer can market a car in England for $750 why can not we do the same?"

Under the tariff as it is at present, wages are higher to the skilled mechanics who are employed by the American factories and the same rule applies to the commoner varieties of labor. Materials are mostly domestic in the low-priced American cars.

With these things ranged against the American manufacturer in the British market, as far as the selling price in competition is concerned, the American cars find a ready outlet.

According to the correspondents of the *Express* the main reason for this condition is that the American is giving best value, which of course means that on an even basis of price the American cars are better and on even basis of quality the American cars are cheaper.

Some of the correspondents deny that the $750 car would never have made its appearance at all save for the enterprise of the American manufacturers and set up the plea that if Great Britain had a tariff, somewhat similar to the one at present protecting the American industry, the British manufacturer and workman would have a chance in their domestic market and would dump their surplus abroad, even as their Yankee cousins are doing at present.

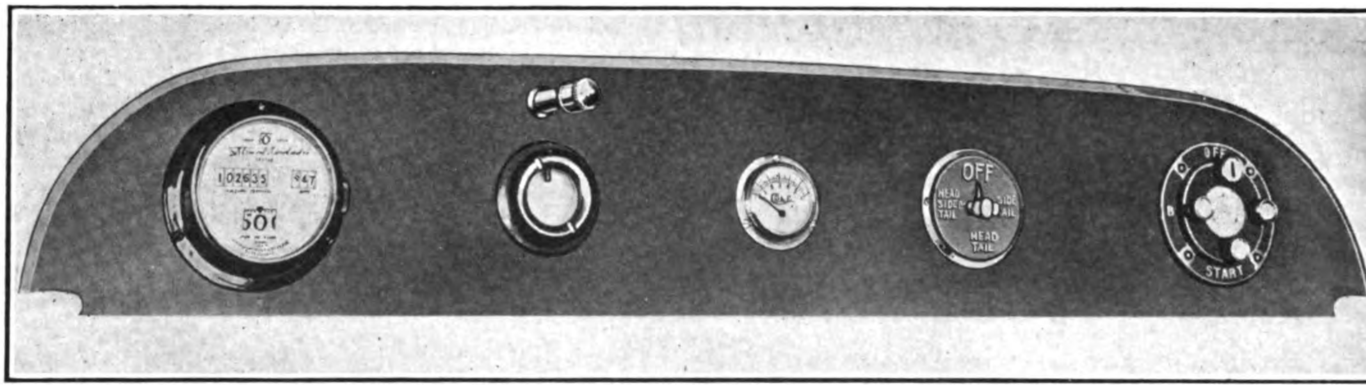


Fig. 1—Cowl board carrying dash equipment which is a feature of the Cole series eight

New Cole Series Has Electric Starter

Three Chassis on the Market for the 1913 Season—Pressure Feed Gasoline Tank Adopted in Place of Gravity—Other Changes of a Minor Nature Made —Cowl Board Adopted for Mounting of Dash Fixtures

SERIES eight of Cole cars will be equipped with the Delco starting and lighting system. This announcement brings to light another firm which has pinned its faith to the electric starting and lighting equipment. It is also the principal change in the Cole line of cars for the coming season barring a few minor refinements which were made merely for the sake of appearance in all but one case where the gasoline feed has been changed from gravity to pressure.

There are three models on the market. They are known as the 40, 50 and 60. The first two are four cylinders, while the 60 is a six-cylinder car. All models have the cylinders cast in pairs and have motors with the same general features of construction, although the bores and strokes vary considerably. The cylinder dimensions of the three models for 1913 follow:

Model	40	50	60
Bore	4 1-8 inches	4 1-2 inches	4 1-8 inches
Stroke	4 3-4 inches	5 1-4 inches	4 3-4 inches

The power plant as a whole is of the unit type suspended at three points. The cylinders are of the L-head type with integral water-jackets of large size which are specially designed to permit of an easy flow of the cooling water about the cylinder walls. The motor is set on a slight inclination to the horizontal plane in order to secure a straight line drive to the rear axle when the car is traveling under its designed load. This angle approximates 2 1-2 degrees.

The pistons are soft gray iron castings. They are fitted with

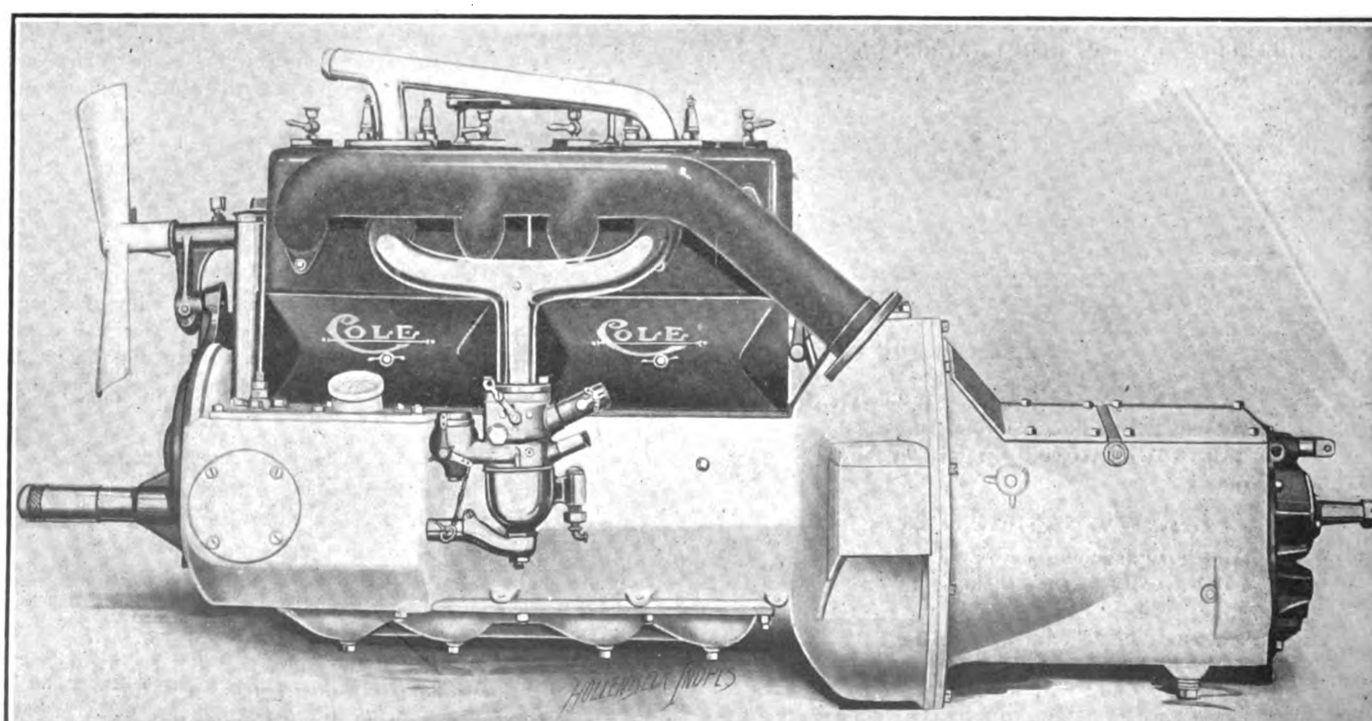

Fig. 2—Left side of Cole model 40; note oil reservoir on side of crankcase and the entirely inclosed valve action

three 1-4-inch rings, all located above the wristpin. There are two oil grooves in the piston, one below the lowest piston ring and the other at the lowest extremity of the piston. The purpose of these rings is to distribute the oil evenly over the surface of the cylinder and in case of the upper one to bring oil up to the wristpin bearing bushing for the purpose of lubricating the oscillating bearing at this point.

The connecting-rods are of I-beam section and are made with extra long bearing surface. The lower bearing is grooved to distribute the oil about this important bearing. The two ducts or grooves pass each other in X form. Besides the grooves there is an oil hole through the bushing by means of which the oil is permitted to enter the bushing and become distributed about the bearing. The lower connecting-rod bearing is bushed with babbitt and the bearing cap is held in place by two large bolts which are castellated to prevent them from working loose and wearing excessively on account of lost motion in the bearing. The connecting-rod is fitted with a scoop on the bottom which is a factor in the oiling system of the car and which will be touched upon later.

The crankshaft is a solid chrome nickel steel drop forging having three bearings in the four-cylinder models and four in the six-cylinder models. The bearings are carried on bridges located in the upper half of the crankcase casting and are situated between each pair of cylinders. In order that it will not be possible for the oil to work along the crankshaft and through the crankcase at the end bearing there is a special device fitted on the end of the crankshaft. This consists of a ring which will catch the oil as it flows along the crankshaft. When the oil reaches the outer diameter of this ring it will be thrown off by the added centrifugal force due to the fact that the diameter of the ring is much greater than that of the crankshaft. The oil so thrown off is caught in a duct in the bearing bushing and thus finds its way to the crankcase. In order that the oil which works its way to the periphery of the ring will be more certainly thrown off, the outside of the ring tapers to a sharp edge around its circumference. No oil will be splashed against the crankshaft beyond the ring as it is placed just at the point where the crankshaft leaves the crankcase. At the rear end of the crankshaft there is a flange which is forged integrally. Its purpose is to sustain the flywheel and it is pierced by six equally spaced holes which take the bolts for attaching the flywheel to the end of the crankshaft.

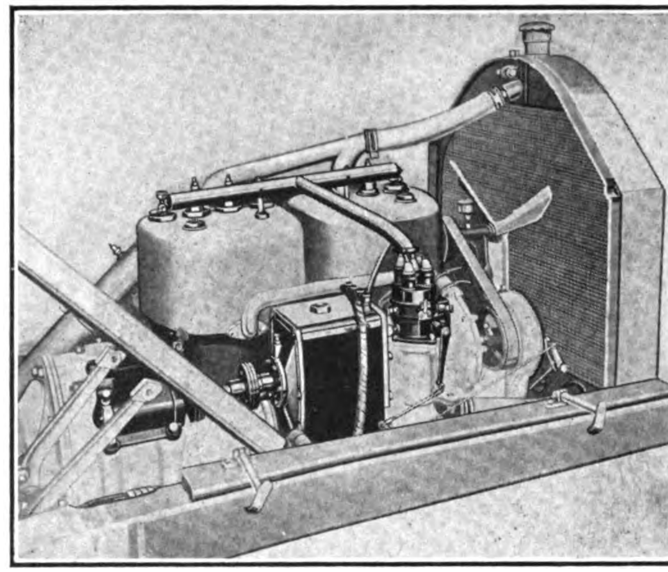

Fig. 4—Mounting of the Delco system on Cole motor

The Cole cooling system has been carefully thought out. The water is circulated by means of an ingeniously mounted water pump located on the right side of the motor, which incidentally is the side opposite the valves. The water-pump casing is firmly bracketed to the crankcase near the forward end of the motor. An extra gear at the extreme right of the timing set drives the shaft for the water pump as well as the fan pulley and the magneto. The pump is separate from the magneto, however, so that if it is desired to remove either it is a mere matter of loosening an Oldham coupling on the shaft. The water inlet is at the lower side of the pump permitting a direct connection with the radiator by passing the pipe under the slight projection in the gearcase formed by the housing for the gear that drives the pump and magneto shaft. The water is discharged at the top at a point very close to the water-jacketing of the

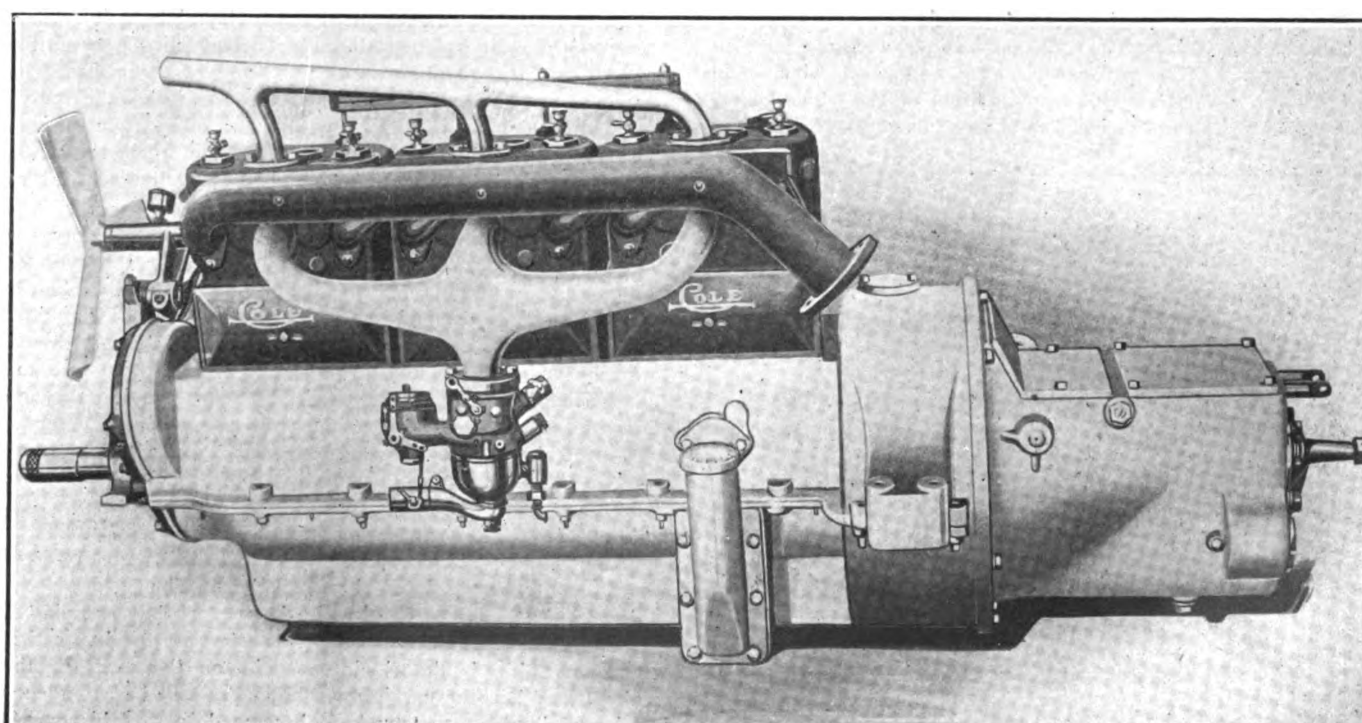

Fig. 3—Left side of the six-cylinder Cole motor, showing unit construction and the mounting of the new Schebler carbureter

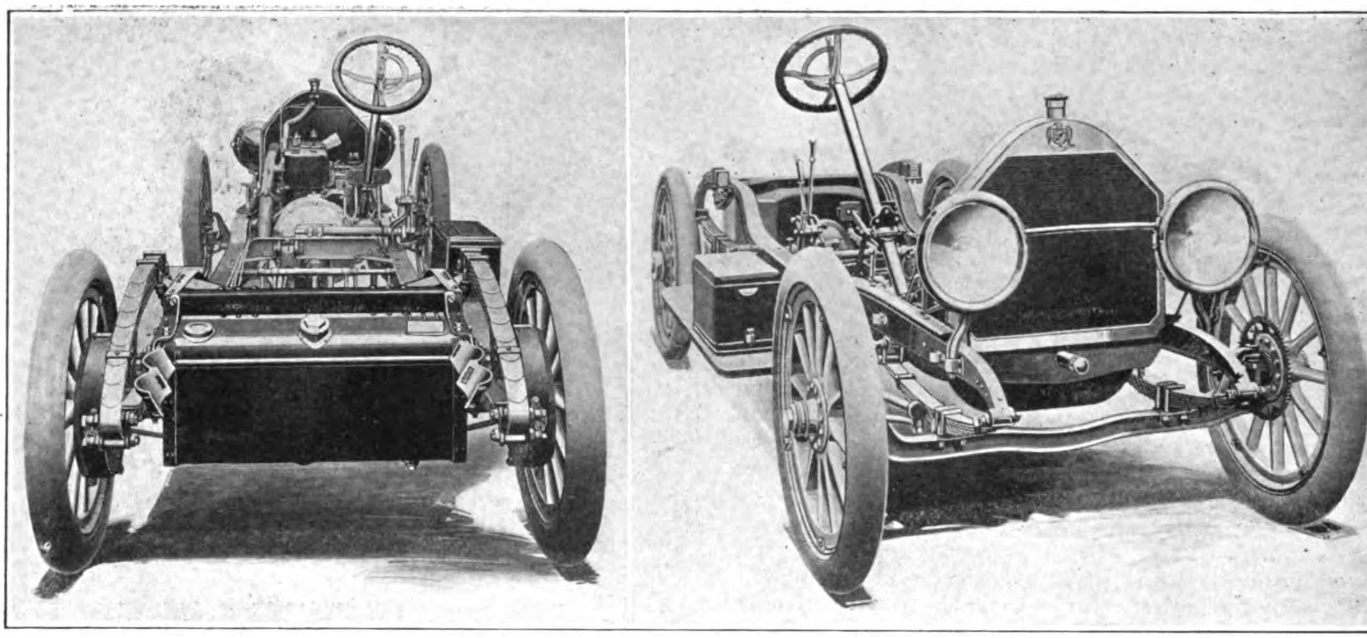

Fig. 5—Rear and front view of the standard series eight Cole chassis with pressure tank

cylinders. The water returns to the radiator through a very straight manifold located on the top of the cylinders outside the valves. The position of this manifold is such that the water must pass around the valves before it can enter the manifold. The radiator is a Mayo honeycomb.

One of the distinctive features of Cole design is the fan. The fan has three blades. It is a solid aluminum casting. It is mounted upon a bracket arm which can be turned about its bottom support, thus putting more or less tension on the fan belt according to the requirements. Should the belt become stretched through long use, the stretch can be compensated for by turning the bracket arm slightly and then tightening the nut at the bottom which holds it in place. The fan bearing is a plain bearing of extra length and is lubricated by a grease cup mounted upon it.

Silence has been made an aim throughout the motor. The timing gears have been given special attention in this direction, as have also the valve springs and push-rods, which are inclosed by heavy plates. The gear wheels have six spokes which tend to break up the noises due to vibration. They have helical teeth which are carefully ribbed to secure silent engagement, and the gears are pinned and keyed carefully to their respective shafts in order that there will be no rattle due to loosely connected gears.

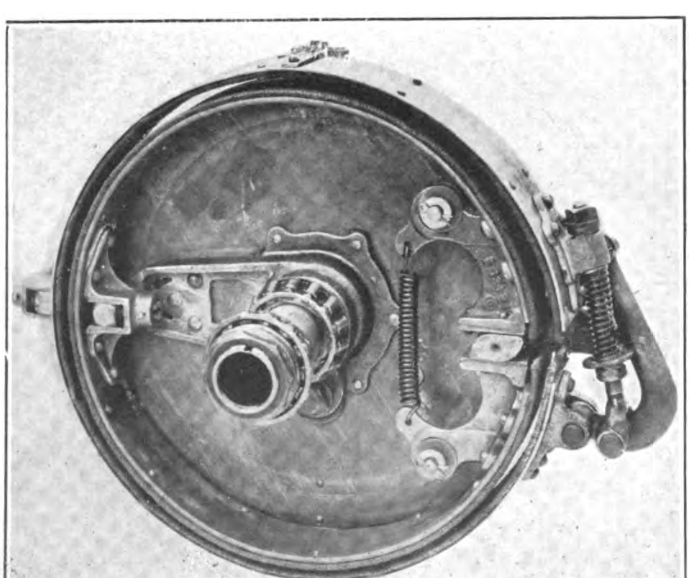

Fig. 6—Interior of the Cole internal and external brakes

The lubricating system employed on the Cole cars is the constant level splash system. In this system the oil is carried in the reservoir in the crankcase. The oil capacities of the different models are as follows: Model 40, 2 1-2 gallons; model 50, 1 1-2 gallons; model 60, 2 gallons. The reservoir is located on the left side of the crankcase in the model 40, and as may be seen in Fig. 2 it can be detected by the box-like projection on the side of the crankcase. The larger four-cylinder model carries the oil in a special compartment located in the bottom of the crankcase, but the method of lubricating the motor is exactly the same in all models.

The oil pump, which is driven by a worm gear from the camshaft, is of the plunger type and is contained directly within the oil reservoir so that on account of the copious lubrication which it receives the wear is practically nil. The reduction between the camshaft and the oil pump is 25 to 1, and as the camshaft is running at but one-half the speed of the crankshaft the reduction to the oil pump is 50 to 1 with the crankshaft taken as a basis. There is an adjustable nut by means of which the stroke of the pump and hence the amount of oil delivered at each stroke may be governed.

The oil pump takes the oil from the reservoir and forces it to a sight feed located on the dash. In this way the operator sees every drop of oil that enters the crankcase and he knows when the supply is running short by the behavior of the sight feed. The oil is sucked into the pump from the bottom on the up stroke and then on the down stroke is forced up into the lead which takes it to the sight feed. After passing through the sight feed the oil is led to the crankcase where it enters a series of troughs which are located one below each connecting rod. On the bottom of the connecting-rod there is a scoop that catches the oil and throws it up into the cylinders, where it is picked up by the oil wiper rings on the piston and distributed about the cylinder walls. The troughs into which the connecting rods dip are curved so that there will be no danger of all the oil leaving one of the troughs should the car be ascending a steep hill. Another feature which takes care of the lubricating system on a hill is the sloping troughs on the walls of the crankcase. When the car is on a hill there will be a tendency for the oil in the rear trough to become deeper. This excess oil will be thrown by the connecting-rods against the walls of the crankcase from where it will drain into a series of sloping troughs which lead the oil back to the front end of the crankcase. The slopes of these troughs are so great that in spite of the gradient there will always be a gravity flow of the oil back to the forward end of the crankcase. These sloping troughs keep the oil in circulation even on a level road. There is no return of the oil to the reservoir, the pump feeding fresh oil continuously as it is used up by the motor.

The entire electrical apparatus is taken care of by the Delco equipment. In the series 7 a separate dynamo was provided for the lighting current; this has been entirely supplanted by the new system which not only takes care of the lighting of the cars, but the starting and ignition. In applying the Delco system to the Cole Northway unit power plant it was only necessary to cut teeth in the periphery of the flywheel to take the reduction gearing on the electric starting motor. No complications were found in doing this work and there had to be no changes in the motor design to make the installation. In placing the Delco system in their cars the Cole company took the opportunity of mounting all their dash equipment in a very unique and ingenious manner. Across the top of the deep cowl, the board which is shown in Fig. 1 was mounted. This board is of highly polished walnut and carries the ignition and lighting switches, the oil sight feed, gasoline tank pressure gauge and speedometer. A cowl light which illuminates the board is also mounted here and is connected in series with the tail light, thus acting to some degree as a telltale besides making the dash fixtures visible.

The Delco system consists of two principal units, a motor-generator and a storage battery. These are so arranged that the generator part of the motor-generator keeps the battery charged when the motor is running and the battery in its turn supplies the current for the motor when the motor-generator takes that rôle for the purpose of starting the motor.

The motor-generator is geared to the flywheel through a train of reduction gears. It is mounted on the side of the crankcase. When the ignition switch is put in the starting position the storage battery furnishes a current of 24 volts which turns and starts the motor-generator, thus turning over the engine by means of the flywheel. When the motor picks up and starts to go under its own power the gearing of the starter is automatically disconnected from the flywheel and thrown into engagement with magneto shaft by means of a ratchet clutch. When driven through this shaft the machine becomes a shunt-wound generator and starts to recharge the storage battery giving it sufficient current to take care of the ignition and lighting. The storage battery starts to be charged at 300 revolutions per minute. From this point up to about 1,000 revolutions per minute the current increases to 12 or 14 amperes. At higher revolutions than this the current does not materially increase. The lamps used with the system have a voltage of 6 1-2; the 6-volt lamps which have been used with the system have exceptional brilliancy but a short life.

The carbureter to be used on the series eight Cole cars is the new Schebler model O. This is a double-jet design with one of the jets concentric and the other located in such a position that it comes into action with the auxiliary air. A feature in connection with this carbureter is the control of the air from the steering post. The gasoline pressure tank on the model 40 has a capacity of 18 gallons and on models 50 and 60 20 gallons. The tank is located in the rear just below the after cross-member of the chassis frame.

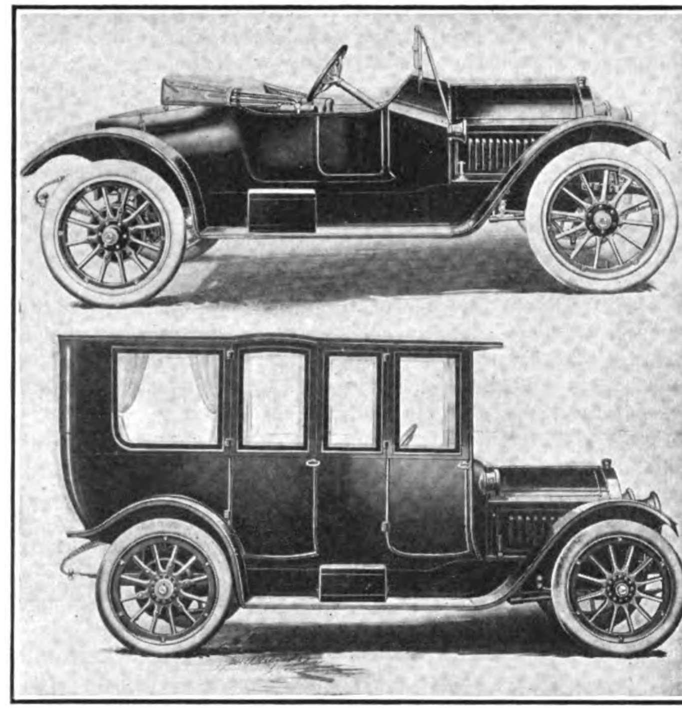

Fig. 8—Model 40 roadster and 50 limousine, series eight

The clutch is of the leather-faced cone type. The engaging stress has been distributed among six smaller springs instead of the former single spring. The object of this to secure an easier engagement than would be possible with the single spring. The springs are distributed equally about the clutch so that an equal engagement is assured. The clutch spider is of aluminum and is of very light construction throughout, not being a solid piece but having ribs which make up in strength what is lost in weight. The clutch spring has a large diameter for its strength, thus securing a maximum flexibility. It is placed on the outside of the clutch hub and is very accessible. The adjustment of the clutch spring is made by turning three nuts which compress the spring, thus increasing the strength of engagement. There is an opening provided in the clutch housing for making the adjustment just mentioned as well as for reaching the grease cups on the clutch yoke which can be turned down or filled through this opening. The disengaging yoke is a solid piece bearing against a flat collar or flange on the clutch shaft just behind the large clutch spring. The yoke is circular in form and of such shape that it bears practically against the whole col-

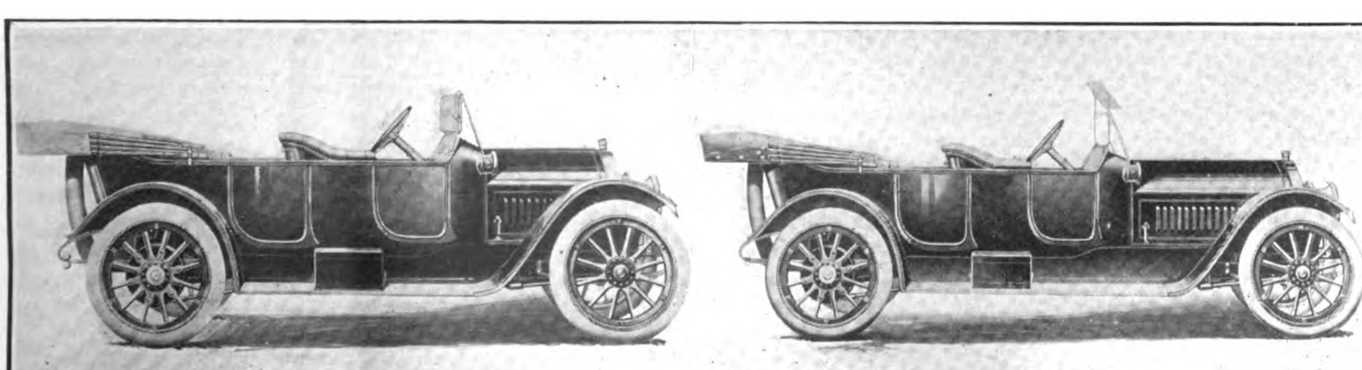

Fig. 7—Cole model 50 with 122-inch wheelbase; 132-inch wheelbase model 60 touring car

lar on the back end of the clutch. The yoke is bolted up in very much the same manner as the two halves of a main bearing and carries a liberal supply of oil in a self-contained well which lubricates the bearing surfaces at the point where the yoke presses against the collar when the clutch pedal is depressed for changing gears or in coasting. The clutch shaft which takes the drive has four splines permitting of a free axial movement, but with a good torque absorption. On the rear end of this shaft is the gearset drive pinion.

The gearset is of the three-speed and reverse type controlled by a lever through an H quadrant. The gearset housing is attached directly to the rear of the motor crankcase giving the unit construction which may be noted in Fig. 3. The housing is of the barrel type, having no joints except the rear removable cover plate which is protected by an oil-tight gasket to prevent the leakage of the transmission lubricant. The shafts of the gearset are all carried on heavy-duty annular ball bearings. Four-spline shafts are used permitting the gears to slide longitudinally, but to be relatively fixed to the axle. The material used in the gears and shafts is chrome nickel steel.

The drive is taken up by a chrome nickel-steel propeller shaft which has a universal joint at either end. This shaft delivers the power to a Timken floating rear axle mounted throughout on Timken roller bearings. The housing of the axle is of pressed steel, and is continuous throughout the whole axle width with the exception of the differential cover plate, which is removable for inspection purposes. The housing has been reinforced at the ends, where it becomes tubular in form by a 3 1-2 per cent. nickel-steel tube. The reinforcement extends from the ends toward the the center of housing past the spring pads. It is welded to the main housing. The drive shafts are of chrome nickel steel, machine finished. They have squared ends, as is usual in the floating type of axle, and are capable of being removed by merely taking off the hub caps and drawing them out.

Rear Axle Bearings Adjustable

Bearings are adjustable in this axle. It is possible to see through a peep hole in the differential casing if the gears are properly in mesh, and if not, the proper adjustments to compensate for wear can be made by external adjusting means which can be reached by removing the plate covering the differential. The torque members are of triangular-sectioned tubing. There are two of these arms connected to the top and bottom of the differential housing in sockets connected to a hardened pin which takes all the thrust. The pin fits into ground bushings and is lubricated by means of an accessible grease cup.

There are two sets of brakes acting on the same drum, one set being of the external contracting type, while the other is of the internal expanding type. The brake dimensions of the four models are as follows:

Model	40	50	60
Diameter	14 inches	15 1-2 inches	15 1-2 inches
Width	2 inches	2 1-2 inches	2 1-2 inches

The lining on the brake is of asbestos fabric interwoven with copper wire to give a high frictional coefficient without burning.

The front axle is of I-beam construction. It is of Timken manufacture with nickel-steel steering knuckles with roller-bearing mountings. A speedometer mounting is provided on the steering arm by a hole drilled through a special box. Careful fitting is made a point in the construction of the steering knuckles and spindles. The grinding work in these parts has limits of tolerance of one thousandth of an inch and less.

The wheels are all of second-growth hickory. They are made on the artillery plan and fitted with Firestone demountable rims. The size of the tires adapted to each model is as follows:

Model	40	50	60
Tire Size	36x4 inch	36x4 inch	37x4 1-2 inch

Firestone or Goodrich tires are furnished as regular equipment.

The spring suspension is half elliptic front and three-quarter elliptic rear. The spring dimensions are the same on all three models, the front being 2 inches wide by 40 inches long, and the rear 2 inches by 51 inches. The steering gear is the Gemmer type with 18-inch steering wheel. The control levers are of solid German silver. Special attention has been given to body design this year. A drop of two inches has been given the frame just behind the dash, giving more sprawl room in the tonneau. The driver has a lower seat also which gives greater comfort. The fenders curve more abruptly around the wheels, giving a long, racy running board. The extra tire is now carried on the rear. The starting crank will be carried in the tool box where it will be handy in case of an emergency.

The equipment consists of an extra demountable rim, speedometer, grade-indicator, Delco starter, electric headlights, side, cowl and tail lights, silk mohair top with side curtains and top cover, clear rain vision wind shield; pump, jack and tool kit under front seat; robe rail and foot rail, rear tire carrier, electric horn, all dash equipment being mounted on the highly finished cowl board.

Harking Back a Decade

What the Motoring Publications of 10 Years Ago Had to Say on Live Matters of the Day

FROM *The Automobile and Motor Review*, September 13, 1902:

Jacob Ruppert, the New York brewer, has installed a 7-ton electric truck made by the Fischer Motor Vehicle Company for use in the delivery department. The current is generated by a four-cylinder, four-cycle gasoline motor, the cylinders of which measure 5 1-2 by 6 inches.

The Hon. Charles Stuart Rolls is coming to the front as a leading race driver in England. Montague Grahame-White is likewise becoming very prominent in the speed world on account of his brilliant skill and fearlessness.

In the early days of automobile construction, in this country at least, the problem of compensating for road inequalities as affecting the means of transmission, was generally accomplished by adopting the principle of the three-point support in the running gear and carrying the machinery on a rigid framework. This has been proved to be unsatisfactory and the next step was to lighten the reaches and strengthen the springs that carry the body. It has come to be accepted practice at present to recognize that flexibility and not rigidity is the proper condition for both frame and transmission mechanism.

John Farson, Jr., in his Winton touring car, won the two 5-mile dash races staged at the Rockford, Ill., county fair. The track is an oval 1-3 mile in circumference with turns unbanked. The best time made was 11:57 1-5.

The Fournier-Searchmont Automobile Company, of Philadelphia, will be moved to a new factory location recently secured near Chester, Pa. The station is now known as Trainer but an effort is being made to have the postal authorities rename it Searchmont. The company expects to move in October.

The name of the Robinson Motor Vehicle Company, of Hyde Park, Mass., has been changed to Pope-Robinson Company. The capital stock has been increased from $100,000 to double that amount. Edward W. Pope has been elected secretary and treasurer.

The Austin Automobile Company has been incorporated under the laws of Michigan to manufacture gasoline automobiles at Grand Rapids. The car will be of the French type, 16-horsepower with detachable tonneau.

Gasoline has advanced in price in New York City from 18 to 20 cents a gallon and 15 cents a gallon by the barrel. There is a scarcity of the 76-degree gasoline.

New Acetylene Starter

Niagara Compressor Mounted on Steering Column Controls Starting of Car and Gas Headlights

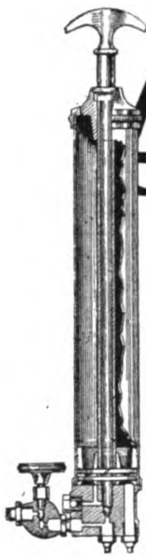

Fig. 1—Part section of compressor

AN ACETYLENE motor starter of very novel construction is the Niagara. The principle upon which it operates is the placing of acetylene and air in the cylinders of the motor thus forming an explosive mixture. The firing of this mixture is effected by the ignition system of the car. The principal feature of the starter is that the mixing of the air and acetylene is done within the motor cylinder and not outside. Another prominent feature is that the acetylene headlights on the car can be regulated by the driver from his seat.

In appearance the starter is a long cylindrical plunger pump a part section of which is shown in Fig. 1. It is attached to the steering post as indicated in the view of the installation, Fig. 2. It is thus within easy reach of the hand at all times. At the bottom of the cylindrical pump there are three copper tubes one of which passes to the acetylene tank and is the source of supply both for the starting apparatus and the lamps, another goes directly to the headlights and supplies them with pure acetylene gas, the third pipe is for the purpose of starting and takes the gas directly to the cylinders. When the plunger is lifted, a measured amount of acetylene is drawn into the barrel of the pump and the correct amount of air for making an explosive mixture with this gas is also taken in through the intake side of the pump. A downward thrust on the plunger sends this gas through the copper lead into the cylinders which it enters and becomes thoroughly mixed in the process so that it is readily combustible.

The connection of the starter lead with the cylinders is T-shaped except in the case of the foremost cylinder where it is an L. The connection to the acetylene tank consists of a regular tube which replaces the valve ordinarily found at this point. The valve control is located at the foot of the pump and it is from this point that the pressure of the feed is regulated. The headlights are thus under perfect control without the necessity of the driver having to leave his seat. The latter valve may be seen in Fig. 1 which shows a section through the lower part of the pump. The other valves are automatic and are of the steel ball type.

The passage of the acetylene gas for the lamps in the illustration is that located nearest to the pressure control valve; it passes out through the base of the pump directly into the copper lead for the headlights. The operation of the headlights by means of this valve does not in any way interfere with the action of the starting device which is altogether independent of the lamp control although contained within the same housing.

Best of Materials Are Used

The barrel of the compressor mounted against the steering column is of mandrel drawn steel tubing. The plunger is cast iron and is made exactly like the piston in a motor with two piston rings. The iron used in the casting is the same style of soft gray iron that is used in the pistons and cylinders of nearly all gasoline motors. This combination of soft gray iron with the two cast iron piston rings working against the steel tube should give an arrangement that will wear as long as the car. Another feature of the construction of the pump which is also of interest is the cover plate over the top of the starter. This forms both the cover to the barrel and the upper bearing of the plunger stem. The bearing is an integral part of the cover which is made entirely of steel to guard against wear through excessive use. The length of the bearing provided for the stem at this point is 1 1-2 inches. Through the cover there is a small vent hole to prevent any compression in the upper part of the compress or barrel when the plunger is lifted up. This vent is small in order that no dust can possibly pass down into the barrel and score the same after it has collected in sufficient quantities to work down past the piston at the same time it is large enough to allow of the free reciprocating motion of the plunger. The vent hole will also act as an oil hole for the introduction of an occasional drop of oil to lubricate the action of the metal plunger and cylinder contact.

The handle of the pump is of such shape that it affords a good grip and is at the same time ornamental. It is connected directly to the hollow steel plunger stem which is screwed at its lowest extremity into the boss in the center of the piston or plunger making a firm connection to the latter so that it cannot possibly work loose.

The piston is of the inverted bucket type with the two rings located at the bottom. The piston seats firmly against the base of the pump around its entire circumference, it is grooved, however, above the air intake and the mixture outlet ports. The base contains the air intake which is governed by a ball check valve held in place by a spring. The lifting of the piston draws the air in through this valve and allows it to enter in the correct proportion to the amount of acetylene that is taken into the cylinder of the pump.

Device Is Easily Installed

The installation of the device does not offer any difficulties on any make of car as it consists in simply clamping the plunger to the steering column and then cutting holes in the footboard to allow the piping to pass to the cylinders and to the acetylene tank. These holes are approximately 1-2 inch in diameter and allow the tubing to pass through without difficulty. The third tube which conducts the mixture to the cylinders will be passed through the dash as it is required to bring the lead directly over the cylinder heads. In installing this part of the device the regular compression cups and release cocks in the cylinder heads are removed and the T connections screwed in the three rear cylinders and the L connection in the forward cylinder. The pipe is then connected to these as shown in Fig. 2 so that there is a straight flow from the dash directly through on a straight line to the end cylinder. The ignition apparatus does not have to be touched unless the car is only equipped with the high tension magneto. In the latter case a battery and coil set for starting purposes can be readily added. In most cases, however, the battery starting set will be found on the car and the matter of installation will not take longer than 2 hours.

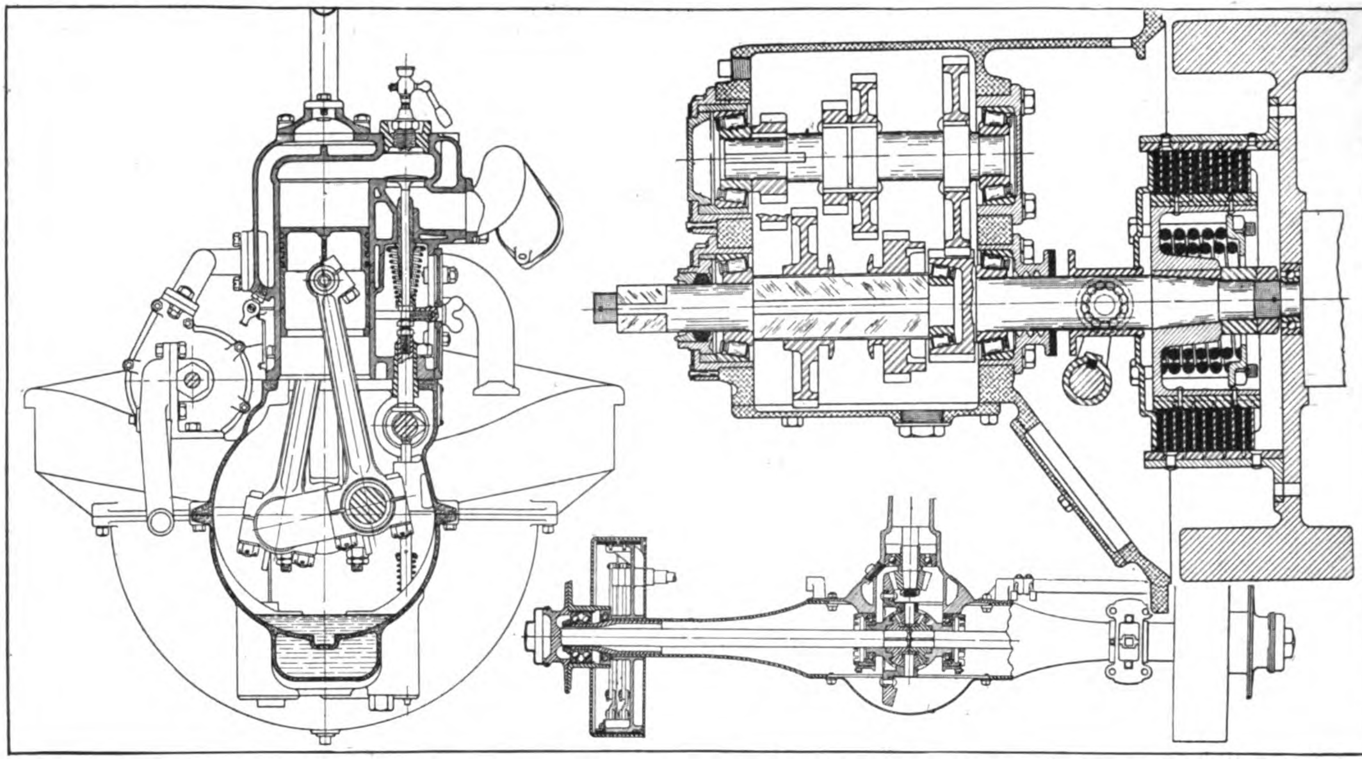

Fig. 1—Showing cross-sections through the new Glide motor, clutch, gearset and rear axle

Glide 1913 Cars Ready

Entirely New Model on the Market for The Coming Season Built on Lines Similar to Former Model

Longer Wheelbase, Increased Bore, Longer Springs and Heavier Parts Some of the Improvements

AN entirely new model Glide car will be put upon the market for the season of 1913. This car, which is to be known as the 36-42 will be built along similar lines to its predecessor, the model 3, which was introduced last year. Aside from the fact that the new car will have a wheelbase of 118 inches, which is 4 inches longer than the model 36 had, and that the new car on account of its higher power and larger dimensions will be built more heavily in the parts subjected to additional strain, the new model is throughout a larger edition of the successful 36.

The motor in the new model is rated at from 38 to 42 horsepower on the actual brake test and is guaranteed by the makers to actually deliver this power. The bore of the motor is 4 1-8 inches and the stroke 5 1-4 inches. The four cylinders are a monobloc casting and have the intake manifold and the valve chambers cast integrally. In the process of construction each block is first bored roughly to center. The casting is then set aside and allowed to age so that any of the internal strains which would be apt to develop in a complicated casting of this nature would be sure to be detected. After this test has been consummated another test by water under high pressure is given to make the soundness of the casting absolutely certain. After this test the cylinders are finish bored and then ground to a mirror finish. The exterior parts of the cylinder castings are given two coats of air drying enamel providing them with a handsome and permanent finish.

The entire valve mechanism, including tappets, valves and springs, is entirely inclosed, keeping them free from dust and moisture and eliminating tappet sounds entirely. The valves have nickel steel heads electrically welded to carbon steel stems providing against burning and warping of the head and wearing of the stems by tappet action. The valves have both seats and stems and are ground to exact size. By removing cast-iron cover plates, the valve springs and tappets are readily accessible for inspection or adjustment.

The pistons are made of the same soft gray iron as used in the cylinders. They are ground to size and each fitted with four diagonally-cut rings. The rings are made of special iron of great elasticity and toughness so as to retain their expansion at high temperatures and under continued use. They are ground on the outside and on both faces and are carefully fitted to the ring grooves in the pistons and to the inside bore of the cylinder. The pistons are also supplied with five oil grooves turned on the outer face and so spaced as to carry the oil to all parts of the cylinder. The piston pin holes are bored and then reamed in special machine tools, insuring alignment. The piston pins are made of seamless drawn steel, hardened and ground to size. The pin is clamped rigidly in the upper end of the connecting-rod and has its bearings in the piston-pin bosses. This provides for a large bearing area and also for lubrication of the pins.

The connecting-rods are of I-section drop forged from high carbon steel and heat treated to secure rigidity. The piston-pin eye and crankpin bearings are bored and reamed in perfect alignment and are tested on gauges for exact center distance. The bearing caps are held in place by means of 3 1-2 per cent. nickel bolts secured by castellated and pined nuts. The bearings are of nickel babbitt, expanded into place, reamed and hand scraped. Sheet steel shims of from .003 to .008 are supplied for affording adjustment of the bearings to take up wear. The cam tappets are of hardened and ground chrome nickel steel and are easily removed for inspection. The crankshaft is of the three-bearing type and is forged from high carbon steel and is heat treated to secure the utmost rigidity and shock-resisting qualities. All bearing surfaces are ground accurately to size. These are of exceptionally liberal dimensions. The flywheel is secured to the crankshaft flange by six large bolts provided with castellated and pined nuts. The crankshaft bearings are of nickel babbitt expanded into place, reamed and carefully hand scraped. They are supplied with thin sheet steel liners like the connecting-rod bearings, making adjustment a quick and simple operation.

The crankcase and flywheel housing is cast of nickel aluminum alloy is made in two pieces, being split on the center of the crankshaft. The upper half carries all mainshaft bearings so that by dropping the lower part these are readily accessible for adjustment. The lower half contains the oil pan and oil reservoir. The flywheel is totally inclosed. The upper half of the crankcase incloses the camshaft and bearings. The lower half contains the oil reservoir pumps, float chambers and screen. The camshaft is a one-piece forging specially heat treated and hardened before being ground to exact size. It is supplied with three liberal nickel babbitt bearings and is readily removed from the motor by removing the gearcase cover.

The two oil pumps situated in the lower oil reservoir are of the plunger type and have their inlet openings below the level of the oil in the reservoir and they cannot become "starved" even when the car is on a grade of 45 degrees. This provides lubrication at all times. The oil is pumped through copper tubes to the timing gearcase and to the rear main bearing, from which points it overflows into the crankcase providing supply for a constant level splash system for the pistons, connecting-rod bearings and crankshaft bearings. The oil may be drained from the reservoir by removing suitable plugs at the bottom of the reservoir. In a similar way the oil screen and pump foot valves may be removed from the outside for inspection and cleaning. The timing gears are all helically cut to reduce gear sound to a minimum and run in oil. They are accurately cut to run without noise, at all speeds. The crank, cam and pump shaft gears are of soft steel, the idler gear of cast iron. This provides a steel and cast-iron contact at all points of engagement.

Water circulation is afforded by means of a centrifugal pump mounted on the right-hand side of the motor. The pump is of bronze throughout and is supplied with two large bearings and two stuffing boxes. A drain cock is provided at the lowest point to drain all water from the housing in freezing weather. The motor is regularly equipped with the Remy dual magneto and a Stromberg model 4 B carbureter.

A multiple disk dry plate clutch is used. It has fourteen steel plates, alternate plates being faced with Raybestos. The clutch throw-out clevis is provided with two annular ball bearings which reduce wear at this point. These bearings rotate only at the instant of release of the clutch and will, therefore, wear indefinitely. The clutch is also supplied with a brake for stopping the spinning of the plates when disengaged. The clutch housing within the flywheel is of pressed steel and is bolted in place after which the bolts are wired, absolutely preventing rattling or misalignment. The plates are provided with square slots which engage hardened steel dogs on the inside of the housing. This reduces wear with consequent noise. The clutch pilot shaft is provided with imported annular ball bearings.

The gearset is of the three-speed selective type. The shafts are of 3 1-2 per cent. nickel steel heat treated and the gears are of chrome nickel steel oil treated. The bearings are Timken roller throughout. The gearset and clutch housings are cast in one piece of nickel aluminum alloy and this unit is bolted rigidly to the flywheel housing on the motor. This provides unit power plant construction and assures perfect alignment of motor, clutch and transmission shafts. The gear shift rods are provided with an automatic lock, making the selection of two speeds at the same time impossible.

The rear axle is of the floating type with drive flange and axle shaft forged in one piece. Both axle shafts and propeller shaft are of 1 3-8-inch diameter heat treated chrome nickel steel. The entire weight of the rear end of the car is supported by the wheel carriers, which are made integral with the pressed steel axle housing. The wheel carriers are of nickel steel tubing ground to accommodate the wheel bearings. The axle housing is virtually of one piece pressed from 3-16-inch sheet steel. The axle is supplied with torsion tube inclosing the propeller shaft. The pinion gear is of 3 1-2 per cent. nickel steel oil treated.

The steering gear is of the screw and nut type and is irreversible. The threads on the operating screw are cut right and left handed and the two half nuts, one right and one left handed, connected through a suitable linkage to the steering crank. The steering is on the left side with center control. The wheels are wood and take 34 by 4-inch tires.

There are two styles of body; a five-passenger touring and a two-passenger roadster. They are both fully equipped with acetylene starter, Ward-Leonard lighting system, motor driven tire pumps, top cover, tire carriers, lamps, horn, complete tool equipment, etc.

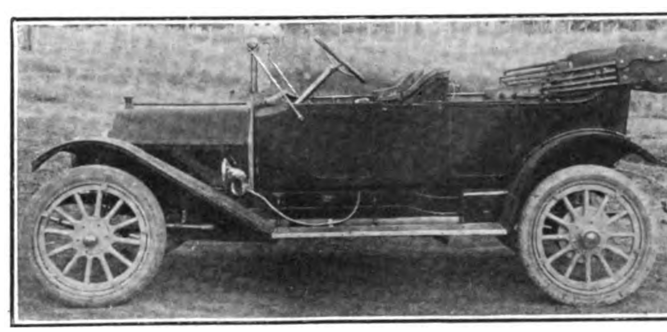

Fig. 2—The Glide five-passenger touring car for 1913

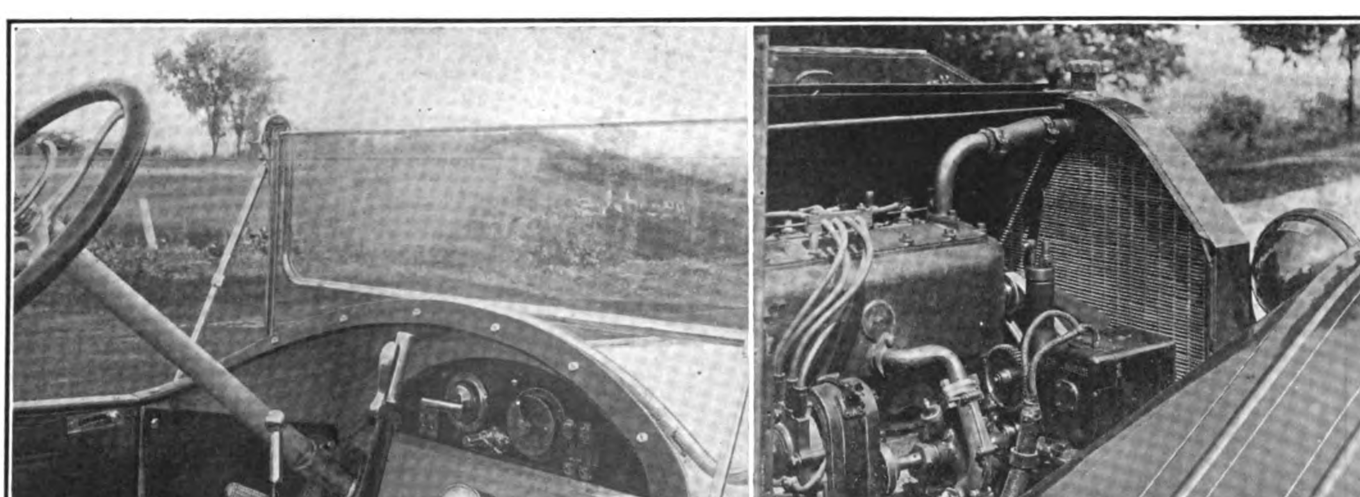

Fig. 3—A view of the dash arrangement and one of the power plants in the latest Glide cars

Garage Man Complains of Ill Treatment; Installing a Platform Spring; Current for Ignition Purposes; How to Set a Splitdorf Magneto Properly; The Four-Speed Discussion

Robbed by Rich Hotel Patrons

EDITOR THE AUTOMOBILE:—As a garage superintendent in New York handling a portion of the automobile trade of the high-class up-town hotels, I have not infrequently come in contact with patrons of the following sort: They are parties who stop at high-grade hotels and leave their car in my place for several days, after which they take it away, for a ride through the town, as they say, without returning again. I have in several cases traced these people by the lists of license-holders which are published by the various secretaries of state, and while in some instances I have been successful in being paid what these parties owed me either with or without the assistance of the court, there are a good many cases where I have no chance of recovering the money due to me unless these doubtful patrons stop at my place once more.

Such losses of money are bound to increase the overhead expense of a garage very considerably, and a garageman brought face to face with this problem must do either of two things. He may bear the loss himself or, what is very much preferred by the great number of men, make the public at large pay for the dishonesty of a few by raising his charges. Of course, the garageman is blamed if he resorts to such a course. However, it is not blaming what he needs, but help and organization. If the garagemen could see their way to combine and inform one another of their cases of meeting fraudulent patrons, they would render themselves and the public a benefit. A general organization would also bring other similar benefits. A list of stolen cars could be circulated among the garagemen and a large percentage of automobile thiefs be exposed. The more orderly the garage business is conducted, the more profitable must it prove and the more service may it render to the public at large.

I would like to know how other garagemen meet this situation, as I believe in New York, at least, it is frequent enough to be serious. In the smaller towns I do not believe that garagemen have to cope with such things.

New York City. A. C. VILLARD.

Altering the Car's Suspension

Editor THE AUTOMOBILE:—Will you kindly answer the following:

1. How could a platform spring be fastened under the rear end of a Ford T car?

2. How can the oiling system on a Ford T car be adjusted so as to limit its feed to the cylinders?

Berwick, N. D. H. W. ARNOLD.

—If you are bent on altering what is now a perfectly good and satisfactory suspension for a light car, it is a job that will call for a shop equipped with tools for sawing channel iron, riveting, drilling and tapping. In order that the propeller shaft and the distance rods will not have to be altered the wheelbase will be left the same, although the overall length of the car will be materially increased.

The two side members of the car are sawed through as in Fig. 3. The spring is disconnected in the rear from the shackles which hold it to the rear axle. The purpose is now to insert in the blank left by sawing off the rear end of the T-shaped piece which will connect the end of the frame and also for the forward support for the platform rear spring. The details of the job may best be seen in the accompanying sketches, Figs. 1 and 3. It will be seen that the same cross spring that you now have on the car will be used for the cross-members of the platform rear springs. There will be two semi-elliptic members inserted in the system, one on each side. The spring pad in the rear axle to take the semi-elliptic member may be purchased of any concern handling forgings. They come of the correct size to fasten to the rear axle and have a flat, smooth pad to take the spring. As long as the pad is flat there is a chance that it will be difficult to keep the U-clips tight on account of the fact that the spring touches only at one point. If a fiber piece is taken and filed out to conform to the curvature of the spring it will be much easier to keep these clips tight.

At the front end of the new spring an ordinary shackle will be used. This will be attached to the cross-member which is inserted for the sake of strength and safety, by a forging which will be of the correct shape to hold the shackle properly. If it is found that the installation fouls the distance rods, short torque members could be inserted between the cross-piece and the rear axle. These would have to be strong and situated as far from the axis of symmetry of the car as possible. Some of the special parts which it would be necessary to purchase are shown in Fig. 1. Altogether, this would be a costly job, although it probably could be done satisfactorily along the lines laid out. The spring suspension of the Ford car as it stands at present has been the result of many years' work by competent engineers and it is difficult to see why it should be changed in any one special case.

The level of the oil in the Ford lubricating system is controlled by two try cocks, shown at A and B, Fig. 2. The upper cock A marks the level above which there should never be any oil. The lower cock is the danger level. When the oil gets below this there is an insufficient quantity. Open the upper cock and let all the oil flow from the crankcase that is above this point and then open the lower cock until the level is about half way between the two cocks. Now try the motor and if it smokes the cause is probably worn piston rings. These cost 15 cents apiece.

Using Too Much Current

Editor The Automobile:—Would you kindly inform me what is the right number of dry cells to use for ignition purposes for a four-cylinder Winton car, equipped with a Splitdorf coil?

At present I am using eight cells, which will give good service until they become as low as 10 amperes. Then the engine will begin to miss. How can I get more service from these cells? Will changing the mixture do any good? Also, is there anything that will dry rubber that has been remelted? I mean the kind that has been previously used in the manufacture of tires.

Hoods Mill, Md. C. W. Cauthorn.

—You are using entirely too many cells if you have them connected in series. The ignition system on your car is designed for 6 volts and you are using at least 10. Do not use any more than five cells if they are new or six cells if the current is weaker. On account of using such a high voltage there is no doubt that the vibrator points on the coil are worn; these should be dressed down with a file and adjusted so that the correct intensity of spark will be given at the plugs. Examine the vibrator points and see if they are flat and clean. Turn on the switch and gradually turn over the motor; if the vibrator does not buzz at once, turn until it does. Now turn the vibrator adjustment screw until the clear humming sound indicates that the vibrator is working as it should. There will be no mistaking the correct sound when it is heard.

When the coil has been adjusted properly and is known to be in good working order it would be well to clean the contact points in the spark-plugs so that the ignition system will not be faulty owing to neglect at such a point as this. Remove the wires from the plugs and take them entirely out of the cylinders, soak them well in gasoline, taking off all the carbon that may be located around the electrodes. After the plugs have been thoroughly cleaned they can be reconnected to the wires, but should not be put back in the cylinders until they have been tested. To test the plugs lay them on their sides on the cylinders, open the compression cocks and turn the motor over slowly, noticing the spark in each plug. If it is found that the spark is good in one and not in other plugs, the chances are that the plugs showing the weak sparks have the gap too wide. The fact that you have been compelled to use such a high voltage to get satisfaction makes it very possible that the gaps in one or more of the plugs are too far apart. After making these simple adjustments, if the coil will not work satisfactorily return it to the makers. Do not attempt to take it apart yourself.

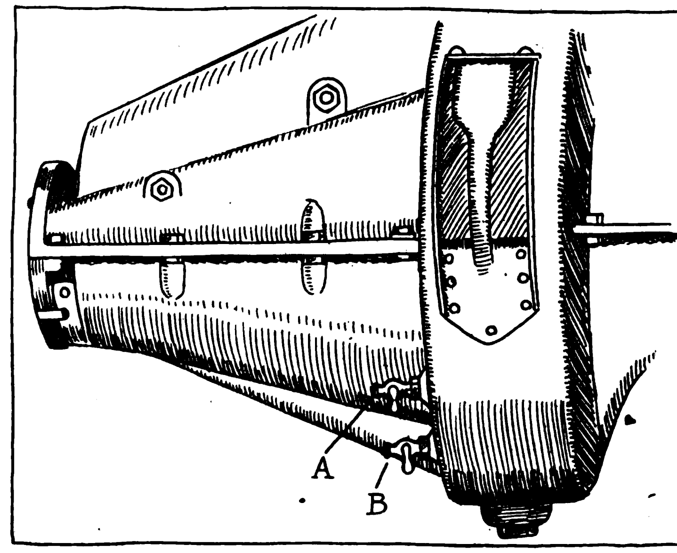

Fig. 2—Trycocks for oil level on the Ford flywheel housing

Do not attempt to change the mixture until after you are sure that the ignition system is working correctly. This will be determined by the test of laying the plugs on the cylinders and turning over the motor. If the ignition is as it should be and you still do not get good results, it is then time to make carbureter adjustments. It is hardly likely that you will need any.

Rubber that has once been melted will be destroyed structurally and will be of no practical use for any purpose that requires strength. Exposure to the atmosphere will eventually dry out the rubber that has been melted.

Setting a Splitdorf Magneto

Editor The Automobile:—I have an E. M. F. 30, and would like to know if you could publish a diagram showing how to time a Splitdorf timer for heavy pulling, showing how the piston should set ready to fire. I would also like to know whether the differential sings when the Timken roller bearing on the main shaft is worn? If not, is there any way to stop it from singing?

Inverness, Fla. E. M. F. 30.

—Assuming that the magneto is in place on the motor, turn the starting crank with the pet cocks on the cylinders open until the number one, or foremost, cylinder is on upper dead center, that is, when the piston is at its highest point. You will be able to ascertain this by looking at the flywheel which is marked to show its position when the number one cylinder is in this position. The motor should be kept in this position throughout the entire operation.

First retard the spark advance mechanism at the steering

wheel to its limit and connect it to the spark advance lever on the breaker box of the magneto, so that if the magneto shaft revolves in a clockwise direction looking at the driving end, the breaker box lever will be at its topmost position. If the shaft revolves left-handed the lever should be at the bottom limit and advance upward.

As all four-cylinder, four-cycle models run at crankshaft speed it is customary to drive either geared direct to the crankshaft or by means of a universal coupling known as the "Oldham" coupling. The latter method is very much to be preferred

to the former, because the accurate setting and alignment absolutely necessary with the direct gear on the armature shaft is not essential with the latter method. There is another drive possible, the chain, but on account of the many wearing points, back slack, etc., this should only be used where gear drive is impossible on account of inaccessibility, or where a large number of gears are objectionable.

If the "Oldham" drive is employed the driving flange is first slotted to fit the Woodruff key supplied with the magneto and then fitted. The other flange of the coupling is left loose on the end of the pump shaft or other shaft used to drive the magneto and the cross block is slid into place.

Now revolve the armature shaft in its direction of rotation until the oval breaker cam comes in contact with the roller in the breaker bar and just begins to separate the platinum contacts, Fig. 4.

The flange of the coupling can then be drilled and reamed for a taper pin and the timing of the magneto is then permanently effected.

After ascertaining the position of the bronze sector of the distributer, Fig. 5, connect the cup directly, shown in the same illustration, over it to the spark-plug in cylinder No. 1. Since the direction of rotation of the distributor is always opposite to that of the armature shaft, the wire from the cup next in rotation goes to the next cylinder in sequence of firing and so

on until all four are connected. Four-cylinder, four-cycle motors always fire either 1, 2, 4, 3 or 1, 3, 4, 2, the latter being the most general rule.

Anent the Four-Speed Discussion

Editor THE AUTOMOBILE:—There have been some interesting and some amusing opinions aired in the current four-speed transmission discussion. Personally, the worm must turn with my failure to appreciate the correctness of the method of determining gear ratio steps as introduced by S. I. Fekete in your issue of August 15.

I learn that "the gears in a transmission should progress in a geometrical ratio because the resistance increases in the velocity interval in a hyperbolic curve." Without discussing the truth of the latter clause, I fail to see why it is a rule or reason for the hypothesis preceding it.

Mr. Fekete gives two equations for forces acting when a car is in motion:

$$\text{resistance} = \text{tractive force}$$

for that case where the velocity is uniform, and

$$\text{force to cause acceleration} + \text{resistance} = \text{tractive force}$$

for that case in which the car is being accelerated. While Mr. Fekete's Fig. 1 seems to distinguish between road resistance and air resistance, his formulas do not; yet the two resistances are of quite different nature, the former probably varying directly with the speed, while the latter varies more nearly with the cube of the speed.

Let us introduce still another equation which will represent more nearly the general case:

delivered HP = tractive effort = force to cause acceleration + road resistance + air resistance + work of lifting.

It is understood that in this equation the sign of the first term will become minus if deceleration be substituted for acceleration, and similarly the sign of the last term will become minus if a grade be descended instead of ascended.

It is true that in this equation there appear terms which have a bearing upon the question of proper transmission gear ratios, but air resistance is not one of them, as Mr. Fekete would have us suppose. Rather do road resistance and work of lifting give the true clue to the situation, and if these terms can be expressed as functions of car velocity I should be interested to learn how.

TABLE V.—PERCENTAGE ERRORS IN ARRANGEMENT BY ARITHMETICAL PROGRESSION AND BY GEOMETRICAL PROGRESSION ASSUMING AVERAGES IN TABLE I AS STANDARDS

Class	1	2	3	4	Algebraic Mean	Max.
Arithmetical Progression						
(1) Four speeds, direct on 4th.	−11	+4	+7	......	0	−11
(2) Four speeds, foreign practice	−4	+11	+7	......	+5	+11
(3) Four speeds, direct on 3d.	0	+11	......	+6	+6	+11
(4) Four speeds, foreign practice	+14	+11	......	+10	+12	+14
(5) Three speeds	+3	+14	......	......	+9	+14
(A) Mean of above	+0.6	+10	+7	+8		
Arith. Mean of (A) = 6.4						
Geometrical Progression						
(1) Four speeds, direct on 4th.	−36	−31	−19	......	−29	−36
(2) Four speeds, foreign practice	−31	−27	−19	......	−26	−31
(3) Four speeds, direct on 3d.	−33	−23	......	+72	+5	+72
(4) Four speeds, foreign practice	−24	−23	......	+78	+10	+78
(5) Three speeds	−30	−22	......	......	−26	−30
(B) Mean of above	−31	−25	−19	−75		
Arith. Mean of (B) = 38						

And, again, assuming the resistance to bear a known relation to the velocity, I am still unable to see how it follows that the correct increments of progression are thus determined. Velocity-resistance laws involve a consideration of the manner in which required power increases with speed; transmission gear ratios involve a consideration of various speeds and torques at a constant power. To consider the two as interdependent seems like adding quinces and apples to get pears.

Taking current practice as a criterion I am still unable to justify the method of geometrical progression. In the appended Table I (some of the data of which has been transposed from an article by D. S. Hatch in *Motor Age* for July 18) are given the gear ratios of some conventional transmissions in which the steps are given in terms of percentages of the direct gear. This form of tabulation is, I believe, more comprehensive for analytical study than that which deals with total reductions. The fact that manufacturers almost invariably offer an option on final reduction ratios makes tables or diagrams of total reduction unfit for purposes of comparison. In column "B" of Table I is given the final drive ratios, and by means of this the total reduction on any gear may be readily found. Column "C" shows the number of cylinders of cars listed.

Table 2 shows at a glance the mistake of assuming a division according to a geometrical progression. In each type considered this method is found to be greatly in error. On the other hand, the arithmetical progression is always reasonably close to the average standard practice, and in the case of four-speed transmissions—which, incidentally, seem to have started this controversy—it seems to be an excellent standard to go by.

As Mr. Fekete says, it is not probable that the ratios of any accepted standard can be duplicated in practice due to the necessity of maintaining a constant center distance and the use

of reasonable pitches. However, if a standard be chosen, the acceptance of it should be justified, and the method introduced by Mr. Fekete may very well be misleading.

Forty-Fort, Pa. N. S. SEELEY.

Trouble with Electric Lights

Editor THE AUTOMOBILE:—I have installed an electric attachment in a Ford car, to be run from the Ford magneto. I am using a 2-candlepower, 6-volt lamp, but am having trouble in the lamps burning out after having been run for a few minutes.

Kindly state what voltage, amperage and candlepower lamps should be used in connection with the Ford magneto.

Wilton Junction, Iowa. H. AMUNDSEN.

—You do not mention what particular lighting outfit you are using, so it is impossible to tell the exact nature of the trouble. It is probable that the trouble lies in the wiring. The correct method of wiring the headlights is shown in the accompanying diagram, Fig. 5. You should use two lights of 10 or 12 candlepower connected in series. The voltage used with these lamps is six and the reflectors are generally of 9-inch diameter.

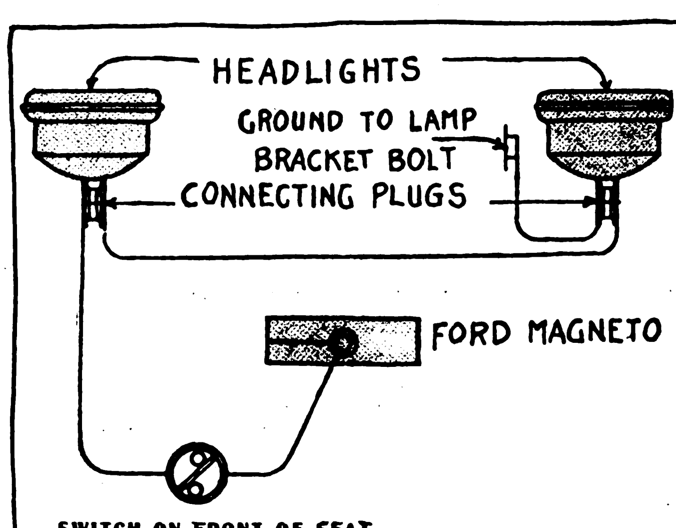

Fig. 5—Wiring diagram of the Ford headlights as it should be when system is operated from the fly wheel magneto

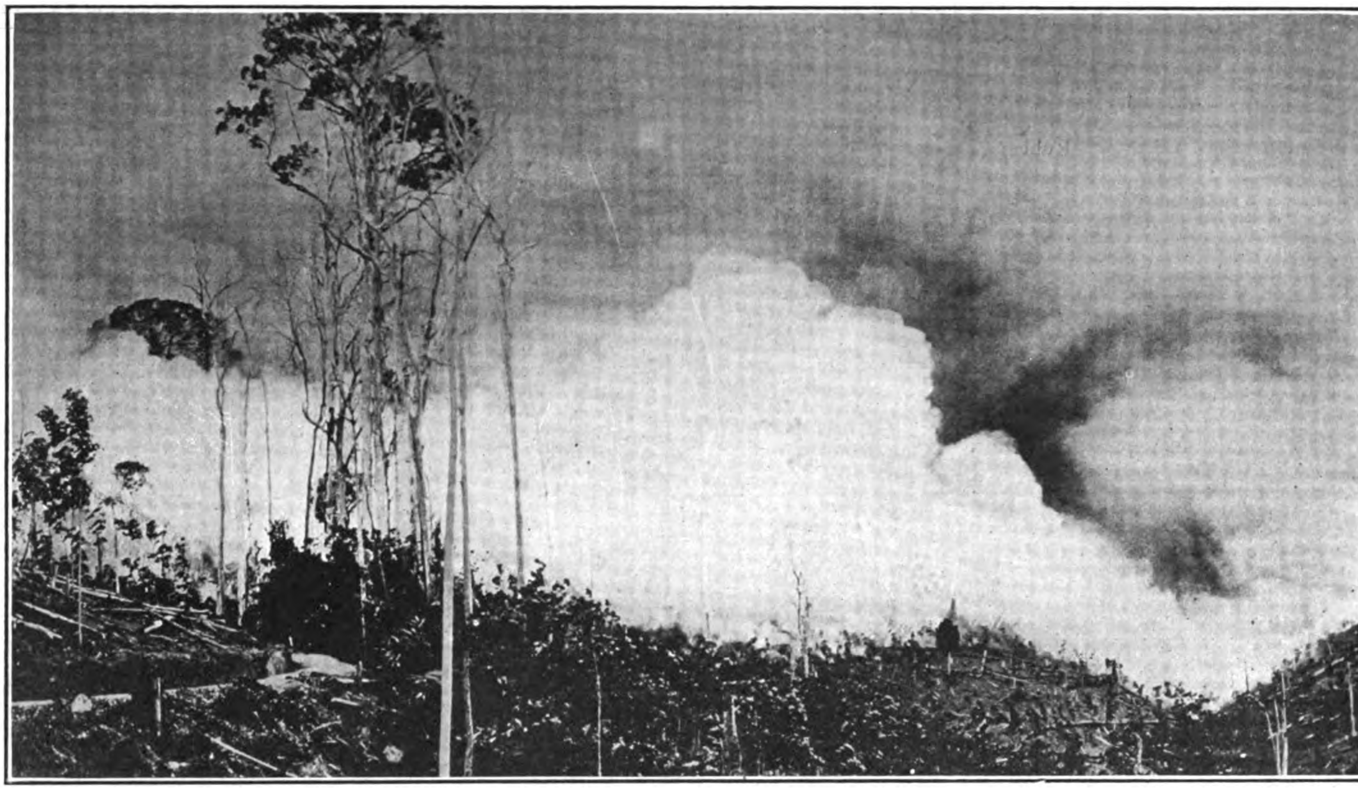

Before the land is planted with little rubber trees, the jungle is burned away and the ashes are used for fertilizer

(*Continued from page 565*)

bale-like packages. Experiments are being made in Hawaii with the castilloa tree. It is estimated that several thousand acres could be devoted to rubber culture in the Hawaiian archipelago.

The Philippine Islands are represented by a small exhibit, showing the progress that has been made in that archipelago since the American occupation. The climate of both of the Pacific island territories of the United States is suitable for rubber culture, but so far the results attained are merely promises for future performance. In Hawaii this progress has been swifter than it has in the Philippines.

The program of the conference is as follows:

Tuesday, September 24, at 2 p. m.—An address of welcome by the president, Mr. Henry C. Pearson. The topic for discussion will be "Crude Rubber." Special papers:

"Rubber Contracts," by Mr. Arthur W. Stedman.

"The Plantation Industry," by Cyril E. S. Baxendale, Esq., of the Federated Malay States.

"Various Manihots Producing Rubber in the Central States of Brazil," by Dr. J. Santiago Cardwell-Quinn, commissioner.

"Possible Rubber Producers in the Temperate Zone," by Mr. Charles P. Fox, Akron.

"Some Effects of Acclimatization Upon Guayule. Parthenium Argentatum," by Francis E. Lloyd, Montreal, Canada.

Wednesday, September 25, at 10 a. m.:

"Problems in Vacuum Drying," by Mr. J. P. Devine.

"Manufacture of Dipped Goods," by Mr. T. W. Miller.

"Physical Methods of Testing Rubber and Rubber Products," by Mr. P. L. Wormeley, Bureau of Standards, Washington.

"Factory Management and Organization Methods," by Mr. J. C. Jurgensen (president of the Institute of Operating Engineers), and Mr. Frederic Dannerth (consulting chemist).

Thursday, September 26, at 10 a. m.:

"A Brief History of Fire Hose Specifications," by E. A. Barrier.

Topical discussion on specifications (mechanical rubber goods for railroads, federal and municipal governments), including as sub-topics: Air-brake hose, railroad steam hose, fire hose, etc.

"The Commercial Possibilities of Synthetic Rubber," by Mr. L. E. Weber, Boston, Mass.

Friday, September 27, at 10 a. m.—A report of the transactions of the Navy Conference at Washington, December, 1911, by Mr. E. S. Land, U. S. N. Topical discussion on specifications: (a) Materials for insulated wire; (b) textile materials (sheeting, duck and yarns).

A preliminary report of activity by the "Railroad Committee" on "Standard Methods of Testing Rubber Products."

At 7 p. m.—Informal dinner for rubber chemists and engineers. (Place to be announced Friday morning.)

Saturday, September 28, at 10 a. m.—Meeting for the presentation of resolutions and recommendation of official methods for physical testing and chemical analysis of crude gum and manufactured rubber goods.

Discussions—A considerable number of topics for discussions have been forwarded to the secretary by manufacturers as well as consumers of rubber goods. These will be presented on the appropriate days.

The following societies will be represented by official delegates:

American Chemical Society.
American Society for Testing Materials.
Society of Chemical Industry.
American Institute of Chemical Engineers.
German-American Technical Society.
Institute of Operating Engineers.

The following governments will be represented by official delegates: Federal Government of Brazil, Federated Malay States and Straits Settlement, Ceylon, Hawaiian Islands, Province of Moro, Philippine Islands, Burma (India).

The State of Amazonas (Brazil), The State of Matto Grosso (Brazil), The State of Para (Brazil), The State of Acre (Brazil), The State of Minas Gereas (Brazil), Bolivia, Republic of Honduras, State of Bahia (Brazil).

President of Conference—Henry C. Pearson, New York City.

Honorary Secretary—Frederic Dannerth, Ph.D.

Executive Committee—E. S. Land, U. S. N., Washington, D. C.; D. A. Cutler, New York; Dr. Lothar Weber, Boston, Mass.; Dr. W. C. Geer, Akron, O.; Dr. S. P. Sharples, Boston, Mass.; Dr. Eugenio Dahne, Brazil; C. E. S. Baxendale, Esq., Federated Malay States; F. Crosbie-Roles. Esq., Ceylon; A. Staines Manders, London.

The list of exhibitors includes the following:

The United States Rubber Company, Broadway, New York City—all descriptions of manufactured rubber goods.

The Swinehart Tire & Rubber Company, Akron, O.—tires and other rubber goods.

The Home Rubber Company, Trenton, N. J.—all kinds of hose, packings, tires, etc.

Manhattan Rubber Company, Passaic, N. J.—a circular loom weaving fire hose jackets, ornamental rubber flooring, conveyor belt in action, moulded goods, etc.

Victoria Balata & Textile Belting Company, New York City.

Dutch Guiana Culture Company—a plantation showing hevea trees at different ages—method of tapping, samples of rubber; also coffee plants and coffee, used as a catch crop.

New York Commercial Company—samples of crude rubber from wild trees and from planted trees.

Henderson & Korn—samples of standard grades of rubbers.

United Malaysian Rubber Company—samples of rubber grown on their estate in the Federated Malay States.

Meyer & Brown—samples of crude rubber.

Rubber Trading Company—samples of crude rubber.

Raw Products Company—samples of crude rubber.

Highlands & Lowlands Para Rubber Company—samples of plantation rubber.

Kalisyndikat—rubber trees, tropical fruits, etc., showing the beneficial effects of manuring with potash.

Buffalo Foundry & Machine Company—vacuum dryers—one very large dryer weighing 20 tons—vacuum pumps, steam hammers, etc.

United Shoe Machinery Company—eyeletting and grometting machine in operation.

The Turner, Vaughn & Taylor Company—motor-driven experimental outfit—washer, mixing mill, etc.

John Royle & Sons—perfected tubing machines.

Farrel Foundry & Machine Company—experimental calender, grinder and washer.

Werner & Pfleiderer—kneading machines, washers, presses, etc.

J. P. Devine Company—vacuum dryers, deresinating and solvent apparatus.

The Curtis & Marble Machine Company—brushing machine for cleaning goods and liners, sewing machine, etc.

The Adamson Machine Company—automobile tire moulds and cores and models.

Hoggson & Pettis Manufacturing Company—moulds of all descriptions, dies, etc.

The Philadelphia Rubber Works Company—reclaimed rubber.

E. H. Clapp Company—reclaimed rubber.

American Rubber Reclaiming Company—reclaimed rubber.

Rubber Regenerating Company—reclaimed rubber.

United States Rubber Reclaiming Works—reclaimed rubber.

New Jersey Rubber Company—hard rubber goods and mechanical rubber goods made from reclaimed rubber.

Monatiquot Rubber Works Company—"Naturised" rubber.

American Wax Company—mineral rubber.

J. W. Coulston & Company—chemicals and colors.

American Asphaltum & Rubber Company—compounding ingredients.

George A. Alden & Company—M. R. for strengthening and preserving rubber.

The Loewenthal Company—reclaimed rubber.

The New Jersey Zinc Company—reclaimed rubber.

H. Muehlstein & Company—scrap rubber.

Electric Rubber Reclaiming Company.

Tyson Brothers, Inc.—rubber substitutes.

The Essex Rubber Company—sheet rubber soling, automobile accessories, asbestos and rubber engineering specialities, etc.

The Diebold Safe Company.

Boston & Bolivia Rubber Company—crude rubber.

Edward Maurer—samples of various grades of rubber.

The Electric Rubber Reclaiming Company—reclaimed rubber.

Charles T. Wilson—rubber broker, New York City.

La Favorite Rubber Manufacturing Company, Paterson, N. J.

General Rubber Company, New York City.

Bartica Crude Rubber Company.

Acushnet Process Company, New Bedford, Mass.

Boston-Bolivia Rubber Company, Boston, Mass.

Lehmann & Voss, Hamburg, Germany—chemicals.

All Eyes On Milwaukee

Despite Postponement of Grand Prize Until Monday—Races Center Attention of Motordom

Promoters Display Much Energy in Belated Effort to Get Course in Shape for Speed Trials

MILWAUKEE, Sept. 17—(*Special Telegram*)—Rain during the last 72 hours interfered with practice on the course today to such an extent that DePalma, in his Mercedes, was the only one to make an effort for time. He accomplished the fastest time so far recorded in the practice; covering the 7.8 miles in 7 minutes and 15.03 seconds, averaging 64.7 miles an hour. During the 2 hours of practice today the best laps made were as follows:

Car	Driver	Time min.	sec.	Average speed miles per hour
Mercedes	DePalma	7	15.03	64.7
Knox Six	Mulford	7	30	63.2
Lozier	Nelson	8	15	57.5
Mercedes	Wishart	8	12	57.6
Fiat	Bruce-Brown	9		52.7
Mercedes	Bragg	9		52.7
Fiat	Tetzlaff	10	14	46.7
Case	Nikrant	11	55	41.0

DePalma's lap was the only one timed by the Warner electric timing instrument which was not ready during the earlier laps. There was but 2 hours' practice, the time being extended to 4 hours for Wednesday.

A new entry, a Bergdoll car, has been entered. The lists will not close until Thursday. The driver of this car has not been named. By fast work the promotors hope to have the track fully restored to condition by the opening race.

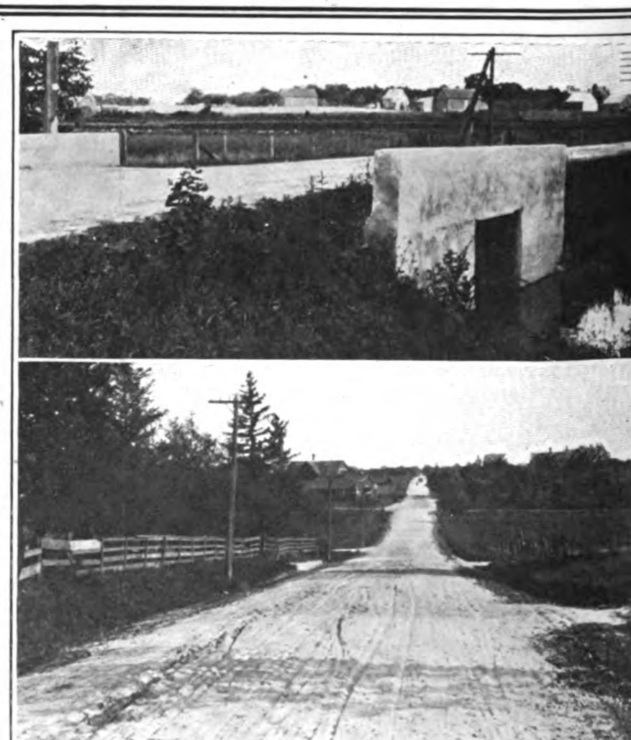
Milwaukee's big road racing carnival will open on Friday noon with the first running of the races for the Pabst Blue Ribbon trophy and the Wisconsin Challenge trophy, the big event scheduled as the curtain-raiser, the fourth contest for the Grand Prix of the Automobile Club of America having been changed to the wind-up, which will take place on Monday, September 23, following the Vanderbilt on Saturday, September 21.

The necessity of a change in the program so that the first events would be set back to give the Milwaukee Automobile Dealers' Association the better part of an additional week to get their course in shape, was anticipated by the inner circle for some days in advance of Thursday, September 12.

The action temporarily staggered the promoters, but all realized the absolute necessity of the change, and then started out to make good. The road construction contractor and his assistants were fired on the spot and some new and fresh blood infused into the thing. Friday morning the dealers cast off their blue spectacles when they saw a half dozen gangs of workmen driven at top speed by the new bosses, actually accomplishing something worth while. The course fairly grew while one looked and the fast work was carried on throughout the night by the light of torches and headlights focused to the best advantage. Monday night, the last drop of oil was on the roads and the final coating of sand was being applied. Starter Wagner announced that official practice would positively start at 11 o'clock Tuesday morning—which, by the way, is the hour at which the Grand Prix was to have been started on that day.

The new arrangement gives the light car drivers two full days of practice; the Vanderbilt contestants four days, and the competitors in the Grand Prix six whole days in which to tune up their cars and make that close acquaintance with the roads which is so necessary to make the best speed possible. Only an insane driver would attempt to start a race of the importance of the Grand Prix or the Vanderbilt without having an intimate knowledge of every inch of the course.

The change in the program carried over the closing of entries



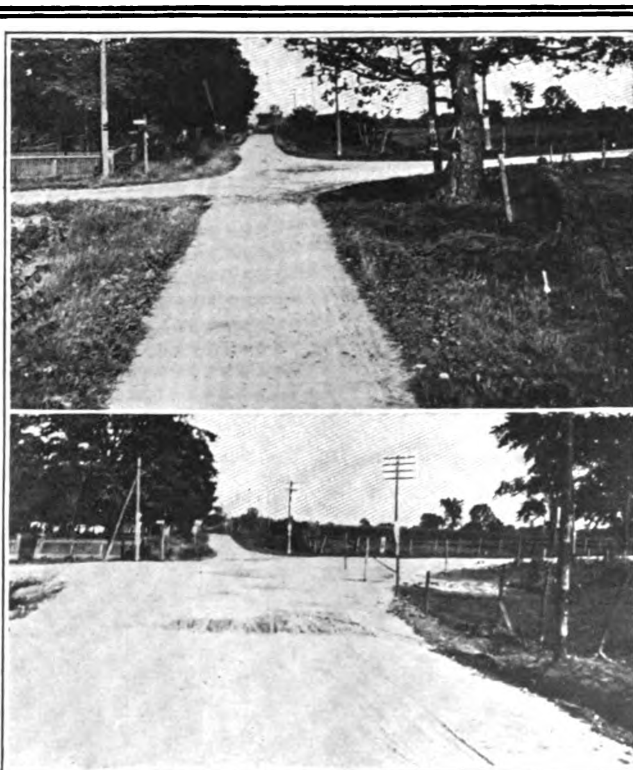
Upper—One of the 19 new culverts on the course
Lower—Heaviest grade on the Vanderbilt course

Curve from Burleigh street to Fond du Lac road

Hairpin turn at Somerville surfaced with concrete

for the Grand Prix to Wednesday night. Twelve cars have already been nominated, and it is possible that two or three more will come in, as it is planned to give any entrant in the other three events a chance to be booked for the final race up to Sunday morning. A few of the Vanderbilters have held off because they desire to get through the Saturday race before taking a chance on the Monday race.

The Pabst and Wisconsin Challenge races show only a fair-sized entry list, but both will bring out classy fields. In the Pabst, for 231 to 300 cubic inch cars, there are three Mercers, one Mason, two Falcars and a Case. Judging from past performance, the calibre of the men behind the wheels should make this a most interesting race, for Hughey Hughes and Spencer Wishart will pit themselves against Mortimer Roberts, Hastings and Trussel, Ed Pullen of their own camp, and Joe Jagersberger, who intends to "come back" after being out of the speed game for nearly a year, and with one good leg, at that. The other limb he lost at Columbia, S. C. last November in a bad spill on a dirt track only a short time before the international races at Savannah. If the "Flying Dutchman" cannot stand the 220-mile gaff, Louis Disbrow or Joe Nikrent will help him out, with "Farmer Bill" Endicott as a third substitute.



Upper—Northeast corner of course before improvement
Lower—Same curve after the improvements were made

The Wisconsin Challenge, a 173-mile contest for the little fellows of 161 to 300 cubic inches, will be a three-cornered fight between the Ford, E-M-F and Mason. It is likely this event will be a duel between Frank Kulick and Harry Endicott, as the other three drivers, Cramer and Roy Snyder, of the Mason team and John Heber of the E-M-F, are lesser lights. Heber is a Milwaukee man and will drive a Milwaukee-owned car, an E-M-F of the type used by Frank Witt in all of his races, the property of Dr. Irving H. Fowle, of Milwaukee. The doctor bought the car only a few days ago and after looking high and low for a competent driver, he found Heber, who has done a lot of track work in Buicks but is new on the road.

The line-up in the Vanderbilt will be similar to that in the Elgin National, although there will be seen at Milwaukee such stars as Teddy Tetzlaff, holder of the world's road racing record for average speed, and Louis Disbrow of the Case team.

VANDERBILT CUP

Saturday, September 21, 1912, at 11 a. m.

Maxwell contender coming into control on the last day's run

Warren finishing third day's run through the hill country

Two Clean in Bison Run

Warren and Maxwell Tied for Sweepstakes Trophies on Face of Observers' Reports—Official Ruling Ordered

Tremendous Truck Parade Marks Chicago Association's Fall Opening—Toronto Has Record Show

BUFFALO, N. Y., Sept. 16—In the third annual 800-mile reliability tour of the Automobile Club, of Buffalo, which closed Saturday night at 6 o'clock, two cars completed the 4-day grind with clean scores—the Warren-Detroit entered by the Poppenberg Motor Car Company, of Buffalo and the Maxwell entry 25, driven by A. G. Schoenthal.

The winner of division 2, was the Maxwell, entry 25, runabout class, with the Paige-Detroit, entry 16, second, a Krit, entry 9, third. In division 3, runabout class, the Warren-Detroit, entry 19, was the winner, with the Maxwell, entry 7, second. The winner in division 2, touring car class, was the Hupmobile, entry 8, with the R-C-H, entry 22, second.

The run covered 838 miles. The rules of the contest provided penalties for taking on gasoline, oil or water short of 100 miles of travel; for late arrivals at noon controls, and for all repairing done on machines. No penalties were to be imposed on work done on tires with the motor in operation, but time consumed on tire repairing was to be added to running time of cars.

A slight accident marred the second day's run, when the McFarlan "6" overturned between Ripley and Findlay Lake, a distance of 75 miles from Buffalo. Although the occupants of the car including the driver, Winfield Graham, escaped with slight bruises, for a time it looked as if the car was out of the contest for the day but the car was righted and the motor resumed operation in about 1 minute and the car finished the run, only 10 points being chalked against it for the accident. The second day's run was marked by fine weather and beautiful scenery.

The third day was the most trying of the tour as many formidable hills were encountered as well as dangerous curves and miles of unimproved highways.

On the concluding day 198 miles were made among steep winding hills and long stretches of rough dirt roads.

Charles F. Monroe, of Monroe Motor Car Company, which concern entered Maxwell No. 25 and the Poppenberg Motor Company, which entered Warren-Detroit, No. 19, both of which cars went through the entire 4 days of the third annual reliability tour of the Automobile Club, of Buffalo, without being penalized, have filed protest with A. W. Kreinheder, official referee of the tour, in the matter of who is entitled to the Laurens Enos and Vars trophies.

Before rendering his decision, Referee Kreinheder will communicate with the contest board of the American Automobile Association and he expects to announce the winners of trophies on Friday night. Referee Kreinheder declares there are several delicate technicalities in the matter and as he is desirous of making an impartial decision, he will await official sanction from the A. A. A.

700 Trucks In Chicago Parade

CHICAGO, Sept. 14—Ushered in by a parade of 700 motor trucks in a parade 10 miles long, moving at the rate of 10 miles per hour, and taking 1 hour and 10 minutes to pass a given point, the Chicago Automobile Trade Association heralded the second annual fall opening tonight. Chicago's motor row on Michigan avenue, which is 3 miles long, has been garlanded with autumn decorations, and at night is illuminated by the brilliant illumination of the showrooms and electrically lighted columns, extending along both sides of the street in a classic colonade of mock marble and leaded glass, strung with webs of electric lights.

The truck parade was made up of machines privately owned and exhibited, being entered in fleets by the dealers in the respective makes, who recruited cars, pairs and triplets of cars and squadrons from among their customers.

Perhaps the most notable feature of the exhibition was the silence of the large majority of the cars. This applied not only to the shaft-driven and pneumatically tired gasoline machines and

electrics, but to the prevalent type of solid-tired, chain-driven trucks. Many trucks carried full loads, a 5-ton lumber truck being loaded with a large load of lumber; and a truck owned by a cooperage concern being piled high with barrels.

Of the 700 machines in line, fifty-seven were electric. The prevailing type among the gasoline cars was of from 1 to 2 tons capacity, chain-driven, with the motor under the seat, and solid tires. A large contingent, however, were of radically different type, as 115 were shaft-driven, and 201 were of the so-called European type, with the motor under the hood, as in pleasure car practice; this type being prevalent in the very small and the largest classes. One hundred and six of the total number were under 1 ton capacity, a large number of high-wheeled wagons being shown. Very few of the big fellows appeared, but seven 5-tonners and eight of greater than that capacity were entered. Of especial significance is the growth of the left-hand steer idea, fully 25 per cent. of the trucks being so driven. Most of these, however, had the levers on the left side, although a few were noticed with center control, in both right and left hand steer types. Block or sectional tires were not much in evidence, even in the larger sizes, the wide tread dual tires seeming to have the preference. Fully 100 of the machines used pneumatics.

Toronto Show Sets New Mark

TORONTO, ONT., Sept. 16—What is claimed to be the greatest display of automobile ever shown in the Dominion of Canada was the exhibition in the Transportation Building at the Canadian National Exhibition where more than fifty dealers were exhibiting at least a half million dollars' worth of pleasure and commercial motor cars, including trucks and automobile fire wagons. The applications for space by the various factories and automobile dealers in Canada and several from the States far exceeded accommodations and it was necessary to press into service a tent, 100 by 50 feet, to the west of the Transportation Building to care for the overflow exhibitors.

At the exhibition many new cars never before seen in Canada were on display, some of these being of Canadian design while others were of English, French and American make. Unusually active business was done at the exhibition in the matter of sales, hundreds of thousands of visitors to the Toronto fair having viewed the automobiles, among whom were many buyers.

The exhibition indicates the great automobile business that the Canadian factories and dealers have had during the past year, over 15,000 licenses being granted to owners of machines alone in the province of Ontario. The greatest demand for automobiles came from the vicinity of Toronto. However, the great surprise in the automobile line this past year was Hamilton, Ont., which factories have had great difficulty in keeping up with the constant demand.

Calendar of Coming Events

What the Months Ahead Have in Store for the Automobilist—Shows, Conventions, Race Meets, Etc.

American and Foreign Fixtures of Importance Set Down in Chronological Order

Shows, Conventions, Etc.

Sept. 14-21	Chicago, Ill., Annual Fall Festival and Show, Chicago Automobile Trade Association.
Sept. 17-20	Denver, Col., Convention International Association of Fire Engineers.
Sept. 23-Oct. 3	New York City, Rubber Show, Grand Central Palace.
Sept. 30-Oct. 1	New York City, Sales Managers' Convention, Automobile Board of Trade.
Dec. 7-22	Paris, France, Paris Automobile Show, Grand Palais.
Jan. 4-11	Cleveland, O., Annual Automobile Show.
Jan. 11-25	New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25	Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1	Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1	Detroit, Mich., Annual Automobile Show.
Jan. 27-Feb. 1	Scranton, Pa., Annual Automobile Show, Hugh B. Andrews.
Feb. 1-8	Chicago, Ill., Annual Automobile Show.
Feb. 10-15	Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22	Kansas City, Kan., Annual Automobile Show.
Feb. 24-Mar. 1	Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1	St. Louis, Mo., Annual Automobile Show.
March 3-8	Pittsburgh, Pa., Annual Automobile Show.
March 8-15	Boston, Mass., Annual Automobile Show.
March 17-22	Buffalo, N. Y., Annual Automobile Show.
March 19-26	Boston, Mass., Annual Truck Show.
March 24-29	Indianapolis, Ind., Annual Automobile Show.

Race Meets, Runs, Hill Climbs, Etc.

Sept. 20	Milwaukee, Wis., Wisconsin Challenge and Pabst Trophy Races.
Sept. 21	Milwaukee, Wis., Vanderbilt Cup Race.
Sept. 23	Milwaukee, Wis., Grand Prize Race.
Sept. 29-30	St. Louis, Mo., Track Races, Universal Exposition Company.
Sept.	Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-20	Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 21	National Tour American Automobile Association.

Proposed Contests

Sept. 21	Detroit, Mich., Track Races, E. A. Moross.
Sept. 21	Pittsburgh, Pa., Track Races, Michigan State Agricultural Society.
Sept. 28	Indianapolis, Ind., Track Races, E. A. Moross.
Sept. 28	Kalamazoo, Mich., Track Races, Inter-State Fair.
Oct. 4-5	Sioux City, Ia., S. C. Auto Club and Speedway Association.
Oct. 4-5-6	Peoria, Ill., Track Races, J. A. Sloan.
Oct. 12	Springfield, Ill., Illinois State Board of Agriculture.
Oct. 12	Salem, N. H., Track Meet, Rockingham Park.
Nov. 6	Shreveport, La., Track Meet, Shreveport Automobile Club.

To Meet America

ENGLAND has just become generally aware of the fact that there are enough people living in the British Isles and British possessions to support a factory building a car that will sell below or at the $1,000 mark. Heretofore the English refused to believe it, they were told so very often, but with characteristic obstinacy they still held out. Today they believe it, they believe it because Ford, Overland, Maxwell, Studebaker and several of the other American makers have sold them in large quantities in England, Scotland, Ireland and Wales.

Now that an awakening has arrived it is expected that the question will be taken up with real commendable English tenacity. The motor car movement was at first very slow through the British Isles due to unreasonable road laws, etc., but once the wheels started moving there was a long certain march and today in the high-priced and medium-priced car field the English product outbalances many of the continental productions which were much earlier in the field. England, which banks on its export trade, realizes that Canada, the Argentine, Australia and South Africa are calling for small cars and to hold her export prestige it is essential that she fill the breach and fill it as speedily as possible.

THE TIME *is today opportune for the development of the export field all around the world by the small-priced American builder.*

Wholesale Financing

LOADING onto the shoulders of one or two healthy units the burden of three or four weaker factories and simultaneously reorganizing the engineering and production methods and utilities, coupled with the problems of financing such an enterprise and carrying out the executive program consequent upon such a unification of factories, proved too stupendous a task for the United States Motor Company, which was placed in receivership a week ago by court order.

The problem of industrial enterprises today is that of securing competent men; the secret of the success underlying some of the biggest individual automobile factories has been one of business executive rather than pioneering in design. Not a few of our factories that have reached the zenith of production success have attained such heights by the calibre of the men who have manned the financing, production and merchandising ends of the business rather than the engineering end. This does not presuppose that a pigmy at the helm of the engineering board would insure success; rather that a medium-calibre engineering department, displaying that good sense of imitating accepted designs and keeping close in touch with public demands, would be more certain of success than an Atlas in command of the engineering forces with secondary financing and production executives.

This is essentially a commercial age; an age characterized by unprecedented demand in the automobile industry; an era of transportation reform in which mental cataclysms with the buyer have been frequent; an age in which ability to deliver has often meant safety and delayed shipments certain destruction; an age in which the ability to quickly make good has been pedestaled by the manufacturers themselves; and an age in which the capacity of a factory has been the measure of its executives to finance the enterprise and the measure of its production and merchandising forces to carry out their part of the program. The concern that could not live up to these stipulations has had to call in the aid of special pilots on many occasions to steer clear of the rocks and shoals.

The entire industry looks to a speedy reorganization of the United States Motor Company, either as a rejuvenated holding company or as a series of reorganized factory units. It will have to be speedy, because of it occurring at the opening of the 1913 manufacturing year, otherwise the wares will be too late on the market and the difficulties of the task will be increased.

What the dynamic results to the industry of this receivership will be cannot at this moment be forecast, but owing to Wall street being so mercilessly bitten it is questionable if the strong movement of banking interests into the manufacture of motor vehicles will not be set back for some time to come. If so, it will be welcomed by some and regretted by others. Talks of enormous combinations of manufacturing units by banking capitalists has been frequent of late; in fact, this seemed the only possible source from which such holding organizations could emanate. The present precipitation will ward off such a situation, which will naturally be welcomed by the small healthy manufacturer, although some of the weaker centers of the industry would naturally be

Hoosiers Pledge $330,000 for Stone Road Project

Indianapolis Automobile Manufacturers Boost Movement by Substantial Contribution—Not Only Car and Accessory Makers Interested in the Work But Also Other Concerns—Great Enthusiasm for Good Roads Found Throughout the Western States Promotes Undertaking

BY the automobile manufacturers of Indianapolis, Ind., agreeing in one evening last week to subscribe $330,000 to the project of buying crushed rock for a transcontinental highway from New York to San Francisco, the movement for practical road construction by the automobile industry has advanced one step further into the realm of the practical. The plan of securing from each automobile or accessory manufacturer one-third of 1 per cent. of his gross business for 3 successive years gives promise of becoming feasible. This has been demonstrated by the attitude of Indianapolis and the motor interests of that city have agreed that there is another $150,000 coming. In the first meeting all but three of the automobile concerns agreed to the proposition and signed the documents. The three not ready to sign are heartily in favor of the movement but due to the holiday season could not close the matter.

The movement in the Hoosier capital has not been confined solely to manufacturers of gasoline machines, electric machines, and accessories. One sporting goods house agreed to give its percentage on the sporting department of its business. Another enterprise with one department only devoted to the automobile trade signed the original document. Many of the dealers were particularly anxious to enter into the proposition and to become one of the many working for practical good roads.

Toward the end of last week the field of activities was centered in Detroit, where the matter was before the consideration of S. D. Waldon, R. D. Chapin, and James Couzzens, who are the good roads leaders in the Detroit automobile industry. A meeting is scheduled for the end of this week, when it is expected somthing definite on Detroit's attitude will be announced. Much of the ultimate success of the movement is dependent on the attitude of Detroit, Cleveland, and Buffalo, and should these three centers act in unity on the proposition there is no doubt that America's first great road across the country will be assured.

Once the manufacturers have subscribed the necessary $10,000,000 to furnish road-building material, the good roads movement will have injected into it a spirit of the practical that has up to the present been unknown in the good roads field. This action should serve as a precipitation in the entire movement, the value of which will not be confined to one transcontinental highway but to all transcontinental highways and to highways linking the North with the South and others in various parts of the country.

S. D. Waldon, of the Packard company, recently returned from a 6,000-mile automobile trip in the western states, was wonderfully impressed with the spirit of road improvement in Nevada and Wyoming, in each of which states much practical work has been done during the last year. "There are only 100 miles of what might be designated really bad roads in the transcontinental trip west of Denver," said Mr. Waldon. "There is a 20-mile stretch at Fallon in southwestern Nevada, extending from 16 miles before reaching this village to 4 miles beyond; there is also an 80-mile stretch in the region of Montello. Generally speaking, Nevada has good gravel for road construction, and, while it is 340 miles across the state by the transcontinental trails, there are really but 50 miles of this bad road. These 50 miles are made up of the district at Fallon and a portion of that at Montello, the major part of the Montello stretch being in the state of Utah. Two-thirds of the way across Wyoming it is possible to travel at 30 or 40 miles per hour, although in parts of this state the roads are bad. The mud flats of Utah are very bad and will call for considerable energy. The garagemen along the line of transcontinetal highways are already wide awake to the possibilities of developing their business and today there are better garages along the transcontinental routes in these states than along many of the routes of Massachusetts. To those who have not traveled West it is almost impossible to picture the beauties of the landscape, and if the public was aware of the advantages of touring through this section on improved highways there would not be any difficulty in securing the funds for building such a roadway."

Although the original plan of this motor highway was a stone road many manufacturers are already talking in favor of brick or cement. The sentiment is general that a highway of this nature should be free from maintenance costs for at least 10 years, and the only road materials considered in this class would be cement and brick. It is not known exactly what materials of this nature would cost but it is undoubtedly true that both the brick and cement interests would be quick to revise their price schedules when the opportunity for such an enormous national undertaking presented itself.

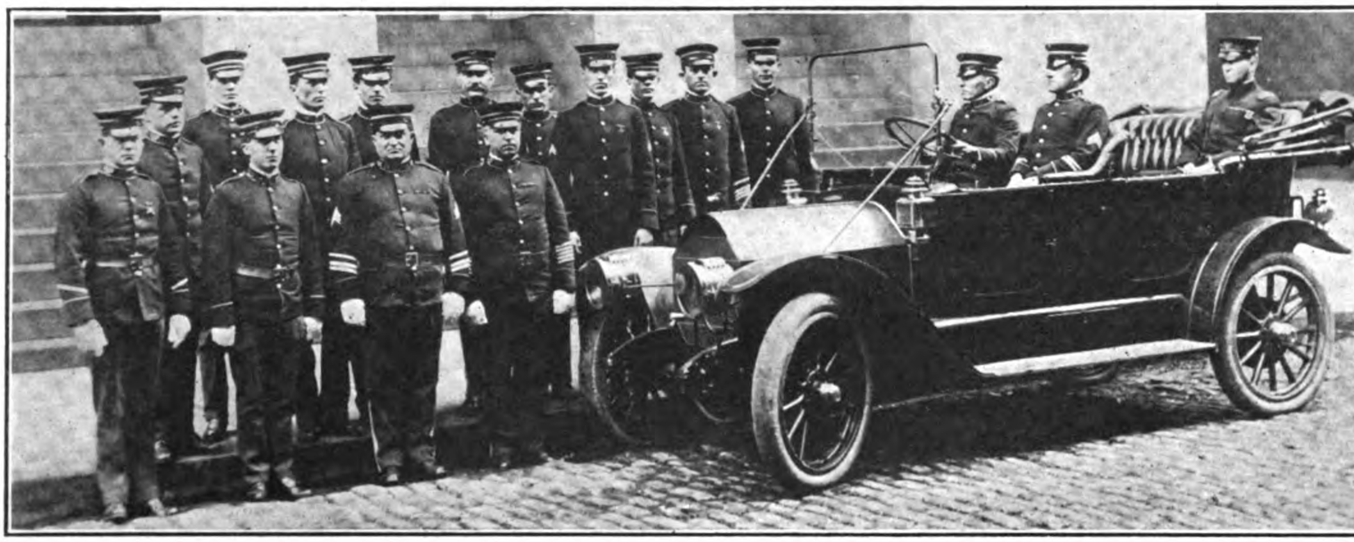
The practical spirit of do-something voiced in this latest road movement has struck a responsive chord practically from one side of the country to the other. This practical aspect of road-building stands out strongly in relief as compared with the oratorical methods so generally used up to the present. The roads movement has gone through a long educational campaign, and everybody is watching for a precipitation of the practical régime. The people owning cars today have a desire to tour over the western states before they are too old to enjoy it, and there is only one way to accomplish this and that is by some precipitation planned such as the present one.

Response to the publication of the first outline of the plans has been received from various communities located along the present lines of transcontinental travel. Without exception, particularly in the western part of the country, every town thinks it has some prime reason for being on the proposed highway and its Chamber of Commerce or Board of Trade has been active in urging that it be not left off the route.

In connection with the main idea, it is now proposed to urge such cities as can not be located on the route to head movements looking to connections with the main artery.

---

interested in any combination in which they had an opportunity of unloading a non-productive white elephant, as has been the case in the formation of both of the present large holding organizations in the automobile field. The present situation should prove a stimulus to the healthy factories of today, it should impress on them the one great fact that to build up an enormous composite organization calls for men of calibre equal to the task and the securing of such men is the most difficult aspect of the undertaking.



Major F. R. Lang, U. S. A., stationed at St. Louis, Mo., who was recently awarded a gold medal by the 50,000-Mile Maxwell Club

ARMY Officer Gets Maxwell Medal—Major F. R. Lang, U. S. A., recruiting officer at St. Louis, Mo., has been awarded a gold medal by the 50,000 Mile Maxwell Club for driving a Maxwell car 50,000 miles. The above picture shows his car occupied by him in front of the Old Custom House, St. Louis, Mo.

Norwalk Distributor for Canada—The Norwalk Motor Car Company of Toronto, Canada, a branch of the parent company at Martinsville, W. Va., is distributor for the Dominion of Canada.

Hadley KisselKar Manager—L. J. Hadley, vehicle division for the Studebaker Corporation of Minnesota, has become manager of the truck sales for the Northwest KisselKar branch, Minneapolis, Minn.

Wheelock Assistant Manager Pioneer—A. C. Wheelock has been appointed assistant manager of the Pioneer Automobile Company, San Francisco, Cal., distributors of the Chalmers and Flanders electric.

Kroha in Milwaukee Truck Firm—John J. Kroha, formerly contracting freight agent for the Wabash system in Milwaukee, has been appointed Milwaukee representative of the motor truck division of the A. O. Smith Company, of Milwaukee, Wis.

Montreal's New Traffic Law—Automobile owners of Montreal, Can., must regard the by-law requiring them to stop 10 feet behind a stationary street car. Should they break it, they must do so only when to do otherwise would jeopardize life.

Harrison Manager 'Frisco Woods—J. W. Harrison, formerly connected with the Woods Electric Company in Chicago, has been appointed manager of the Woods electric department of the Pacific Motor Car Company, San Francisco, Cal., distributors of the Woods and the Stevens-Duryea in Northern California.

Matheson's New 'Frisco Building—The Matheson Sales Company, San Francisco, Cal., distributors of the Warren and Matheson cars, which heretofore has made its headquarters across the bay in Oakland, has now centered all its energies in a handsome new building on Van Ness avenue, near Pine street.

Richardson Distributor Punctureless Tire—C. S. Richardson, for several years manager of the Reliance Automobile Company, San Francisco, Cal., distributors of the Knox pleasure cars and trucks and the Detroit Electric in this territory, recently resigned to take over the distribution of Punctureless in California.

Alberta Automobile Famine—According to the reports of prominent American motorists who have been touring Canada, there is an automobile famine in Alberta. With the enormous strides that the city of Moncton has been making during the past dozen years it has been found impossible to keep pace with the demand for automobiles.

Carroll 'Frisco Goodyear Manager—Frank E. Carroll has been appointed manager of the San Francisco, Cal., branch of the Goodyear Rubber and Tire Company. Carroll has been associated with the sale of Goodyear tires on the Pacific Coast for several years. For some time past he has been manager of city sales in the local branch.

New Chase District Manager—Mr. Royal B. Curtiss, who up to September 1 was sales manager of the Royal Equipment Company, resigned his position to accept a district managership of the Chase Motor Truck Company, with headquarters in Cleveland, O. Mr. Curtiss will have jurisdiction over the following territories: Ohio, West Virginia, Kentucky, Indiana (except the vicinity of Chicago), Michigan and Western Pennsylvania.

Bonnheim-Moore's New Quarters—The Bonnheim-Moore Motor Car Company, San Francisco, Cal., which has secured the Henderson agency for Northern California, Nevada and Hawaii, has taken handsome quarters in the big Goodyear Tire Building on Van Ness avenue, at the corner of Sutter street, which is apparently to be the new automobile center of San Francisco. Bonnheim is a wealthy California merchant, and Harry G. Moore comes to San Francisco from Chicago, where he was engaged in the automobile business.

Autocar School Reopens—The motor school which was opened last fall by the Boston, Mass., branch of the Autocar Company, has been reopened again this season and already a large number of drivers have been enrolled. A special representative of the factory is coming to Boston to take charge of it this year.

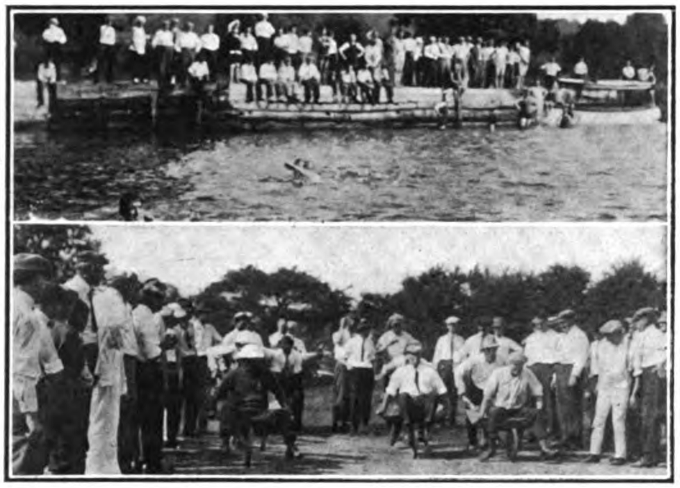
Richardson Handling Cleveland Cole—F. E. Richardson has withdrawn from the firm of Richardson-Neighbors Motor Company, Cleveland, O., distributors for the Cole and Hupmobile. He has organized the Richardson Motor Car Company and will be located next door to the old company. Mr. Richardson will handle the Cole lines exclusively, while Mr. Neighbors will look after the Hupmobile interests.

Baker Line Together—The Baker commercial and pleasure vehicles are now being handled under the same roof in Boston, though by distinct agencies, A. F. Neale, who has the pleasure cars, and Frank A. Phelps, who handles the commercial line, having moved their quarters to the former salesrooms of the King agency, corner of Boylston and Fairfield streets.

Lehigh Adopts Automobile Handcars—The adoption of motor cars for track work in place of the old-fashioned manpower handcars has been decided upon by the management of the Lehigh Valley Railroad. Forty-seven of the new cars, the first installment, have been ordered, and the substitution of gasoline for muscle for transporting repair men and tools over the line will eventually be applied to the whole Lehigh Valley system.

Readjustment of U. S. Motors in Columbus—A readjustment of the sales force of the United Motors-Columbus Company, Columbus, O., in a large portion of Ohio, Kentucky and West Virginia has been made. F. P. Corbett, who has been in charge of the Columbus distributing point for some time, will be district manager of the three States. The local agency in Columbus will be signed up soon. The wholesale and retail end of the business will continue in the same location, 246-248 North Fourth street. Manager Corbett is now busy signing up sub-agents in his territory.

New building of the Overland Automobile Company of Dallas, Tex.



Swimming and wheelbarrow races at the recent outing of the New York City Big Village Motor Boosters

Miller Atlanta Branch Store—The Chas. E. Miller Supply House, Atlanta, Ga., will move its branch store to 259 Peachtree street.

Motor Bus Line in Bay State—A motor bus line has been started between Pittsfield, Mass., and Troy, N. Y., and the volume of patronage has been very good since the line was started.

Meiser with Knipper-Kipp—John Meiser, superintendent of the Selden Motor Car Company, Rochester, N. Y., has resigned to become connected with the Knipper-Kipp Company in the Kondolf Garage, Monroe avenue.

Manager Sackett Resigns—Louis Sackett, recently appointed manager of the Boston, Mass., branch of the Oakland, has resigned and the branch is being conducted now by Fred Walsh, sales manager of the branch for some years.

Stearns Philadelphia Branch House—The F. B. Stearns Company, Cleveland, O., has opened a branch house in Philadelphia, Pa., located at 449-451 North Broad street. Mr. G. Hilton Gantert is manager, with Mr. Evans Church as sales manager.

New Service Station Manager—Walter Jones, for some years manager of the Whitten-Gilmore Company's service station, Boston, Mass., agents for Chalmers cars, has resigned, and Mason H. Kimball has been appointed to succeed him.

Morgan Severs Truck Connections—Ralph L. Morgan of Worcester, Mass., has severed his connections with the Morgan Motor Truck Company, Worcester, Mass. He has taken a suite of offices in the People's Bank Building, 452 Main street, Worcester, Mass.

Automobile Funeral Procession in District of Columbia—The first funeral procession composed exclusively of motor cars ever held in the District of Columbia was that of Paul Peck, the aviator, who was killed by a fall from his biplane in Chicago, Ill., September 11.

Mantell with Michigan Company—C. S. Mantell, formerly manager of the Portland Motor Car Company, Portland, Ore., has recently taken charge of the sales department of the Michigan Motors Company of Portland, handling the Havers Six as well as Lippard-Stewart trucks.

Stearns' New Trade Mark—The F. B. Stearns Company, Cleveland, O., has just copyrighted a new trade mark. It is a 3-inch metal figure of a knight fastened to the radiator of all Stearns-Knight cars, with the wording "Stearns-Knight" on the pedestal on which the knight stands.

Hauger 'Frisco Haynes Manager—Fred W. Hauger, for several years assistant manager of the Haynes Automobile Sales Company of San Francisco, Cal., has been named as manager of the Oakland branch of the Haynes. C. H. Haynes, a brother of Ellwood Haynes, has been appointed treasurer under the reorganization.

New Poppenberg Buffalo Home—Plans have been completed for the construction of the new home for the Poppenberg Motor Car Company at Main and Carlton streets, Buffalo, N. Y. The mansion on the site at present is being razed for the new structure, which will be seven stories in height and will extend from Main to Washington streets.

Lawrenceburg Automobile Club Organized—The Lawrenceburg Automobile Club has been organized at Lawrenceburg, Ind., with twenty-seven members, the officers being: President, John W. Oberting; vice-president, Robert E. Oberting, and secretary-treasurer, Edmund Bauer. An effort is being made to enlist every motor car owner in Dearborn County in the organization.

Watertown's Club Road Experiments—The Watertown Wis., Motor Club, organized three months ago with seventy-five members, has completed a sample stretch of road, the principal value of which is to illustrate the small cost of maintaining ordinary highways when proper methods are used. A stretch of 1 mile of dirt road between the western city limits and the village of Ixonia has been scraped, the stones removed and a split log drag applied after even the lightest shower and is today one of the finest pieces of highway in Wisconsin. The expense has been approximately $60 for three months' work.

Automobile Incorporations

AUTOMOBILES AND PARTS

Atlantic City, N. J.—Pierson-Harris Company; capital, $50,000; to manufacture automobiles. Incorporators: Gilbert Pierson, Edward G. Harris.

Buffalo, N. Y.—Niagara Devices Company; capital, $100,000; to manufacture transmission for automobiles, machines, devices and patented articles of all descriptions. Incorporators: Edward D. Matteson, George A. Cotton, George R. Volkmar.

GARAGES AND ACCESSORIES

Albany, N. Y.—Rondout Rubber Company; capital, $1,000,000; to deal in crude and reclaimed rubber. Incorporators: Calvin Tomkins, Harry C. Clews, Frederick E. Townley, William A. Bishop.

Brooklyn, N. Y.—Q.-C. Storage Battery Company; capital, $2,000; to manufacture storage batteries. Incorporators: Albert M. Friedenberg, Robert W. Vicarey, Leopold Friedenberg.

Brooklyn, N. Y.—Brooklyn Terminal Garage and Machine Company; capital, $10,000; to carry on a garage business. Incorporators: Donald B. Abbott, Charles E. McMahon, Joseph D. Fackenthal.

Brooklyn, N. Y.—Haas Garage Company; capital, $2,000; to carry on a garage business. Incorporators: Louis Haas, Emma Haas, Oscar Hauman.

Buffalo, N. Y.—Continental Motor Company; capital, $100,000; to deal in motors. Incorporators: Gordon F. Matthews, Frank V. Wayland, Allen E. Choate, Walter Schmieding, Reverdy L. Hurd.

Cincinnati, O.—Bond Hill Auto Service Company; capital, $20,000; to operate a freight and passenger service. Incorporators: Jacob Clos, John F. Ahlers, Joseph B. Arlinghaus, Arthur H. Pohlman, W. A. Earle.

Cincinnati, O.—Cincinnati Automobile Club Company; capital, $25,000; to operate a social club for the purpose of advancing the interests of motorists generally. Incorporators: D. McKim Cook, Louis J. Merkel, Gustav W. Drach, A. O. Streitman, Charles W. Ireland, L. S. Coltor.

Cincinnati, O.—Ideal Steel Wheel Company; capital, $500,000; to manufacture steel automobile wheels and automobile accessories. Incorporators: J. B. Fitch, J. E. Strietmeier, E. H. Maffrey, B. L. Mattox.

Cleveland, O.—Auto Electric Appliance Company; capital, $20,000; to manufacture electric automobile appliances. Incorporators: Paul T. Crampton, Charles R. Brown, Guy W. House, Frank B. Fults, Henrietta Davis.

Cleveland, O.—Northern Ohio Automobile Company; capital, $10,000; to conduct all kinds of races of motor-driven vehicles. Incorporators: Richard H. Lee, Florence Gawood, John A. Alburn, H. E. Weffler, Fred Hockley.

Davenport, Ia.—Overland Motor Car Company; capital $10,000; to deal in motor cars. Incorporators: G. H. Knowles, Henry Bierkamp, Henry Meyer, J. G. Foy.

Grafton, W. Va.—Grafton Motor Company; capital, $5,000; to repair and store automobiles, deal and hire same, etc. Incorporators: Henry J. Pracht, H. D. Comerford, J. Howard Reynolds, A. R. Huns, D. C. Peck.

Grand Rapids, Mich.—Hand Corporation; capital, $30,000; to manufacture and sell automobile and garage accessories. Incorporators: O. H. L. Wernicke, H. C. Cornelius, George H. Hand, J. A. Whitworth, L. A. Cornelius, George G. Whitworth.

Indianapolis, Ind.—Showalter Manufacturing Company; capital, $10,000; to manufacture motor car bodies. Incorporators: E. W. Showalter, William Small, H. G. Showalter.

Kingston, N. Y.—Taxicab Transportation Company; capital, $5,000; to carry on a taxicab transportation business. Incorporators: Wm. Hilterbrant, Elizabeth K. Hiltebrant, Elsa Hiltebrant.

Milwaukee, Wis.—New York Tire & Vulcanizing Company; capital, $10,000; to manufacture an inner liner for casings. Incorporators: Vivian Brownell, Bertrand Brownell.

Westfield Truck Branch—The Westfield Motor Truck Company, of Westfield, Mass., has opened a factory branch at Boston at 287-293 Northampton street with George L. Cooke in charge as manager.

Russell Company's New Quarters—The W. L. Russell Company, agents for the Haynes in Boston, Mass., and the Regal wholesale and retail for New England, has moved to the Motor Mart, still retaining the retail branch at 10 Park square.

Garford Now in Boston—The final arrangements were completed last week whereby the R. & L. Company, of New York, comprising J. T. and J. A. Rainier and Paul Lineberger, took control of the Garford business in Boston to operate in connection with the New York agency as a sub-branch.

New Company Formed—The Tyler Motor Car Company, Boston, Mass., formed by Frank J. Tyler and his brother, Lucius, has secured quarters in the Motor Mart and have taken on the Little Four roadster. The new company is making investigations of other propositions and will handle other cars and trucks.

Changed to a Branch—The Detroit Electric, formerly handled as an agency proposition by James A. Binney in Boston, has been changed over to a branch by the Anderson Electric Company, of Detroit, and Albert Weatherby has been sent to Boston as manager. A new service station has been opened at 25 Irvington street with Nicholas Rommefauger in charge. Mr. Binney has gone into the gasoline field, having taken on the Henderson.

Zimmerman and Brewer, old-time cyclists, renew ancient rivalry at the Big Village Motor Boosters Outing

Iowa Has 38,924 Automobiles—According to the latest reports from the office of the Secretary of State, there are now 38,924 automobiles in Iowa. There are 1,480 dealers and 3,890 motorcycle owners registered. During the present year up to August 31, $45,657.81 has been paid into the State Treasury for automobile registrations; $14,851.29 was paid in August.

Ohio Has 60,500 Automobiles—According to the latest report of State Registrar of Automobiles J. A. Shearer, Ohio now has 60,500 registered automobiles of all kinds. This number is far in excess of the total registered in 1911, and applications for registration are coming in at the rate of 60 per day. It is believed the number will exceed 70,000 before the year ends.

Wisconsin's Registration Large—The rank and wealth of Wisconsin as a motoring state is indicated by a compilation of statistics by A. J. Cobban, in charge of the motor registry and license department of the secretary of state's office at Madison. During the period from January 1 to July 1, 1912, there were licensed 23,505 motor cars and 3,816 motorcycles, a total of 27,321, or one motor vehicle to every eighty-five persons resident in Wisconsin, according to the given population of 2,333,860.

District of Columbia's 1912 Registration—The annual report of H. M. Woodward, permit clerk, reveals the fact that permits to operate motor cars in the District of Columbia were issued to 2,343 out of 2,393 applicants who were examined by the motor car board during the fiscal year that ended June 30 last. Of the permits granted 200 were for the operation of electric vehicles, 1,790 for gasoline machines, 22 for steam cars and 331 for motorcycles. The revenue derived amounted to $6,022. There were registered and paid for during the year 3,924 metal identification tags, which produced a revenue of $7,848. Two permits were revoked during the year because of charges filed and upon recommendation of Major Sylvester, superintendent of police.

California's Registration Increases 50 Per Cent.—California took delivery on 34,110 automobiles during the fiscal year, which closed August 31. These figures are issued by the Secretary of State, as the number of motor cars registered during the 12 months period, and places California near the top of the list. That the automobile industry is growing by leaps and bounds is attested by the fact that during the 1910-11 season but 15,905 machines were registered at Sacramento, giving the season just closed an increase of 8,205 cars. This is greatly in excess of 50 per cent. of the former total and represents the actual gain in a single year. Of all the makes of motor cars, the Studebaker 20 and 30 proved the most popular, 3,653 cars of these makes being registered. Next in point of popularity cames the Ford with 3,453.

Automobile Incorporations

MONTREAL, QUE.—Belleville Garage & Auto Company, Ltd.; capital, $90,000; to deal in motor cars, commercial trucks and doing a general repair business.

NASHVILLE, TENN.—Cumberland Motor Company; capital, $10,000; to deal in motors. Incorporators: W. D. Caldwell, J. H. Cheek, J. O. Cheek, Jr., D. M. Baver.

NEW YORK CITY, N. Y.—Simplex Carbureter Company; capital, $150,000; to manufacture carbureters. Incorporators: Albert L. Kull, Col. Cord Upton, Simon J. Mayer, Milton Mayer, John J. Welch.

NEW YORK CITY, N. Y.—Englebert Tyre Company; capital, $100,000; to deal in automobiles and other tires. Incorporators: Samuel K. Kellock, Clarence B. Campbell, Edward W. Elverson.

NEW YORK CITY, N. Y.—Zilio Sales Company; capital, $5,000; to deal in automobiles and accessories. Incorporators: Edward Moyse, Felix H. Moyse, Isaac J. Phelps.

NEW YORK CITY, N. Y.—Imperial Auto Renting Company; capital, $1,000; to carry on an automobile renting business. Incorporators: Abraham S. Gusson, David Abraham, Alexander Miller.

NEW YORK CITY, N. Y.—Knickerbocker Havers Company; capital $50,000; to deal in automobiles and motor vehicles. Incorporators: Erastus M. Cravath, Albert C. Hubbel, Burwell M. Crosthwaite.

NEW YORK CITY, N. Y.—Ames Automatic Shock Absorber Company; capital, $25,000; to manufacture shock absorbers. Incorporators: Louis E. Bomeisler, George H. Edwards, George Isaksen.

NEW YORK CITY, N. Y.—Commercial Delivery Company; capital, $500; to deal in automobile delivery cars, trucks, etc. Incorporators: Abraham Miller, Nathan Tarakan, Louis Tarakan.

ROCHESTER, N. Y.—Automobile Safety Fender Company; capital, $100,000; to manufacture automobile fenders. Incorporators: William A. Snyder, Abram Dewolf.

ST. JOSEPH, MICH.—Wizard Manufacturing Company; capital, $10,000; to manufacture and sell improved carbureters, and motor vehicle accessories. Incorporators: Frank A. Sharpneck, Thomas Robinson, Gerald C. McDowell.

TOLEDO, O.—Landman-Griffith Company; capital, $10,000; to deal in and repair automobiles of all kinds and handle parts and accessories. Incorporators: Charles P. Landman, Charles K. Friedman, Warren E. Griffith, Hattie Landman, Gertrude D. Griffith.

TOLEDO, O.—Rapp Manufacturing Company; capital, $15,000; to manufacture spark plug and automobile accessories. Incorporators: Fred Hummel, Clifford Stone.

WELLSBURG, W. VA.—Brooke Auto Company; capital, $10,000; to deal in automobiles. Incorporators: J. H. Scott, W. H. Scott, C. M. Magee, F. A. Chapman, E. A. Fegan.

WILMINGTON, DEL.—L-A-W Motor Truck Company; capital, $200,000; to engage in automobile truck business. Incorporator: G. G. Rheubym.

WILMINGTON, DEL.—Auto Service & Supply Company; capital, $15,000; to engage in automobile and accessory business. Incorporator: F. A. Webb.

CHANGES OF CAPITAL

BUFFALO, N. Y.—United Motor Buffalo Company; change of name to Monroe Motor Car Company.

DETROIT, MICH.—Ignition Starter Company; increase of capital to $500,000.

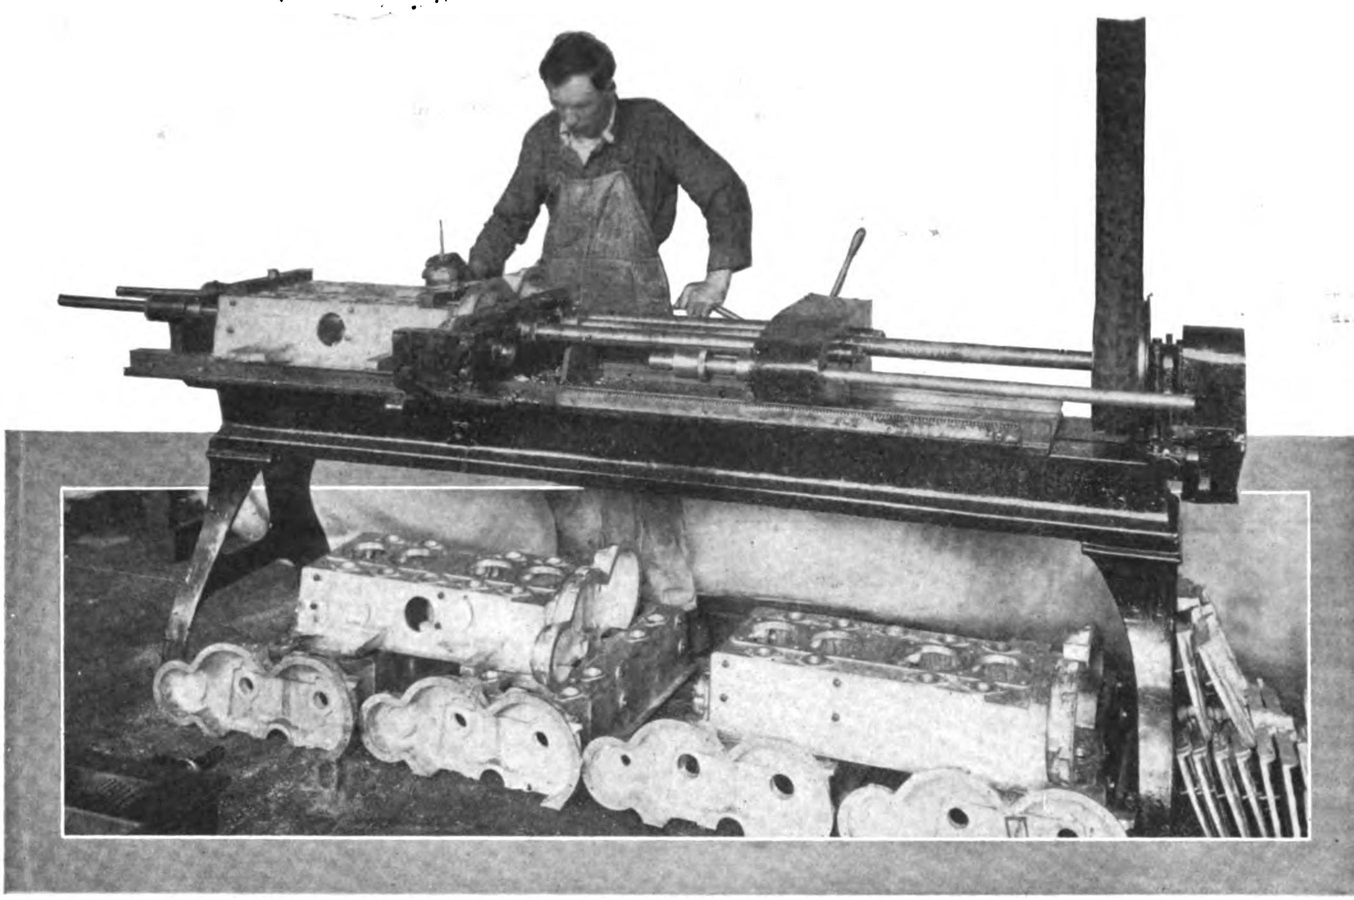
HOUSTON, TEXAS.—Stafford Illuminated Automobile Lamp and Number Company; increase of capital from $25,000 to $50,000.

INDIANAPOLIS, IND.—Marion Motor Car Company; increase of capital from $1,125,000 to $1,250,000.

PROVIDENCE, R. I.—A. W. Harris Oil Company; capital, $7,500; to succeed A. W. Harris Oil Company. Incorporators: Benjamin S. Terry, Arthur D. Greene, George F. Heywood.

MIDDLETOWN, O.—Middletown Buggy Company; change of name to Crescent Motor Truck Company; to manufacture motor trucks in the future.

Factory Miscellany



Camshaft boring machine made by the National Motor Vehicle Company for use in its factory at Indianapolis, Ind.

The object of this machine is to save time. It requires the attention of one man and can completely bore a crankcase and prepare it for the camshaft bearings in 30 minutes. It can work steadily at this rate for a working day, turning out twenty finished jobs in that time. The machine is so designed that the axis lines up with the axis of the crank shaft, thus securing parallelity between the latter and the crankshaft. The machine has a guide which passes through the center of the crankcase through the main bearings, that is, following the line of the crankshaft. The National motor, being of the T-head type, requires a set of camshaft bearings on each side of the crankcase. At the end of the machine carrying the driving gear train there is a wheel on either side of the main drive wheel. These two side wheels run at the same speed and each one carries a cutter allowing the boring on both sides of the crankcase to be carried on simultaneously. The former practice of boring both sides separately required practically double the time, while the parallelity of the shafts was not so well assured.

Lippard-Stewart Assembly Room—In the accompanying illustration is shown a part of the assembly room of the Lippard-Stewart Motor Car Company, Buffalo, N. Y., makers of light commercial cars. The entire factory is roomy, light and as well adapted to the work as is the section shown.

Battery Concern in Canada—The Hart Accumulator Company, of London, England, manufacturers of storage batteries, will establish a factory in western Canada. E. J. Clark, managing director of the company, who is one of the manufacturers touring the country, will recommend that a large plant be built at either Winnipeg or Fort William.

Ford's Memphis Assembling Plant—Contracts have been let for the erection of the assembling plant of the Ford Motor Company, Detroit, Mich., at Memphis, Tenn., and work will be commenced at once. The site is a triangular lot with 114 feet frontage. The entire plant when completed will represent an investment of $200,000.

Overland's Two-Story Addition—The list of contemplated additions to the Willys-Overland factory, Toledo, O., was increased Tuesday, when work was started on a two-story factory building to be used as an addition to the present plant. The addition will be 40 by 60 by 39 feet and will cost $8,000. The additions now planned for this mammoth concern will cost several hundred thousand dollars and work is being pushed as rapidly as possible so that the buildings may be completed before the arrival of winter. Four of the largest buildings are being made considerably larger. Additions are being made to the final assemblying room, the main factory building, the forging plant, the shipping rooms and the railroad docks. Railroad docks of this plant will be more than doubled in size and will be uniquely commodious and modern when completed. At present but three cars can be loaded in a day and as 200 cars are shipped each day the space required as railroad dockage is enormous. This improvement alone will cost an immense sum. The two new buildings, one to be occupied by the Overland proper, the other by the Kinsey Manufacturing Company, must be completed under the terms of the contract by November 1, which means some rapid building.

Republican Company's Flint Plant—The Republican Motor Company, Flint, Mich., contemplates erecting a $1,000,000 automobile plant at Flint.

Oakland's Factory Addition—The Oakland Motor Car Company, Pontiac, Mich., contemplates the erection of a large addition to its present plant at Pontiac to cost about $100,000.

Miller Company's New Building—The Miller Rubber Company, Akron, O., is erecting a new building at a cost of $5,000. It will be of steel construction and will be used as a mixing department.

Federal 1913 Output Large—The Federal Motor Truck Company, Detroit, Mich., will have a large output, according to the way rush and repeat orders are coming in. The output for 1913 has been raised to 2,500 cars.

Keeton Installing Machinery—The Keeton Motor Car Company, Detroit, Mich., is installing machinery at the Wyandotte plant, Wyandotte, Wis., and will start manufacturing this month and will give deliveries in October.

Gramm-Bernstein's New Plant—The new Gramm-Bernstein Company, Lima, O., started the manufacture and assemblying of motor trucks in the new factory. B. A. Gramm stated that 250 motor trucks will be turned out by the plant within the next six months.

Remy's Large Contracts—The largest orders ever obtained by one factory for magnetos was recently enacted by the Remy Electric Company, Anderson, Ind., with the Willys-Overland Company, Toledo, O., and the Buick Motor Company, Flint, Mich., for a total of 70,000 magnetos.

Rauch & Lang's Factory Addition—Rauch & Lang, builders of motor vehicles, are to build an addition to their factory, West Twenty-fifth street, to be four stories high. It will be 100 feet by 112 feet in size and made of brick with a concrete roof. George S. Rider & Company is drawing the plans.

Velie's Repair and Test Building—The Velie Motor Vehicle Company, Moline, Ill., is to erect a $15,000 road repair and test building. The new building, which will be erected south of the present shop, will be 80 feet by 200 feet in size. The contract has been let to Henry W. Horst, of Rock Island, Ill.

McLaughlin to Build Addition—The McLaughlin Carriage Company, Oshawa, Ont., has taken out a permit to build an addition to their factory, two stories high and 250 feet by 60 feet in size. Their present manufacturing facilities are inadequate to meet the increasing demand for McLaughlin Blick motors.

Visit Jeffery Plant—Fifty members of the Western Society of Engineers, Chicago, Ill., visited the Rambler factory recently and made a close inspection of the unit gasoline and electric motor with which the 1913 Cross Country is equipped. The engineers came to Kenosha, Ind., as the guests of the Thomas B. Jeffery Company.

Project Factory for Trucks—Phillip S. Longest, president of Longest Brothers, Louisville, Ky., announces that C. G. Stoddard and H. J. Edwards, of Long Island, N. Y., are negotiating with him for the expansion of his place into a factory for the manufacture of commercial cars. It is their desire to lease the place from the Longest Brothers.

Pierce Company's Machine Shop—The Pierce Motor Company, of Racine, Wis., the motor car division of the J. I. Case Threshing Machine Company and manufacturing Case cars, is building a new machine shop and assembling building, four stories high, 130 feet by 80 feet in size. The new building is situated between the present motor car works and the $1,000,000 foundry plant now under construction for the Case company at Lakeside, Racine.

Flames Sweep Martinsburg Plant—The Stewart Vehicle Works of Martinsburg, W. Va., employing 400 men, was completely destroyed by fire recently, entailing a loss of more than $150,000. The plant had been in operation less than a year and practically all of their stock, including hundreds of vehicles, were destroyed. A providential fall of rain prevented the destruction of the Norwalk Motor Company and hundreds of thousands of dollars worth of the best property in that city.

Pharis Tire Company Busy—The Pharis Tire & Rubber Company, of Columbus, O., recently incorporated, has been organized by the election of A. R. Lindorf, president; R. W. Pharis, secretary and treasurer, and Carl Pharis, general manager. The concern, which took over the plant of the Newark Tire & Rubber Company, of Newark, O., recently decided to keep the plant at that point. Additional machinery will be installed, including grinding apparatus. The capacity of the plant now is fifty tires daily, which will be doubled in the near future. In addition to making what is known as the Pharis tire, the company will make a 4,000 miles guaranteed tire called the Packard.

Krit's New Service Building—The Krit Motor Car Company, of Detroit, Mich., is erecting a new service building adjacent to its factory on the East Boulevard. This addition is to be used as a service stockroom and there will also be a showroom in connection. The construction is of brick, one story high, all sides are to be filled with Fenestra sash, giving a very light and airy storeroom. The roof is of the saw tooth construction, liberally fitted with glass. The building is 85 feet wide by 125 feet long of which 85 by 15 will be used for a showroom. In the center of the front is a large plate glass window in which will be shown the latest Krit models. It is expected that this addition will enable the Krit company to materially better its service department and enable repair parts to be shipped without delaying production of current models.

Further Extensions of Goodrich Plant—The extreme popularity of Goodrich tires has caused an era of factory expansion at the already extensive plant of the B. F. Goodrich Company, Akron, O. Although by far the largest rubber factory in the world, several more acres of floor-space will be added by the time the snow flies. Work is already begun on a six-story office building which, with a two-story addition to the present quarters, it is hoped will be adequate for handling the rapidly growing business interests of the concern. The structure will be of steel and concrete, faced with brick and finished in the most modern style. A new factory building, also six stories high, is rapidly nearing completion. This big addition is 270 feet long by 157 feet wide and contains 6 1-2 acres of floor-space.

Assembly room of the Lippard-Stuart Motor Car Company, Buffalo, N. Y.

Spark Plug With Double Connection; New Rear View Mirror; Heavy Duty Spark Plug; Device to Reduce Cylinder Compression; Punctureproof Automobile Tire; Gasoline Filter

Superior Double Spark-Plug

TESTS have shown, according to the Superior Motor Specialty Company, Philadelphia, Pa., that the use of two sparks on a single plug in a cylinder results in a considerable increase in fuel efficiency. The production of two simultaneous sparks furnishes more heat at the critical moment when the mixture is ignited, so that the process of combustion is started more rapidly and more dynamically. The plug, Fig. 1, consists of two positive electrodes contained in a double insulation, which may be wired either both to the magneto, or one to the magneto and the other to the battery, utilizing either a double or a dual ignition system. The timing of the ignition naturally is not disturbed or influenced in any way by the use of this plug. It is claimed by the maker that the increase in horsepower obtained by the use of this plug over the power output with a single-spark plug is 17 per cent.

Hoco Rear View Mirror

Hoeft & Company, Inc., Chicago, have designed a new type of rear view mirror, Fig. 2. The mirror itself consists of a beveled, oval-shaped plate, 6 by 8 inches, which is held in a brass frame mounted on a horizontal rod. The latter slides in a metal sleeve and is adjustable at any point along the length of the same, its maximum extension being 13 1-4 inches. The sleeve is attached to the windshield post by a clamp being held together by two bolts or by a screw plate. The mirror comes in nickel or brass finish. The device is of exceptional value in that it can not only be swung at any angle but may be given a longer arm at any time by simply loosening the connection and pulling out the slide.

In insurance statements it has been shown that a large percentage of the number of accidents from careless driving, have been caused by the driver turning to look at a car behind

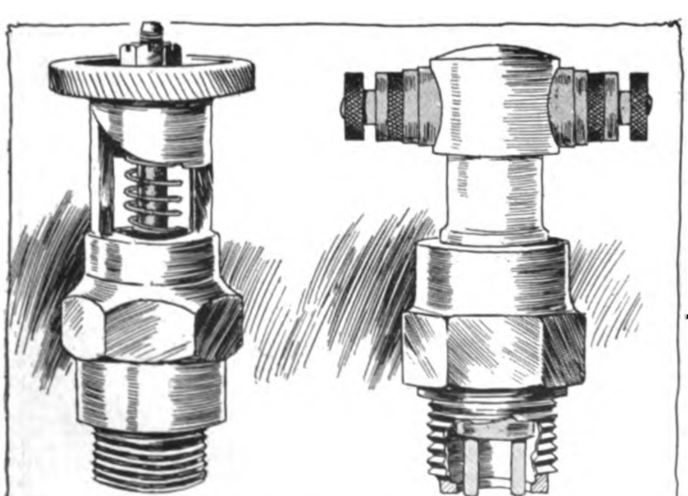


Fig. 1—Endrick motor decompressor and Superior double spark-plug

Hartford Heavy-Duty Plug

A spark-plug which is designed to withstand high heat and its accompanying influences is the Hartford plug, Fig. 3, made by the Hartford Suspension Company, Jersey City, N. J. This plug is so constructed that it may be easily cleaned, this feature being obtained by making the insulation practically in one piece with the bushing and nut, while the second piece of the plug is the shell. The nut may be easily screwed out of and withdrawn from the shell so as to permit of cleaning the electrodes from soot and oil deposits, which are the most frequent causes

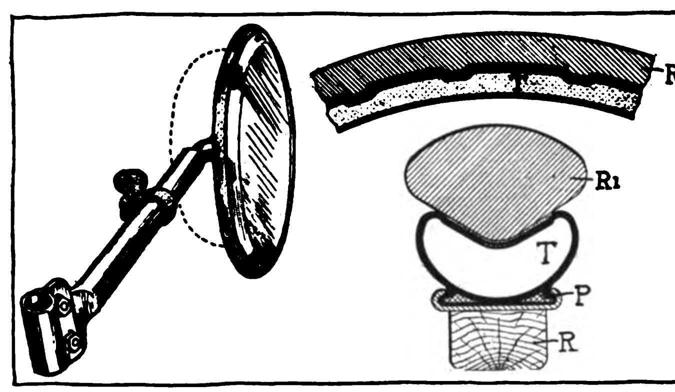

Fig. 2—Hoco rear view mirror and section of Montgomery tire

of trouble in the case of plugs capable of withstanding the pressure of a high-tension current. The illustration shows the plug in its two portions and attention is called to the peculiar construction of the negative electrode, which is formed as a long U-pin inserted in the base face of the bushing. The positive electrode is a straight heavy wire of such composition as enables it to remain solid at all temperatures encountered in spark-plug service. The porcelain insulation surrounding the central electrode is substantial but not cumbersome, and the whole plug has a pleasing appearance.

Endrick Motor Decompressor

Owners of automobiles with high compressions would in many cases gladly sacrifice a fraction of this feature if starting could thereby be made easier. To meet their wishes, the Endrick Engineering Company, Warwick Road, Olton, near Birmingham, England, has constructed a decompressor which may take the place of the priming cock, the latter being made obsolete by its use. The decompressor consists of a poppet valve shaped with a double face. The lower one is ordinarily pressed against its seat by a spring, while the upper one positively limits upward movement of the mushroom. The action of the decompressor, Fig. 1, is as follows: On the compression stroke the valve is slightly lifted and part of the compression is lost, and a slight leak is also encountered during the power stroke as well as the exhaust stroke. On the suction stroke the presence of the decompressor does not influence the operating conditions in any way, so that the ratio of gasoline and air laid down by the adjustment of the carbureter is not altered due to the use of the decompressor.

Montgomery Punctureproof Tire

One of the latest efforts to overcome punctures is the combination pneumatic and solid tire made by Harry B. Montgomery, Harrisburg, Pa. This tire, Fig. 2, consists of an inflatable tube of strong rubber, the inner portion of which is so shaped as to fit within the bead portion of the rim. Around the tube the solid rubber tread is arranged which bears in an annular depression of V-section. The thickness of the solid tread protects the inflated tube from punctures, while its rhomboidal cross-section insures the immunity of the tube against rim cutting, since practically all the pressure is applied along the V-shaped depression of the tube. If the tube is deflated the rim may be removed, its tight fit on the tube being but the result of the air pressure in the tube, forcing the outer wall of the same against the inner surface of the tread.

The tube is so far above the tread that the danger of its puncture is very slight as only a thrust from the side could reach it. This is almost impossible in regular running conditions. Owing to the enormous thickness of the casing it would be a long time before the wear from ordinary running began to show. It would be necessary to maintain the proper pressure in the inner tube in the same manner that it is required with the ordinary clincher type of tire. The solid rubber constituency of the outer shoe gives an added resiliency to the tire, it is claimed, and thus aids in absorbing a heavy shock without transmitting it to the body of the car and its occupants.

Bousman Fuel Autofilter

Impurities of the gasoline, consisting both of foreign matter and water, are detrimental both in decreasing the efficiency of the fuel and necessitating a relatively large consumption of the same by the motor, but they also cause such acute troubles as stopping up a lead in the carbureter or the formation of a water trap in the line. It is therefore essential that pure gasoline only be fed to the carbureter, and for this purpose the Bousman Manufacturing Company, 18 Plainfield avenue, Grand Rapids, Mich., has constructed the Autofilter, Fig. 4. This is

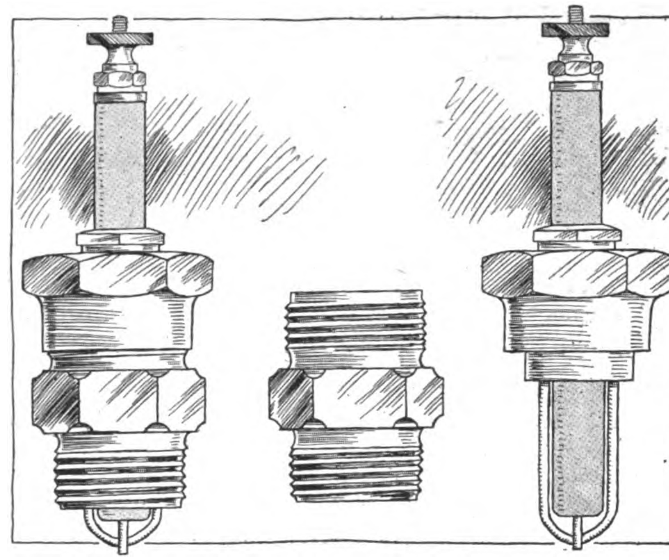

Fig. 3—Assembly of the Hartford heavy-duty spark plug

a highly polished bronze casing equipped with brass fittings and containing a fine wire gauze screen which is visible through a cylinder of heavy glass, making a tight fit with the bronze casing. The gasoline enters at a fitting which connects with the gasoline tank lead by a compression coupling and enters the space surrounding the filter cylinder. The pressure behind the gasoline forces it through the filter and out of the casing, while the water or foreign matter remains in the space which surrounds the filter, whence it may be drained by opening the cock. The view of the parts, Fig. 4, shows the construction of the details. The filter consists of a very fine mesh screen, inside of which a piece of filter fabric is placed. Inside this material there is another cylinder of wire screen, which, however, is coarser than the outside one. The fitting is on a level lower than the top of the filter cylinder, between which and the casing a tight fit is preserved through the sleeve, a highly machined and finished brass casing. The sleeve has eight small holes around its circumference, presenting passages between the interior and exterior of the cylinder and through which the pure gasoline which has passed through the filter may flow to the exit fitting. The bevel-shaped lower portion of the sleeve warrants an absolutely tight fit against the casing, while the same condition is obtained at the upper end of the sleeve by the contact with the interior of the cap. The filter may be attached at any suitable location by means of the plate which carries a clamp fitting around the casing that may be secured firmly in place by means of screws.

ELECTRIC Automobile Signal—In which the sound is generated by a rotating ratchet and strengthened by an acoustic chamber.

Fig. 1 shows the subject matter of this patent, an electric signal. The sound is produced by a ratchet R engaging a projection of an acoustic chamber A which is inclosed in a casing C, provided with a resonator. The acoustic chamber A is not in direct contact with the casing.

No. 1,035,745—to Ernest Rubes, Brooklyn, N. Y. Granted August 13, 1912; filed January 11, 1911.

Anti-Creeping Tire Device—Which consists in a method of positively holding the inflating valve in a stationary position relative to the rim.

The patent refers to the combination of an inner tube having a strength-giving envelop on the inside, with a tube surrounding the first-mentioned tube and having a disk-like flange F, Fig. 2, which is positively held in place in the interior envelop. A portion of the flange is formed as a tube adapted to inclose an inflating valve V; this latter tube extends through the wheel rim and is threaded to receive a clamping nut N by means of which the valve can be securely held in position relative to the rim.

No. 1,036,085—to Clarence E. Falor, assignor to the Goodyear Tire & Rubber Company, Akron, O. Granted August 20, 1912; filed October 31, 1911.

Carbureter for Automobile Motors—In which two sleeve valves serve as auxiliary air inlets.

The carbureter described in this patent, Fig. 4, has a mixing chamber M in the lower part of which the nozzle N is located. The air entering through the primary inlet P and passing through the carbureter is regulated by the throttle T and the upper portion of the chamber M is formed with an annular port which, when the throttle is closed, is closed only by a sleeve S_1 connected to the throttle. A lower sleeve S_2 is connected to the first sleeve so as to be actuated in unison therewith and the lower end of S_2 is shaped with an outward flange to direct the incoming air toward the nozzle N. Therefore when the throttle is gradually opened more widely the sleeves come into action and a mixture of correct air-fuel proportion is produced.

No. 1,036,301—to Harry A. Miller, Los Angeles, Cal. Granted August 20, 1912; filed October 19, 1910.

Self-Inflating Pneumatic Tire—In which the inner tube is composed of a number of sections inflated by a pump plunger which is actuated by the flexure of the tread when running.

The subject-matter of this patent is shown in Fig. 3, where R is the rim and C the outer casing of a tire. The inner tube is composed of a number of sections, each one of which has two abutting end plates E. These rest on plates P separating them. In the channel formed between the two tube ends a helical spring S is placed, one end of which is secured to P and the other a pump plunger P_1 capable of reciprocating on a cylinder C_1. This cylinder is reciprocated when the plate P passes through its lowest position, whereby air is pumped into the cylinder whence it is forced into one of the two sections.

No. 1,035,283—to Frank F. Wear, San Francisco, Cal. Granted August 13, 1912; filed November 23, 1910.

Cushion Device for Automobiles—In which oil and air are used to absorb shocks by passing through a dashpot arrangement.

One of the principal claims of this patent refers to the combination of a packed sliding joint formed by two telescoping members, Form S. A constriction is provided about midway between the ends of the two members when fully extended. The chamber formed by the two telescoping parts contains a pump the inlet of which is in operative connection with the sliding joint and the discharge of which connects with the chamber, the constriction giving rise to the operation of the pump.

No. 1,036,043—to George Westinghouse, Pittsburgh, Pa. Granted August 20, 1912; filed September 28, 1909.

Internal Combustion Motor—Which compresses pure air in the crankchamber, the quantity of fuel being mixed with it depending on the suction created in the cylinder during the upstroke of the piston.

This patent relates to a two-cycle motor, of the following construction: The cylinder and crankcase are so connected as to form a gas-tight space in which air entering through a valve-controlled port is compressed, when the engine piston is on the out-stroke. At the end of this stroke the compressed air is forced through a passage and inlet port into the cylinder. On the up-stroke the port is closed and the evacuation of the crankchamber draws in fuel from the reservoir.

No. 1,035,513—to Gustav A. F. Ahlberg, Chicago, Ill. Granted August 13, 1912; filed November 28, 1910.

The Automobile

World's Greatest Racing Car

Description of Peugeot Racer, Victor at Dieppe, Le Mans, Mont Ventoux and Boulogne—Photographic Reproductions Disclosing Details of Design and Construction—Most Consistent Speed Creation Yet Produced

WITH Dieppe, Le Mans, Mont Ventoux and Boulogne as evidence, the Peugeot racer is undoubtedly the finest pure speed production France has ever possessed. Built under no-limitation regulations, the car is distinctive as a specimen of the light-weight, high-efficiency type developed of recent years in Europe. Its four cylinders measure 4.3 by 7.8 inches, bore and stroke, from which it has been possible to get 175 horsepower on bench tests; the maximum speed of the car is about 120 miles an hour; its total weight empty is 2,000 pounds; and although shaft-driven, it holds to the road better than the majority of chain-driven racers. The car is largely the production of Georges Boillot, the Peugeot race driver, and his companions, Goux and Zuccarelli. With their experience in light car races, they determined the distinctive features of the big car and were responsible for many of the interesting details which go far toward the making or the marring of a speed production. Shaft drive was decided on after lengthy experience with both types of final drive, Peugeot having at first been a partisan of side chains for racing, and later coming over to the propeller shaft for all models.

The importance of restricted weight and perfect adherence to the road were manifest at the Dieppe Grand Prix. It was undoubtedly owing to the lower tire consumption consequent on the lower weight that the car with one-half the cylinder area was able to beat the Fiats in this long-distance event. At maximum speeds the Peugeot appeared to

Fig. 1—Peugeot racer, Europe's fleetest speed production, which has swept the boards during the present season in long-distance road races, speed trials and hill-climbs. The machine, the development of racing engineers, is a light-weight, medium-powered creation, weighing under 2,000 pounds and with four cylinders 4.3-inch bore and 7.8-inch stroke, much smaller piston displacement than cars it has outdistanced. On road straightaways it has proven to be speedier than any cars entered in contests this year

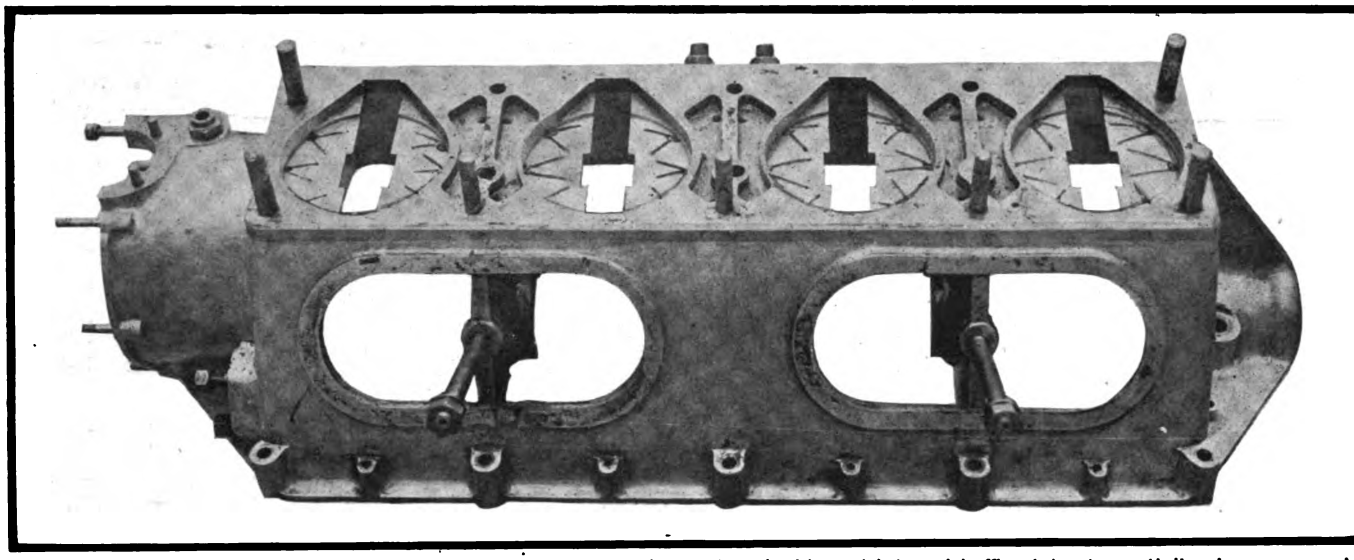

Fig. 2—Crankcase of Peugeot, showing large inspection opening s at each side and integral baffle plates to partially close open ends of cylinders to prevent an excess of oil reaching them

stick to the road better, and was probably easier to handle than Bruce-Brown's Fiat, although it would be impossible to offer much criticism of the Fiats on this.

A study of the accompanying tables will show the speed in the long races in the last few years. The French Grand Prix is of special interest in considering the Peugeot racing car. The average speed attained by this racer over the 478.4 mile course was 72 miles an hour.

The entire Peugeot power plant is carried on a three-point suspended subframe having the form of an elongated U, the curve being at the fore end and having a central trunnion attachment to a very substantial double cross-frame member. Both this and the two rear ball-and-socket attachments are provided with lubricators, the object of the design being to free the power plant from all the twisting straining of the main frame members. The frame members themselves have not much that is distinctive; they have an upward curve in order to clear the back axle; the chassis is carried on very broad flat springs, and two stout leather bands encircle the rear axle and the rear transverse frame member in order to eliminate violent action of the springs.

The motor has its cylinders in one casting, is attached to the crank chamber by five bolts a side, and has its valves inclined in the head at an angle of 45 degrees. There are four valves per cylinder, their diameter being 2.36 inches and their lift .43 inches. The normal speed of the motor is 2,200 revolutions, which gives a piston speed of 2,860 feet per minute. The valve design is a Peugeot patent, for, although the inclined position of the valves is not unusual, the method of operating them by means of independent overhead camshafts is altogether original. This position gives a hemispherical combustion chamber and allows the placing of the spark plug, one per cylinder, directly in the head. Each camshaft, with its push rods and recall springs, is complete in an aluminum housing placed sufficiently high above the head of the cylinder to isolate it from the heat of this latter, and is carried on a series of seven long projecting bolts. The drive is obtained by a vertical spindle at the fore end of the motor and enclosed gearing at the upper front end of the engine to the spur pinions on the end of each camshaft. Profiting by racing experience, the design of the valve is such that in case of a breakage it is impossible for the head to drop onto the piston. The camshafts, complete with their housing and pinion, are mounted over the respective range of valve stems and can be lifted away by removing a series of seven nuts. The exact nature of the valve operating mechanism has not been revealed. Each camshaft naturally carries eight cams operating within the interior of an eccentric having a push rod without roller forming an integral part with the eccentric. The tappets have adjustable heads and are recalled by light coil springs on the top of the camshaft housing.

The crankshaft is carried on five plain bearings, is of BND chrome nickel steel and is bored throughout for lubrication under an exceptionally high pressure. Steel pistons are used with hollow connecting rods, the weight of the reciprocating parts being kept as low as possible, the complete piston, with rings and wrist pin, weighing only 32 ounces. The wrist pin is fixed in the connecting rod and is carried in bronze sleeves within the piston. The crank chamber, divided horizontally into two portions and having the crankshaft carried in the lower portion, is provided with two large hand holes on each side for an inspection of the connecting rod ends. The space between the top of the crank chamber and the base of the cylinder is filled up with the exception of the space necessary for the passage of the

Fig. 9—Top of cylinder casting, showing studs to anchor camshaft housings

connecting rod, and in this guard plate a series of holes is drilled to allow of the return of the oil swept from the cylinder walls into the base chamber. The lower portion forming oil tank is deeply ribbed to assist in cooling the oil. A constant level is maintained, and if this level should be exceeded a hand pump allows the mechanic to draw the excess out of the motor to the reserve tank. A gear pump carried within a cylindrical housing and having a cone seating draws the oil from the base chamber, delivers it to the main bearings through the hollow crankshaft to the connecting rod ends, and up the tubular connecting rods to the wrist pins. All the oil leads are internal and are steel tubes brazed in the crank chamber, special care having been necessary to prevent leakage owing to the unusually high oil pressure maintained. The camshafts are fed by a hand pump, with an overflow to the base chamber. A downward extension of the vertical spindle driving the timing gears operates the oil pump, and the Bosch high-tension magneto and the water pump are driven from the respective extremities of a transverse shaft. During all its races the car was fitted with a new type of Claudel carbureter.

A multiple-disk clutch takes the drive from the motor to the four-speed gearbox, this latter, as already explained, being mounted on the subframe. The gearbox is a compact structure with the two shafts carried in a horizontal plane and having the selector within the box, instead of being on the outside of the frame members, as is usual. Fig. 11 shows it is absolutely protected from dust, there being nothing external but the change speed lever. The arrangement of the three sliding sets of gears is not that usually adopted; the first one gives the first and reverse speeds; the second the second and third speeds, and the fourth direct drive by means of a dog clutch. At a motor speed of 2,200 revolutions a minute, the ratios give a car speed of 55, 74, 99 and 112 miles an hour. Both primary and secondary shafts are bored out in order to obtain a reduction of weight.

The propeller shaft has a universal joint at each extremity, these joints being carried on ball bearings. A floating rear axle is employed with a vertically divided differential housing of aluminum. This rear axle is a remarkably light construction, and in order to reduce weight

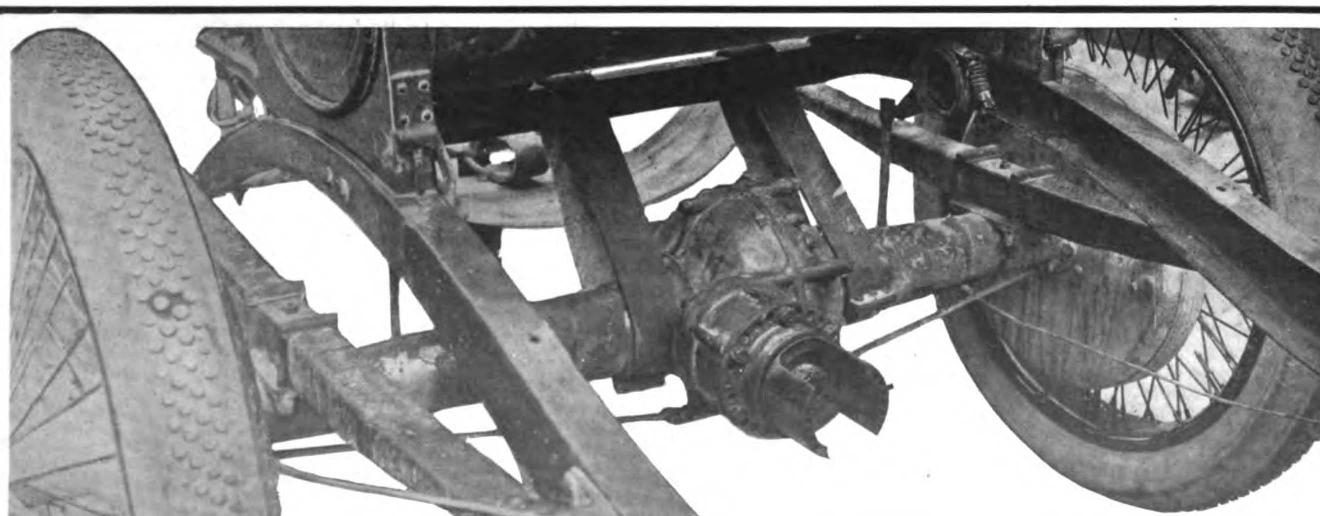

Fig. 10—Rear axle details of the Peugeot and mounting of gasoline tank. Springs are specially flat and frame is upswept over the axle

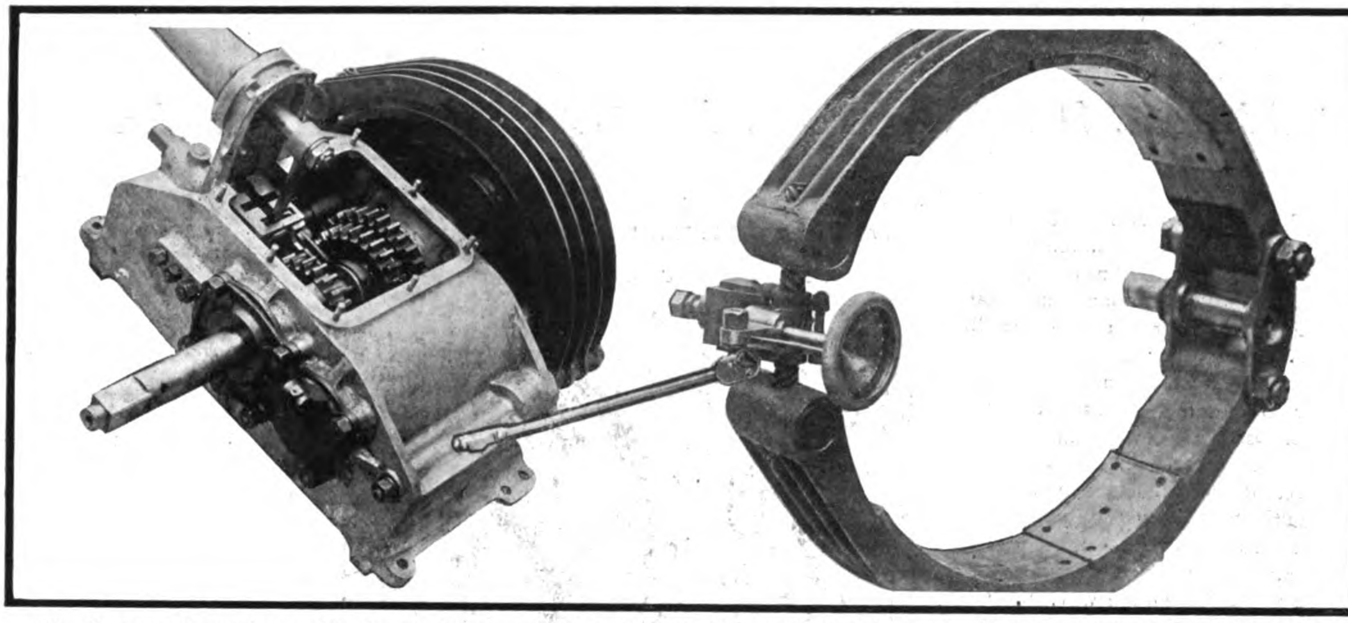

Fig. 11—Peugeot gearbox and brake, the former with its entire selective mechanism inclosed. All parts are protected from stones

even the cover of the bevel pinion housing and the jaws of the universal have been drilled (Fig. 14). Very large diameter ribbed brake drums are fitted, the operation of the rear wheel brakes being by hand lever with steel cable connection. There are neither radius nor torsion rods, all the effort being transmitted through the rear springs. The foot brake, also of the ribbed type (Fig. 11), encircles a broad-faced big diameter drum at the rear of the gearbox. The two shoes are united by a vertical screw having rapid right and left hand threads cut on it, it thus being merely necessary to turn this screw in either one direction or the other in order to separate or bring together the two shoes. Provision is made for very rapid regulating of the brakes; the hand brakes can be regulated through a trap in the footboards while the car is in motion.

No attempt whatever has been made to adopt a stream line body. The bonnet is narrowed in somewhat at the front, thus reducing the width of the plane surface radiator, but there is no other attempt at wind cutting. The gasoline tank is carried transversely across the frame behind the driver's seat and the two spare wire wheels are to the rear of the tank. Generally the car is run with 815 by 105 millimeter front tires with 880 by 120 tires at the rear.

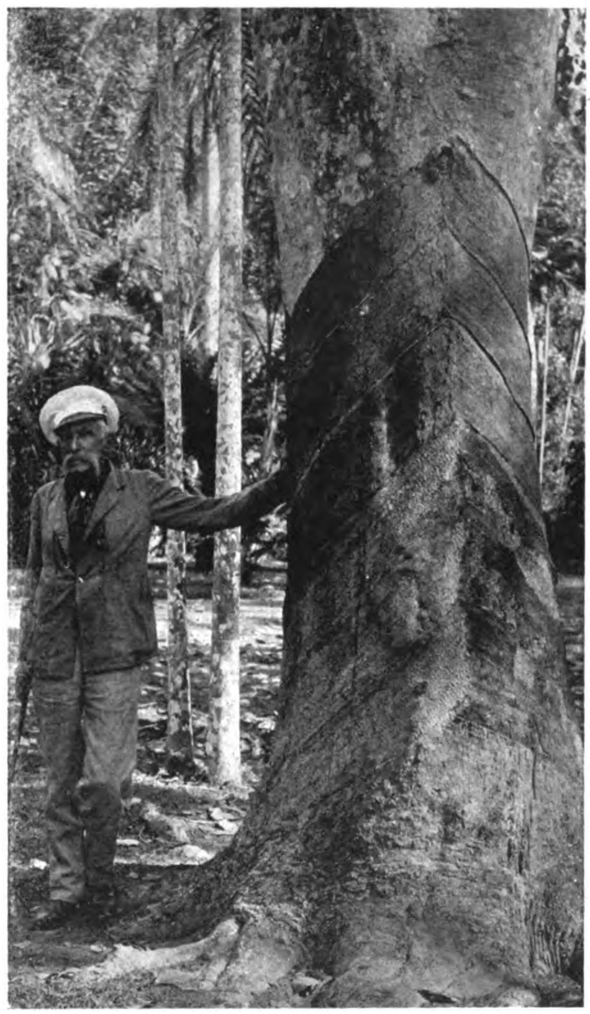
Stealing World's Greatest Industry

Imperial Commissioner from Ceylon Predicts Wider Use for Product of the Plantations

RUBBER production has superseded tea, coffee and sugar as major crops in Ceylon and Malaya and stands second to coffee among the Brazilian agricultural activities. F. Crosbie Roles, Imperial Commissioner to the International Rubber Exposition from Ceylon, and considered one of the highest authorities of the world on the subject of cultivate rubber, says that the industry as a whole is only at the beginning of its day. He predicts that 2 shillings a pound will be the prevailing price of pure gum rubber within calculable time and that at that price the planters will net a comfortable profit. From his viewpoint, he can see a gradual limitation of the indigenous production as the level of prices comes down, cutting off the rubber growing in the most remote districts first and gradually tightening the territorial lines until the only wild rubber that will be able to compete with that of the plantations will be that which costs so little to produce that it can be sold at a profit on the same general level of prices as the cultivated rubber.

In discussing the industry and its prospects Mr. Roles gave this exclusive statement to THE AUTOMOBILE:

"Plantation rubber, which will have a commercial production this year of about 20,000 tons, worth about $50,000,000 in your money, ranks first in the history of mankind for the rapidity with which it has taken its place as a factor in agriculture.



He Acted Under Orders

H. A. Wickham, who, on instructions of the Marquis of Salisbury shipped the rubber seeds from Brazil which formed the basis for the cultivated rubber industry of the Mid-East

"There is no record in history where any other agricultural element became an important wheel in the vehicle of commerce in so short a time. Only about 37 years ago H. A. Wickham, under orders from the Marquis of Salisbury, succeeded in shipping a boat load of rubber seed from Brazil. Brazil, naturally wished to retain its practical monopoly on the production of the *hevea brasiliensis* tree from which is obtained the crude rubber that sells at the highest levels in the markets of the world. The Brazilians had a very strict penal statute against exportation of the seed and Commissioner Wickham was instructed to get possession of some of it for introduction into the Asiatic possessions of the British Empire.

"After a series of wild adventures, Wickham managed to get out of the country with a boat load, numbering 70,000 seeds. It was well known that the seed of the hevea is exceedingly delicate and that even moderate ranges of temperature will serve to destroy its life. Therefore, Wickham observed all possible care in smuggling out the seed to protect it from exposure to the weather. Despite all this care only a small proportion of the seed germinated when planted in the Kew Gardens. All told 2,000 seeds retained enough of the vital principle to sprout, and from these seedlings the great plantation industry of the East has sprung.

"I do not mean to say that there never was any other rubber produced in the East except from these seedlings. because even today the production of low-grade rubber from a variety of trees, shrubs and vines is an important element in the industry. India, Borneo and the Malay peninsula grow large quantities of rubber from plants that have been known and exploited to some extent for centuries.

"But such elements are not included in the broad generic term plantation rubber.

"A brief outline of the various steps required to place rubber on the market may be described as follows: Plantations are usually about 3 square miles in extent, but may be either larger or smaller. The land selected for the active production of rubber is first cleared of jungle and underbrush. This is accomplished by burning over the land, or by some other method of clearing it. Latterly there has been a sharp question raised about the value of the burning method. It has been shown that there is more wind in Ceylon than in the Amazon valley and that after the clearing fire has done its work the air currents are very likely to whisk the ashes from the ground and deposit them in the nearest watercourse. Thus a large element of potash and nitrogen is lost to the land. Conservation engineers also point out that where land is denuded of its covering and where heavy rains mark some season of the year, there is great danger that exposed soil will be washed away and lost.

"But the use of fire is cheap and effective in clearing and if conditions are right rich soil of the tropics is soon covered with vegetation carpeting the ground in which the rubber trees stand. The hevea is not a very sturdy growth and excessive wind proves destructive.

"The planting is done with hand drills and the plantation is laid out in conventional form, the trees being placed in rows at regular distances. There is some difference of opinion as to the correct interval to be allowed between the rows and the trees in the row. Ordinarily there will be about fourteen rows of fourteen trees to the acre, or about 200 trees to the acre. This varies with the idea of the company as to the correct number to put out. Some experts favor less than 100 trees to the acre and some hold that 500 is not too large an amount to plant. The general average is probably about the figure I have indicated.

"The little trees are delicate and require care to bring them to maturity. In a carefully prepared and fertilized soil their growth is rapid. Noxious growths must be eliminated with the hoe or harrow and the surface of the earth must be protected as quickly as possible from the baking of the sun and the action of the elements. There are many expedients used by the planters to accomplish these ends, chief among which are the planting of catch crops between the rows, the introduction of certain types of vegetable growths that will crowd out the noxious weeds and by careful cultivation of the plants themselves.

"Take the case of a typical planter who has cleared and planted 2,000 acres of land. At the end of 1 year he will have 400,000 young trees, minus an uncertain proportion of initial losses. This proportion varies in response to numerous factors, some of which have been outlined above.

"Where the seedlings have failed, they are replaced as promptly as possible, for it has been shown that immature latex produces rubber less strong than that derived from mature trees, but more particularly because the mixture of the latices of immature trees with those of more fully developed plants results in a lack of uniformity of the marketed rubber. Thus it is important to use latex from trees of similar age in the manufacture of rubber of a standard grade.

"The time for tapping is reached when the trees are large enough. The rule has been that the tree should be 18 inches in circumference, 3 feet from the ground, before tapping is begun. This is usually some time after the end of the fourth year.

"The tools used in tapping are simple, almost primitive. Chief among these implements is a long, heavy, curved knife. The tapper, following the particular set of rules in force on the specific plantation, cuts into the bark of the young trees, first making a main channed down the trunk to carry the flow of latex. He leads into this channel a series of parallel, slanting cuts, so that the juice can flow by gravity. The utmost care is used to avoid cutting into the body of the tree and at the same time the cuts must be deep enough to reach the arteries that carry the latex.

"The cup placed at the bottom of the perpendicular channel is usually made of tin, but in many cases it is enameled inside and out.

"The flow of milk continues for only a short time, ceasing when the sun grows hot. The collectors move along the rows of trees after the daily flow has ended and dump the contents of the cups into pails that they carry. Having collected the milk from a certain section, the laborer pours his milk into a tank-wagon, drawn by man or animal power, which covers his section of the plantation. There may be one of these tank-wagons for each block of 5, 10 or more acres. Of course, all the trees in a plantation are not tapped the same day, the work being arranged so that every division receives regular attention at regular intervals during the tapping season.

"The tank-wagons proceed to the plantation factory, where their contents are run into vats. The main idea of the vats is to have them arranged so as to protect the latex as much as possible from the oxidizing influence of the air as well as extraneous matter.

"The process of coagulation is achieved by putting a certain amount of acetic acid into the vats. This causes the thick part of the rubber milk to rise and leaves a yelow serum at the bottom of the tank. The more advanced planters are now working on an efficiency plan to save a lot of labor in the process of coagulation. The latex consists of practically two-thirds serum, which is valueless at this time. Still it requires twice as much carrying power to bring it to the central station in its original form as is needed to carry the valuable part of the latex.

"The plan I refer to is one which contemplates the separation of the serum from the solid part of the milk right on the ground. But no matter how this question is settled eventually, the main idea of preparation for market is the same in any event.

"When the serum is separated, it is run off and the solid, cheeselike rubber is left. This is subjected to manipulation to remove as much of the serum as possible before subjecting the product to the roller machines.

"These machines are of two general types. First, is the machine which has two cylinders of equal size, geared to run in opposite directions on fixed axles. The rollers turn toward one another and are placed so that their surfaces come within a small distance of touching. The white rubber is run through these rollers until it is fairly free from water and when it emerges it is in the form of rubber known as Ceylon sheets.

"The other type of machine has its cylinders geared at different speeds and one of them is corrugated so that when the rubber is run through it comes out either stamped with a regular pattern or wrinkled, in the conventional form known as crepe.

"This crepe is hung in storehouses to dry out without smoking if it is to be marketed under the trade designation of pale

North corridor of the third floor at the Rubber Show in Grand Central Palace, showing some of the Brazilian exhibits

Where the Malayan products are shown under the auspices of the British government

crepe. If it is to be sold as smoked crude, it is placed in a smoke-house where the fumes from burning wood can be introduced.

"Just what effect smoking has upon crude rubber is still a problem. It is said that the wild rubber gains strength from the process. In my opinion the smoke acts as a preservative by introducing an element of creosote. I am not prepared to say that it adds anything to the strength of the product.

"The crepe or sheet is then packed in boxes or other packages and shipped to market.

"Mechanically the requirements of the plantation rubber industry are few and simple, as may be seen from the foregoing outline. In fact, it is one of the most obviously direct and uninvolved processes in agriculture. A knife, a cup, a pail, a tank-wagon, a coagulating vat, a little acetic acid, a pair of rollers and some green wood smoke.

"Now, as to the future of the industry. Broadly speaking, no large general commercial project can ever pay 100 per cent. on the investment per annum for any extended period of time, figuring the appraised valuation of the property each year with reference to its return in dividends.

"In other words, if rubber now returns 100 per cent. or more on current investment over the cost of production, and if there is a possibility of increasing the acreage and consequently the yield, the increase must be accomplished because the industry would attract unlimited capital and energy to participate in such profits.

"If the field is open and the opportunities unlimited, the man who has money to invest will choose rubber with a large return rather than something else which returns less.

"I can say that there is still a vast acreage available for rubber production that has never been exploited so far.

"It is generally admitted that at 2 shillings a pound there is a comfortable margin of profit, and the price averages over 4 shillings. It should be understood that the plantations now in bearing are those planted prior to 1907 and that since that year the acreage under rubber has doubled and trebled. The United States Rubber Company now has 22,000 acres of land planted to rubber in Sumatra and is extending its planted area with much vigor and will probably reach 25,000 acres before the end of this season. None of these trees is producing yet. Some idea of the producing capacity of the transplanted rubber tree can be gained from the careful records kept of the first trees raised in Ceylon. The figures show that a single tree has produced 240 pounds of dry rubber in 3 years. In the Ceylon exhibit at this show we have 17 pounds of dry rubber produced by that particular tree in April, 1912.

"Of course, such a general average production is away beyond our hopes and expectations, but if at full maturity the trees will yield even an average of 50 pounds per year, the total production of the plantations will be enormous. If the average acre under rubber has 200 trees, and supposing that the total acreage is 1,000,000, a very conservative figure, the eventual yield would be 10,000,000,000 pounds a year, or 5,000,000 short tons. At 4 shillings a pound this would represent a sum equal to the total valuation of the bumper crops of the whole agriculture of the United States for 1912.

"It is inconceivable that there should be any such price secured and the obvious conclusion is that the market level must yield. When it does yield, it will cut off the more remote sections raising rubber under jungle conditions. This must be true, because the expense of collection, transportation and marketing will prevent the wild rubber from such districts from competing with the cultivated product.

"Of course, I realize that improvements will be made in present methods of handling the wild rubber situation. Good roads, more railroads and a variety of factors will be introduced, but you may put it down as a settled fact that wild rubber costing more to produce and market than cultivated rubber must yield the right of way.

"In the past the point has been strongly made by the wild rubber section of the industry that the wild rubber is stronger, more uniform and more satisfactory than the cultivated varieties. There was some element of truth in these contentions, but great improvements have been made in the way of securing uniformity in plantation production. It is only reasonable to conclude that approximate uniformity can be gained under scientific methods, which, in my opinion, is all that need be said on that subject. As far as strength is concerned, it has been learned that immature rubber, or rubber obtained from immature trees in the plantations, is not so strong as that from the veterans of the Brazilian forests. Neither is mixed latex as good a foundation for rubber as pure milk from trees of full size and approximately equal age. But I am awaiting a test of the lump of rubber from the oldest and biggest tree in Ceylon in comparison with the best of the indigenous types of rubber. I believe the slight difference in tensile strength that has been noted is the result of the difference in the ages of the trees whose product was tested."

E. G. Salmon, Commissioner from the Imperial Institute to the exposition, takes a most optimistic view of the plantation rubber industry. Mr. Salmon believes that in the near future the lowering of prices and increase in the visible supply of rubber will cause it to be used much more widely than at present. He estimates that the automobile industry eventually will use something in excess of 100,000,000 pounds of rubber each year, but that the supply will be increased to such a degree that there will be a falling market for rubber for several years.

In a broad sort of way such an hypothesis would account for the attitude of buyers in the markets of the world. It has been noted that since April, 1910, when up-river fine stood at $3.10 a pound the buyers of rubber have been inactive. The trading was largely limited to the acceptance of rubber offered rather than securing it by bidding. As the supply has increased gradually but constantly and with it the offerings in the market, the lot of the purchaser has been easier than that of the seller.

From the buyers' viewpoint, purchases for future delivery in large lots could not be justified in a falling market on a basis of current prices. Therefore the dealings have been on a basis of lower figures for over 2 years, despite the much augmented total of sales.

On the other hand it is pointed out that the demand will increase much above the present level as new uses for rubber make themselves felt. Mr. Salmon believes that in the future rubber shoes without fabric will be common.

Rubber in the Spotlight

Large Attendance Marks First Sessions of Convention and Exposition In New York

Twenty-two Countries Represented by Official Exhibits of Which Brazilian is Largest

CRUDE rubber, rubber machinery used in production and preparation for market and in shaping the substance under various manufacturing processes and the finished manufactured products based upon rubber are shown with a wealth of detail at the Third International Rubber Exposition, which opened at the Grand Central Palace on Monday.

The exposition will continue until October 3 and during that period the men connected with the industry, shippers, manufacturers and growers will hold a convention similar to those of 1908 and 1911 in London.

Three floors of the big building are used for the show, the main floor being devoted to machinery; second, to manufacturing processes, reclaiming, chemicals, etc., and the upper floor contains a very complete display of crude rubber.

There are twenty-two countries or states represented in the crude rubber show, the largest display being made by Brazil, which has an exhibition space of 10,000 square feet. All the Brazilian states in the Amazon valley are represented with complete displays of crude wild rubber and a small representation of the cultivated product.

Among the other countries showing wild rubber are the African colonies of various European countries, Mexico, Central America and some parts of the East Indies.

The plantations are represented mostly in the displays of Ceylon, Malaya and the East.

Synthetic rubber has a part in the show, but from the commercial viewpoint it is not important at this stage of development. Such samples as are shown are said to equal the natural product in quality and service, but are eliminated from consideration by the cost of manufacture.

On the third floor there are exhibits of crude rubber aggregating not far from 150 tons and worth approximately $350,000 in the market. The Brazilian exhibits weigh about 90 tons and include all the commercial grades in six different varieties. All told, the different kinds of rubber shown in the Brazilian space number over thirty-five. The production of Brazil is about 40,000 tons a year.

Next in size to Brazil is the display of Malaya, which includes the Straits Settlements and Malay states under British protectorate on the Malay peninsula along the Straits of Malaca. This display is almost wholly of high-grade plantation rubber, ranging from pale crepe, which is not smoked at all, to smoked block rubber, which is about as dark as the wild Brazilian product. The Malayan production is not far from 15,000 tons.

Ceylon comes next in size and importance from the viewpoint of the automobile industry, its annual production being around 5,000 tons at the present rate. Other countries have exhibits, particularly the Philippine and Hawaiian Islands, but aside from Brazil, Malaya and Ceylon they are not of the first importance to the automobile business.

It has been conservatively pointed out that the world's production of rubber in 1912 will be about 90,000 long tons and that the automobile industry will account for 31,000 long tons.

Production is increasing steadily, but not rapidly in Brazil and is racing in the plantations of the Mid-East. It is estimated that the total yield of the plantations in 1915 will equal that of the indigenous product.

The United States Rubber Company has one of the largest show spaces in the building. A full line of its product is displayed and an interesting announcement has just been made by President Samuel P. Colt that the company has nearly finished the planting of 25,000 acres in the Island of Sumatra. Reckoning this plantation at 200 trees to the acre and the eventual yield at 50 pounds of dry rubber per tree, the supply of rubber for this company will some time reach the enormous amount of 50,000,000 pounds a year. Such a result is still far in the future, as the oldest of the trees on the plantation is now only 18 months. Trees begin to bear after their fourth year, and the production is small until they are 12 years old or more. The life of the rubber tree has not been determined so far as the plantations are concerned. The oldest trees in the Ceylon plantations are about 36 years old and all others are younger. The veterans are producing more rubber per tree than any of the others, and so far have shown few symptoms of age.

The exposition was preceded by a formal luncheon on Sunday at which Henry C. Pearson, vice-president of the convention, acted as toastmaster. It was attended by most of the dignitaries present as representatives of the rubber countries and the speeches promised much interest in the convention of the industry.

Mayor William J. Gaynor opened the show on Monday noon and a large attendance was enjoyed. The chief interest centered in the displays of crude rubber. A. Staines Manders, who successfully managed the former shows, is the organizing manager of the present exhibition.

A preliminary session of the convention was held on Monday, but the actual business of the gathering did not commence until the following day.

The attendance of Tuesday proved a surprise to the management on account of its size and quality. There were delegations from practically every section of the rubber industry, which were expected, but in addition the general public and particularly the automobile interests were strongly represented.

One feature of the show which proved surprisingly acceptable to the patrons was the fact that no retail selling was countenanced and the attendants at the various booths were equipped to inform inquirers as to the features of the exhibits displayed.

The general plan of decorations uses more color than has been customary in exhibitions held in the Grand Central Palace but the general effect is not unpleasant. In the crude rubber section the native types of architecture form one of the most interesting features of the show.

Growing rubber plants forms leading feature in the decorative scheme of the exposition

Trade News of the Week

Palmer & Singer Manufacturing Company Takes Out Licenses Under Two Groups of Dyer Patents

Applications for Space in Both Big National Shows Coming in Faster Than Ever Before

LICENSES under two groups of Dyer patents have been granted to the Palmer & Singer Manufacturing Company and the long litigation between the Enterprise Automobile Company and the defendant concern will be abandoned.

The patents involved in the license rights are first, the two covered by the settlement recently made between the Enterprise company and the Automobile Board of Trade by which the A. B. of T. was given the right to recommend the issuance of seventy-five licenses to its members on payment of a lump sum to the assignees of the patents. These patents cover the selective type of gear-change mechanism with direct drive in use generally. The other patent is one of the group of five that were originally sold to the Patents Holding Company in the days of the Association of Licensed Automobile Manufacturers and which were reconveyed to the Enterprise Company as part consideration for the license rights granted to the A. B. of T.

It is understood that the royalty rate is to be 1-10 of 1 per cent. on each of the three patents, thus making the aggregate royalty paid $3 on each $1,000 based on the retail list price.

The Enterprise Company has been inactive in prosecuting individuals since the settlement was made.

The suits against the defendants are docketed in the United States District Courts for the Southern and Eastern Districts of New York and will be expunged from the records as soon as the formal order is entered.

Berkshire Undergoing Liquidation

BOSTON, MASS., Sept. 23—Creditors of the Berkshire Motor Company, of Cambridge, Mass., have been notified by attorneys that the company is financially embarrassed. Its liabilities are placed at $25,000. Although the company has assets of greater book value than the liabilities, the attorneys have found it necessary to liquidate the affairs of the company. This is being done at the instance of the larger creditors. B. Deveraux Barker, an attorney, and James Addison, of the company, have been appointed agents to carry out the liquidation.

V-C Company to Make Truck

LYNN, MASS., Sept. 23—The recently formed V-C Motor Truck Company organized in Lynn, Mass., with Frank S. Corlew, president and sales manager, and Frank E. Vallier, treasurer and general manager, has secured temporary offices. The company has some well-known men affiliated with it, among them being John M. Nelson, John P. Stevens, William T. Langmaid, J. P. Crosscup, Charles M. Alley and S. D. Ritcey. The company is seeking a factory site in Lynn. The truck will be 1 1-2 tons, using a Continental motor, left-hand drive, center control and with a loading space back of the driver's seat of 9 1-2 feet.

Show Space Is in Great Demand

Applications for space in both the big national automobile shows have been coming in faster this year than ever before in the history of the industry. The New York show under the auspices of the Automobile Board of Trade will be larger than ever before, judged by the character of the applications. Merle L. Downs, secretary of the show committee, has announced that practically every application so far received is for a materially larger space than was asked by the same applicant last year.

He estimates that there are 15 per cent. more early applications than last year.

With regard to the Chicago show, the National Association of Automobile Manufacturers report much the same state of affairs as applies to the New York exhibition.

The Motor and Accessory Manufacturers, which handles a certain amount of space in each of the shows is in receipt of more and larger applications for representation at the shows than ever before.

Allotments of space will be made at the regular meetings of both organizations, which are scheduled to take place during the first week of October.

Johnson Heads Warner Gear

Ray P. Johnson has been appointed general manager of the Warner Gear Company, of Muncie, Ind., to succeed C. E. Davis, who has been named general manager of the automobile department of the American Locomotive Company, at Providence.

Mr. Johnson is an engineer of high attainments and has had much success in the line he has followed. He received his technical education at Chicago University.

World's Crude Rubber Market Sags

Still slowly sagging, is the news of the week from the crude rubber markets of the world. The price basis has been lowered to a level of $1.14 a pound for up-river fine, with the other grades in proportion. This represents a decline of about 2 cents since last week. On account of the record-breaking proportions

Automobile Securities Quotations

Irregularity marked the changes in the list of automobile and accessory stocks during the past week. Most of the list was weak but there were several notable exceptions. No marked advances were scored and the best that can be said for the standard investment stock is that they have been steady. In the speculative issues the trend was downward but the range was small. U. S. Motor showed a fractional advance on covering of short contracts. General Motors was slightly easier. International Motors gained a fraction on persistent buying of small lots.

*Old. †New.

of the offerings at the regular auction in London 2 weeks ago and the reports of large receipts of plantations which will go on the block this week, the buyers are disposed to be conservative and as a result the offerings proved to be in larger volume than the demand could take care of. The New York market has been quiet all week.

Vital Subjects for Sales Managers

The Sales Managers' convention, which will be held under the auspices of the Automobile Board of Trade, September 30 and October 1 will probably attract a large attendance and preparations for a representative gathering from all parts of the country are being made.

The program of the meeting will embrace a wide field of observation. Among the subjects that will be treated by the convention are the following: Freight, shipping, motor car equipment, enclosed bodies, selling and advertising and annual models. As a whole volume might be presented on any one of these subjects the chances are that the proceedings will be filled with interest.

The committee in charge of the affair includes the following: H. O. Smith, F. C. Howard, W. E. Metzger, C. W. Churchill, W. T. White.

C. W. Eggers Promoted by Willys

TOLEDO, O., Sept. 23—C. W. Eggers, who for the past 2 years has been traffic manager for the Overland company, has been made general traffic manager for the Willys-Overland Company; the Garford Company, Elyria, O.; Gramm Motor Truck Company, Lima, O.; Federal Motor Company, Indianapolis, Ind.; Morrow Manufacturing Company, Elmira, N. Y.

Market Changes of the Week

The most important feature of the week's market was the decrease in price of rubber, which was $.02 per pound, caused by lack of trade. Tin varied throughout the week, closing at a gain of $.03 per 100 pounds, as a result of the great demand for it in foreign markets.

French Also Fear Invasion

Foreign Makers Generally Alarmed But Unable So Far to Find Practical Check for Americans

Britons and Gauls Futilely Complain That Their Market for $1,000 Automobiles Is Gone

SYMPTOMS of panic which marked the British automobile industry last week, due to the invasion of the British market by low-priced American automobiles, have subsided to a certain extent after a view of the situation from the standpoint of sober second-thought.

According to the cabled news from London, nothing further has developed as regards the formation of a $25,000,000 corporation to make cars to sell at from $1,000 to $1,250 in competition with American lines of somewhat similar price. The idea, according to the distinguished speakers, including the Duke of Westminster and Lord Montagu, was that while the company probably could not equal the American cars of the same class on an even price footing, that the government might be prevailed upon to impose a preferential tariff against the American automobiles to cover the difference in price between the new British lines and the regular product of the American factories.

Aside from the fact that the working of a protective tariff tends to raise wages, and consequently manufacturing costs, which must be covered by the selling price, thus still further emphasizing the difference between the British and American cars, it is pointed out that the secret of American success in the line of small cars lies in economic quantity production, using the most advanced types of machinery regardless of cost.

Leading members of the automobile fraternity emphasize the fact that British production is only about 15,000 cars a year and that if such a factory as has been outlined is to be operated at a profit, the local market must be vastly stimulated and the company must stand ready to compete in the markets of the world for business. A factory such as has been indicated would have to turn out at least 25,000 cars a year which means that a market for at least 20,000 cars a year would have to be found outside the British Isles.

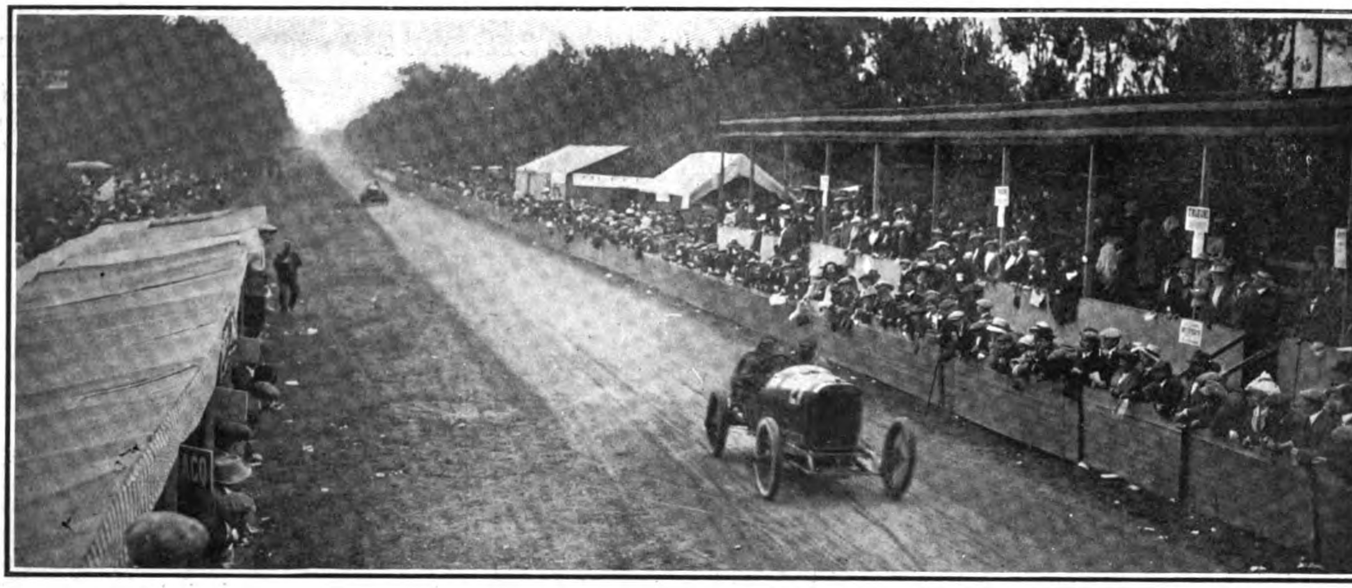
As the proposed preferential tariff would not affect the sale of American cars outside of Great Britain and Ireland, the American manufacturers are not alarmed over the situation.

Following the agitation in England about the invasion of the American small car, which has led to talk of the formation of a corporation with a capitalization of $25,000,000 to build lines to compete with the American automobiles, the French manufacturers are also becoming stirred up. The Frenchmen point out that their local market for cars listed at $1,000 is dead as the result of the American invasion. Both countries are to be protected from the dreaded American automobile by a tari ffwall if the wishes of the agitators are followed. The general opinion of American manufacturers is that no big competitive companies will be formed and that the preferential tariff talk will end in nothing.

BUFFALO, Sept. 23—Formal notification to the creditors of the E. R Thomas Motor Car Company has been issued that George C. Finley and Adolph Rebadow have been named receivers

A preliminary survey of the properties shows that while the nominal assets are in excess of the indicated liabilities, but that a severe shrinkage will be experienced in converting the assets into money. The liabilities are now estimated at $1,100,000.

The factory is closed, but the receivers have determined to continue the operation of the repair and parts departments.



Goux in his Peugeot racer in the Sarthe Grand Prix of 402.6 miles, in which he broke all European records for the distance

New Road Record in Sarthe Grand Prix

Goux Covers 402.6-Mile Course at 73 Miles an Hour—Zuccarelli Wins 3-Liter Race

Peugeot Proves Itself the Fastest Long-Distance Car France Has Ever Produced

LE MANS, France, Sept. 20—At practically 73 miles an hour Jules Goux won the Sarthe Grand Prix, 402.6 miles, race on a Peugeot identical with the car with which his teammate, Georges Boillot, captured the grand prix at Dieppe. This performance, of which a cable dispatch appeared in THE AUTOMOBILE last week, broke all European records for this distance and finally classed the Peugeot as the fastest long-distance racing car France has ever produced. Incidentally, this was one of the cars which should have been sent to the American races at Elgin and Milwaukee, but at the last moment was kept back to race at Le Mans, owing to a disagreement between the American backers and the French firm. It was fortunate that the Peugeots were kept at home, for without them the free-for-all class at Le Mans would have been a hollow event. There were the two Peugeots belonging to Goux and Boillot, a Crespelle with long-stroke single-cylindered De Dion motor and practically a stripped touring model S. P. A., driven by Leduc. As the Peugeots could walk around their rivals, there was an entire absence of competition in this class.

Boillot, who had started last, came in at the end of his first lap for a tire. At the end of the second lap he pulled in for another tire. After the third lap he took a wheel in place of one that had shed its tire. After the fourth lap he stopped again, crawled under his car to look at the universal housing, peeped at his motor, and went on. In the fifth lap he made the record of the race—33.55 miles in 25 minutes 9 seconds, including a stop for a tire—being equal to 79.9 miles an hour. Making a deduction for the stop, the average speed for the lap was about 85 miles an hour. His accident was not altogether unexpected and was irreparable. One of the bolts holding the exhaust manifold had broken; a repair was effected at the last minute, but, as the bolt went through the waterjacket, a leak was feared. It was after the fast lap that the water began to get away, finding a passage into the crankchamber and the oil reservoir and suddenly causing the complete seizure of the engine.

With Boillot out, it remained for Goux to maintain the Peu-

Molon in his Vinot at the Ponthiou hairpin turn

Zuccarelli finishing the small-car race in Lion-Peugeot

geot fame. He did it by covering the twelve rounds with nothing more than three punctures and a stop at half time to fill his tanks.

The competition lacking in the big class was provided in the 3-liter section, that is, for cars of 183.069 cubic inches piston displacement. The two sets of cars were run together, the small ones going away first at intervals of a minute and the big ones after. Lion-Peugeot, Alcyon, Schneider, Vinot-Deguingand, Hispano-Suiza, Crespelle, Cote, Picker and Koecklin were the firms represented. Thomas, on Lion-Peugeot, set a fast pace, coming round to the stands before Boillot had got away, and maintaining an average of 70 miles an hour, a really fine performance for a car of 3.07 by 6.14 inches bore and stroke. Guyot, handling a car known as the Picker, was unable to get away when his call came. He had to take down his clutch, remove a defective plate and put it back again, the work occupying almost 2 hours. Nicodemi, one of the Schneider men, was not present when his start was announced. He had started out late for the course, but at length appeared on the course with a loss of 30 minutes.

After his fast initial lap Thomas disappeared; Zuccarelli took his place, with Barriaux and Duray, both on Alcyons, hard after him and the two Vinots pressing the Alcyons close. The Schneiders were further down the list, but going well. After three laps, Zuccarelli with the small Lion Peugeot had got ahead of Boillot with the big Peugeot, and had a lead of more than 4 minutes on Barriaux, the nearest rival in his own class. Champoiseau of the Schneider firm had pulled in ahead of the Vinots and Croquet; another Schneider man was just to the rear of the Vinots. At half distance six cars were closely bunched, the intervals between them varying from a few seconds to 6 minutes. On the seventh lap Duray began to have trouble with the valve springs of his Alcyon, and realizing that the race was finished so far as he was concerned, stopped to bring Boillot home on his car. At this time the greatest excitement of the race was felt. Zuccarelli was being dangerously pressed by Barriaux on the Alcyon; the Vinots were running the Alcyons close, and Champoiseau and Croquet, of the Schneider team, had a personal jealousy in addition to their desire to beat the others. Guyot, after his long delay, had got into the running in excellent style, although obviously unable to wipe out the initial handicap of 2 hours. On his seventh lap, after making second best time, Guyot pulled in for gas. He filled the dashboard tank from a big can without the use of a funnel, and in doing so allowed a considerable amount of gasoline to run over the car. Just as he was pulling away there was a pop at the carbureter, and at the same instant flames appeared around the filler cap. Guyot and his mechanic jumped out and instinctively backed away from the car, while the grandstand spectators began to run at the fear of an explosion of the tank. But no explosion came, and after a few seconds of panic rags were thrown on the car to stifle the flames, and in 5 minutes the fire was extinguished. Having replaced his burned-out ignition wires, Guyot continued, put up a couple of fast laps, but was unable to finish in the time limits

Upper—Duray starting in Sarthe Grand Prix race in his Alcyon
Lower—Champoiseau starting his Schneider in 3-liter race

Towards the end Zuccarelli and Barriaux were fighting for first place, with Champoiseau on Schneider and Molon on Vinot struggling for the following positions. The final result was doubtful when, with only 20 miles to run, a ball bearing broke in the steering gear of the Alcyon car, making an easy win for Zuccarelli's Lion-Peugeot, putting Champoiseau's Schneider second, with Molon's Vinot a very close third and Croquet's Schneider fourth. Duray had been held back by valve-spring troubles; the two Cotes were regular without being particularly fast, and Riviere's Hispano-Suiza, a 4-year-old model of 2.5 by 7.8 inches bore and stroke, did not show itself equal to the modern cars.

TABLE SHOWING THE TIME MADE IN EACH LAP BY THE CONTESTANTS IN THE 402.6 MILE SARTHE GRAND PRIX

Start of the fourth annual secret time sociability run for the "Syracuse Herald" trophy. C. B. Shaw won the run in a Buick

Speedway Races for 1913

May 30 and 31 Are Dates Set for 2-Day Meet—Entries Open January 1 and Close May 1

Entry Fee $500 for Long Distance Race, Which Will Probably Cover 500 Miles

INDIANAPOLIS, IND., Sept. 25—C. W. Sedwick, manager of the Indianapolis Speedway, has announced that a 2-day meet will be held on May 30 and 31. The first day's event will be a long race, in all probability 500 miles, while the second day's card will include a series of shorter races. For the long race the piston displacement will be fixed at a maximum of 450 cubic inches and the minimum weight at 1,600 pounds. Entries will open January 1 and close May 1. The entry fee for the long race is $500. For the latter race one of the requirements will be that the cars must be able to attain a speed of 75 miles an hour. A purse will be put up for the winner of the long race while on the second day, the prizes will probably include the Wheeler-Schebler trophy, the Prest-O-Lite trophy or the Remy brassard with its attendant salary of $75 per week.

Glidden Tour to Start October 14

On account of slowness in receiving entries for the National Reliability Tour of the American Automobile Association, the date of the start for the tour has been postponed until October 14, a week later than the original date. Announcement has been made by the A. A. A. that the reason for the slowness referred to is that many owners wished to compete with 1913 models and that deliveries of such have been slow.

The tour will cover 1,670.3 miles, commencing at Detroit and ending at New Orleans and will require 13 days of running.

Dawson Reinstated by A. A. A.

NEW YORK, Sept. 24—At the September meeting of the Contest Board of the Automobile Association held at headquarters yesterday Joseph Dawson, winner of the 500-mile Indianapolis speedway race, who was automatically disqualified as a registered driver for giving an exhibition at an unsanctioned meet at Memphis, Tenn., July 4, was reinstated, to take effect at once, as was his manager Shuart. Fred Radina, a Cino driver, was also reinstated. Applications for reinstatement from the Schacht Motor Car Company, Hugh B. Andrews and T. S. Duby, were rejected. The Cleveland agency of the Stutz was disqualified until January 1, 1913, for advertising the Stutz performance at Elgin as that of a stock car, when these races were non-stock. The records of Spencer Wishart in the 200-mile race at Columbus were accepted; the recent Brighton Beach records, timed by Warner timer, were accepted; and the recent track records at Cleveland, timed by the Baker electrical timer, were also accepted.

Minor Contest Items

As a test of reliable service the Long Island Automobile Club will conduct a century run October 5. Under the conditions the contesting cars must make five control points without allowing more than 15 seconds tolerance at any of the checking stations. They are approximately 20 miles apart and the whole course is exactly 100 miles. The aggregate running time for the 100 miles is 5 hours, or an average of 20 miles an hour.

The course is from the old Pettit Hotel, Jamaica, to the Mansion House, Roslyn; Grand Central Hotel, Hempstead, Creed avenue and Hempstead Turnpike and back to the starting point.

PITTSBURGH, Sept. 21—Four out of the six races run today on the Brunots Island track, near this city, were taken by Klinekars entered in the events by the manufacturer. The Kline drivers were Menker and Kerr. Menker drove the 6-60 Klinekar against Burman in the Ohio "999" and Horan in a Cutting, defeating both in the 5-mile free-for-all in 4:55, Horan dropping out of the race due to his running through a fence. Menker also won another 5-mile event in 4:58.06, while Kerr took the 5-mile free-for-all in a 4-40 Klinekar in 5:34. Burman and his Ohio were defeated in this event also.

ATLANTIC CITY, N. J., Sept. 21—Car No. 2, a Cadillac, Charles L. Martin driver; No. 36, a Pullman, C. Edward Firth; No. 25, Reo, David Cram, and No. 74, American, J. E. Mountain, captured the prizes awarded the four contestants finishing nearest a secret time schedule in the second annual sociability run of the

Lu Lu Temple Automobile Club from Philadelphia to the Hotel Strand, Atlantic City, today, seventy-four cars participating.

The official time designated for the 61 miles was 3 hours 13 minutes 30 seconds, and that competition was keen is indicated by the fact that all four winners finished 2 minutes or less from the mark. First prize winner's time was 3 hours 13 minutes 10 seconds; second, 3 hours 13 minutes 10 seconds; third, 3 hours 11 minutes 30 seconds, and fourth, 3 hours 13 minutes 25 seconds.

Although the weather was a trifle too cool for comfort, necessitating the wearing of heavy wraps, the South Jersey constables made it warm enough for many contestants before reaching the terminus of the run. These worthies made themselves more than usually bothersome to those participants in the run who were at all inclined to take improper advantage of the splendid roads of New Jersey.

Taken all in all, the run was a great success, not only as a competition, but also as a social event, the contestants especially enjoying the warmth and comfort at their destination after driving in the cold.

Syracuse Run a Success

SYRACUSE, N. Y., Sept. 23—The most successful automobile run ever held out of Syracuse, under the auspices of any organization, took place Saturday when 110 machines took part in the fourth annual sociability run for the handsome silver trophy cup offered by the Syracuse *Herald*. The small number of machines that turned out for the Watson Cup run of The Automobile Club, of Syracuse, this summer had led some to believe that public interest in runs was waning. However, today's fine showing proves two things: first, that motorists hereabout prefer the shorter runs, and second, that ideal weather and road conditions will bring them out.

C. B. Shaw's Buick, the winner, has the distinction of coming in within 23 seconds of the official time designated, this being 3:48:45 and known only to Mayor Edward Schoeneck. For this run of 60 miles, over beautiful country southwest of Syracuse, the secret time had been based generally upon both state and local speeding laws, and the times made showed that motorists had been studying these to a great extent.

MEMBERS of the St. Louis Automobile Club and a number of other St. Louis Motorists will take part in the Pilgrimage to the old home of Daniel Boone, at Mineola Springs, on September 26 and 27. A part of the road which leads to this historic old place is in bad condition and a number of state officials are working to have it put in first-class condition.

Milwaukee Postponed

Bad Condition of Course and Continued Inclement Weather Responsible for the Change of Schedule

Vanderbilt Now Set for October 2 with Small Car Races on October 3 and Grand Prix on October 5

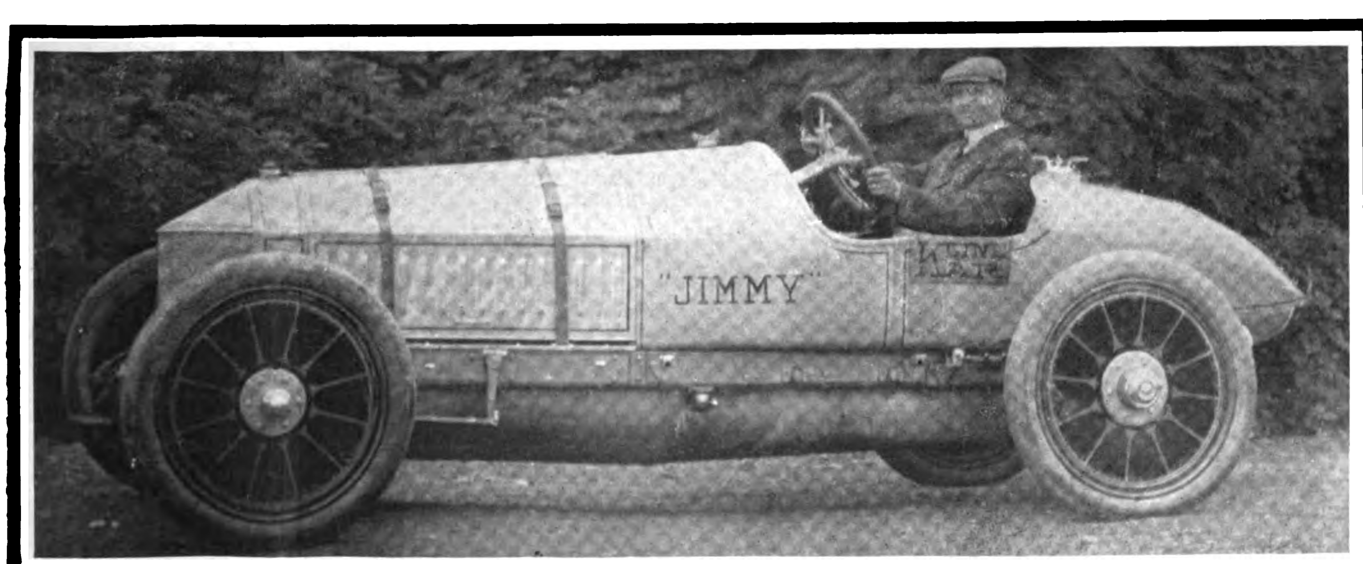
MILWAUKEE, Sept. 21—Bad course and inclement weather were responsible for the postponement of the race carnival, which was scheduled for September 20, 21 and 23, until the first week in October. As now arranged, the Vanderbilt Cup race will be staged Wednesday, October 2, followed by the two small car races, namely, the Pabst Blue Ribbon and the Wisconsin events on October 3, with the Grand Prix Saturday, October 5.

The week previous to the race week as scheduled was rainy, and this was of course a handicap to the road builders. On Friday, the race fans, drivers and all Milwaukee awoke to find an exceedingly threatening sky overhead and the disagreeable weather continued through Saturday.

Fully 40,000 tickets had been sold for the Vanderbilt Cup race, and these as well as those for the other 2 days' racing will be honored on their respective dates next month. No ticket money has been refunded.

All that is needed is warm sun for the coming week, and with continued work on those parts of the course which have proven to be soft, the road should be in fair shape by October 2. Considering that the course has been out of the road maker's care only a few days, and that there has been much rain lately, it is in as good condition, and even better, than should have been expected.

It is understood that the whole city of Milwaukee will combine with the M. A. D. A. to make the meet a big success when it is finally pulled off. All the various associations of the city will pull together, and with this increased interest, things should move along at a good clip. The hotel men's association, the Chamber of Commerce, the automobile club of the city have all joined hands with the parent organization. In fact Milwaukee has completely waked up, and has realized what it will mean to the city to carry the speed carnival off creditably, and all interests intend to see that such is the case.



James Kline, builder of the Klinekar, in one of his racers which starred at the Pittsburgh races last Saturday

Fire Chiefs See Motors

500 Department Heads at Denver Convention Look for Motorization of Their Equipment Throughout Land

Find That Economy, Reliability and Availability Under All Conditions Favor Automobile Against Horse

DENVER, COL., Sept. 23—Motor-driven fire-fighting equipment was the almost universal topic of discussion among the fire chiefs who met this week in Denver at the fortieth annual convention of the International Association of Fire Engineers. Of the eleven papers read and discussed at the meetings of the association, five dealt with motor-driven equipment, and none was more thoroughly discussed or listened to with greater attention than those on the subject of motors in the fire department service.

Among the subjects presented to the convention were papers on Tractors for Steam Fire Engines, Aerial Trucks and Water Towers, read by Chief Kenlon, of the New York fire department, and R. H. Bawker, chief of the department of Passaic, N. J.; Motor versus Horse-drawn Apparatus in Deep Snows, by Chief Smart, of Calgary, Can.; The Efficiency of the Motor Pumping Engine, by Geo. W. Boothe, chief engineer of the National Board of Fire Underwriters; and the Triple Combination Hose Wagon, Chemical and Pumping Engine, by F. J. Connery, chief of the Newcastle, Pa., fire department.

A canvass of the 500 fire chiefs gathered at Denver showed that practically every municipality of 10,000 inhabitants and over had one or more pieces of motor-driven equipment, and in some towns, notably Savannah, Ga., horses had been eliminated. Very few cities are there in which the chief's wagon is not a motor car, and usually the complete motorization of the department is only a matter of time after the advantages of motors over horses are demonstrated by the chief's own vehicle.

Speed Factor Is Important

Discussion of the advantages of the motor car over the horse-drawn wagon for the chief is hardly necessary. The foremost consideration is the speed with which it enables the head of the department to reach the scene of fire, have its seriousness gauged, his campaign planned, and be ready to give the necessary orders by the time the apparatus arrives. This is assuming that the motorization of the department has proceeded no farther than the chief's wagon. Where there are other pieces of motorized apparatus, a motor car for the man in command is an absolute necessity, otherwise he would be lagging so far behind his motor apparatus that his usefulness as a field commander would be seriously impaired. As to the actual speed, except on the very shortest runs, motorization of the chief's conveyance cuts in half the time required to reach the scene of battle. And this may be taken as generally true, that wherever the horse has been replaced by the motor in fire department service, the length of time to reach the fire from the station under average conditions is just about one-half of the time required for a similar piece of apparatus drawn by the four-legged tractor. What this means to a department at the early stages of fire when seconds mean thousands of dollars, or perhaps even human lives, needs no dilation here.

This average figure of twice the speed for the motor apparatus to that obtained by horse-drawn equipment is only for runs of medium length. In very short runs there is slight advantage in the point of time for the motors, but when the length of run approaches 1-2 mile or more, the motors gain more noticeably. In the case of very long runs, the motors show the most superiority, for they can maintain speed for the entire distance, whereas the horse driver must regulate his speed according to the distance. All in all, the advantage of the motor in the point of speed increases proportionately to the distance covered.

Very forcibly was this phase of the question presented to the chiefs at Denver on the evening of September 18 when an illuminated fire run was made.

Under average conditions, of load, distance streets and traffic, horse-drawn equipment can make from 10 to 15 miles per hour, while the motor-driven equipment under corresponding conditions can average between 20 and 30 miles per hour.

Figures for the cost of keeping a horse vary between $15 and $25 per month. Chief Kenlon, of New York, finds that the average cost to keep one horse 1 month in the fire department service of that city is approximately $20 per month. In this statement Chief Bawker, of Passaic, N. J., coincides, as do most of the others. Chief Kennedy, of Billings, Mont., finds that each horse costs him $17 per month; Chief Post, of Shelby, O., puts the figure at $19. San Francisco, St. Louis, Chicago, Los Angeles, Cleveland, Cincinnati, Boston, Savannah, New Orleans, Montreal—in fact all of the larger cities expend very close to $20 a month for each of their horses, so this figure can be taken as a good average.

Motor Apparatus Economical

Cost of maintenance of motor apparatus shows a wide variation. A chemical and hose combination costs Shelby, O., $2.60 per month for maintenance, including repairs, gasoline, oil, etc. The motor displaces two horses at $19 per month each or a total of $38 for the two. This represents a saving of $35.40 to the city per month, or over 90 per cent. T. F. Kennedy, chief of the Billings, Mont. department finds that triple combination displacing three horses costs $10 per month. The horses cost $17 each or $51 total per month, a saving through the motor of $41, or better than 80 per cent.

Savannah, Ga., a city of about 100,000 population, has effected a saving of $2,225.78 in 5 months by the use of its motor-driven equipment, according to Chief Ballantyne. This city is completely motorized. It has fourteen pieces, including two chief's cars. The pumps are all gasoline except three which are motorized steamers and are held as reserves. Chief Ballantyne states that the motor pumps save from three to four men, or rather make that many more available as fire fighters in each company.

Very naturally, one of the first developments in the way of the motorization of fire departments was the substitution of a gasoline tractor for horses, hitching the tractor to the same machine as the horses formerly pulled. This method of motorization has been successful, particularly with such heavy pieces as steam pumps, aerial ladders and water towers. New York is perhaps the leader in this method of motorizing, although some other towns are employing it. Passaic, N. J., is one of these and the chief of its fire department, R. H. Bawker, is authority for the statement that the cost of hauling the apparatus so equipped was one-tenth of he cost of hauling the same apparatus with horses. Chief Bawker states two tractors were purchased at the beginning of the year 1910 for pulling the hook and ladders. One is a 90-horsepower tractor which pulls an aerial truck having a 75-foot extension ladder and weighs 10 tons; the other is an 80-horsepower tractor pulling an ordinary city size truck. During the year ending May 30, 1912, the two tractors averaged a cost of $8.85 per month against the cost o $190.10 per month for horses on the same apparatus. These fig ures include gasoline, oil, and repairs of every description to the tractors, and the figures for the horses include feeding and shoeing, repairs to harness and veterinary fees.

Of even more importance than economy is the question of reliability. Chief Kenlon states that during the 6 months ending August 19, a motor-drawn steam fire engine has answered upwards of 500 calls, and in no case has it failed to reach the fire, in most cases in better time than the horses. On the strength of this performance the city of New York has just

(Concluded on page 643)

Autumn Care of the Car

At This Time of the Year Moist, Cold Days Affect the Finish If the Garage Is Not Adequately Heated

Vacuum Cleaner Is Excellent for Removing Dust and Dirt From the Interior of the Body

THE autumn months are always trying to the paint and finish and upholstery of the car. High winds, driving rains, muddy highways and abnormal road and weather conditions generally all conspire to viciously attack everything that makes the car beautiful. Decaying organic and other matter found in country and village highways mixed with the manifold soils are particularly destructive to varnish. Moreover, the car is more frequently and at longer periods exposed to beating storms, which exposure is harsh and unrelenting and blighting to the finish. These same untoward conditions are likewise detrimental to the upholstery, affecting its wear and color and general appearance.

No hard-and-fast rules need be written down to govern the care of the car during this period of weather extremes. Local conditions and circumstances must naturally to a certain extent be considered. However, this one general rule will apply to all classes of cars and to all sections of country, namely, frequent washing of the car with water robbed of its chill. At all events, wash the car immediately after a drive over muddy or wet streets and highways. Wet dust or mud are powerful absorbents, and acting on recently applied varnish, or upon varnish in the full flower of its luster, it will nip the gloss beyond any remedy other than revarnishing.

During the cold, moist days of autumn the car should have storage in quarters with sufficient prevailing warmth to dispel moisture. Moisture in any form except that applied through the process of washing is to a greater or less extent injurious to the finish or to the color under the protection of the finish. Moisture is a subtle medium, and it penetrates spaces often deemed impervious. When gaining a foothold under a body of paint its progress is certain, and the undoing of the finish is sure. It may not undermine the paint structure in a day or a night, and possibly not in months, but once seated it works persistently and with the certainty of fate. Garages and repositories are often inadequately heated during the cold months of the year. This is a bad practice, and to the car owner an expensive one. Other things being equal, the varnish will wear longer and maintain its luster more uniformly when given storage quarters uniformly warmed.

Water Baths Should Be Frequent

The top should at this period of the year receive constant attention, for now are the days of hard usage with days of improper storage. If, when exposed to stormy weather during road service, it is folded up immediately upon its return to storage quarters without drying off, and without the necessary cleaning operations, the top is sure to become very soon the shabbiest-looking part of the car.

Into a 12-quart pailful of tepid water whip enough Castile soap to create suds, and with a soft sponge clean off the accumulations and freshen up the enamel. This, in fact, is about all the treatment that the hand-buffed or the machine-buffed leather top should receive at any time so long as the enamel continues in good condition. Dry off the leather with a chamois skin. If the top is made of rubber, wash with the same weak soap solution, dry off, and, when the wear of the rubber has progressed sufficiently, apply a good, reliable dressing, preferably one bought ready for use.

If choice is made of a shop-prepared dressing, the following formula provides for a thoroughly reliable one: Of liquid asphaltum, one part; castor oil, three parts. Stir into the mass a bit of drop black to soften and increase the density of the color. Rub this on the top with a tuft of clean waste. Mohair tops will require a smart going over with a whisk broom. Pantasote may be sponged off and given a rub with some renovating medium to freshen the finish and keep it in presentable condition.

Ultimately, of course, the Pantasote will require something more substantial than a mere renovating, and when this stage of wear is reached, a thin coat of finishing varnish fully elastic, and thinned with turpentine, should be brushed on.

As a matter of general information for the car owner, it should be stated that all top dressings, renovators and the like should be put on sparingly. A thin, uniform application is more beneficial, invariably, than a heavy volume of material. All cloth linings for the top should get a systematic brushing out, and the leather furnishings likewise require attention. Clean white cotton waste will take up dust and dirt from the leather upholstery. To clean the parts around buttons and tufting, an oval chiseled sash tool, such as painters use in washing up work for varnishing, will be found effective. Carpets and other removable furnishings need to be taken out of the car often and put under the vacuum cleaner. Indeed, the vacuum cleaner under the right adjustment can be put inside the car and made to take out every atom of loose dust and dirt.

A car in constant use, and particularly during late summer and autumn, soon becomes unsanitary if left without regular cleaning work for the inside. With all dirt there is mixed more or less decaying matter, and this to make the car clean and wholesome should be taken out at the end of every run.

Top Should Not Be Folded When Wet

A good practice for removing dust from the outside of the body after a run is to go over the surface with a wool duster. For anything that sticks closer than dust, resort must be had to the water bath; and, in any event, this water bath, as already advised, should be often and generously given. With emphasis it needs repeating that under no circumstances, except those which for the present cannot possibly be surmounted, should mud be permitted to dry upon the finish of the car. When, unfortunately, this happens, a soft spray of water will loosen the earthy substance, and then under a gentle volume of water the surface will come forth clean and bright. Always dry the washed surface off with a clean, lint free chamois skin.

During the autumn months the surface, shorn of its high luster and perhaps a little parched from summer wear, will need, and should receive, the renewing effect of a first-class varnish polish and feeder. What the car owner requires of a varnish cleaner and polisher is that it is positively non-injurious to the finish.

Previous to using any cleaner and polisher the surface, if muddy or overcast with dirty accumulations, should be washed off with clean water.

The same practice applies to the chassis except that, after rinsing off the mud and dust from these parts, they should be coated over with kerosene oil, using a paint brush—a 6-0 oval bristle brush will serve the purpose completely—and then wiped dry with soft, clean waste. This sort of preliminary treatment will ordinarily suffice to clean up the chassis in good shape for the cleaner.

Automobile finishing varnish should possess a multiplicity of virtues chief among which is an elasticity sufficient to respond to all the demands made upon it through the oscillation and straining of the car. It should dry in a manner to be proof, so far as it is possible for the most perfect varnish to so prove itself, against a multitude of enemies. It should have a tough, durable surface, with a capacity to endure and hold itself intact and lustrous to the maximum limit, and it should have the property of being easily cleaned.

Interesting Mathematical Development of Surprising Theory on Countersprings Placed on Record Though with a Note of Disagreement—To Make Tires Hold Carbonic Gas—Some French and German Accessories

COUNTERSPRINGS in Theory and Fact—Matters relating to the spring suspension of motor vehicles form the subject of a widely diffused discussion in European technical publications at present. The use or non-use of spring moderators or shock absorbers interests some of the writers. The means for making a heavy motor truck run smoothly and without harmful vibrations though unloaded present a problem admittedly unsolved as yet. The influence of the spring suspension on the wear of tires and especially the means for obviating the extra wear of tires which is said to be due to the great weight of the parts which move up and down with the rear axle in all vehicles with shaft drive, whether the final driving element is a bevel or a worm gear, form divisions of the subject which engage the attention of the press, though so far, it seems, only with inconclusive results. The use of springs which act in a contrary sense to the action of the ordinary vehicle springs, and yet in conjunction with them, is one of the expedients on which both the theorists and the practicians disagree, though with a tendency to admitting that "there is something in them."

With regard to this expedient Mr. Contet, an engineer whose technical contributions on automobile subjects often scintillate with brilliant ideas, has advanced a startling theory in two issues of the most specifically technical French publication devoted to the construction of automobiles and aviation machines, and references to this theory as one now established are already noticed in articles by his *confrères*. His presentation of the subject is rendered in the following:

CONTET'S THEORY ON COUNTERSPRINGS

An expedient often employed to improve the suspension of automobiles consists in fitting the vehicle spring with a counterspring. The latter is a leaf spring, like the vehicle spring proper, but one whose flexure (or "open") is oppositely directed. This counterspring is then pressed down against the main leaf of the vehicle spring and is held in this position by clips or center bolt, so that the two springs now constitute a single spring in which the main leaf, which alone is formed with eyes for attachment to the vehicle frame, is held between two sets of leaves acting in opposite directions.

It has often been said that this system has no other effect than that of increasing the flexibility of the vehicle spring, since the counterspring acts in the same direction as the load. We shall show that this view is false and that this combination, far from increasing the flexibility, has on the contrary the effect of reducing it.

Let us consider two springs R and R_1, being respectively the vehicle spring and the counterspring. To facilitate matters, they may be supposed to be of the same length. Their ends coincide, their flexures f and f_1 are opposed, f being below the horizontal and f_1 above it. Their coefficients of flexibility are respectively y and y_1. United they form a new spring with a new flexure f_2 which is measured from the contact of the main leaves. Let us calculate this flexure f_2.

As understood, the flexibility of a spring is its deflection under a load of 100 kilograms. The deflection is proportionate to the load. [Hence 100 kilograms divided by y equals the load divided by the deflection.—Ed.]

As the spring R has been deflected f minus f_2 its load must be $100\,(f - f_2) \div y$.

The counterspring has been deflected f_1 plus f_2, and its load must be $100\,(f_1 + f_2) \div y_1$.

As the two springs are in equilibrium the loads which they support and which are due to their mutual reactions are consequently equal, and this fact may be written:

$$100\,(f - f_2) \div y = 100\,(f_1 + f_2) \div y_1$$

from which

$$(f - f_2)y_1 = (f_1 + f_2)y$$

By isolating f_2 we obtain

$$f_2 = (fy_1 - f_1y) \div (y + y_1)$$

The two springs thus constitute a new spring having the flexure ("open") f_2 of the value expressed in this equation.

Now let us seek to calculate the total flexibility Y of this new spring. To this end let us load it with a weight P and let us find what deflection this weight causes. Let f_4 be the new flexure which the spring takes under the action of this weight P.

The load of the main vehicle spring in the combination under the deflection f minus f_4 must be $100\,(f - f_4) \div y$.

On the other hand, the counterspring which presents the same flexure f_4 must be under the load $100\,(f_1 - f_4) \div y_1$.

Further, the combination of the two springs is in equilibrium under the action of the load (or tension) of the vehicle spring proper on one side and of the weight P plus the tension of the counterspring on the other side; for the spring is balanced between these forces. We therefore have the equation

$$100\,(f - f_4) \div y = P + 100\,(f_1 - f_4) \div y_1.$$

Assuming that P equals 100 kilograms, the deflection of the whole spring must then measure its flexibility.

The equation under this assumption is written

$$100\,(f - f_4) \div y = 100 + 100\,(f_1 - f_4) \div y_1$$

and from this we derive

$$(f - f_4) \div y = 1 + (f_1 - f_4) \div y_1$$

By multiplying the two sides of the equation by yy_1 (which is larger than 0) we get

$$(f - f_4)y_1 = yy_1 + (f_1 - f_4)y.$$

From this again

$$f_4\,(y + y_1) = fy_1 - f_1y - yy_1$$

and finally

$$f_4 = (fy_1 - f_1y - yy_1) \div (y + y_1).$$

As, further, the deflection of the complete spring due to the imposition of the weight of 100 kilograms is $f_2 - f_4$, and this deflection represents the coefficient of flexibility Y, we have, by going back to the value given above for f_2,

$$Y = f_2 - f_4 = (fy_1 - f_1y_1) \div (y + y_1) - (fy_1 - f_1y - yy_1) \div (y + y_1)$$

and by developing and simplifying this equation we get

$$Y = yy_1 \div (y + y_1).$$

This result is remarkable, since f and f_1 have disappeared, showing that the original "opens" of the vehicle spring and of the counterspring are of no consequence. The flexibility of the compounded spring depends absolutely upon the respective flexibilities of the two springs only.

Considering the value for Y, namely $Y = yy_1 \div (y + y_1)$, we see that, as y and y_1 are both positive, the fraction $y_1 \div (y + y_1)$ is smaller than unity and that consequently Y, which equals this fraction multiplied by y, is smaller than y.

The addition of a counterspring, far from increasing the flexibility of the ordinary vehicle spring, has thus, on the contrary, reduced it. And this fact is well known by the makers of these springs; for, when they remodel a vehicle suspension by adding countersprings they are very careful to increase the flexibility of the original springs, either by grinding down the leaves or reducing their number, so that the compound spring may be as flexible as the original spring. Without this precaution the addition of the counterspring would have for its first result a considerable stiffening of the suspension.

We can on this subject make even another curious observation. Supposing that in the value of Y, which measures the flexibility of the compounded spring, y and y_1 are equal; in other words, that the flexibility of the two springs is the same and that the springs are identical, in fact, we shall then have it that

$$Y = y^2 \div 2y = y \div 2.$$

Hence, if two identical springs of opposite flexure are mounted together on the counterspring plan, the flexibility of the combination is one-half of the flexibility of each of its constituents. If instead of placing these two springs in opposition we had placed them side by side, while having them support the same load, the result would have been the same. The flexibility of the combination would have been one-half of that of each of the springs. Identical results are thus reached by contrary expedients.

And if, on the other hand, our two springs had been combined in the shape of a full-elliptic, the total flexibility would have been twice that of each of the two springs, as well understood. By change in the manner of mounting the two springs, it is seen, absolutely different results are obtained.

Since now this is so; since the combination with a counterspring reduces flexibility instead of increasing it, where does then the improvement in vehicle suspension come from which has been ascertained as a result of this combination, provided, that is to say, that the flexibility of the compounded spring has first been reduced to what it ought to be?—From *La Technique Automobile et Aérienne,* July 15 and August 15.

A HITCH IN THE ABOVE MATHEMATICS

[Closing his argument with this question Mr. Contet has completely stated his new theory, and it does not seem to have been disputed as yet. Unless one's faith in mathematics includes faith in the mathematician, however, the theory must be hard to accept. The mere fact that the tension of the counterspring is high when that of the main spring is low, and *vice versa,* makes it appear peculiar that a definite value for Y can be found expressed in y and y_1 alone, these being both constants, while at least two variables ought to enter. One is tempted to look for a flaw in the mathematics. Astonishment begins where it is proposed to calculate the total flexibility of the new spring. Then comes the sentence: "On the other hand, the counterspring which presents the same flexure f_4 must be under the load $100 (f_1 - f_4) \div y_1$."

Exception may be taken to this. The flexure of the counterspring is not f_4 but $f_1 + f_4$, since this is the distance from its position of equilibrium, and thus its load or tension becomes $100 (f_1 - (f_1 + f_4)) \div y_1$, equalling the negative value of $100 (-f_4) \div y_1$ which is also more plausible than the value given by Mr. Contet, since the tension on the counterspring works in the opposite direction of that caused by the load P to which the whole spring is supposed to be subjected. By inserting this corrected value in the subsequent equation one gets

$$100 (f - f_4) \div y = (P - 100 f_4) \div y_1$$

and by insertion of the value of 100 kilograms for P

$$(f - f_4) \div y = (1 - f_4) \div y_1$$

and the value for f_4 is found to be $y_1 (y - f) \div (y - y_1)$, in which f_1 but not f is eliminated. Continuing with this value on the plan followed by Mr. Contet, the value of Y, which with a load on the spring of 100 kilograms equals $f_2 - f_4$, is now found to be

$$Y = (fy_1 - f_1 y) \div (y + y_1) - y_1 (y - f) \div (y - y_1)$$

Possibly this equation may be simplified, but the variables remain in it, and it does not seem to support the otherwise so delightfully simple new theory.

In continuing his exposition of the qualities of a spring compounded with a counterspring, Mr. Contet dwells upon the action of the counterspring to moderate the strain of rebounds which in ordinary springs must be borne by the main leaf alone (an effect which may be obtained less perfectly by clipping one or more of the short leaves, near their ends, to the main leaf); upon the tendency of the counterspring to break up periodic oscillations of the main spring; upon the increased friction between the spring leaves which has the same effect as a shock-absorber working by progressive friction, and finally upon those ruptures of the main leaf which have taken place when countersprings were employed and which he ascribes to the extra load placed upon the main leaf by the pressure of the counterspring, causing it to work nearer to its elastic limit, as indeed it would if the practice of paring down the main spring when a counterspring is applied actually obtains.—ED.]

—

NEW French Accessories—The combination of a gasoline filter and a secret gasoline lock is brought out under the name Vivax. It is intended to be secured to the outside of one of the frame reaches. Referring to the accompanying illustration, Fig. 1, the pipe from the gasoline tank is screwed on at A and the pipe to the carbureter at B. P is the filter through which the fuel must rise and to get to this filter it must pass through the opening L. Two slits M and N in the tubes D and F must register with L to make the latter opening accessible. Their positions are controlled by the disks E and G, upon whose circumferences the rings I and K are mounted secured by screws, and these rings are engraved with letters. With 15 letters on each ring only one out of 225 possible combinations in the positions of the two rings opens the lock for the flow of gasoline. The combination may be changed by turning one or both of the rings on their respective disks and securing them in new positions by means of the two screws and various threaded holes provided for this purpose in the disks. H is a stuffing box nut, also serving to hold the two tubular keys in their longitudinal alignment. The leaf spring J acting on the knurled edges of the lettered rings prevents accidental displacement, and the bolt holding it in place acts as a stopper in the drain through which accumulated impurities may be removed. The most obvious objection to the scheme of the device seems to be the ease with which the combination may be detected whenever the car is in operation, unless the driver gives it a twist at every trifling stop.

—

A simple device for telling the content of a gasoline tank consists in a split tube made in two parts hinged together and pro-

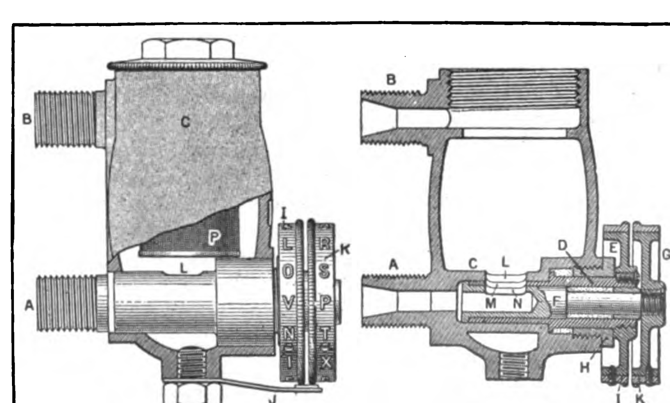


Fig. 1—Combination gasoline lock and filter

vided with a spring which tends to close the slit formed between its free edges. A float inside of the tube prevents the edges from meeting, however. When the tube is to be inserted in the gasoline tank to measure its content, the spring is compressed by means of a push button at the top of the tube, and the expansion of the tube releases the float, which drops to the bottom, where it is stopped by a lid secured to one of the tube parts. Upon insertion of the tube in the fluid, the float rises to the level of the latter and, when the spring is now released, it is held between the two tube-halves in the position given it. To make the instrument available it must, of course, be known to what content a given level of the gasoline corresponds.

—

As fire insurance for automobiles is expensive and in some cases hedged with doubts, and as prevention at all events is preferable to cure, a suitable portable fire extinguisher has for a long time been considered an accessory which would meet the wishes of many prudent owners of cars. But the ordinary fire extinguisher, as used in buildings, is usually made of frail material, contains sulphuric acid and depends upon the mixing of two substances for the developing of fire-quenching gases. Most of all, it cannot be safely exposed to the shaking it would receive in a moving car. The Petrolex extinguisher devised in France consists in a metal bottle containing the active fluid ready for its work, and to the top of this bottle is screwed a faucet in which a conical valve with lateral ports opens an exit for this fluid through the faucet spout and at the same time brings pressure upon it by opening a channel connecting the interior of the bottle with the interior of a Sparklet phial secured to the top of the faucet. The Sparklet phial contains liquid carbonic acid gas and is of the same kind as those used for tire inflation.—From *Omnia*, Aug. 31.

—

TIRES and Carbonic Gas—New light has been shed upon the question whether pneumatic tires may be inflated with carbonic acid gas—from a small bottle containing this gas in liquid form—without injury to the tire or risk of finding it deflated in short order by leakage. Laboratory experiments of older date on the diffusion of carbon dioxide through sheet rubber left the practical question in doubt, but recent tests by F. Steinitzer which are recorded in *Gummi Zeitung* this year are more nearly conclusive. A solution of 10 to 15 parts of glycerine and 20 parts of glue in 100 parts of water is recommended for producing a gas-tight coating on the inner surfaces of tire tubes. The tests related partly to the absorption of carbon dioxide by rubber and partly to the passage of the gas through rubber membranes, and it was found that different grades of rubber behaved very differently. As a rule, the purer grades absorbed much more of the gas than the mixed ones. The former became more or less tacky and lost from 12.6 to 27.5 per cent. of their tensile strength by exposure to the gas for a period of 5 to 8 days under a pressure ranging from 1 to 1.5 kilogram per square centimeter.

Where rubber washers are used to help in confining carbon dioxide their absorbent properties toward the gas are, on the other hand, found advantageous. P. Phillips reports in the other hand, found advantageous.

In the Steinitzer tests for diffusion through tire tubes the pressure used was 1 kilogram per square centimeter. Some time passed in all cases before diffusion began, after which it continued for 10 days with only slight abatement in the rate. As the samples varied not only in quality, but also in thickness the results are somewhat confused, not showing clearly whether the rate of diffusion is due to one or the other factor. A gray inner tube of poor quality and only 1.75 millimeter thick lost 4.90 cubic centimeters of gas in 36 hours through a surface of 22.3 square centimeters. The rubber in it had an admixture of 58 per cent. of mineral matter. A good black tube, 1.90 millimeters thick and containing 18 per cent. of mineral matter, lost 6.99 cubic centimeters. A good red tube, 2.15 millimeters thick and with 38 per cent. of mineral matter, lost 2.07 cubic centimeters, and a Best Para with only 12 per cent. admixture and 4.17 millimeters thick lost nearly as much, viz., 1.90 cubic centimeters. The time of exposure and the area tested were alike in all cases. Higher temperatures increased the diffusion.—From *Engineering*, September 6.

GAS Regulation Without Moving Parts—The German-made Marvel carbureter is characterized (1) by having no adjustment of the air openings leading to the atmosphere, (2) by having a lining—24 in the illustration, Fig. 2—in the air channel surrounding the concentric nozzles, the thickness of which is varied according to the requirements of each motor, but not subject to adjustment after once fitted, and (3) by having the bottom entrance 9 to the outer annular nozzle 10 so subdivided and reduced that capillary effects retard the discharge from this nozzle when the discharge from the central nozzle tends toward its maximum by reason of high motor speed. By means of the latter provision the incoming air when moving at its highest velocity draws less gasoline than it would under ordinary circumstances, and thus the same result is attained as by automatic regulation of the air supply in other carbureters. The accelerator acts upon the rotary valve 15, which is shown in the illustration adjusted for starting the motor or runnning it idle. At this adjustment the mixture is drawn into the induction manifold through the small opening at 17 only, and the opening around the nozzle 8 is also contracted to a minimum, which is subject, however, to regulation by means of the screw 18. Even slow cranking draws air at high velocity through these small openings and therefore a rich mixture. A number of small holes, 11 and 12 in the drawing, are bored through the wall of the outer nozzle 10, 1 to 2 millimeters above the level of its fuel content. When the motor is sped up by turning the rotary valve, the first effect is to draw strongly from both nozzles, which makes the motor responsive, but at increasing motor speed the fuel in the outer nozzle falls to a lower level because the calibrated bottom entrance channels to this nozzle will not feed the fuel as fast as the holes at the top will discharge it, and then the central nozzle is functioning practically unaided. But at a reduction of the motor speed the fuel level rises again in the outer nozzle and it resumes its part in the action. The arrangement is plainly empiric and its efficacy must depend largely on preserving the capillary channels at 9 unclogged. In accordance herewith it is noticed that the gasoline enters the float chamber through what seems to be a triple metal gauze filter, marked 32, 33 and 34—From *Automobil-Welt*, September 1.

Among the New Books

Recently Issued Works of Interest to the Car Builder—Deal with Grinding Work and the Principles of Efficiency

Rubber Trade Directory of the World Should Appeal to Tire and Accessory Manufacturers

IN the following book reviews, which are of interest principally to the manufacturers and students of the automobile, an outline of the contents is given together with remarks intended to bring out the value of the work and for whom it is particularly intended. Covering a broad field of allied industries as the automobile does, the books which are of interest to the automobile manufacturer as well as to the driver embrace nearly every field of science and research work. A few volumes which have recently appeared are reviewed below.

American Machinist Grinding Book, by Fred H. Colvin, Associate Editor, American Machinist, associate author of American Machinists' Handbook, etc., and Frank A. Stanley, Associate Editor, American Machinist, associate author of American Machinists' Handbook, etc. Published by McGraw-Hill Book Company, New York, 383 pages, 6 by 9 inches, with nearly 300 line cuts and engravings. Price, $3 net.

A compilation of data on a given subject by two men whose daily work brings them into contact with the subject-matter is bound to be of value where the work is carefully done. This seems to be the case in the American Machinist Grinding Book and the critical faculties of the authors give the volume an added value. The early chapters of the work are devoted to a description of the different types of grinding machines. These machines are profusely illustrated and the particular field for which each one is adapted is outlined. The machines are divided in to five groups. The first are intended for grinding cylindrical and conical surfaces; the second for plane surfaces and the third for cutters, tools and drills. The fourth and fifth include special portable apparatus. These are taken up and discussed at length and a clear insight into each is given. The remainder of the work is devoted to the actual work of grinding and many valuable kink will be found within its pages.

The Twelve Principles of Efficiency, by Harrington Emerson. Published by The Engineering Magazine and copyrighted by John R. Dunlap, New York City. 423 pages, 4½ by 7½ inches, with diagrams. Cloth, $2.

An organization with clearly defined ideals, governed with common sense, aided by competent counsel, discipline of its units, fair dealings to others as well as to itself, maintaining reliable, adequate and permanent records, adherence to schedule, standardized conditions throughout and rewarding the efficient employees by direct compensation, will represent the modern idea of efficiency and system. The author makes each of the qualities of success which are outlined above the subject of an essay, citing facts and figures to further illuminate the points which are to be driven home. The perusal of this work is a study which cannot but be of benefit to any reader. Although one might not agree with the author in many of the minor points of the work where he seems to depart from the main issue, the book, taken as a whole, is filled with useful facts.

The Young Electrician, by Hammond Hall, second edition, published by the MacMillan Company, New York City, 289 pages, 5 by 7 1-2, with numerous illustrations. Price $1.50.

Having no higher pretentions than the amusement of boys and at the same time presenting the subject in such a simple and interesting manner that the elementary principles of electric phenomena are readily grasped, this work should be a welcome addition to any boy's library. The first chapter tells of the early history of electricity, going back as far as the origin of the name, tracing it to Elekton the sun-god whose daughters wept themselves into poplar trees from which every year flowed amber which is possessed of electric qualities. Many other interesting legends are distributed throughout the book, giving an added interest to the phenomena which are described. Various electric machines and the methods by which boys can readily make them are also taken up, while a chapter on wireless telegraphy gives an insight into the fundamental principles of this important invention. It is not intended as a text book.

Rubber Trade Directory of the World, compiled by the *India Rubber World* and published by the India Rubber Publishing Company, New York City. 314 pages, 6 by 9 inches. Cloth, $3.50.

This work is intended to place at the disposal of buyers for the home or export trade, full lists of the manufacturers of rubber goods in every country of the world, although special prominence is given to those of the United States and Canada. The directory should also interest manufacturers as it gives a list of makers of compounding ingredients and also the manufacturers of machinery used in the rubber industry. It also contains a mass of valuable data on the trademarks now adopted in the various branches of the rubber industry in the United States and Canada together with a chapter on trademark legislation.

Harking Back a Decade

FROM *The Automobile and Motor Review*, September 20, 1902:

For several years past the governments of France, England and Germany have been deeply interested in the testing and improving of all types of motor cars with a view to their use in field service. Touring cars are used for following the great annual army maneuvers and carrying dispatches and heavy tractors are being tested with a view toward their ultimate utilization for moving troops, stores and ammunition.

The Standard Oil Company has put into effect a new schedule of gasoline prices, the 76-degree grade being quoted at 14 1-2 cents a gallon in barrels, including both barrels and cartage f.o.b. New York. A rebate is made to dealers of 95 cents for each barrel returned, which amounts to about 2 cents per gallon. The company declares that the amount of gasoline used for automobile fuel is trifling compared with the commercial demand. Stove gasoline is 11 1-2 cents a gallon net, under the same conditions.

The use of the motor car by commercial travelers is still in its infancy, but there is no question that it will in time largely supplement the railways for this class of work. The small car having about 6 horsepower and weighing about 600 pounds is being introduced into this field with much success where it is necessary to cover territory not thoroughly served by railroads.

The committee in charge of the A. C. A. Reliability Tour from New York to Boston and return has issued its preliminary road charts giving a description of the itinerary to be followed. There are thirty entries already for the run, which is scheduled to start October 9. The total distance to be covered is 488.4 miles.

William K. Vanderbilt lost one of his front teeth during the running of the recent Paris-Vienna race. Mr. Vanderbilt was moving along at 65 miles an hour when a stone thrown up by another car struck him in the face and knocked out the tooth.

During the calendar year of 1900 the American production of automobiles totaled 4,192 cars, according to the last report of the Census Bureau. These were manufactured in 109 factories and the value of the product was placed at $4,899,443. Of the aggregate number made, those designated as gasoline cars were 936.

The Winton Bullet broke the 10-mile track record at the race meeting held in Cleveland September 16. The time made by the Bullet was 10:50 for the distance.

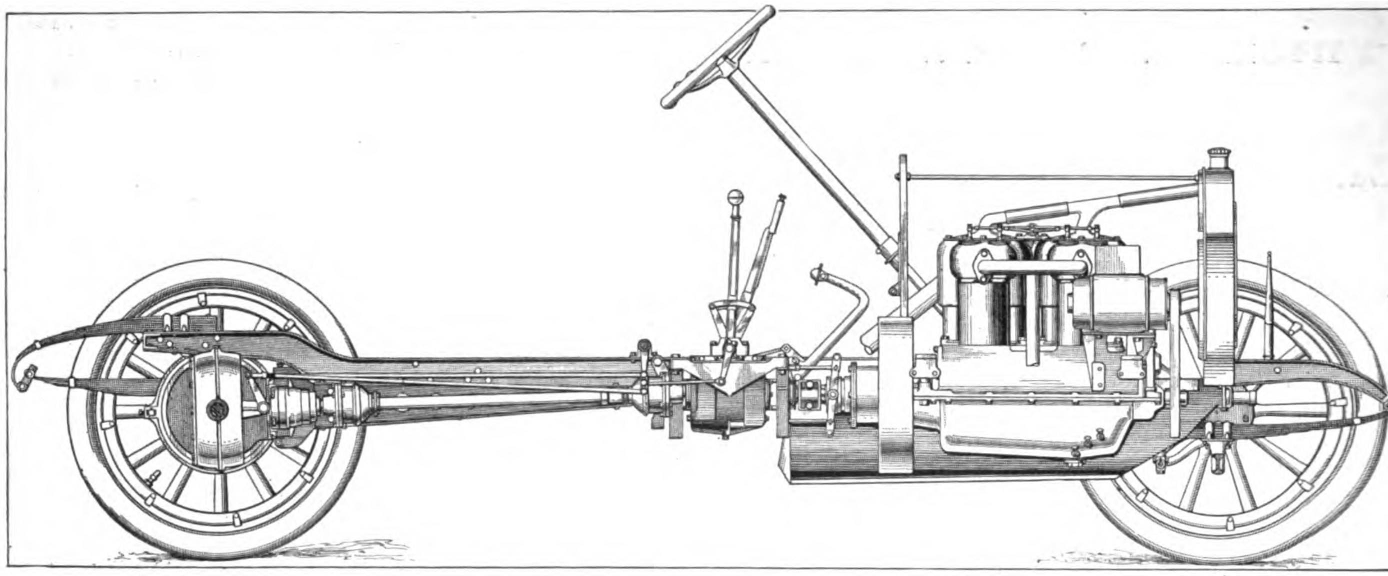

Fig. 1—Moon four-cylinder model 48 chassis showing arrangement of drive and control used on all three models

Moon Adds a Six to Its Line for 1913

Three Models Fitted with Electric Starting and Lighting Equipment to Be Placed on the Market for the Coming Season—Left Side Steering and Center Control a Feature—Mechanical Changes Few

AN entirely new departure for Moon practice is the building of a six-cylinder car. The motor of this type which will be marketed by this firm during the season of 1913 will be rated at 65 horsepower, it will be electrically started and will have an electric lighting equipment. It will have no crank attached to the front of the car. This latter feature will be common to all Moon cars for the coming season as will left-side drive and center control. There will be no difference in the mechanical details of the four-cylinder models, while the six will be a larger edition of the four-cylinder for last season.

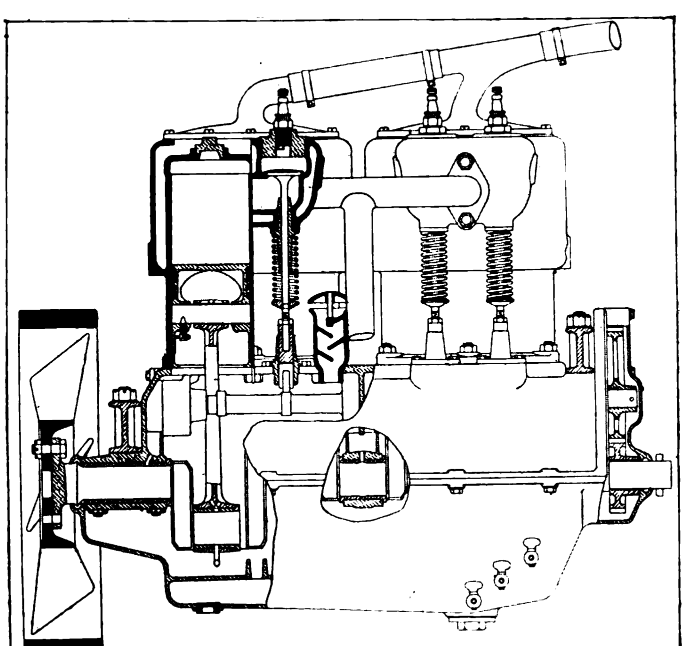

Fig. 2—Partial longitudinal section through model 39 motor

The Moon motors are all of the T-head type with the cylinders cast in pairs. The bore and stroke of the three models are as follows:

Model	Bore	Stroke	Horsepower
65	4 inches	5½ inches	65
39	4 inches	5¼ inches	39
48	4½ inches	5 inches	48

These horsepowers are all developed at 1,500 revolutions per minute and are determined by the brake test. It will be seen that the models are named after the motors' brake horsepower.

The valves are 2 inches in diameter and have a lift of 3-8 inch. This allows for a rapid entrance and escapement of the gases, even when the motor is turning over at low speeds. The valves are of the regular 45-degree poppet type and are made in one piece of chrome nickel steel. They work on a cast-iron seating. The valve tappets and cam followers are of roller type. The roller followers are made as large in diameter as possible to eliminate wear to the greatest possible extent, both on the cams and on the followers themselves. Wear is also kept down at this point owing to the fact that the cams receive a liberal supply of oil through the oiling system of the car. The tappets and valve stem guides are bushed with phosphor bronze, giving hard and durable bearings with very good frictional qualities. The adjustment feature of the valve stems is the same as that common to most modern cars. Turning a nut on the valve stem just above the tappet guide will take up the wear resulting from actual contact as well as for the drop of the valve after grinding. Silence in the valve action is secured by a solid aluminum cover plate which incloses the entire action.

The pistons in all the motors are of gray iron. They have four rings, all mounted at the top of the piston above the wrist-pin. The wristpins are set near the top and the pistons in all models are made long. The wristpins are hollow and run in bronze bushings. The latter are lubricated by oil forced through them. The pistons are all interchangeable, being made on automatic piston machines which turn them out in quantities. The wristpins are held solidly in position by a stud bolt fastened by a clip against the wall of the piston. They are thus prevented from working loose under running stresses.

Connecting-rods of I-beam are employed in all models. They are drop forged and bushed with Parsons white bronze bearing metal. The connecting-rod lower bearing caps are exceptionally strong and heavy and are held in place by four bolts. The diameter of the lower connecting-rod bearings is 1 3-4 inches.

The crankshaft of the Moon motor is 1 3-4 inches in diameter; it is of solid steel heat-treated, with the flywheel flange made integrally. In the four-cylinder models the total length of the main bearings is 11 1-4 inches. There are three main bearings in the four-cylinder models and four in the six-cylinder. These are supported by bridges in the upper half of the crankcase, the lower half being independent of the bearings and removable without disturbing the crankshaft. The grinding work on this part of the motor has a very small limit of tolerance, accuracy within .0005 inch being required by the inspection department. There is no key in connection with the crankshaft to the flywheel, the integral flange and the large bolts forming the only means of connection.

The camshaft and its connections are all one piece. This includes the shaft itself, the oil pump gear and the cams. This piece of metal is a drop forging given a double heat treatment under a secret process. The unit construction is more expensive, but the advantage claimed is greater silence owing to the impossibility of parts working loose. The camshafts are driven by a spiral gear train so designed that there are always three teeth in mesh. Lost motion is eliminated in this construction and exceptionally noiseless running assured. The load is distributed between the three teeth and the wear on the gears correspondingly lessened. The limit of tolerance on the gears is as small as that on the crankshaft. The final grinding in order to pass the inspection department must be within .0005 in. The lubrication of the gears is taken care of by the general lubrication system of the car.

The cooling system is taken care of by a circulating pump mounted on the left side of the motor. The waterjackets are of large size and a honeycomb radiator is used. Two features of the waterjackets are worthy of note, that is, the uniform thickness of the walls throughout, which will prevent internal strains due to the unequal expansion of the metal, and the extension of the waterjackets around the valve chambers. Owing to the T-head construction, it is possible to extend the waterjacket entirely around each valve and this has been done in the Moon motors. A drain cock placed on the bottom of the radiator is located at the lowest point of the cooling system and by opening this it is possible to remove all the water in the entire cooling system.

Lubrication of the Moon cars is accomplished in the same manner in the latest models as has been used in the Moon line for the past 6 years. The system is a combination of the force-

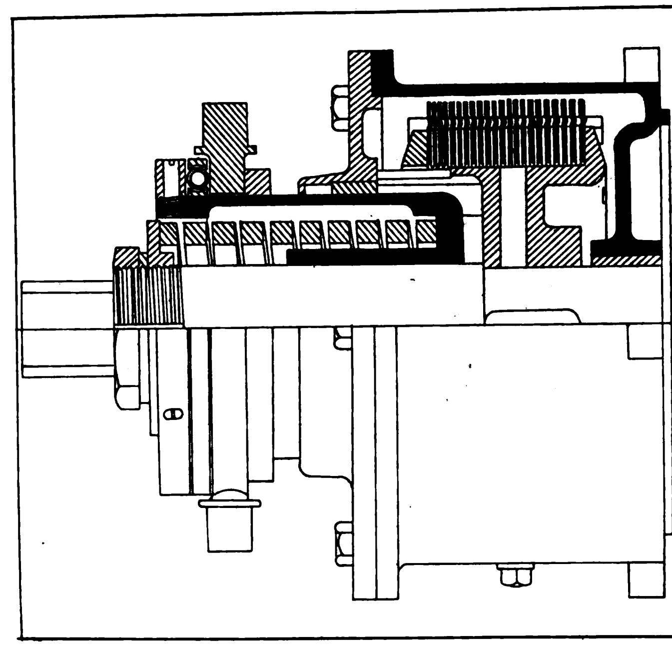

Fig. 3—View of clutch, showing spring, disks and housing

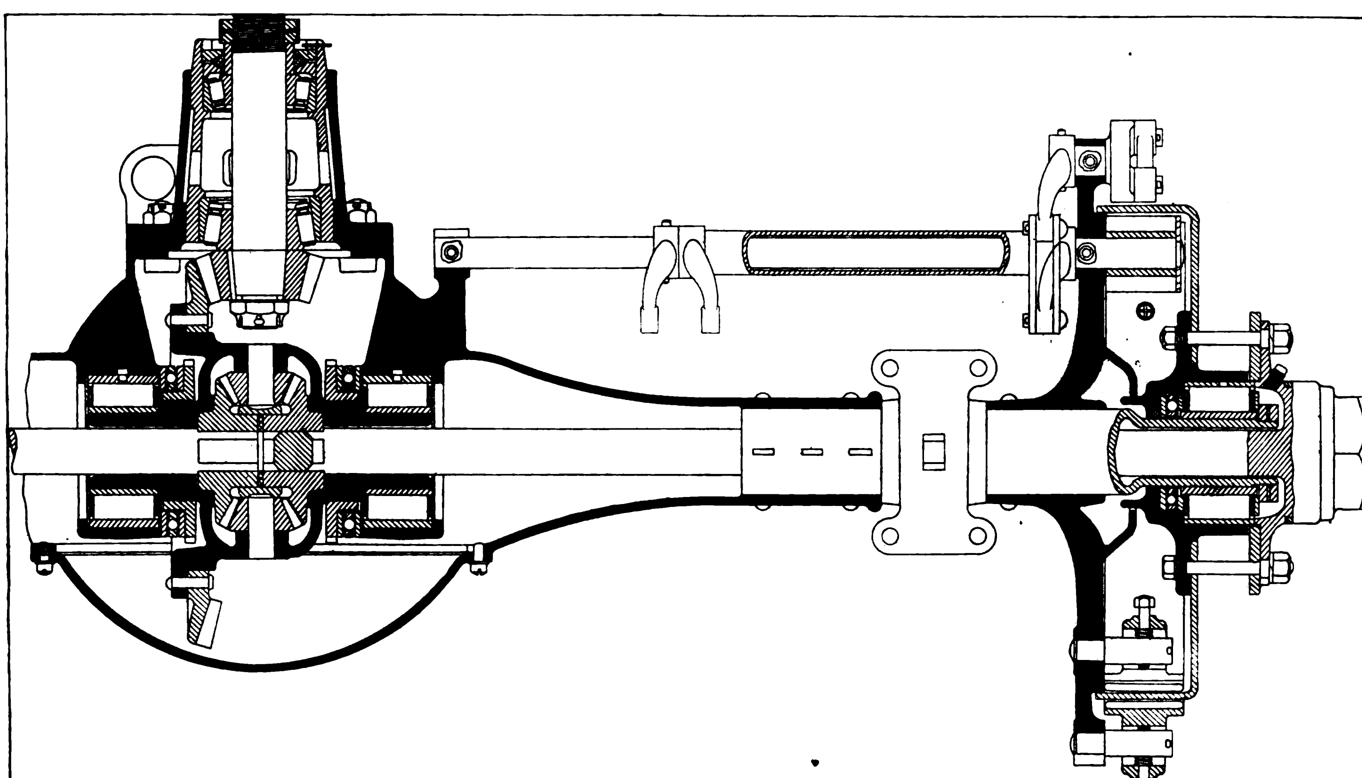

Fig. 4—Horizontal section through the rear axle. Note special Moon mounting of brake rod and ball and roller bearings in differential

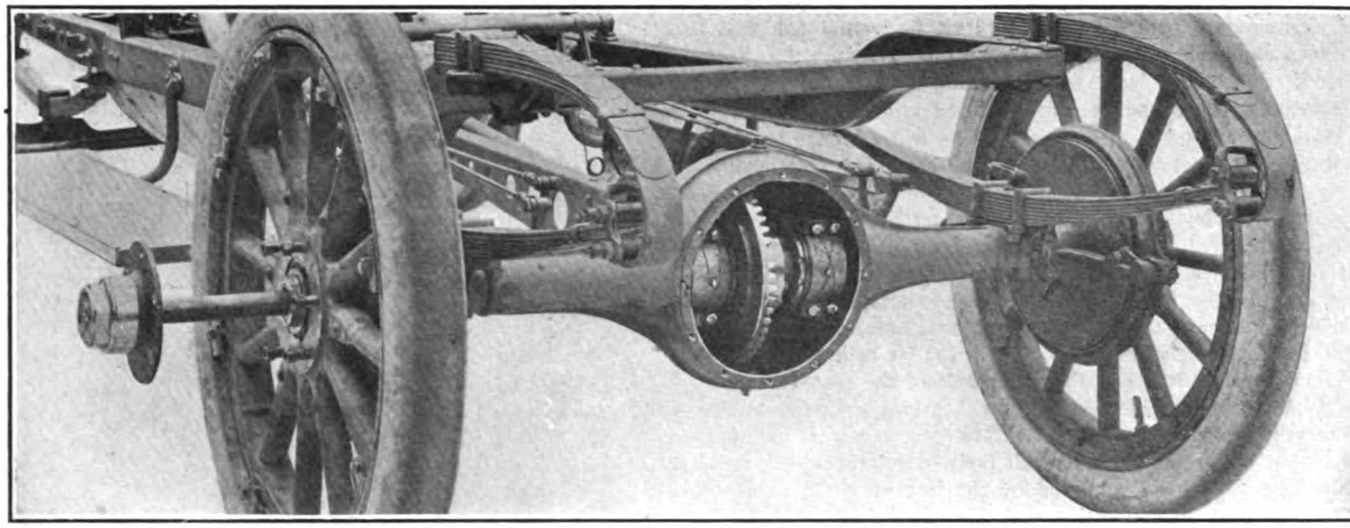

Fig. 5—Rear construction of the Moon 1913 rear construction showing torque member and differential

feed and splash systems. The oil is carried in the lower part of the crankcase. From the reservoir it is lifted by a circulating pump of the gear type driven by a vertical shaft from the exhaust camshaft. The oil is first led through a copper lead to a sight feed on the dash. All the oil passing through the lubrication system first passes through the sight feed so the driver is always aware of the quantity of the supply as well as the quality, for the oil turns to a dirty, brown color after it has been used too long in the crankcase and the observer can readily determine when the supply should be renewed. After leaving the sight feed on the dash the oil is led through independent leads to each main bearing. This assures the lubrication of these bearings immediately after the motor is started. After leaving the main bearings, the oil takes its course to the splash troughs in the crankcase just above the part that contains the oil. The troughs are separated from the oil reservoir by a horizontal partition which supports them. This partition is pierced by overflow holes to which the oil finds its way through standpipes so arranged that the overflow will not take place until after the oil has reached its proper level.

Lubrication of all the internal bearing surfaces of the motor, including pistons, connecting-rod bearings, camshafts, timing gears, etc., is taken care of by the splash of the connecting-rods in the pools of oil contained in the splash troughs. As the speed of the motor increases, the supply of oil is augmented in two ways. In the first place, the gear pump is driven at a higher rate of speed and thus furnishes a greater supply of oil to the main bearings and to the splash troughs and, in the second place, the connecting-rods will be moving more rapidly and the individual splashes into the oil pools will occur at lesser intervals. There are no adjustments necessary to the oiling system except that once a month the oil should be drained from the crankcase and a fresh supply put in. This is accomplished by means of a large drain plug located at the bottom of the crankcase. It is possible to tell very closely at any time the level of the oil in the crankcase by the three pet-cocks which are shown along with other details of the oiling system in Fig. 2. The first, or upper, cock should be opened. If there is no oil flow from here the others should be tried. The lowest cock is the danger point. If there is no flow from this cock the oil has reached a level which is unsafe for the proper lubrication of the car. The oil is poured into the crankcase reservoir through the large breather pipe located on the right side of the motor.

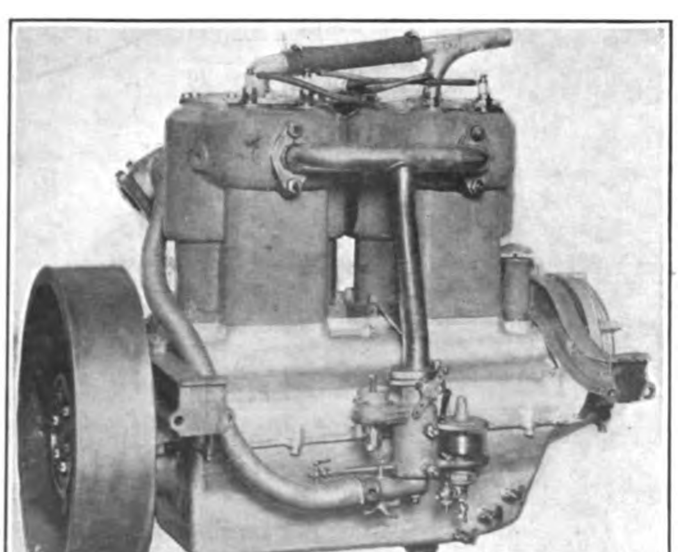

Fig. 6—Intake side of the Moon model 39 motor

The carbureter used with the 1913 Moon cars is the latest type Stromberg. This carbureter has independent adjustments for low and high speed and is hot-waterjacketed. Another feature of the carbureter is the hot air intake which allows the carbureter to draw in air which has been heated by the exhaust pipe, thereby eliminating to a large extent carburation difficulties in cold weather.

The electrical equipment of the car is in two independent parts. The two systems are the ignition outfit and the starting and lighting attachments. The former is the standard Bosch high-tension dual system. It is entirely independent of the starting and lighting systems, of which a short description follows:

The starter is built by the Wagner Electric Company, of St. Louis, and is known as the Moon-Wagner system. The system consists of a six-cell storage battery which are so arranged that the same electrical connections serve for charging as for discharging, that is, it is not necessary to connect the batteries in series for discharging and in multiple series for charging. The starting is effected by a motor weighing 60 pounds which is geared to the flywheel of the motor. When a button is pushed the current from the six-cell storage battery starts the electric motor and turns over the engine until it picks up speed under its own power. The motor is then automatically disengaged from the flywheel and after the car has reached a speed of approximately 8 miles an hour, the electric motor, which now acts as a generator, commences to recharge the storage battery. In a very short distance the storage battery is again stored up to its capacity. The batteries in this system are entirely self-regulating. There are no voltmeters nor ammeters to watch. The motor generator and its connections can be taken off the car by the removal of three bolts.

The multiple-disk clutch is shown in Fig. 3. The spring is of very generous dimensions, large in diameter and of square section. As may be seen, it is adjustable for tension by turning the nut on the end of the spindle. A ball thrust bearing is mounted at the end of the clutch shaft. The plates are of saw steel. There are twenty-three altogether and they are securely housed in a solid casing which is independent of the crankcase of the motor.

The gearset is of the three-speed type mounted throughout on annular ball bearings. The shafts are splined and the entire case is mounted in a solid aluminum casing. The use of aluminum throughout the Moon car wherever possible is intended to give as light a construction as possible and through the fact that aluminum is, to a large extent, a non-vibrating metal, the noise made by the gears is cut down to a minimum. A view of the gearset, looking forward, is shown in Fig. 7. The splined shafts and the relatively short distance between the bearing points may be seen in this illustration. The gearbox is supported by four strong arms cast integrally with the gearset housing. The gearbox is oiltight, a copper-asbestos gasket being fitted between the box and the coverplate.

From the gearbox, the drive passes through a universal joint to the propeller shaft and thence to the bevel gear differential. The differential may be partially seen in Fig. 5, which shows the rear construction and the axle with the differential coverplate removed. Timken roller bearings are used in the differential and the gears are made of large pitch with a factor of safety great enough to withstand a load three times as great as the maximum possible under any driving conditions. Adjustments on the bearings may be made without taking down the axle, but if necessary the entire differential can be removed from the rear axle housing through the opening left by the removal of the coverplate.

The axle construction is of the floating type and is designed and made by the Moon company. The housing is of one piece of pressed steel. The gears in the differential are of chrome vanadium steel heat-treated. The torsion member in the Moon cars is of exceptional strength. It is made of pressed steel in channel section and pierced by holes for the purpose of decreasing the weight without materially affecting the strength. The front end of the torque members terminates in a ball and is carried between two springs which cushion the shocks of the torsion strains.

The brakes are large in dimension. On all models the diameter of the drum is 16 inches and the face of the brakes is 2 1-4 inches. The brakes and the rear axle construction are shown in Fig. 4. The brakes are controlled through a cross-rod mounted on the rear axle frame. This cross-member is of tubular form and permits the linkage for the two sets of brakes to be carried to the drums through the tube. The clevises on the brake linkage may be taken up to compensate for wear at the point where the two sets of brake linkage are connected to the cross-member. A series of small oil drains in the rear axle housing permits the oil to flow from the rear system without letting it get as far as the brakes and thus cause these to slip. An equalizing bar is inserted in the brake linkage to allow of the

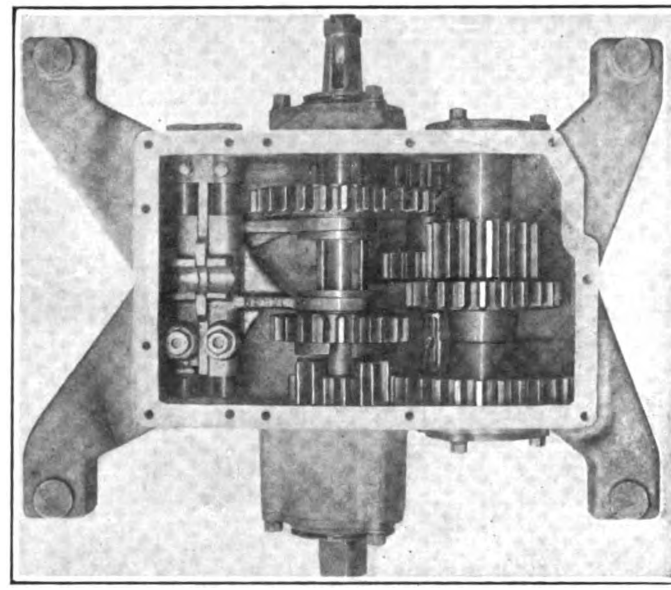

Fig. 7—Gearset with cover plate removed showing splines

same pressure being placed upon both brakes and to prevent excessive wear on one tire due to its taking up the entire braking load.

Hot riveting is used throughout the frame construction. The cross-members of the frame are all gussetted heavily to prevent racking strains. At the rear end of the frame there is a kick-up to carry the side-members over the rear axle and at the same time to furnish support for the three-quarter elliptic rear spring. A semi-elliptic spring suspension is used in the front. All the spring shackles are provided with integral grease-cups, which provide adequate lubrication for these bearings.

The wheel sizes are the same on all three models, but the spokes are heavier on the wheels for the six-cylinder and larger four-cylinder cars. The wheels will be 36 inches in diameter and will be equipped with 4 1-2-inch tires. There are ten spokes in the front wheels and twelve in the rear. The spokes are 1 5-8 inches for model 39 and 1 3-4 inches for models 47 and 65. Demountable rims are a part of the regular equipment and an extra rim of this type will be furnished with each car.

A worm-and-gear type of steering is used. On all Moon models for 1913 this will be mounted on the left side and the control levers will be in the center. The steering wheel is 18 inches in diameter and is provided with a safety grip.

Full equipment will be furnished with the 4-48 and the 6-65, on the 4-39 the equipment is extra if desired. The equipment consists of top, windshield and speedometer. The top is of imported mohair, padded and made to fit the car neatly. It is furnished with side-curtains and a close-fitting dust cover. The windshield is nickel trimmed in black with rain vision, clear vision and ventilating features. The speedometer is of the latest type and combines a grade indicator with the regular speed and odometer features.

Tests of C. L. C. Rotary Sleeve Motor

French Club Finds Rotary Sleeve Type a Success—Single Cylinder Develops 11 Horsepower at 2,188 Revolutions

PARIS, FRANCE, Sept. 3—Official power and fuel consumption tests have been carried out at the laboratory of the Automobile Club of France on a rotary valve motor built by the C. L. C. Company under Da Costa patents. The motor is a single-cylinder model of 3.1 by 5.5 inches bore and stroke having a cylindrical sleeve rotating at half engine speed. The sleeve carries one opening A, Fig. 2, which in its rotation covers and uncovers the intake and exhaust ports set at an angle of, roughly, 90 degrees from each other. The official tests lasted 1 1-2 hours, during which the motor was run from 1,882 to 2,188 revolutions per minute. At 1,882 revolutions the horsepower was 8.6; it increased to 9 horsepower at 1,952 revolutions; to 10.1 at 2,108 revolutions and the 11 horsepower at 2,188 revolutions. The oil consumption of the rotary distributor was 0.278 kilograms per hour. The total oil consumption could not be obtained owing to a leak. The cooling water remained between 60 and 75 degrees centigrade throughout the test, and according to the official report it was possible to maintain the hand on the part of the cylinder corresponding to the distributor throughout the whole of the time the motor was on the bench.

Since it was first introduced the C. L. C. motor has undergone a number of detailed improvements. Its sleeve, which is a gray iron casting fitting loosely in the cylinder, is carried on a combined radial and thrust bearing. Fig. 2. A gear B cut on the base of the sleeve receives a helical pinion C on a lay shaft obtaining its drive from the crankshaft by means of a Renolds silent chain. This shaft is carried on ball bearings and at its forward end drives the magneto by means of a dog clutch, while its rearward extension carries a pulley from which a belt transmits the drive to the mechanical lubricator. The sleeve is not relied on for gas tightness, this being assured by means of a deep compression ring having a rectangular opening corresponding with the intake and the exhaust ports and the opening on the sleeve. The ring has overlapping ends and is pinned on the sleeve in the manner often adopted for piston rings. This disposition allows a very wide tolerance in the fit of the sleeve within the cylinder, this tolerance having been increased, in certain cases, as high as 1 millimeter without any inconvenience. In ordinary practice, however, the tolerance is very much lower. In addition to the deep ring assuring gas tightness there are two ordinary compression rings D mounted on the sleeve below the opening and another one above it. These rings are pinned, having a stepped gap and are of greater depth than usually employed for piston rings. To assist in lubrication a spiral groove is formed on the outside of the sleeve and an oil lead is carried to the walls.

RESULTS OF OFFICIAL TESTS ON C. L. C. MOTOR

Model of Dynamometer	Size of Plates in Millimetres	Number of Hole	Temperature Degrees Centimetres	Atmospheric Pressure in Millimetres of Mercury	Revolutions per Minute	Indicated Horsepower	Corrections in Hundredths	Effective Horsepower	Fuel Consumption, Kilograms per Hour	Specific Consumption in Kilograms per Horse-power-Hour

Huber's Monopoly on Flexible Suspension

Patent Confronting Many Manufacturers Describes Specific Method of Mounting on a Three-Point Support

DETROIT, MICH., Sept. 16—The Huber automobile patent which is in the spotlight of the manufacturers at the present moment and under which some of Detroit's leading companies have taken out royalties relates to the suspension of the motor, clutch, and transmission mechanisms of a chassis on a sub-frame construction supported at three points, at the front center by a trunnion and at two rear points by a sliding support on the side members of the main frame. Fig. 1 reproduced from the patent papers dated August 25, 1905, Letters Patent No. 788,407 shows a plan view in which the two parallel sub-frame members SS support the motor, clutch and gearset mechanism. These two frame members are tied together at the forward end by a cross piece S1 which is supported by a trunnion S2 on the cross piece C of the main frane. At the rear these sub-frame members S attached rigidly to a frame cross piece T which rests upon the flanges of the side bars A of the main frame and are free to move fore and aft on these side members. At W1 is an elastic buffer between the cross member T and another cross member B, which latter is rigidly attached to the side members of the frame. This buffer keeps the trunnion S2 at the forward end of the sub-frame in engagement and allows a slight endwise movement of the sub-frame with the object of preventing destructive shocks. By not uniting the cross piece T to the side frame members any diagonal strains brought upon the main frame are not submitted to the sub-frame members S as the cross bar T is free to slide. Diagonal strains are resisted by angular braces U which bolt to the end of the cross bar T and extend diagonally forward and downward and are firmly attached underneath and beyond the flywheel H to a casting V, Fig. 2.

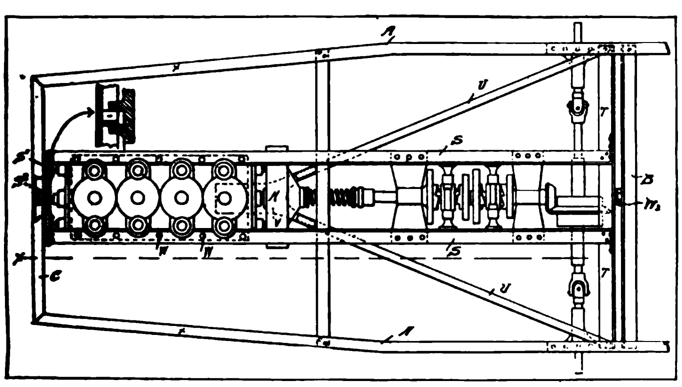

Fig. 1—Plan view showing suspension covered in Huber patent

The claims of the patent are:

1. In a vehicle, the combination of a main frame, a subframe rotably pivoted at its front end to the main frame and supported at its rear end by bearings resting upon but detached from the main frame, said sub-frame carrying the machinery of the driving mechanism, and whereby the twisting strains brought to bear upon the main frame are entirely relieved from the subframe and the machinery carried by it.

2. In a vehicle the sub-frame supported on three points, one of which is rotable in a perpendicular frame and the other two supported by the main frame, and diagonal braces running from the supporting points at the base of the triangle and to a common point in conjunction with the sub-frame substantially as described.

Electric Business Increases 45 Per Cent.

The fact has been noted that according to the latest figures available the electric vehicle business increased 45 per cent. in New York from July 1, 1910, to the same date in 1911, including, of course the growth of the commercial vehicle branch. During the past year an increase of 100 per cent. has been noted in the pleasure car sales of one company and since August 1, this concern has employed thirteen additional salesmen. The manager of the company said that prospects and indications all point to a much larger trade in the coming season. He says that he expects to double his sales.

In a general way the same story is told in other agencies. The Baker, Detroit, Rauch and Lang, Hupp-Yeats, Flanders and others have scored increases over 1911, the latter of course not being represented in the previous period and the Hupp-Yeats dating back only part of the year. Several agencies have been established in the past only to be abandoned, the latest example of that kind having been seen only recently.

Among the electric trucks an excellent business has been done for many years, the General Vehicle, General Motors, Studebaker and Lansden having a steady trade and several of the newcomers such as the Atlantic, doing a promising trade.

According to the New York dealers, the 1912 product is lighter, stronger, cheaper and much more satisfactory than the average product of former years. The radius of action is much extended. At present the dealers sell their cars on representations of from 65 to 100 miles on a charge.

This means that quite as much riding can be had in a day as the great majority of owners wish to take. Charging stations are more numerous and efficient than they used to be so that it is now possible to take long tours with an electric car.

Car for Poor Mail Route; Various Motor Troubles Explained; Derivation of French Automobile Words; Cure for Motor Knock; Changing Gears in Two Ways; Suggests a Change-Gear Device; Poppet Valve Design

Wants Car for Bad Mail Route

EDITOR THE AUTOMOBILE:—We would like to get some advice as to the proper kind of a machine to be used on a mail route 22 miles in length. Twelve miles over an ordinary turnpike road, which is rather rough in places, the last 10 miles of the road is a steady climb up a mountain, the grade in some places being as great as 8 to 10 per cent. The road in places is rather rough, having many rocks in it; portions of the road, both on the level stretch and on the climb at times, when there have been rains, are muddy and rutted a good deal. When the weather is good, and the roads are dry, they are fairly good, but they are in their worst condition during the winter months when there is mud, snow and some ice on the ground, and also in rainy and muddy weather.

What is wanted is a machine that will cover this distance within a reasonable time—not necessary to have high speed, but a reasonable speed should be maintained. The load to be carried, in addition to the driver, would be the mail, consisting of five or six mail bags, sometimes rather heavy—possibly after the parcels post is put into operation the load would be still heavier. It would also be desirable to be able to carry one or two passengers in the machine should occasion require.

What we want to know is what type of machine you would recommend as best suited for the conditions above named.

Charlotte, N. C. A. H. WASHBURN.

—The vehicle which would probably suit you best would be a light delivery wagon of good construction. To secure the latter feature it will be necessary to pay a good price. It would be possible to secure a cheaply built car that would last for a short time, but it would be cheaper in the end to put more money into the car and get a vehicle that will stand the test of time. Wagons of 1,500-pound capacity are sold by a large number of makers who would be glad to make small modifications in the body so that two or three removable seats could be installed to take care of occasional passengers. This vehicle should have pneumatic tires of very substantial size so as to secure the maximum tire economy. If it is to be placed in the hands of a driver, it should be fitted with a governor that will not permit the speed of the vehicle to run above what the owner deems is safe. It is also suggested that the gear ratio be approximately five or six to one on the direct drive, that is, the highest gear.

Condition of Merrick Road

Editor THE AUTOMOBILE:—As many tourists are interested in the Merrick road, which runs along the south shore of Long Island, I would like you to tell me in what condition that road is at the present time.

Rondout, N. Y. E. P. MOORE.

—The Merrick road is very good except a few bad stretches where it is under repair. These are at Rockville Center, Amityville and Patchogue. Along the rest of the route the road is all that can be expected.

Cures for Several Troubles

Editor THE AUTOMOBILE:—Will you kindly give me the causes of the following:

1. A large quantity of smoke and a few explosions come out of my muffler.

2. When running on third speed my engine jerks a little and then stops.

3. Two of my cylinders do not explode because the vibrators stick to the pieces below them.

4. What does 40-45 H.P. 24.5 mean?

5. My magneto refuses to operate the engine.

My car is equipped with a Holley carbureter, sliding type transmission, Splitdorf four-cylinder coil and a Bosch magneto.

Watchung, N. J. A READER.

—1. You are using a mixture which is too rich. A section through the Holley carbureter is shown in the issue of September 19. This shows the adjustment point which is a knurled screw on the bottom of the carbureter. By turning this the mixture can be controlled and the smoke and muffler explosions stopped.

2. The reason your motor stops is probably because it cannot carry the load of the car on two cylinders which are alone firing according to your question No. 3.

3. Try a voltmeter on your battery current and see if it is 6 volts, which is the correct strength for the ignition system. File the vibrator contact points so they are flat and adjust on the adjustment screw until they vibrate properly.

4. It is difficult to say, but it is possible it is the rating of a motor which develops from 40 to 45 horsepower on the brake and has an S. A. E. rating of 24.5 horsepower.

5. This might be from most any cause and it is impossible to state without further details. It is recommended that you send the magneto to the factory where it will be placed in good condition at a very reasonable charge.

Derivation of French Terms

Editor THE AUTOMOBILE:—In view of the fact that there are several French words which have come into general use throughout the United States in connection with the driving and manufacture of cars it would be interesting to know their derivation and other interesting facts concerning them. There are three of these words to which I have particular reference and which I would like to see published in THE AUTOMOBILE together with their derivation and correct meaning. They are: chassis, tonneau and chauffeur.

Plainfield, N. J. JOSHUA T. LAMY.

—The derivations and plurals of these words as as follows:

(1) Chassis; plural, Chassis.

Derivation: French word signifying a frame of wood or metal; the frame work of a wagon. Later the term was applied to the frame work of a locomotive and then to the transverse and longitudinal frame members of the motor car. More correctly, however, the word chassis should only refer to the metal framework of the car receiving the motor, gearset and control mechanism.

(2) Tonneau; plural, Tonneaux.

Derivation: French word meaning a barrel; a wooden vessel formed of staves and hoops and made to contain a tonneau (1,000 kilogrammes) of oil. Later, a horse-drawn carriage, known in England as a governess car, having a rear entrance. A similar type of body was first applied to a motor car by M. Huillier, of Paris, and by reason of its resemblance to a barrel and to the horse-drawn tonneau already existing, was known as a tonneau.

(3) Chauffeur; plural, Chauffeurs. This word is always masculine in French, having no feminine form.

Derivation: From the French verb Chauffer—to heat. A chauffeur is a man in charge of a furnace or boiler fire. The first use of the word chauffeur was during the revolution of 1789 when bands of brigands heated (*chauffé*) the feet of their victims in order to make them reveal the place where their money was hidden. The chauffeurs were stamped out during the Consular period. The word chauffeur was first applied to automobile drivers under the popular supposition that they had to tend a fire. On the French railroads the chauffeur is the fireman, the engine driver is the mechanician.

Suggests Change Gear Device

Editor The Automobile:—I am sending a sketch (reproduced, Fig. 1) showing a suggested arrangement of the gears in the flywheel to provide for a change of speeds. The flywheel has three sets of cogs on its face for the purpose of giving the different speeds. The transverse shaft across the face of the flywheel carries the small pinions upon ball bearings. The shaft, as may be seen, is square between the pinions to allow them to slide into position to secure the different speeds. The cogs on the flywheel can either be made a part of the wheel or can be mounted upon it in some other manner. With this arrangement every speed would be a direct drive. Should it be desired the teeth could be omitted and the device made a friction drive. The pinions could be made hollow and the clutch could be of the cone type. The entire outfit can be housed within a tight casing and should be as silent as any type of drive. I would like to know what other readers of The Automobile think of the device.

Artesia, Cal. M. A. Cook.

—This device would never be of any practical value because the cross-shaft would be a point of weakness, in the first place. It would be difficult to get sufficient bearing space on the shaft to take care of the tremendous torque caused by the transmission of the entire motor power through the transverse shaft. When the high-speed pinion was in engagement there would be a noise that could be heard for blocks. The linear speed at which the periphery of a 2-foot flywheel travels at 1,000 revolutions per minute is over 6,000 feet per minute. The noise that would occur when the high-speed pinion came into engagement with the fast-running flywheel can be imagined. The arrangement would not be as compact as many of our three-speed boxes now in use and the distance between bearings would be greater. Changes of alignment in the propeller shaft would also not be compensated for as well as in the regular gearset. On the whole, it would not pay to attempt this type of gear change mechanism.

Mathematical Balance Possible

Editor The Automobile:—In reference to a statement in The Automobile of September 5, which, I believe, is not quite true, I would like to make a correction.

It is stated that "When measured mathematically the balance of a machine can never be perfectly determined because both primary and secondary forces and moments are involved, and, although the first may be reduced to zero, the secondaries can rarely, if ever, be nullified."

It is quite possible by mathematical calculation to determine accurately the balance of a crankshaft and if the theory and practice do not quite correspond, it is due to the fact that the crankshaft forging is not a true reproduction of the mathematically perfect balance crankshaft drawing.

As to the secondary forces and moments referred to by the author it is not correct that they can only rarely, if ever, be nullified, for the simple reason that a rotary mass can never produce a secondary force or moment. The secondary, fourth period and sixth period forces and moments which are present in a motor are due to the angularity of the connecting-rod and can be produced only by reciprocating masses.

It may be interesting to give a short explanation of these terms which are so often misused and which are so easy to understand without any special mathematical knowledge, if they are looked upon in the proper way.

In a standard four-cylinder motor it is apparent that when the piston turns the top dead point, the convexity of the imaginary circle, being just then swung by the connecting-rod, adds to that continuously described by the crank and that for this reason the deceleration of the upward movement and the acceleration in starting the downward excursion is more rapid than when the piston is turning the bottom dead point where the arc swung by the connecting-rod subtracts from that swung by the crank. Perceiving this, it is at once clear, as previously stated, that whenever two pistons are turning the top dead point and are supposedly balanced by two pistons turning the bottom one, the balance will not in fact be complete and the motor as a whole will jerk upwards. When one-half revolution has been performed and the pistons have changed places, the same thing will be repeated and there will be another jerk, not downwards but again upwards. Hence, since the motor cannot keep on continually going up, and must move down between these two jerks, it is apparent that it will vibrate up and down at a rate or periodicity twice as great as the speed of revolution. This makes clear the reason for the presence of the second harmonic force and moment.

Another effect of the angularity of the connecting-rod is that a piston going downward reaches its middle position before the crank has moved a full 90 degrees. It can again be qualitatively worked out on the basis of the physical conception without mathematics that at the 90-degree position there is a further unbalanced acceleration upward due to this cause, of which the maxima occur halfway between the upward jerks before referred to.

Thus it is apparent that with such a motor running at 1,000 revolutions we shall find that while there is no up and down

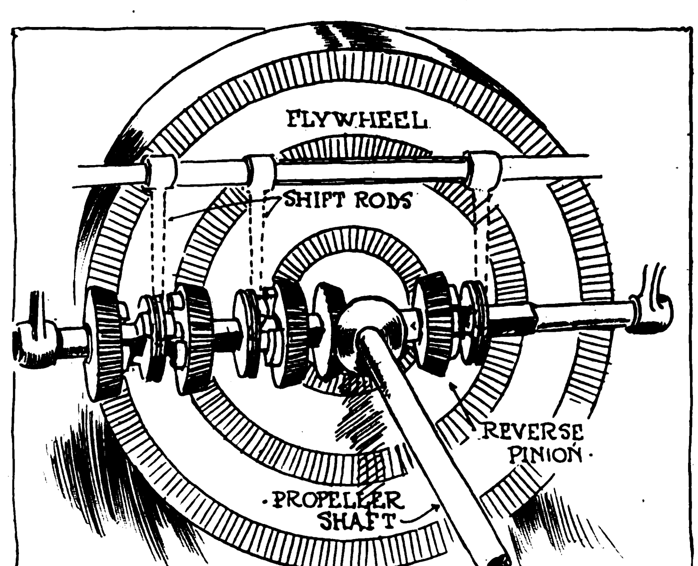

Fig. 1—Change-gear device suggested by a reader which is ingenious but not practical

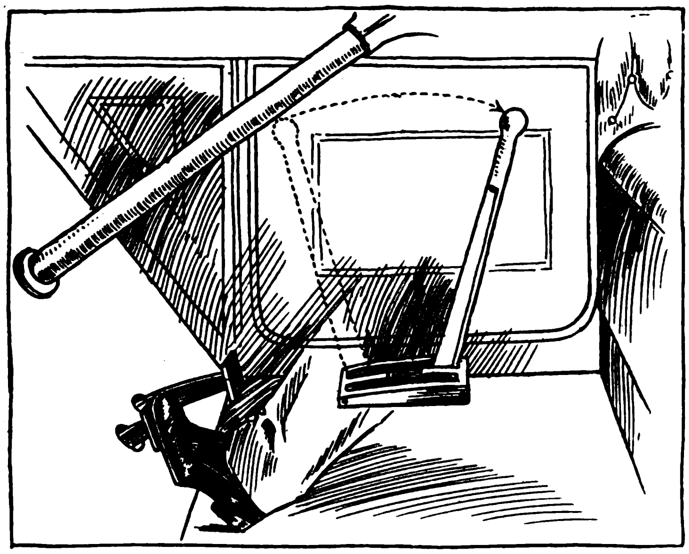

Fig. 2—Ordinary gear change. Straight pull of lever from one speed to next

vibration of a periodicity of 1,000 there is one at a periodicity of 2,000 and another one at a periodicity of 4,000.

The machine illustrated on page 508 of your September 5 issue seems to be a Norton running balance machine, which can only be used to determine if a crankshaft will give any vibratory moment, as the other disturbances which might be caused by the crankshaft—that is, the unbalanced forces—can be nullified by balancing the crankshaft on parallel ways, which has to be done before placing the same in the rotary balancing machine.

General Motors Company. ERNEST R. FRIED, Research Engineer.

Engine Knocks on Hill Only

Editor THE AUTOMOBILE:—I have a four-cylinder touring car with a 4 by 4-inch motor. It is equipped with a Splitdorf magneto and Maxwell 1912 carbureter. The engine picks up very well on level ground, but when climbing a hill on high gear it does not take hold but dies right down with a knocking sound in the motor which sounds exactly the same as when traveling with a spark that is too far retarded. What is the cause for this and what is the remedy?

Spokane, Wash. TROUBLED.

—There may be several causes for the trouble which you mention. When the motor is on a hill if there is any tendency to knock at all it is there that it will surely develop. The troubles which are commonly the cause of a knock that develops on a hill and which is not perceptible on level ground are as follows: Lean mixture, magneto set too early, valves seat poorly, carbon in cylinders, poor valve adjustment, loose wristpin bushing, loose magneto shaft coupling, sticking valves and piston slap. The cures for these may be taken up in order. They are as follows:

Lean mixture can be cured by opening the needle valve slightly or by closing the air valve. The former is preferable as it is easier to make a correct fuel adjustment than an exact air adjustment. This adjustment should be made on the road. Take the car out on a hill and run it up in the condition that it is at present. Return to the bottom of the hill and make a change in the mixture by turning the fuel adjustment. When this is done run the car up the hill again and note if there is any decrease in the knock. If there is none or the change is only slight it is time to pass to the next cause.

The setting of the Splitdorf magneto is explained in detail in the issue of September 19, and it is only necessary to follow the directions contained therein to secure perfect timing.

Bad seating of the valves may be due to two causes. Carbon or other foreign matter may lodge on the seats and prevent the valves from seating properly, or they may be adjusted too closely so that they are not able to get down to the seats when the motor is hot enough to have caused the valve stems to expand. The latter would be apt to cause a knock on level ground as well as on a hill, however, and thus can be discarded from the list of probable causes. Carbon flakes on the valve seats are common, however, and may be the cause for the whole trouble. They can be removed by dosing the cylinders with kerosene or some other carbon remover and then turning the motor over to work the deposits out from around the valve seats. In case the valves are worn or pitted they will have to be reground.

Carbon in the cylinders is removed as just described. If patent carbon removers are used be sure to follow directions accompanying same.

Loose magneto shaft couplings are readily cured by tightening up the connections. Should an Oldham coupling be used in your car and it is found that considerable play occurs between the driving and driven faces, coat these with solder.

Sticking valves are caused by insufficient lubrication of the stems. A little oil will cure this trouble, which is not probable in your case as it would have been evidenced on level ground as well as on hills. Slapping pistons are due to excessive wear and are of such a nature that the repairs can only be made at the factory.

Difficulty in Changing Gears

Editor THE AUTOMOBIE:—In the issue of September 12 there appeared an article entitled, Changing Gears Without Noise, in which the contributor, Elmer E. Grove, gives a particular method for changing from high to intermediate which I have tried with success. Perhaps he, or some of your other readers would give their experiences when shifting to various gears and the different methods which they use under different conditions. This is always an interesting topic.

I find, for instance, that when shifting the selective transmission on the Buick from first to second speed it requires a lengthy stroke to push the lever diagonally through the entire length of the gate, passing through the neutral point during the operation. The result is that often the speed of the car diminishes to such an extent that the engine has to struggle to pick up the load smoothly. Is this due to incorrect handling?

2. What is the proper method of dropping from second to first speed on a hill so that the change is made without grating the gears?

New York City. JAMES WOOD.

—In making a correct change of gears, a knowledge of the car itself is very often a necessity, although if a knowledge of the principles and conditions involved is possessed by the driver, a great amount of trouble will be avoided. In spite of the fact that there is apparently nothing complicated about moving the change gear lever to the different positions in the quadrant there are several methods by which these changes can be made and each is best suited for one particular condition.

Assuming the car started and running on first speed, before making the change to second speed it will be necessary to have the car traveling at such a rate that the drop in speed during the length of time it takes to bring the gearshift lever from the first speed position, through the neutral gate and into the second will not result in the car traveling so slowly that there will be any difficulty in the motor picking up the load. It will not be necessary to attain a speed of more than 7 miles an hour to make this change on level ground. When a speed approximating this has been attained make the change by a smooth but quick pull on the lever. You should practice the movement to such an extent that the transverse movement in going through the neutral gate movement will be made so quickly that it will hardly be apparent and will not interrupt to a perceptible degree the smooth movement of the gearshift. In making the change to a higher speed it is necessary that the throttle be opened as soon as the gears are meshed. The spark is also at once advanced slightly.

In driving the car the motor is acting on a system of levers.

When running on low gear the effect is just the same as if the power was applied at the end of a very long lever. A greater effort is applied to the load, but the effort is applied more slowly. Changing the motor to a higher gear corresponds exactly to the shortening of the length of the lever arm and consequently takes more power to move the load. This is given by opening the throttle.

When the car is resting on a hill and facing upwards it is a little more difficult to be able to judge when the speed is sufficiently great to justify a change from first to second speed. The hill may be of such slope that it is an easy matter for the car to take it on high in ordinary running, but is still steep enough that the pause in the gearshifting act is sufficient to cause the speed to drop considerably. In a case of this kind the driver should be able to judge just at what speed he should throw out his clutch and make the change. The steeper the hill the greater will be the speed required before the change can be safely made. In going from second to high speed the same directions apply except that the complication of passing through the neutral gate is not present and therefore the change is simplified to a slight extent.

In dropping from a higher to a lower speed a different set of circumstances will arise and a different method will have to be pursued. Unlike changing from low to high, when dropping down it is possible to make an advantageous shift by moving the gearshift lever in two movements. This was brought out by Mr. Grove in his communication to THE AUTOMOBILE of September 12. When traveling through traffic it is sometimes desirable to change to a lower gear on level ground without slowing down the car. To attempt this by de-clutching and putting the lever directly into the lower speed notch in the same way that this is done while ascending a hill would be to invite a very noisy clash of the gears. Instead the change is made in three progressive steps, as shown in Fig. 3, and the speed of the car is not reduced to any appreciable degree. The first movement shown at A in the illustration is to disengage the clutch and to bring the shifter lever back to neutral. This leaves the car coasting with the motor running. The clutch is now let in and the levers are in the position shown at B. Now the part where the skill is required and where practice is necessary comes in. The motor is speeded up until it is turning over at the same rate of speed that it would be were the second speed engaged. It will take a little practice to accustom the ear to judge by the sound of the motor whether it is turning over at the correct speed or not. After the motor is speeded up to the proper degree, the clutch pedal is depressed, as shown at B, and the change gear lever brought into second speed. The same method will apply in going from second to first. On some cars a better change can be made this way than in the usual manner of bringing the lever straight through as shown in Fig. 2, where the usual manner of making a gear change is depicted.

Trouble in dropping to lower speeds on a hill can be averted if the critical moment at which to make the change is learned. If the driver waits too long he may stall the motor and sometimes place himself in a very serious position. If he tries to make the change too soon he will clash gears. By changing at the critical moment, however, an easy, quick change can be made.

Correct Lift of Poppet Valves

Editor THE AUTOMOBILE:—Would you please tell me how to calculate the lift of a poppet valve when the diameter is known and the area of the part through which the gases must pass has also been calculated? I would like to know the lift required for valves of the conical type commonly known as the 45-degree valve and also for the flat-seated valves. I am designing a motor to have valves of which the diameter of the seat will be 1 1-2 inches. The diameter of the pipe to which the valve opening must correspond in order to get the gases into the cylinder with a great enough velocity is 3 inches.

New York City. J. E. S.

—According to data furnished by the Society of Automobile Engineers the following formulæ have been worked out for the computation of the valve lifts for both the flat-seated and the 45-degree types of valves.

Taking D as the smaller diameter of the valve seat and d as the diameter of piping to which the valve opening must correspond, the ratio of these two, r, will be:

$$r = \frac{D}{d}$$

The formulæ for flat-seated valves are as follows:

When $r = 1$ Lift $= d \times 0.250 = D \times 0.250$
" $r = 1.25$ " $= d \times 0.200 = D \times 0.160$
" $r = 1.50$ " $= d \times 0.166 = D \times 0.111$
" $r = 2.00$ " $= d \times 0.125 = D \times 0.162$
" $r = 2.5$ " $= d \times 0.100 = D \times 0.040$

For cone-seated valves when the cone angle is 45 degrees the formulæ are:

When $r = 1$ Lift $= d \times 0.307 = D \times 0.307$
" $r = 1.25$ " $= d \times 0.256 = D \times 0.205$
" $r = 1.50$ " $= d \times 0.219 = D \times 0.146$
" $r = 2.00$ " $= d \times 0.170 = D \times 0.084$
" $r = 2.25$ " $= d \times 0.138 = D \times 0.055$

The above are theoretical lifts and an excess is left over these for wire drawing. This is especially true of the flat-seated valves where 25 per cent. over the theoretical lift is often allowed.

For a valve of the dimensions you have given, the lift for a flat-seated valve would be about 1-2 inch and for the conical valve about 11-16 inch, which would be very high.

Some Observations on Solid Truck Tires

Efficiency, Durability, Resiliency, Weight and Cost Determine the Value of the Different Makes

Tests at Different Speeds and Pressures Show That Tire Loss Varies Directly with the Load

THE object of this paper is simply to bring out some interesting points noted in studying the various types of truck tires on the market, the effect of load upon them and some rather peculiar characteristics. As my experiments have been confined to vehicles traveling at speeds below 20 miles per hour we have not considered pneumatic tires as entering the field. The various makes of tires now on the market may be divided into four distinct types.

Type A—Side Wire—Uniform compound throughout attached to wheel by means of cross wires embedded in rubber at base and secured to wheel by side wire or side flanges. Characteristic makes of this type—Firestone, Swinehart.

Type B—Wire Base—Uniform compound having several wires embedded in rubber at base running around wheel and secured to wheel by press fit on band and side flanges. Characteristic makes of this type—Diamond, Kelly-Springfield, Hartford.

Type C—Hard Rubber Base—Soft rubber tread, hard rubber base vulcanized to steel bands and secured to wheel by press fit and side flanges or T bolts. Characteristic makes of this type—Gibney, Goodrich, Polack, Goodyear.

Type D—Block—Separate blocks secured by cross or side wire and metal cages over blocks bolted through felloe. Characteristic makes of this type—Kelly-Springfield and others.

In considering the value of different makes of tires for use on commercial vehicles there are a number of features to be taken into consideration which will depend somewhat upon the type of vehicle on which the tires are to be used. These characteristics are: Efficiency, durability, resiliency, weight, cost.

NOTE—From a paper on "Some Observations on Tires for Commercial Vehicles" presented to the Philadelphia branch of the Society of Automobile Engineers by F. E. Whitney.

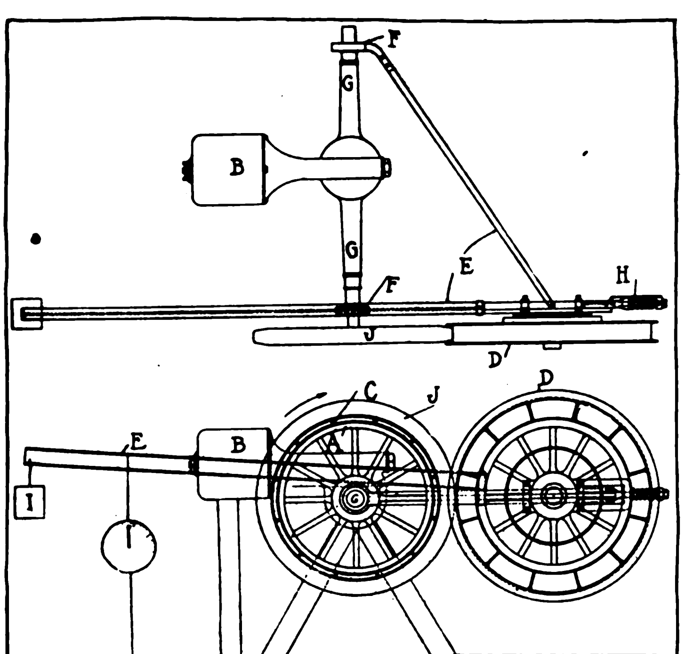

Fig. 1—Plan and elevation of apparatus for making tire efficiency tests

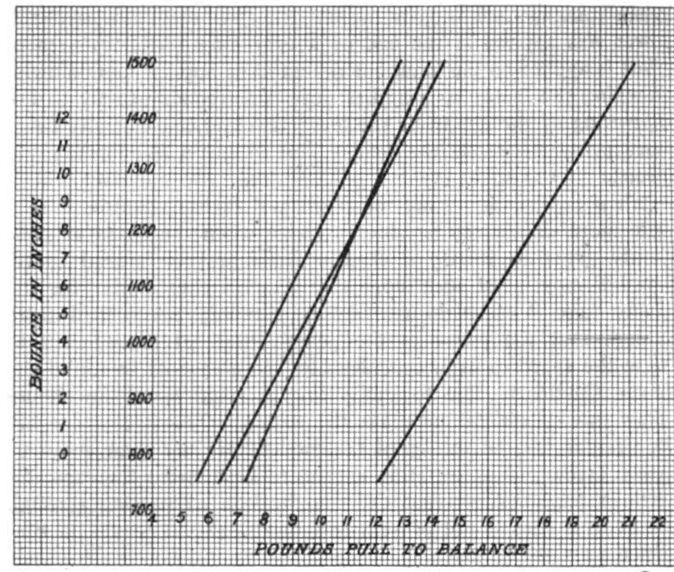

Fig. 2—Diagram of results of tests made on tires with the apparatus shown in Fig. 1

In determining the value of the different characteristics to the truck manufacturer I have arranged these in the above order as representing the order of their importance to the manufacturers of electric vehicles.

In making observations a number of tests have been made on various makes of tires, the size used being 3 inches by 36 inches. This particular size was selected because of ease in handling, loading, etc. The standard load rating of this tire is 950 pounds, but tests were carried up to 1,500 pounds.

Efficiency—In rolling a wheel along the road over any surface there is a resistance to rolling depending on road surface and type of tire, which varies all the way from 3 pounds per ton with true steel wheels rolling on heavy clean rails up to the 200 pounds per ton in ordinary wagon wheels through sand.

The best authorities give the following figures:

Steel-tired wheels on steel rails............	3 to 5 pounds.
Pneumatic-tired wheels on asphalt pavement..	15 to 35 pounds.
Solid-tired wheels	20 to 40 pounds.
Steel-tired wheels on average road, about	50 pounds.

In making tests on trucks with different makes of rubber tires results have been secured where the total resistance has run as low as 25 pounds per ton and as high as 60, all other conditions remaining the same except the tire. This is simply due to a variation in the compound of the rubber, the low results being with a very high quality of rubber, whereas the high results were due to an inferior compound. Of this the loss in transmission amounts to approximately 3 pounds per ton, friction and windage 5 pounds per ton, the remainder being in the tires.

In order to test for efficiency we make use of several methods:

First—by allowing the vehicle to coast down a grade and determine the distance it will run, this being repeated with different makes of tires. The more efficient tire will naturally coast further.

Second—Run the vehicle over a measured course and with electric instrument and stop-watch determine the power consumed per mile per hour, this being repeated with different makes of tires.

Third—The more accurate test has been with the use of a dynamometer on which the tire to be tested is mounted and rolled against a plain steel band. The resistance to rolling is determined in pounds at various speeds and pressures.

Fourth—The fourth and very simple method is to follow the system used in the Shore scleroscope for testing steel, which simply consists in dropping a piece of hard material on the tire from a definite height and measuring the height it will rebound, the efficiency of various tires comparing with the rebound.

Fig. 1 shows in plan and elevation an apparatus devised for making these efficiency tests. It consists of the rear construction of one of a worm-driven light delivery wagon. By means of a special driving shaft the differential is locked so that a wheel mounted on one end of the axle at A will be driven from the motor B in the same manner as the vehicle operating on the road. This wheel is made small enough so that a 36-inch tire mounted on its steel band will slip over the outside. The rim of this wheel is fitted with a number of set screws C, so that the tire can be readily centered and secured in position, after which it is securely wedged. Steel-tired wheel D, mounted on annular bearings, is carried by frame E so mounted that it swings readily on the annular bearings F of the axle G. The wheel D is mounted so that it can be moved in or out and it can be pressed against the wheel to be tested by means of the coil spring H. The wheel with its supporting frame is counterbalanced by the weight I. It will be seen that by revolving the wheel A in the direction indicated by the arrow with no pressure between the tire to be tested J and the wheel D, there will be no tendency to rotate the whole apparatus about the center of the axle G. When, however, pressure is applied any resistance or drag at the surface of the tire J will be resolved into a tendency of the whole system to rotate about G and this is determined in pounds pull by means of the spring balance K. In addition to the apparatus indicated the wheel is fitted with a speedometer so that tests at different speeds can be made. In this manner a range of tests has been made at varying speeds and pressures and the results plotted in curves, Fig. 2.

As a direct comparison with the above method of test, the bounce in inches of the same tires has been plotted, as shown at the left side of Fig. 3, from which it will be noted that tire 6 shows a bounce of 8 1-2 as against 4 1-2 for tire 3, showing about the same relative efficiency with the different method of test.

As indicating the effect on the mileage secured from one charge of the battery in an electric truck with the extremes as indicated by tires 3 and 6, a vehicle equipped with tire 6 would cover, say, 50 miles on one charge of the battery, whereas a vehicle equipped with tire 3, over the same route, and using the same battery equipment would be able to cover only 30 to 35 miles.

The amount of cushion which the tire interposes between the wheel and the road is an important factor in the value of the tire as measuring the amount of injurious vibration and shocks which are absorbed. In order to determine this effect tires were given various loads and observations taken of the compression of the tire; also of the area in contact with the road. From these observations curves have been plotted showing the load characteristics of various makes of tires and also the contact with the road and the load per square inch of the surface in contact.

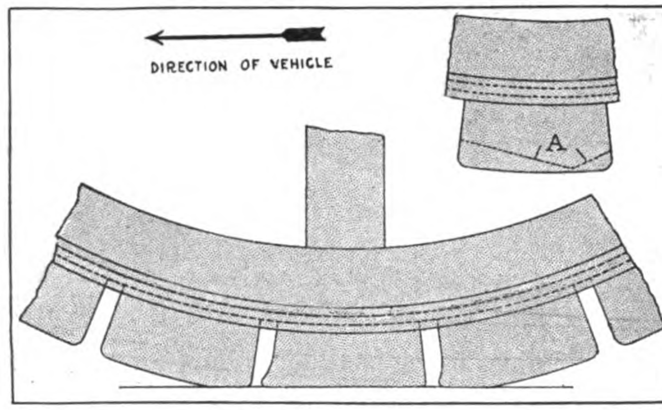

Fig. 3—Showing how the toes of block tires creep out from under the load and, at A, the shape resulting from long service

Fig. 4 shows a series of curves in which the deflection of the tire in sixty-fourths of an inch is plotted against load in pounds. This test is made by pressing the tire between two parallel surfaces and simply measuring the compression in inches. On curve 3 with a load of 1,250 pounds a compression of 16-64 is shown as against 24-64 on curve 4. In other words, on a bump tire 4 will compress 50 per cent. more than tire 3, and, consequently, absorb proportionately more vibration.

In Fig. 5 pressure is plotted against pounds. In Fig. 6 pressure per square inch is plotted against pounds. The area in contact with the road varies with the different makes of tires from 8 6-10 to 11 3-10 square inches.

I have shown in Fig. 3 the effect which is obtained with block tires. It is interesting to note that usually the heel of the blocks is worn out first, but, as a matter of fact, the toe is worn more on account of its creeping out from under the load as the wheel revolves. The dotted line A indicates the shape the blocks assume after having been in service for some time.

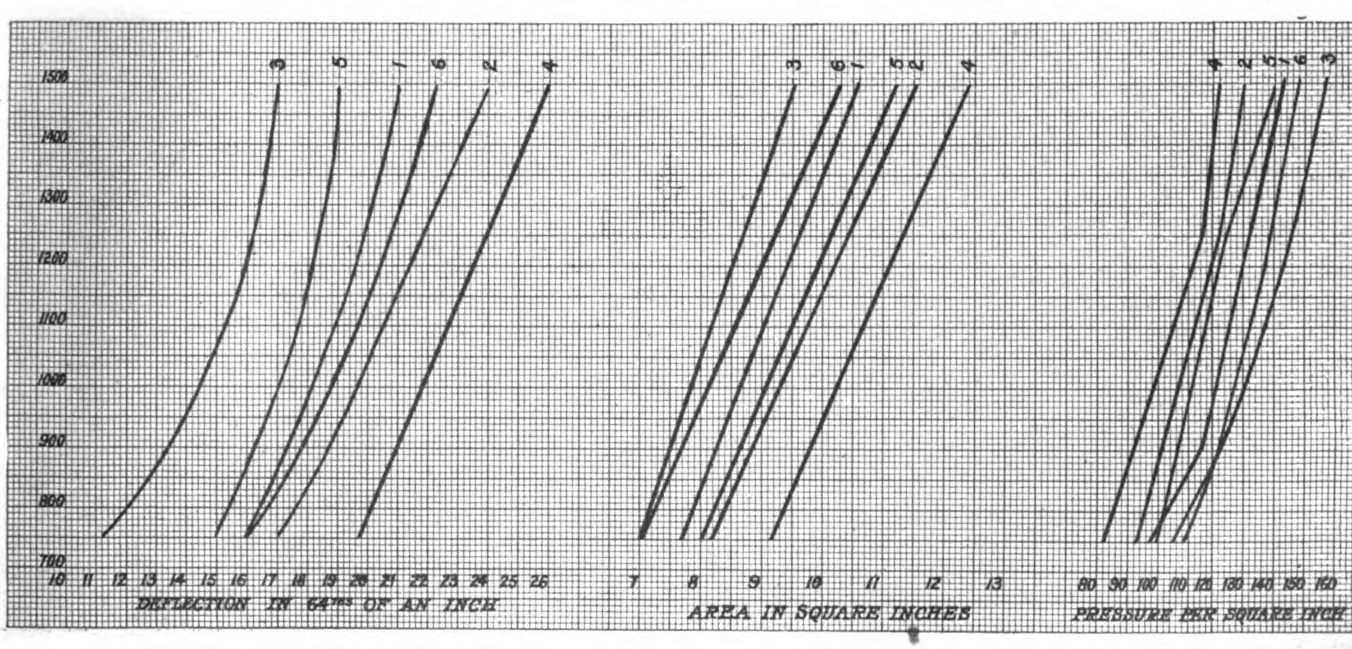

Fig. 4—Curves with the deflection plotted against the load in pounds. Fig. 5—Showing pressure plotted against pounds. Fig. 6—Pressure per square inch plotted against pounds

Alco truck, the first to cross the continent with a load of merchandise, passing a 20-horse freighter in an uninhabited mining district

Transcontinental Alco Finishes Run

Averages 44.09 Miles a Day for 94 Days—Weather and Road Conditions Very Trying

AVERAGING 44.09 miles a day for 94 days, the Alco 3-ton truck which started from Philadelphia with its rated load of merchandise has reached its destination at Petaluma, Cal. The road conditions and weather were extremely trying during a large portion of the run. There were cloudbursts in the desert states where rain is a novelty in summer and the extreme of everything had to be endured by the vehicle and travelers.

In the state of Iowa, where good roads and easy conditions generally might be expected, the crew had to inspect 500 bridges and strengthen 100 of them so that the truck could pass over them. In the far West dynamite had to be used to blast a path for the truck to cross some of the mountains.

After crossing the Missouri into Nebraska, better conditions were found and these prevailed until the truck ran into a series of terrific rainstorms in the western desert country.

Up to the time of reaching Julesburg, Col., the truck covered 2,184 miles in 24 days.

This is an average of 92.66 miles a day and an eloquent plea for better roads through the intermountain section, because the final results show that the average for the whole trip was about half the average daily mileage to Julesburg.

Wyoming proved a nightmare but in Utah, despite the heavy grades, much better road conditions were found. Nevada proved to the satisfaction of everybody concerned that it is no nice place to run a truck. In the first place there are no roads worthy of the name and in the second, the trails were so narrow and the curves so abrupt that dynamite was needed to make it possible to turn the truck around some of the projecting rocks. Between Elko and Austin, the progress was slow, climbing one grade 6 miles long that is said to average 20 per cent.

The course then lay southward through Reno to Carson City and thence up the main wall of the Sierras, rounding Lake Tahoe in the crest of the range. This climb was very severe on account of the steepness of the trails. From the California line to Folsom City the road was good but was largely up and down until after the second range of mountains was passed. From Folsom through Sacramento to San Francisco the truck traveled over boulevards.

Records of the time-measuring and distance-measuring instruments covering the run from Philadelphia to the Lucin cut-off at the north arm of Great Salt Lake are now available. The running time each day on the average was 10 hours, 29 minutes. The average actual operation was 5:21 per day and the average number of stops, per day, 25.

The longest day's run was August 8, when the truck was kept on the road for 20:03 but only traveled for 3:28, making forty-one stops.

The shortest day's run was 1:27, on July 27. The day's run in which the largest number of stops was made was July 20, when 100 were recorded on account of the weak bridges in Iowa.

While the general average of the whole trip is placed at 44.09

Blasting the rocks on a narrow mountain trail

Forging along more than 10,000 feet above sea level

Negotiating a boulder-strewn pass in the Desatoya range

per day, deductions are not allowed for Sundays, when the truck did not run as a rule. No allowances, however, were made for the days when it was impossible to run the vehicle for reasons beyond the control of the crew. By making allowance for the Sundays, and non-operative days, the average daily mileage during actual running is raised to 55.26. This makes the total mileage 4,145.

Cost figures of the trip have been kept in much detail and when the tabulations have been completed they will be presented.

The truck carried two drivers and was in charge of E. L. Ferguson as official pilot.

The trip was the first of its kind ever undertaken in that the load carried was regularly consigned freight routed via the truck instead of some other means of transportation.

The chief lesson learned by the experience of the trip was that it is possible to ship freight in that way, but that in point of time, the truck can not hope to equal transcontinental railways. In fact, that element of the problem was not considered in making the trip. The unprecedentedly bad weather conditions were purely incidental and the fact that the truck prevailed over them shows simply that weather will not stop the automobile truck where it can get traction and does not run into an immovable obstruction.

The most striking testimony of the trip is an affirmation of the chief lesson taught during the military maneuvers in Connecticut last month with regard to the weakness of bridges. The big car was stalled hundreds of times during the long run while its crew shored-up suspicious culverts and bridges and extricated it from the bottom of some creek after treacherous bridges let it down.

Alco crew picking the road to Eureka, Nevada

Captain Ferguson reports that many of the worst specimens of medieval bridges are being replaced with stone and concrete culverts, particularly in Iowa, and that subsequent trips across the continent will be made without such a grave complication as beset the Alco.

The car will be shipped back to Philadelphia and will resume its work in the service of its owner.

Calendar of Coming Events

Shows, Conventions, Etc.

Sept. 23-Oct. 3....New York City, Rubber Show, Grand Central Palace.
Sept. 30-Oct. 1....New York City, Sales Managers' Convention, Automobile Board of Trade.
Jan. 2-10..........New York City, Importers' Salon, Hotel Astor, Importers' Automobile Alliance.
Jan. 4-11..........Cleveland, O., Annual Automobile Show.
Jan. 11-25.........New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25.........Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1.....Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Jan. 27-Feb. 1.....Scranton, Pa., Annual Automobile Show, Hugh B. Andrews.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show.
Feb. 10-15.........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 24-Mar. 1.....Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1.....St. Louis, Mo., Annual Automobile Show.
March 3-8..........Pittsburgh, Pa., Annual Automobile Show.
March 8-15.........Boston, Mass., Annual Automobile Show.
March 17-22........Buffalo, N. Y., Annual Automobile Show.
March 19-26........Boston, Mass., Annual Truck Show.
March 24-29........Indianapolis, Ind., Annual Automobile Show.

Race Meets, Runs, Hill Climbs, Etc.

Sept. 29-30........St. Louis, Mo., Track Races, Universal Exposition Company.
Sept. ....Washington, D. C., Reliability Run, Automobile Club of Washington.
Oct. 7-20..........Chicago, Ill., Reliability Run, Chicago Motor Club.
Oct. 21............National Tour American Automobile Association.

Proposed Contests

Sept. 28...........Indianapolis, Ind., Track Races, E. A. Moross.
Sept. 28...........Kalamazoo, Mich., Track Races, Inter-State Fair.
Oct. 4-5...........Sioux City, Ia., S. C. Auto Club and Speedway Association.
Oct. 4-5-6.........Peoria, Ill., Track Races, J. A. Sloan.
Oct. 12............Springfield, Ill., Illinois State Board of Agriculture.
Oct. 12............Salem, N. H., Track Meet, Rockingham Park.
Nov. 6.............Shreveport, La., Track Meet, Shreveport Automobile Club.

Large-Diameter Tires

JUDGING from a 2000-mile road test on which 7-inch pneumatic tires were used on a car with loads weighing over 5000 pounds it is certain that tires of this diameter are going to receive much more attention than they have up to the present. Several cars have been equipped with tires of this diameter, tests with them have been made over rough roads, and in every case the judgments given have been uniform, namely, that they are a big improvement in many respects over smaller sizes.

Instead of using a pressure of 75 or 80 pounds per square inch as would be used on a 36 by 5-inch size pressures of 40 pounds are possible with a 7-inch size on the same diameter of wheel. Using so low a pressure greatly reduces the possibilities of blowout, due to temperature rises in hot weather, and so adds to the period of usefulness of the tire. The large-diameter tire has been introduced because of its resilience due to the much greater distance between the wheel rim and the tread of the tire.

With the large-diameter tire a much larger rubber surface is in contact with the ground at all times and this results in a reduction in skidding as compared with smaller tire sizes running at much higher air pressures. In actual tests this anti-skidding factor has been much greater than first imagined and drivers consider it one of the merits of the large-diameter tire.

Front-Door Policy

Surroundings Influence Results

THE atmosphere of the business offices of an automobile factory is reflected in all of the manufacturing departments—it permeates every department from raw stock to the final assembly.

The slovenly factory head has his office more like the corner of a stockroom than a manager's sanctum. Disorder is its chief characteristic. The business units are promiscuously positioned around the room; the window blinds are at varying heights; submitted accessories or other units that should find a resting place on the shelves of the engineering department are strewn over the floor; the manager's desk bears close resemblance to a scrap pile in a foundry yard, it contains broken pieces of car parts, selling orders, parts orders and a score of other things; in a word, the entire room breeds a feeling of utter lack of business, and, while at heart the business executive may be a Napoleon, the influence that his surroundings have on those who come in contact with them cannot possibly be salutary.

Visit the factory and in not a few departments the same lack of system is apparent. The machine shop is ill-kept. Instead of cuspidors beside the various machines, the workmen are left to their whims; the floors are not regularly swept, and when cleaned it is only a semi-cleaning; raw stock, instead of being neatly piled at convenient places to await its going through the miller, the lathe or drill press, lies around in disorder; racks for carrying small parts to be machined and other racks, on which the workman can place them after machining so that he has not to move away from his machine or stoop to pick parts off the floor, are entirely wanting; several machines instead of being erected on substantial bases are poorly mounted, reducing their efficiency and, perhaps, the accuracy of their work; adequate provisions are not made for properly lighting the factory so that in the early fall and winter the efficiency percentage of the workman is sadly reduced because of lack of good light; poor ventilation is general; often machinery is not mounted with the aim of greatest economy of space, greatest lighting capacity, greatest ventilation and minimum handling of material—**from Alpha to Omega it is a poorly arranged, poorly conducted factory—every department in it reflects the dominating shortcomings of the management.**

Careless environments engender careless workmanship: It is not surprising in such a factory to find a high percentage of discarded parts due to over-allowances. The very atmosphere of the factory breeds such a condition. Men in such a factory work at much lower capacity than in a highly-organized and efficiently-conducted plant. Contrast the assembly work on a car in such a plant with that done on another make of car in which environments are so different. Contrast the workmanship with that in a plant where workmen on careful parts are required to wear white linen or cotton coats in order to impress on them the importance of cleanliness and accuracy. Contrast the work with that in a factory where the floors are kept clean every hour of the working day, where ventilation is looked after, where light falls upon the work at the correct angle, where individual towels are furnished for the workmen, where the entire atmosphere is order, cleanliness, brightness and system. **The result shows in the work, it exhibits itself in the manufacture of every part entering into the make-up of the car, it exhibits itself in the assembly of the car parts, in fact, it exhibits itself in every component part of the machine.**

A man's work cannot be any better than its creator. If the man is ill at ease, his work will be unreliable. If the worker operates in orderly surroundings, he will instinctively put the best there is in him in his work. The highest efficiency—which incidentally is economy in its strictest sense—can only be had as a result of the supreme effort which is the result of suitable surroundings. The investment, on the other hand, by which these effects are brought about, is comparatively small and pays for itself immediately and at a very high rate of interest.

Country's Fire Chiefs Meet in Convention at Denver

(Continued from page 622)

let the contract for twenty-eight tractors. Sixty-one new companies are being organized fully motorized. Instead of stables the stations are garages.

In illustrating the dependability of the tractors in the Passaic service, Chief Bawker stated that during the 18 months in which they have been pulling the trucks, there has not been a time when the alarm has sounded that there has been trouble in starting, and when started the tractors have always arrived at and returned from the fire without trouble or delay. There are some very steep hills in the city of Passaic but the tractors make 8 miles an hour on the steepest of them.

Bad Weather Has Little Effect

In the winter season when snow and ice cover the streets it does not interfere to any extent with the operation of the tractors. In one instance, Chief Bawker states, it snowed continuously for 24 hours when an alarm was turned in from the hill section of the city. A speed of 15 miles an hour was made through streets unbroken by traffic. The best horses could have done under similar circumstances would have been 5 miles per hour.

With tractors doing so well it is to be expected that apparatus in which the motor is on the same truck would do as well or better in snow and ice, for in the latter type the weight is on the driving wheels, where it should be to give traction.

According to Geo. C. Hale, Fire and Water Commissioner of Kansas City, Mo., a motor-driven three-way combination got to a fire and handled it through 26 inches of snow when all the horse-drawn equipment became irretrievably stuck. With chains on all four wheels and the load helping to give traction these motor-driven pieces can go through storms that horses cannot face.

For experiences in snow, one would imagine Calgary, Can., to be the city offering the most rigorous conditions, but James A. Smart, chief of Calgary's fire department, says that the snowfall is not great but is very dry and often drifts to a depth of 2 or 3 feet. He has had in use for the past three winters a 40-horsepower squad wagon and during that period has never been tied up and never failed to reach a fire under any weather conditions.

Mr. Smart believes that motor-driven apparatus has the advantage over horse-drawn apparatus wherever the use of wheels is possible and only in the use of runners has the horse-drawn apparatus the questionable advantage, for in severe storms horses will not face the average blizzard of the Northwest, and the motor will. Under light flaky snow, Chief Smart says he has seen 75 per cent. of the horses fail in attempting to reach a fire on asphalt pavement up a slight grade, that the motors negotiated without difficulty. The Society for the Prevention of Cruelty to Animals never had a spasm at seeing a motor standing facing a blizzard.

There is not the unanimity of opinion in regard to the availability of the gasoline motor as a pumping engine that there is as to its advantages as a propelling unit.

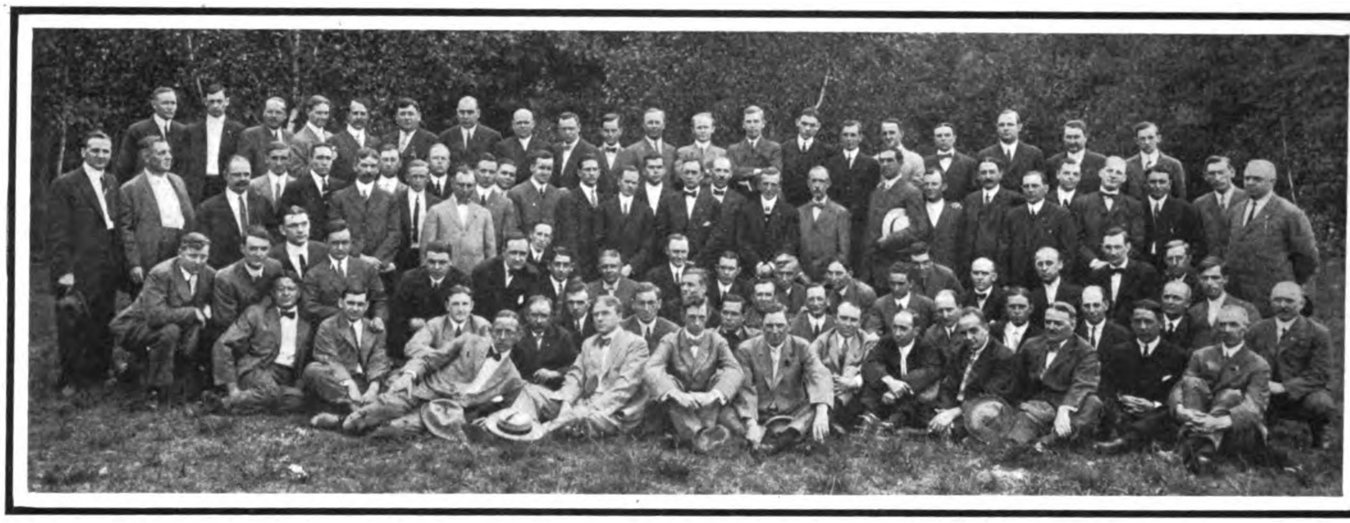
Chief Magee, of Dallas, Tex., allows but one man to look after his motor pump and permits no one else to lift the hood. He cites one long stretch of work which proved the reliability of the motor pump to his satisfaction. After getting the pump to the fire in record time the motor pumped water for three lines of hose for 17 1-2 hours and for one line of hose for 3 hours longer. The operators of the Dallas motor pumps number three to each pump and work on three shifts. One of these is called the chief engineer.

Motor pumps as distinguished from steamers have not yet proven their entire reliability to the complete satisfaction of many fire engineers, who hold that though the gasoline engine is the best method of getting the pump to the fire, the steamer is the better for doing the pumping. One of the reasons advanced by the adherents of the steamer as a pump in conjunction with the motor as the propeller, is that it is asking too much of the gasoline engine in its present state of imperfection, to expect entire reliability for hours of steady work at top load after it has been pushed to get the pump there in the shortest possible time. Adherents of the motor pump say that if the motor is looked after and operated by a competent man, and by that man alone, there need be no fear of premature exhaustion of the motor from overwork.

Frozen Hydrants a Problem

Another objection against the motor pumps is that with the present arrangements their exhaust gases cannot be used to thaw out frozen hydrants as is done with live steam from the boiler of the steamer. In answer to this, those who uphold the motor pump say that when the hydrants are properly installed and looked after, they will not freeze. Nevertheless, hydrants do freeze, and some means must be provided to thaw them out. Chief Kenlon urges the use of electricity in the same way as it is employed on water pipes and even suggests that the motor pumps carry with them an arrangement of some sort for utilizing the power lines and lighting mains. Chief Ringer, of Minneapolis, states that alcohol in the quantity of about a pint thaws the hydrants in a short time. Means for thawing hydrants with motor pumps is a question that the makers will have to solve.

There is another point in which motor pumps of some types at least are weak, although makers are waking up to the fact. As pointed out by George W. Booth, chief engineer of the committee on fire prevention of the National Board of Fire Underwriters, in his paper presented last week on the efficiency of the motor pumping engine, the chief reasons for the breakdown of motor pumps during service is the continued running at high speed. It is the opinion of all the engineers who have observed tests of motor pumping engines, that these machines should be provided with high-powered motors.



Branch managers and salesmen of the Fisk Rubber Company, Chicopee Falls, Mass., assembled during their recent conference

FISK Salesmen Hold Conference—From September 9 to 14 branch managers and salesmen of the Fisk Rubber Company, Chicopee Falls, Mass., were in conference at the factory. This conference ended at a clambake, and the above illustration represents the sales organization of that company.

Clarke with Chalmers Company—J. I. Clarke, formerly with the Boston "Post," has taken a position in the advertising department of the Chalmers Motor Company, Detroit, Mich.

La France Company's Bulletins—The American-La France Engine Company, Elmira, N. Y., makers of motor fire apparatus, is issuing monthly bulletins which give valuable advice to city officials who are contemplating the purchase of fire trucks.

Indianapolis Collects $25,000 on Licenses—Approximately $25,000 has been collected by the city of Indianapolis, Ind., so far this year for motor vehicle licenses. Until this year the annual fee was $3 and the amount raised last year was $7,800.

Columbus Club Fighting Ordinance—The Columbus Automobile Club, of Columbus, Ohio, will make every effort to secure the repeal of the recent ordinance that provides that an automobile while passing a street car discharging passengers must come to a full stop.

Omaha's Automobile Floral Parade—Many entries are being received for the automobile floral parade to be given in Omaha, Neb., during the Ak-Sar-Ben festivities early in October. A number of neighboring towns have expressed their intention of entering cars.

Drawback on Gear Duty—Under a ruling of the Treasury Department at Washington, D. C., a drawback of duties will be allowed under section 25 of the tariff act of 1909 on gears imported in the rough and finished by grinding and polishing by the Gear Grinding Machine Company, of Detroit.

Y. M. C. A. Has Automobile Class—The Y. M. C. A. of Columbus, Ohio, in order to teach the intricacies of the automobiles to business men has started a class which meets every day between the hours of 12 M. and 1 P. M., which is quite popular among the business men of the Buckeye capital.

Havens Resigns from Abbott Firm—C. E. Havens has resigned his position as manager of the technical and service department of the Abbott Motor Company, Detroit, Mich., and is taking an extended vacation in an effort to recover his health. Mr. Havens was at one time connected with the Hudson Motor Car Company.

Indianapolis Club's Road Activities—An appropriation of $2,000 has been made by the Hoosier Motor Club of Indianapolis for the fund being raised to buy the material for building a rock road from New York to San Francisco. The club has endorsed the plan, as has the Indianapolis Commercial Club. The club on September 28 and 29 will give a sociability run to the farm of George Ade, at Brook, and to Kentland. A reception will be given by the Commercial Club of Kentland to the club on the evening of September 28. Those making the trip will spend the night at Kentland.

New Headquarters for Baker Brothers—The Baker Brothers Motor Company, Buffalo, N. Y., formerly located at 846 Main street, have moved into the building at 1227-1229 Main street which was formerly occupied by the sales department of the E. R. Thomas Motor Car Company, which concern recently went into receivers' hands. Although originally constructed for the display of automobiles, the Baker company has had the entire showrooms remodeled and the 1913 Cole car, of which the Baker Brothers Company is local agent, is now on display in the new building.

Novel Use of Stearns Car—D. M. Clark, of Prescott, Ariz., road superintendent of Yavapai county, is transforming his 40-horsepower Stearns car into a road-building utility. The rear seat has been discarded and replaced with a big air compressor. This apparatus will be driven by power from the auto's engine and attached thereto will be a big mine drill. When the remodeling is complete the automobile drill will be used in boring on the Copper Basin Road, which is to be widened and repaired. It is expected that it will be very valuable in rock work. Mr. Clark plans to patent his invention.

New Agencies Established During the Week

PLEASURE CARS

Place	Car	Agent
Albany, N. Y.	Hupmobile	Park Garage Co.
Albany, N. Y.	Lozier	C. S. Ransom
Albany, N. Y.	Stutz	Northern Motor Car Co.
Aledo, Ill.	Moon	E. B. Miller
Baltimore, Md.	Cutting	Baltimore Garage Co.

Secures Arizona Essenkay Agency—R. Alyn Lewis, of Phoenix, Ariz., has secured the Arizona agency for Essenkay.

McWhirter Manager Rubber Company—H. D. McWhirter has been appointed acting manager of the Winnipeg Rubber Company, Winnipeg, Canada.

Haines Company Moves—Carroll A. Haines & Co., Baker electric distributers in Philadelphia, moved September 15 to their new and larger salesrooms at No. 1927 Market street, Philadelphia, Pa.

Page Joins Accessory House—Wallace G. Page, for many years connected with the Shawmut Tire Company as sales manager, has become associated with George S. Van Voorhis in the American Marine Equipment Company, 27 Haverhill street, Boston, Mass. This company has built up a large business selling automobile tires and supplies.

Mapping the Pasear Tour—The photograph shows the caravan of Studebaker cars used by Californians in laying out a model trip for tourists who will visit the 1913 exposition at San Francisco, Cal. The cars made the trip of 2,000 miles without repairs or adjustment to their machinery. The photograph was taken at Jawbone Pass, overlooking Mojave Desert.

New Boston Baker Quarters—F. N. Phelps and A. F. Neale, representing the Baker Motor Vehicle Company in Boston and surrounding territory, have taken new headquarters at No. 801 Boylston street. Mr. Neal is one of the Baker Company's oldest pleasure car dealers. F. N. Phelps represents the truck department of the Baker Motor Vehicle Company in a large part of New England.

Hear Sermon in Automobiles—To compete with the motor car, as he expresses it, the Rev. Louis Magin, pastor of First M. E. Church at La Crosse, Wis., is trying the experiment of holding outdoor services, the steps of the church being used as the pulpit. All motorists of La Crosse and visiting motorists have been invited to drive up to the church, remain seated in their cars and participate in the services from the curbstone.

Nebraskan Clubs Hold Meetings—The annual meeting of the Nebraska Automobile Association will be held in Lincoln, Neb., the last week in November. The Knox County Automobile Association held its annual meeting at Bloomfield recently, electing officers and appointing delegates for the coming convention. Many new members were added to the rolls. O. C. Turner, secretary of the State Association, was present and gave an address on the State and National bodies and on good roads.

Hoosier Members' Police Power—Special police powers have recently been granted a number of members of the Hoosier Motor Club, Indianapolis, Ind., for the purpose of aiding the Police Department in enforcing the speed law. One evening recently, W. S. Gilbreath, secretary of the club, ran down and arrested Baird Brill, who was running at the rate of thirty miles an hour. In police court Gilbreath "made his case," Brill being fined $30 and costs. The regular schedule of fines for speed violators in the Indianapolis police court is $1 a mile up to the maximum of $50 provided by the law.

Studebaker cars laying out the Pasear tour at Jawbone Pass

Baseball team of Streator Motor Car Company, Streator, Ill.

National in New Quarters—The National Motor Car Company, Pittsburgh, Pa., has moved into its new showrooms at Baum and Beatty streets.

Sandell Gets Oakland Appointment—Herbert S. Sandell has been appointed retail sales manager of the new Oakland Philadelphia, Pa., branch, 506 North Broad street.

Goodrich Declares Quarterly Dividend—The B. F. Goodrich Company, Akron, O., declared its regular quarterly dividend of 1¾ per cent on the preferred stock, payable October 1.

Hatter Resigns from Velie—C. P. Hatter, assistant manager of the Velie Motor Vehicle Company, Moline, Ill., has resigned and is succeeded by George Fitzsimmons, formerly with the Thomas factory at Detroit, Mich.

To Build 11,500 Oaklands in 1913—The Oakland Motor Car Company, Pontiac, Mich., announces that the plans for next season call for the building of 11,500 Oakland cars, and that this will necessitate a number of factory additions.

Halladay's Baseball Team—The Halladay baseball team, composed of employees of the Streator Motor Car Company, Streator, Ill., recently closed a very successful season, having played 26 games, winning 21 and losing 5. The accompanying photograph shows the team.

Automobiles Yield Big Revenue—A $91,497.19 gain in state revenue over the corresponding period of the previous year is shown in the report of Commissioner of Motor Vehicles Lippincott, who has remitted $440,509.89 to the State Treasurer as against $358,012.71 over last year.

Lasher Joins Abbott-Detroit—William J. Lasher has just severed his connection as branch manager of the Carl H. Paige Company, New York City, handling the Chalmers, to join forces with the Abbott-Detroit Motor Company, New York City. He will in his new capacity have charge of the agency business.

Winning Cars Bosch Equipped—At the recent Light Car Grand Prix of France, arranged by the Automobile Club of Sarthe, Zuccarelli driving a Lion Peugeot car gained first place, being equipped with a Bosch magneto. In the race for the Sarthe Cup, Coupé de la Sarthe, Goux in a Peugeot gained first place, also equipped with a Bosch.

Wilby's Across-Canada Trip—Thomas W. Wilby of New York City, who last year made a 9000-mile automobile tour of the United States from the Atlantic to the Pacific and return, is this autumn undertaking the first motor tour ever attempted across Canada. The tour is made for the purpose of mapping out a Canadian highway from ocean to ocean.

Association Opens Twelfth Branch—The Automobile Service Association, a mutual service corporation launched about a year ago, the main offices of which are located at Fifty-second and Chestnut streets, recently opened its twelfth branch, at Lancaster, Pa. S. M. Waasus is president of the association and G. W. Carrington is vice-president and general manager.

Dwight President Iron Firm—John H. Dwight, manager of the motor car body and wagon departments of the Mitchell-Lewis Motor Company of Racine, Wis., has resigned to become president and general manager of the Belle City Malleable Iron Company of Racine, Wis., which does a large business in supplying motor car manufacturers with castings of all kinds. Mr. Dwight succeeds W. C. MacMahon, who has become vice-president and manager of the Northwestern Malleable Iron Company of Milwaukee.

Road Improvement in Amarillo—The fact that Amarillo, Tex., is on the motor car tourist route between points in Texas south and east of here and Denver, as well as on the route between Oklahoma and Kansas points and New Mexico and other points of the Southwest, has forced upon the people of this section of the Panhandle the necessity of improving the highways, and with this object in view steps have been taken by the chamber of commerce of Amarillo and other civic bodies of this part of the state to not only improve the existing roads but to construct others that will be devoted exclusively to motor car travel. Signboards and distance markers will be placed upon all of the main highways.

Automobile Incorporations

AUTOMOBILES AND PARTS

CINCINNATI, O.—Federal Motor Supply Company; capital, $250,000; to manufacture and sell all kinds of automobiles, parts and accessories. Incorporators: George W. Platt, Emil C. Schmitt, R. L. Dollings, A. M. Draddy, M. F. Platt.

DETROIT, MICH.—Traveler Motor Car Company; capital, $15,000; to manufacture automobiles and accessories. Incorporators: Wm. J. McIntyre, Joseph P. Lavergne, William L. Kenfield.

FLINT, MICH.—Sterling Motor Company; capital, $300,000; to manufacture automobile engines. Incorporator: W. C. Durant.

INDIANAPOLIS, IND.—Martin Tractor Company; capital, $350,000; to manufacture automobile tractors. Incorporators: C. H. Martin, H. R. Richarss, E. D. Moore.

JOHNSTOWN, PA.—United States Motor Sales Company; capital, $50,000; to manufacture motors. Incorporators: A. C. Simler, J. L. Simler, C. H. Raymond.

NEW YORK CITY, N. Y.—Motor and Gear Improvement Company; capital, $1,250,000; to manufacture automobile parts, etc. Incorporators: Henry C. Derham, S. V. Brady, Dwight Partridge.

ROCHESTER, N. Y.—Lamay Manufacturing Company; capital, $25,000; to manufacture motors, etc. Incorporators: Arthur B. Headley, Philip E. Tucker, Arthur C. Lamay.

TORONTO, CAN.—Standard Motors, Ltd.; capital, $40,000; to manufacture automobiles. Incorporators: George S. Skinner, Harry A. Newman, George P. McHugh.

GARAGES AND ACCESSORIES

ALBANY, N. Y.—Taxicab Transportation Company; capital, $5,000; to run a motor car business. Incorporators: William Hildebrant, Elizabeth Hildebrant, Elsa Hildebrant.

BALTIMORE, MD.—Automobile Tire Repairing Company; capital, $500; to carry on a tire repairing business. Incorporator: L. Vernon Iller.

BOSTON, MASS.—Motor Service Company; capital, $2,500; to carry on a motor service business. Incorporators: Sanford Small, Harold Chisholm, Williams H. Evans.

BUFFALO, N. Y.—Buffalo Resilio Company; capital, $25,000; to manufacture and deal in tire fillers. Incorporators: Stafford D. Noble, Alexander D. Falck, Philip E. Lonergan.

CLEVELAND, O.—Pioneer Gasoline Company; capital, $10,000; to deal in gasoline. Incorporator: Edward J. Cherney.

DALLAS, TEX.—Automobile Owners' Protective Association; capital, $25,000; to carry on a garage for the use of members of the association, and to give legal advice. Incorporator: O. H. Bettes.

DETROIT, MICH.—Motor Patents Company; capital, $10,000; to manufacture machinery and mechanical devices. Incorporators: John W. Dyar, Sherman L. Depew, Earl W. McGookin.

DETROIT, MICH.—General Castings Company; capital, $2,000; to manufacture castings. Incorporators: F. Walter Guibert, J. C. Eckliff, D. Fitzgerald.

DETROIT, MICH.—National Automobile Owners' Protective Association; capital, $2,000; for the purpose of protecting automobilists. Incorporators: H. Bertram St. Clair, Henry O. Sage, Elmer H. Beach.

INDIANAPOLIS, IND.—Glover Equipment Company; capital, $20,000; to manufacture automobile accessories. Incorporators: Frank L. Glover, Leonard Gieger, William A. Uphrey, Louis A. Libkings.

INDIANAPOLIS, IND.—Showlater Manufacturing Company; capital, $10,000; to manufacture automobile bodies, etc. Incorporators: H. G. and F. W. Showlater, William Small.

JACKSONVILLE, FLA.—Chalmers Motor Company; capital, $15,000; to deal in automobiles. Incorporators: C. L. Bagwell, Garland J. Bagwell, W. Parker Holmes.

Richmond Clubhouse Nearly Completed—Completion of the new clubhouse of the Richmond County Automobile Club, Richmond, N. Y., is expected in a few weeks.

Willman, Sales Manager Warren—G. L. Willman, formerly connected with the Board of Commerce, has been made sales manager of the Warren Motor Car Company, Detroit, Mich.

Clark Makes Cole Change—A change in the Cole Kansas City distribution house has taken place. H. J. Clark, who formerly worked for the Cole distributers in Kansas City, secures the distributing business.

Essenkay Opens Buffalo Salesroom—The Empire Essenkay Company, which concern was incorporated recently at Albany, N. Y., to deal in that city in automobiles, has opened a salesroom at 248 Washington avenue, Buffalo, N. Y.

Morgan Joins Machine Company—C. L. Morgan, formerly sales manager of the electric division of the General Motors Truck Company, has resigned to take a position with the Moon-Hopkins Billing Machine Company of St. Louis.

Speedwell San Francisco Branch—The Speedwell Motor Car Company, Dayton, O., has established a branch in San Francisco, Cal., taking over the interests of the Speedwell Motor Car Company of California. R. Harry Croninger is manager.

Trego With Packard Company—Frank H. Trego has returned to Detroit from Buffalo, where he was chief engineer of the E. R. Thomas Motor Car Company, to take charge of the department of research engineering for the Packard Motor Car Company.

Sampson truck displacing sixteen mules in Santa Monica, Cal.

Foster Company's New Men—The Foster Motor Sales Company, Detroit, Mich., State distributers for Cutting cars, has secured the services of T. E. Ball as sales manager. Two other automobile men, George H. Irvine and Edwin G. Galvin have recently taken positions with the Foster Company.

Russell Company's Annual Conference—The branch managers and salespeople of the Russell Motor Car Company, Toronto, Ont., held their annual conference last week at the West Toronto headquarters of that concern, sessions including demonstrations of the new Russell models and a conference on automobile business matters.

Sampson in Oil Service—One of the latest concerns to dispense with their mule-driven transportation system is the A. F. Gilmore Oil Company, Santa Monica, Cal., which supplies oil for road work from their wells in the Santa Monica district. The Gilmore Company has recently purchased a five-ton Sampson truck and has fitted it with a huge tank of 1,100 gallons capacity. The accompanying photograph shows the truck.

Holmes Resigns from Swinehart—C. E. Holmes, formerly of the Diamond Rubber Company, Goodyear Tire and Rubber Company, and the late Southern manager of the Swinehart Tire and Rubber Company, resigns his position on September 15 to enter into the retail tire and vulcanizing business in Birmingham, Ala. Mr. Holmes has traveled East and South, representing the above firms for the past eight years, and is quite well known with the automobile distributors.

Studebaker's New Detroit Quarters—On October 1 the Studebaker Corporation will take over the new garage and showroom at Woodward and Charlotte avenues, Detroit, Mich., now occupied by the United States Motor Company, the deal involving a consideration of about $100,000. The Studebaker interests will use the property as headquarters of a recently formed Detroit branch which is at present located at Studebaker Plant No. 1 on Piquette street. The new headquarters will be managed by A. K. McLundy, Michigan sales manager.

Kurtschora President Battery Company—Martin W. Kurtschora, for many years manager of the Beaver Manufacturing Company, manufacturer of motors, Milwaukee, Wis., has purchased the controlling interest in the Northwestern Storage Battery Company, of Milwaukee, and will assume the active management. Officers of the reorganized company are: President, Martin W. Kurtschora; vice-president, E. D. McLaughlin; secretary, F. E. Scudder; treasurer, William Jacobs. The new management is outlining a policy of immediate expansion.

Automobile Incorporations

MARIETTA, O.—Gerhart Spring Tire Company; capital, $15,000; to manufacture vehicle wheels of all kinds, including automobile tires. Incorporators: J. A. Gerhart, G. O. Salzman, Casper Hopp, O. C. Mohler, A. A. Schramm.

MARLINGTON, W. VA.—Marlington Garage Company; capital, $10,000; to carry on a garage business. Incorporators: F. T. McVlintic, C. A. Yeager, M. E. Pue, C. R. Goodall, L. S. Shoemaker, G. W. Clark.

MINNEAPOLIS, MINN.—O. Fenstermacher Company; capital, $300,000; to deal in automobile supplies. Incorporators: O. Fenstermacher, T. O. Fenstermacher, Fred Chambers.

MONTREAL, CAN.—Mount Royal Garage Company; capital, $500,000; to carry on a taxicab business. Incorporators: James A. Brooks, George Ross, Sen. F. L. Beique, F. A. Beique, L. J. Beique.

NEW YORK CITY, N. Y.—Miller, Hicks & Hewitt, Inc.; capital, $10,000; to go into the automobile business. Incorporators: Harry D. Miller, Henry T. Hicks, George A. Hewitt.

NEW YORK CITY, N. Y.—Cameron-Rowe Auto Service, Inc.; capital, $10,000; to conduct an automobile service business. Incorporators: James Cameron, Norman Cameron, August T. Rowe.

NEW YORK CITY, N. Y.—Mercedes Daimler Selling Corporation; capital, $50,000; to carry on an automobile business. Incorporators: A. M. Becker, John A. Lemline, E. H. Ferguson.

NEW YORK CITY, N. Y.—Hunt & West, Inc.; capital, $10,000; to carry on an automobile business. Incorporators: Burton R. Law, John W. Collopy, Elly Z. Parker.

NEW YORK CITY, N. Y.—Volkmar Manufacturing Company; capital, $100,000; to manufacture automatic starting devices for automobiles. Incorporators: William M. Giegerich, Edward Giegerich, Bernard Volkmar.

NEW YORK CITY, N. Y.—Auto Despatch Bureau, Inc.; capital, $25,000; to carry on an automobile business. Incorporators: Walter Stackhouse, Harold Parker, L. S. Parker.

PEORIA, ILL.—Jefferson Automobile Company; capital, $30,000; to manufacture, repair and deal in automobiles, and operate garage. Incorporators: R. C. Uckena, Frank E. Howland, F. I. Archdale, W. C. Rounneberg, Cederic Howland.

ROCHESTER, N. Y.—Automobile Safety Fender Company; capital, $100,000; to manufacture automobile fenders. Incorporators: William A. Snyder, Abram DeWolf, Abram Bune, William D. Elliott, Abraham DePotter.

SAN ANGELO, TEX.—S. L. Henderson Company; capital, $10,000; to deal in automobiles. Incorporators: S. L. Henderson, J. S. Allison, George S. Alleson.

WELLSBURG, W. VA.—Brooke Automobile Company; capital, $10,000; to deal in automobiles. Incorporators: J. H. Scott, C. M. Magee, P. A. Chapman.

ST. LOUIS, MO.—Lewis Automobile Company; capital, $26,000; to engage in the automobile and garage business. Incorporator: J. D. P. Lewis.

WELLSBURG, W. VA.—Brooks Auto Company; capital, $10,000; to deal in automobiles. Incorporators: J. H. Scott, W. H. Scott, C. M. Magee, F. A. Chapman, E. A Fegan.

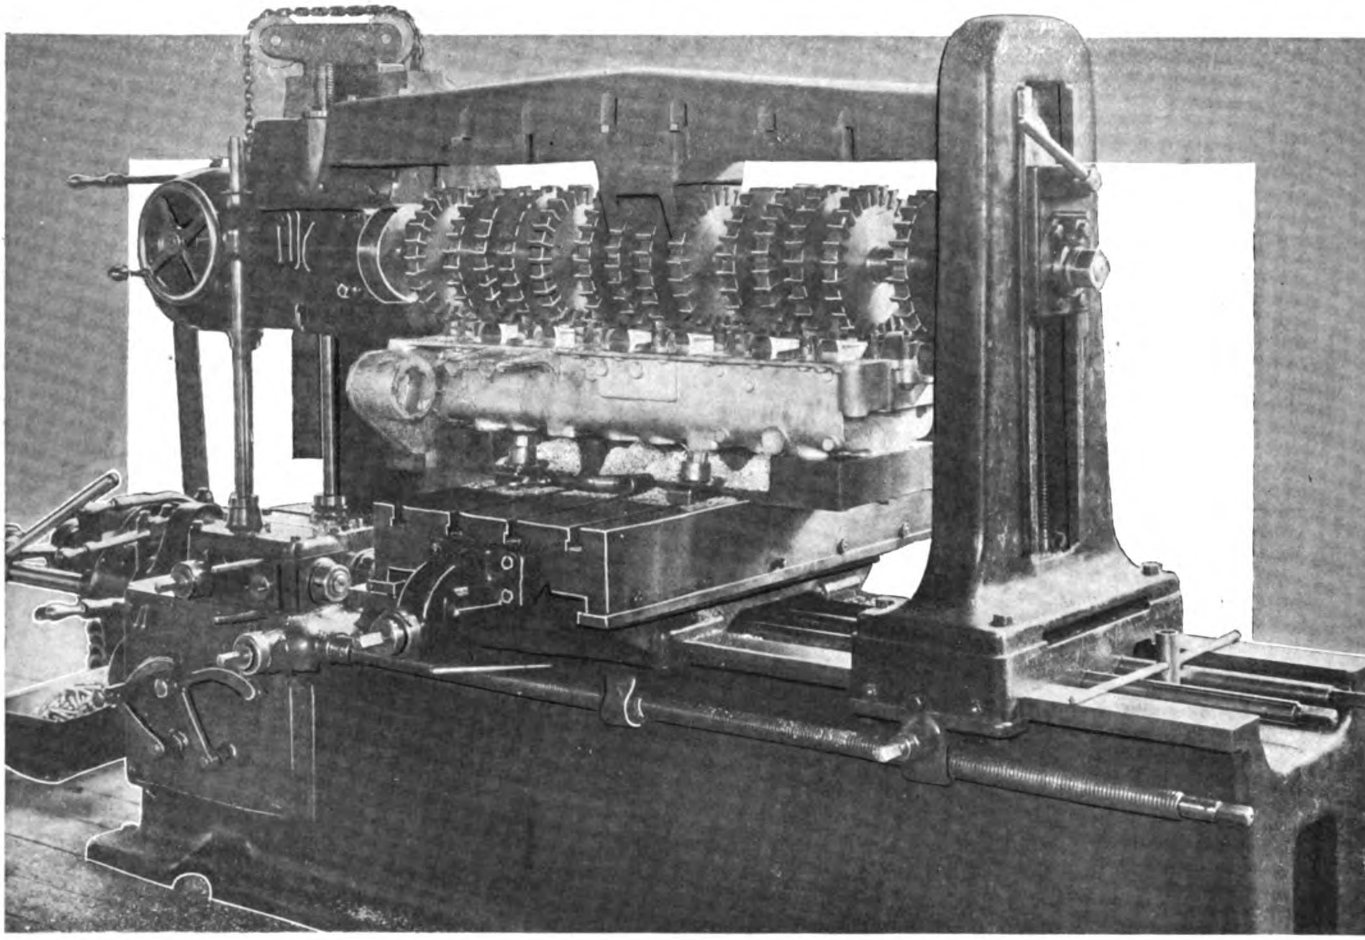
CHANGES OF CAPITAL.

DETROIT, MICH.—Kelsey Wheel Company; increase of capital from $500,000 to $1,000,000.

DETROIT, MICH.—Detroit Socket Company; increase of capital from $40,000 to $75,000.

JACKSON, MICH.—Hayes Wheel Company; increase of capital from $100,000 to $300,000.

TOLEDO, O.—Hupp Motor Car Company; increase of capital from $500,000 to $750,000.



Machine used for milling crankcases in the factory of the Peerless Motor Car Company, Cleveland, O. It mills a crankcase in 25 minutes

The machine depicted above accomplishes a large quantity of work in a very short space of time. It is used by the Peerless Motor Car Company in its factory at Cleveland, O., for milling crankcases. It will be remembered that the Peerless six-cylinder car has a seven-bearing crankshaft so it will be realized that the machine is accomplishing a large amount of work in completely finishing the milling work on one of these crankcases in approximately 25 minutes. The machine can work steadily during the working day of 10 hours and in that time will turn out 25 completed jobs. It requires but one man to run and take care of the machine. As will be noted from the above illustration, the milling of every part requiring this work is accomplished simultaneously. It is very easy to set the job up as the castings to be handled are of aluminum and consequently very light while the table carrying the work can readily be adjusted owing to its easily controlled mounting. The cost of operating this machine is low on account of the small wear on its parts, while performing the work and the fact that it requires but one man to operate it and to set up the work. One setting of the machine is all that is necessary for each job and when the piece is removed from the machine it is finished.

POPE COMPANY DOUBLES CAPACITY—The Pope Manufacturing Company, Hartford, Conn., has its plans nearly completed for a big four-story factory, to be erected to produce a line of lower priced cars. It is expected that this plant will double the capacity of the Pope plant. The accompanying photograph shows the Pope Manufacturing Company's proposed new building.

Packard Kansas Company's Plant—The Packard Kansas City Company, Kansas City, Mo., a subsidiary of the Packard Automobile Manufacturing Company, Detroit, Mich., will build a $30,000 plant at that city for repair works.

Ford Acquires Factory Site—The Ford Motor Company, Detroit, Mich., has acquired 51 acres of land adjacent to its branch plant at Walkersville, across the river from Detroit, with a view of permitting extensions to the plant.

Flanders Plant Enlarged—Extensive additions are now being made to the Flanders plant, Detroit, Mich., which when completed will more than double the floor space and bring up the output fom 3,500 cars in 1912 up to about 15,000 cars in 1913.

Olmstead Company Erects Additions—The Olmstead Traction Engine Company, Great Falls, Mont., which proposes to manufacture traction engines and automobile trucks, has made arrangements to erect two buildings. They are to be 50 by 200 feet in size and will be used for manufacturing purposes, while the other will be the office building.

Grand Rapids Company's Addition—The Page Automobile Hoist Company, Grand Rapids, Mich., is making negotiations with the common council for a lease of the old lighting plant on South Market avenue, which was abandoned when the city occupied its new lighting and water station on Monroe avenue. The business of the company has increased until it has been forced to seek more room.

General Vehicle's $600,000 Building—The General Vehicle has started a $600,000 plant in Long Island City, N. Y., which will form a unit of an extensive plant.

Croxton's Washington Plant—The Croxton Motor Car Company, Cleveland, O., is building a new plant at Washington, Pa., for the manufacture of automobiles.

Peteler Car Company's Building—The Peteler Car Company, St. Paul, Minn., is making arrangements preliminary to the building of a plant on a 23-acre tract recently acquired.

Negotiating for New Albany Plant—The Advance Power Company, Chicago, Ill., is negotiating for the plant of the American Automobile Corporation, New Albany, Ind.

Northway Plant Doubling Capacity—The Northway Motor & Manufacturing Company, Detroit, Mich., is preparing to double the capacity and to this end has awarded a contract for five new buildings.

Oakland to Build Factory Addition—A total of 300,000 square feet of space will be added to the factory of the Oakland Motor Car Company, Pontiac, Mich. These additions will be started at once.

Pontiac Firm's New Factory—The Pontiac Automobile Casting Company, Pontiac, Mich., has recently incorporated and has purchased a five-acre site and awarded a contract for the erection of a one-story building, 40 feet by 100 feet in size.

Hess Spring Company's Addition—The Hess-Pontiac Spring & Axle Company, Pontiac, Mich., maker of automobile springs, will build an addition, 62 by 54 feet, which with the addition now being completed, will double its present manufacturing capacity.

Whiting Company's Addition—The Whiting Manufacturing Company, Hartford, Conn., manufacturer of machine tools and automobile driving chains, is preparing plans for the erection of a two-story addition to its plant. It will be of steel and concrete construction.

Kissel Adds Two Buildings—The Kissel Motor Car Company, Hartford, Wis., recently added two commodious buildings to its plant at that city, and figured that the additional facilities thus provided would enable a less nerve-racking production schedule than that of last year.

Pierce Adding to Assembling Building—The Pierce-Arrow Car Company, Buffalo, N. Y., has awarded contracts for three additional stories to its truck assembling building. The size will be 184 feet by 244 feet, and one additional story will be added to each wing of its three-story body building, the sizes being 60 feet by 402 feet and 60 feet by 325 feet.

Julian Factory Under Way—Work has been started on the construction of the Julian Motor Company's new factory at Messina Springs, N. Y. A building site of 15 acres has been acquired and it is expected that the factory will be in operation by February 1, 1913. The company is comprised of Syracuse men who will put out the highest-priced motors in the country, for automobiles, boats and stationary work.

Peninsular Company Purchases Works—The Peninsular Steel Casting Company, recently formed by men of Detroit and Pontiac, Mich., to make lines of crucible steel castings that are in strong demand in the automobile industry, has purchased the former Michigan Bolt & Nut Works property in Detroit, Work of remodeling, building furnaces and installing equipment has begun and operations are expected to be started within 60 days.

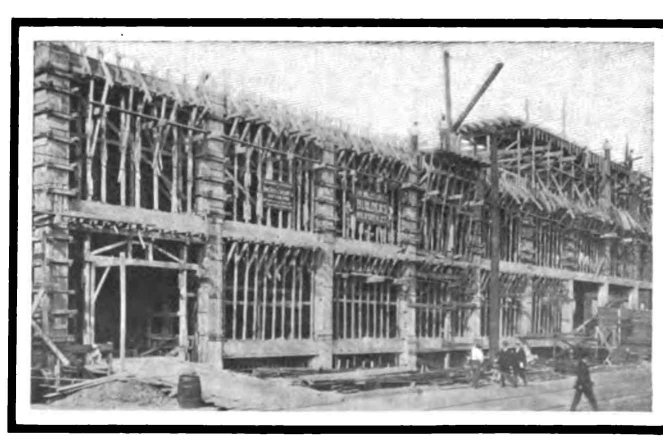
Remy Increases Factory Building—The Remy Electric Company, Anderson, Ind., has started the addition of two fire-proof buildings. The new buildings will give the Remy factory an increase of 10,600 additional square feet of floor space. They will be completed within three weeks. The factory is at present the largest of its kind in the world, employing over 1,000 men and working day and night shifts.

Motor Company Increases Capacity—The Milwaukee Motor Company, Thirty-second and Burleigh streets, Milwaukee, Wis., has completed additions and improvements which will increase its capacity by one-third. The company manufactures motors for pleasure cars and commercial vehicles, furnishing the power plants for all Imperial cars made at Jackson, Mich. More than $70,000 worth of new machinery and equipment has been installed during the summer months. The officers of the company are: President, E. E. Warner; vice-president, John D. Bowers; secretary and treasurer, Charles J. Kaiser.

Trabold Heads Johnstown Concern—Adam Trabold, who is one of the Johnstown, Pa., pioneers in the automobile business, is at the head of a new concern which has for its purpose the manufacture of high-grade trucks. Mr. Trabold has been working on the plans for such an institution for some time, but did not make his intention public until he was sure that a truck could be built that would stand up under the severe roads and heavy grades in that section, at a price that would be attractive to the purchaser of this class of vehicle. The first truck built was recently delivered to the Germania Brewing Company, of Johnstown.

Case Puchases Pierce Company—It is announced that the J. I. Case Threshing Machine Company of Racine, Wis., has purchased the stock, plant and rights of the Pierce Motor Company, of Racine, which has been building the Case car for the big farm machinery works for two years. The Pierce works will at once be consolidated with the immense Case works and lose its identity as a coporation. The change is simply one of name, as the principal stockholders in the Case company in July, 1910, purchased the entire stock issue of the Pierce company from A. J. Pierce, the noted motor designer, and his associates, at the same time that the Case company purchased the entire output of the Pierce works and began to market the cars under the trade name of Case. Thus the Pierce company has been for two years the property of the owners of the Case corporation.

New Fond du Lac Corporation—The R. C. Wells Manufacturing Company, a new corporation at Fond du Lac, Wis., has leased a large plant and will engage at once in the manufacture of electric lighting and starting systems for motor cars. The company virtually is the successor of the Duplex Coil Company, of Fond du Lac, Wis., which recently was purchased by the wealthy Rueping interests from E. J. Huber and his associates. R. C. Wells was the general manager of the concern, which manufactured coils, batteries, ignition devices and electric lighting systems for the motor car trade. The new corporation is capitalized at $200,000, the 2,000 shares being divided into 1,500 common and 500 preferred. The principal product will be an improved electric lighting system designed by Mr. Wells, although the production of all kinds of electrical devices will be continued.



View of the partially completed addition being made to the plant of the Pope Manufacturing Company, Hartford, Conn.

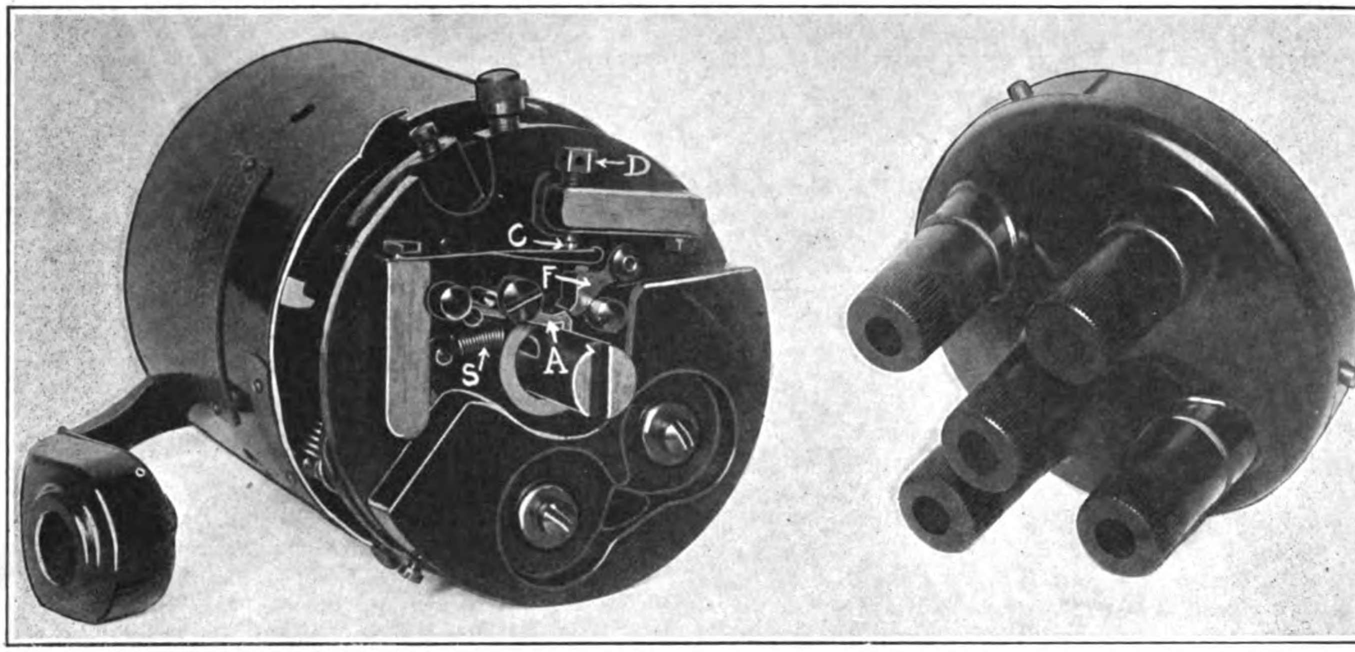


Fig. 1—Showing assembly of new Unisparker with rubber cover plate removed and details of the contact breaker mechanism

New Unisparker Has Automatic Advance

Improved Atwater-Kent Device Precludes Back Kicks—Is Silent in Operation

MODEL K Unisparker is now on the market. It is an improvement on its predecessor in that it embodies an automatic advance which makes it impossible for the motor to kick back when cranking. It is also more silent in its operation; the slight click which is made while making and breaking contact is hardly perceptible.

Realizing the increase in the use of the electric starting and lighting systems with the use of the storage battery for ignition, the Atwater Kent Manufacturing Works have turned their attention for the past three years to an instrument which would be of the utmost satisfaction when used with a battery ignition system. During the last seven years the former type of Unisparker has been on the market. It did not incorporate the automatic advance which is in the improved type but proved so popular that 75,000 of them have been sold during this time. With the introduction of the unique spark control and the added feature of silence the new system, according to the engineers of the Atwater Kent Company, has been brought to a state of perfection.

In appearance the device is cylindrical in shape and, when

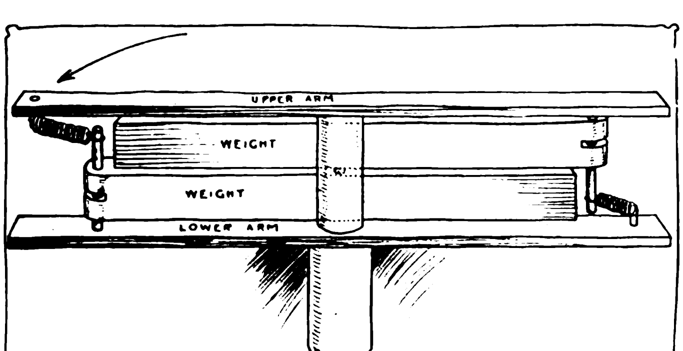

Fig. 2—Diagrammatic view, showing operation of automatic advance

completely assembled, is of the form shown in Fig. 4. The casing is of pressed steel while the cover piece containing the binding posts is of hard rubber. It is mounted on a vertical shaft which is driven at half the speed of the crankshaft. Within the casing are contained the governor which automatically controls the advance, the circuit breaker and the high tension distributor.

The governor is a highly ingenious modification of the regular centrifugal type. The first feature which is noticeable is the complete balance of the revolving parts. The weights, arms and springs which compose the mechanism are symmetrically disposed and remain so regardless of the motor speed. The principle upon which the automatic advance operates is illustrated in the diagrammatic view in Fig. 2. The lower arm marked in the sketch is attached to the vertical half-time shaft and is solidly fixed in relation to this shaft. The upper arm is entirely independent of the lower arm and the vertical shaft to which the upper arm is attached fixedly is capable of turning independently of the lower arm. The upper shaft corresponds to the one which operates the circuit breaker so that it will readily be seen that the time at which the circuit is broken will be sooner or later in relation to the vertical half-time shaft's position according to the position of the upper arm in relation to lower arm.

Assuming the motor to be rotating the lower shaft in a clockwise direction when moving slowly there will be no relative motion between the two shafts. The upper and lower arms will be in the correct relative position to cause the circuit breaker and distributer to give a spark at the correct time for cranking the motor or for driving very slowly. When the motor is speeded up the tendency for the weights to fly away from the center of rotation becomes stronger and the weights move away from the axis of the half-time shaft.

There are two sets of these weights or four weights altogether, one set only being shown in the illustration for the sake of clearness. Each pair of weights is pivoted together at their centers. A cross sectional view as in Fig. 4, shows the pivots which join the weights A, more clearly. When the half-time shaft starts to revolve rapidly, the weights will fly away from the center and at the same time, being pivoted together will rotate in relation to each other, while the pivoted point moves directly away from the axis. Each weight will pull the arm to which it is connected away from the center of rotation and as the weights are connected to the arms on different sides of the center this will give a relative motion of the arms. Since the arms are connected rigidly to their respective shafts the positions of these shafts will change in respect to one another. In order that the weights will not move away from the center too easily and give too great an advance at low speeds, the arms carry springs so arranged that the weights have to act against them when obeying the impulse of centrifugal force and moving away from the axis of rotation. Virtually each weight is a bell-crank lever with one point of connection at the point where it is pivotted to the arm and the other point of connection being where it is pivotted to the weight. The four weights thus give four bell-crank levers which work in the same direction at the same time against the four respective springs.

Referring to the sectional view of the governor in Fig. 4, the weights are shown at A, E is one of the springs connecting the lower arm B with the pivot pin holding one of the weights. B' is the upper arm and C, the connection to the half-time shaft of the motor. The distribution of the weights in the governor is shown plainly in the assembled view in the left side of Fig. 3. The slotted part shown in the illustration is the upper shaft which carries the circuit breaker and the distributer. The weights are labelled W1, W2, W3 and W4, in this view, while the springs are lettered S.

In Fig. 3, the governor and the circuit breaker are shown independently, while in Fig. 1 they are shown assembled. Referring first to Fig. 3 it will be noted that in the shaft with the slotted end there are four nearly crescent shaped indentations on the side of the shaft, one of which may be very plainly seen. The purpose of the indentations on the shaft is the operation of the circuit breaker through the trigger arm A in Fig. 1. As the shaft revolves, the trigger A in Fig. 1 or E in Fig. 4 engages with the slot in the shaft. As the shaft revolves it pulls the trigger with it against the spiral spring S, Fig. 1, or G, Fig. 4. until it has turned so far that the indentation in the end of the trigger no longer has a grip on the slot. The trigger is then released and snaps back, striking on its way the hammer F, Figs. 1 and 4. The hammer striking in turn against the contact spring C will bring the two contact points together and then permit them to fly apart with a make and break action so rapid that the eye can scarcely follow it. It will be noted that the stationary contact point is carried on a spring B instead of directly on the adjustment screw. The smallness of the moving parts and the short distances through which these parts travel reduce the noise to a slight click which is barely perceptible when the cover is on the device. As may be seen in Fig. 4, the wires are led through the casing A and connected to the interior binding posts on either side of the hole through which the wire enters. The current is led to the contact points from these binding posts through flat busbars which are insulated from each other and from the metal work on the interior of the box by hard-rubber and leather washers which are specially prepared to resist a high tension current.

Above the circuit breaker is the high tension distributer. This

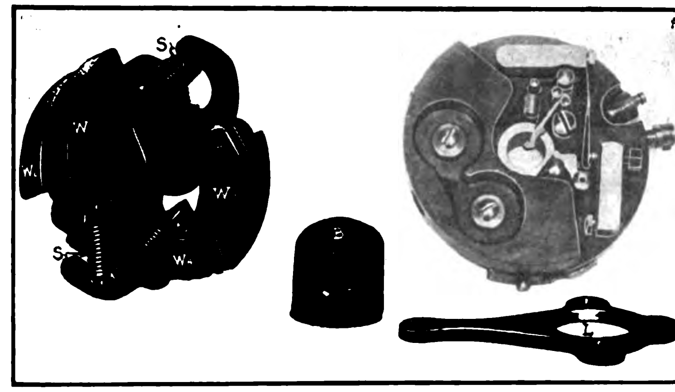

Fig. 3—Illustrating the centrifugal governor and circuit breaker

is shown in the foreground of Fig. 3 and again in Fig. 1. It is a hard rubber block which fits over the slotted shaft shown in Fig. 3. A key within the recess that contains the hard rubber shaft allows the block to become fixed to the shaft and rotate with it. The rubber block carries a segment of bronze which forms a wiping contact with the four distributer points embedded in the hard rubber cover. Each of these contact points is connected with a binding post from which a high tension cable is led directly to a spark-plug. There is no ground connection used rendering the entire system independent of other circuits such as that used for lighting or wiring systems, etc., should the latter become grounded.

One of the greatest advantages claimed by the makers for the Unisparker is that a perfectly synchronized multi-point igntion system may be installed by its use. It is claimed that the automatic advance is so regulated at the factory that two of these instruments could be used for the purpose of double ignition and that the resulting sparks would be simultaneous. The automatic advance feature does not interfere with the hand control of the spark but does in a measure render it useless except to an expert driver. There are very few drivers who carry the spark continually in the correct position. In driving through traffic for instance the speed of the vehicle is changing continuously and a driver has no opportunity to manipulate the spark to take care of every change of speed. For such an occasion the automatic advance is ideal. During the January meeting of the Society of Automobile Engineers in New York, the automatic advance was very thoroughly discussed and the advantages of the system in city work were clearly brought out. In country work, where the driver was not exceptionally skilled the difference in economy with the automatic and hand advance was little if any. With very skilful drivers greater economy was obtained with the hand control.

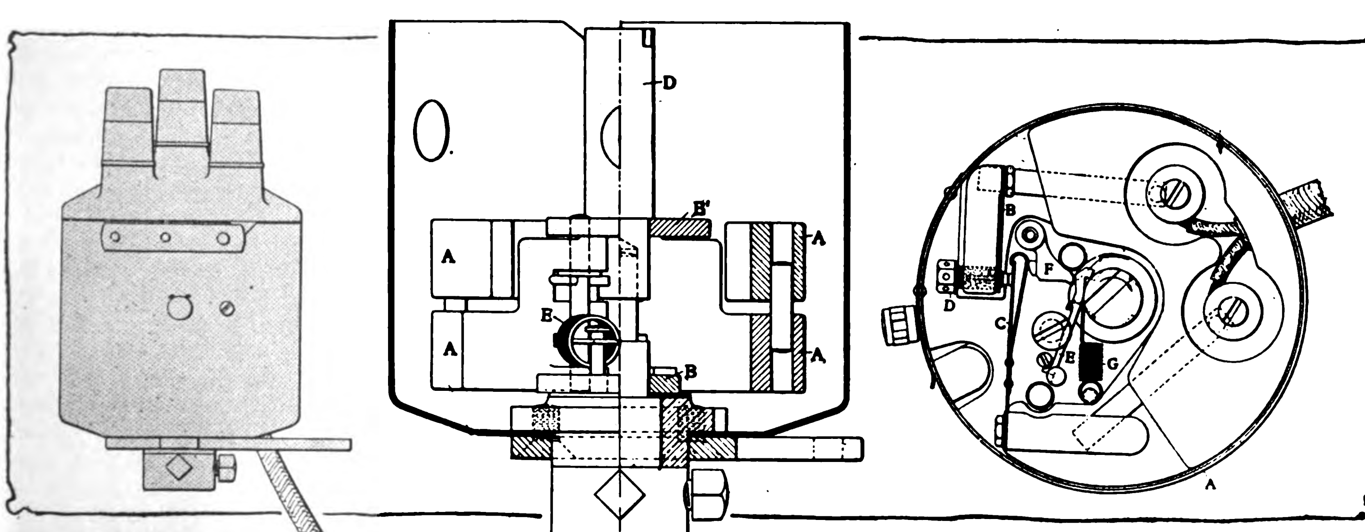

Fig. 4—Exterior view, transverse section through Unisparker assembly and plan view of circuit breaker with wiring connections

Rubber Glove for Steering Wheel; Tire Paint for Waterproofing Shoes; Cementless Inner Liner; Buggy Reach for Light Runabouts; Device for Turning Headlights in the Direction of Motion; Silver Plating Preparation

Steerease; a Rubber Wheel Grip

THE purpose of this article is to provide a good non-slipping grip on the steering wheel. It is made of rubber and slips over the rim of the wheel, being held in place by cement and its own elasticity and fit. This article, which is illustrated in Fig. 3, Steercase, replaces twine, rope and tape wrappings on the steering wheel and overcomes the principal objection to these, which are their unsightliness and the tendency of all windings of cord or rope to be tight on the inside of the steering wheel, but loose on the outside. The rubber used in the Steerease grip is moulded to the form of the steering wheel and does not require any preparation for putting it in place. It is simply slipped over the wheel and is then ready for use. The quality of the grip which it is possible to get on the wheel is better because the rubber is corrugated to such an extent that the hand cannot slip. A small flap on the rubber handle is left at each steering wheel spoke and as may be seen in the illustration the wheel grip is so designed that the ends of the spokes pass through the projections on the rubber giving a very neat and close fit all over the wheel. To apply Steerease, the steering wheel is thoroughly cleaned and dried to remove all moisture and grease from the surface. When thoroughly clean the Steerease is slipped over the wheel, adjusting the rubber neatly to shape and seeing that the edges fit closely together. The edges are then trimmed to conform to the spokes, should this be necessary, and then turn the edges back and apply the cement which accompanies the Steerease outfit. Allow the cement to spread as much as possible to secure a firm, solid grip and then wind with tape to hold the rubber in place. Let this stand over night, when the tape can be removed and the work is finished. Steerease is made by the Goodyear Rubber Hose and Parking Company, Philadelphia.

A New Preservative for Tires

Preserv-O is a tire paint packed in a cylindrical tin can with a friction cover. The can holds enough paint to cover six large tires. The object of the paint is to give a waterproof covering to the tire that will not only cover the exterior part of the casing, but will penetrate into the cuts and crevises, thus preventing water from working its way into the fabric and ruining the tire in a short space of time. The use of this paint will make the tires look like new, giving them a new white appearance. It is claimed by the makers that nothing is used in the paint that is not used in the manufacture of the tire itself. The preparation is made by the Atlas Auto Supply Company, of Chicago, Ill.

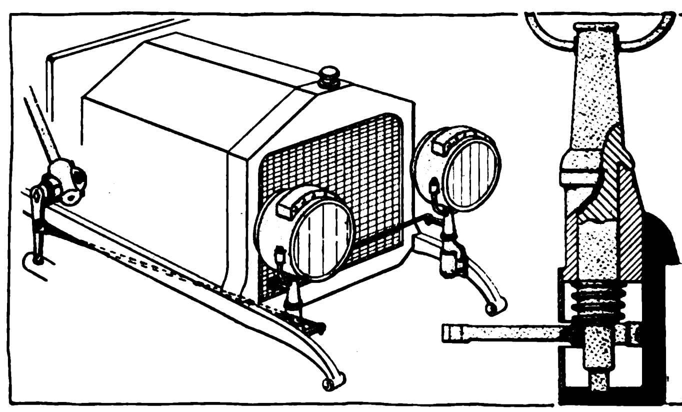

Fig. 2—Peters headlight turner interconnected with steering gear

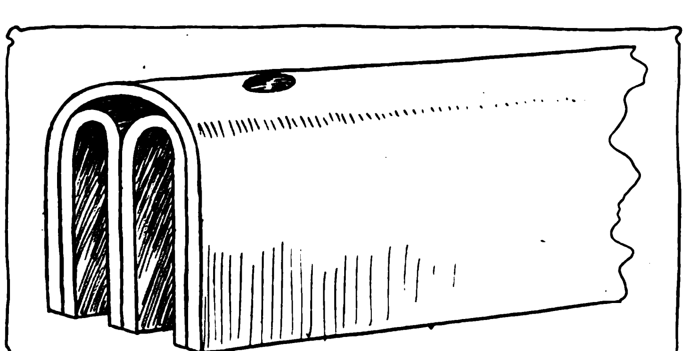

Fig. 1—A buggy reach suggested for use in light runabouts

Self-Vulcanizing Inner Liner

This is an inner liner which vulcanizes itself to the casing without the aid of any cement. It is made by Hagstrom Brothers Manufacturing Company, Lindsborg, Kan., who claim that a product of this kind has long been desired owing to the impossibility of getting the right kind of cement to fit the ordinary inner liner while on the road. A section of the inner liner is illustrated in Fig. 4. It is composed of four-ply, best quality Sea Island cotton thoroughly filled with raw rubber. There are no seams in the liner and special care is taken that there shall be nothing on its surface to chafe the inner tube. They are vulcanized at the factory to the exact shape of the tire and are given a soft cure. The adhesive property is given to the inner liner by a heavy coating of pure raw rubber cement which, it is stated, will positively not crumble or disintegrate under the stress of travel. The inner liner can be inserted on the road should the tire give evidence of being weak and will make the casing last for a sufficient length of time to carry the car through several hundred miles. It is applied by washing out the casing with gasoline and also the outer surface of the inner liner. When the gasoline on the latter has evaporated sufficiently to leave a sticky surface the liner is then gently inserted in the casing until it is flat against it around its entire surface. The flaps, which will be noted in the illustration, are then pulled out and passed around the bead of the shoe to be held by the clincher ring, thus preventing any tendency to creep.

A self-vulcanizing outside blow-out patch, which is also new on the market, is shown in the same illustration. This is put on over the shoe where the blow-out has occurred and will vulcanize itself firmly to the shoe, forming a fixed support for the weakened spot and not permitting sand or water to work its way into the shoe and destroy its integrity. The application of the outside patch is taken care of in the same way as the inner liner. The outside of the shoe is thoroughly cleaned by washing with gasoline and the interior of the blow-out patch is rendered sticky by the same kind of treatment. The patch consists of the same material as the inner liner, being Sea Island cotton thoroughly impregnated with raw rubber. It is made heavier, however, to take care of the wear which will be imposed upon it while acting as the tread of the tire for the time being.

Bryant Steel Runabout Reach

A steel reach has been brought out by the Rochester Pressed Steel Company which is designed to replace the wooden reach or the steel reach with the metal filler. The material used in the reach, a section of which is shown in Fig. 1, is high carbon annealed steel of from 19 to 20 gauge. The advantages claimed for the reach are that it cannot rumble, will cost no more than second-growth hickory which has been properly ironed and that owing to the double U-section it is impossible for it to buckle under the stresses of ordinary running. The bolt holes in the reach are not drilled but are embossed or corrugated, forming a supporting wall for the bolt. The hole is punched so that no stock is removed in cutting the hole.

Automobile Headlight Turner

This is a device for turning the headlights in the direction that the car is tending to go for the purpose of examining the state of the road on that side of the car. Ordinarily the rays of light which are thrown out by the parabolic headlight reflector do not permit of the illumination of the roadside and as a result when a turn is made the car is forced to traverse a dark stretch of ground which may be full of holes, broken bottles or any of the other perils of the road. The lamps are mounted on brackets which in form are similar to the ordinary brackets used on the stationary light. As illustrated in Fig. 2, the upright posts are pivoted and held in their correct positions by spiral springs which also check vibrations and permit no noise to emanate from this source. The interior construction of the bracket is shown in the sectional view. The main standard consists of a casting, bolted rigidly to the frame, within which the movable spindle, which supports the lamp fork, is pivoted. A

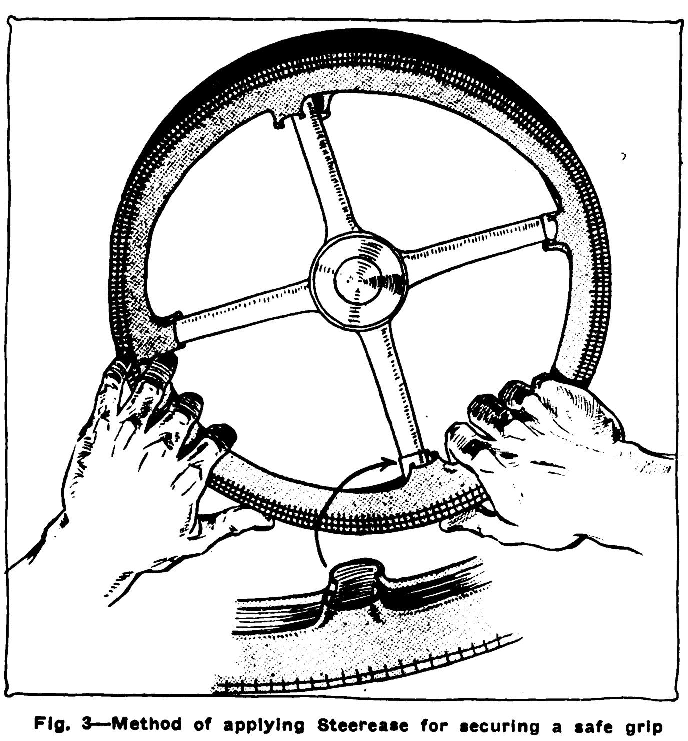

Fig. 3—Method of applying Steerease for securing a safe grip

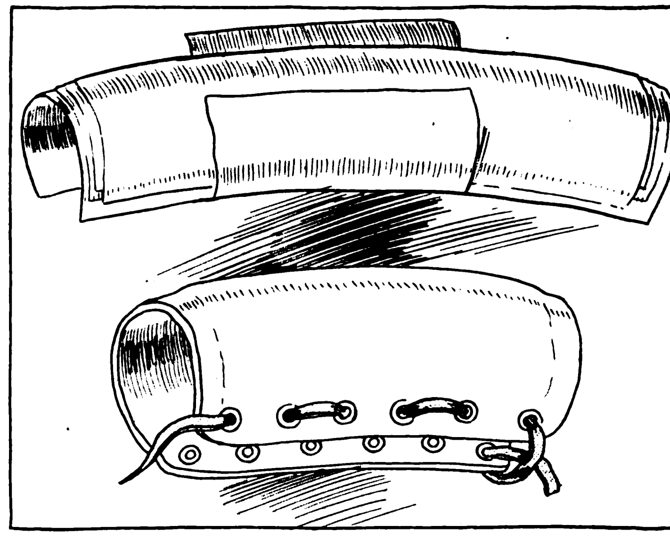

Fig. 4—Section of Hagstrom inner liner and outside blowout patch

spiral spring holds the spindle down in contact with a dust-proof bearing at the top of the stationary bracket, bearing against the shoulder on the spindle. Below the sprong, which is seated on its lower portion against a strap iron bracket, the spindle shank is square, and arms are disposed thereon. These arms extend behind the column and are connected by a tie rod. To one of the brackets is attached an additional control arm, which is connected by means of another rod to the steering arm, as shown in the illustration. All working parts with the exception of the two rods just mentioned are concealed and out of the way. H. D. Peters, of Sioux Falls, S. D., is the inventor.

Silver-Quick for Silver Plating

One rub with this material will silverplate brass or copper. Silver-Quick is a milky liquid put up in bottles holding about one pint. It has a smell similar to that of most metal polishes employing whiting as a base. To use Silver-Quick the article to be polished should be cleaned thoroughly and wiped dry. The bottle containing the preparation should be shaken to thoroughly mix the ingredients, which are held in suspension. A piece of cheesecloth is then saturated with the solution and rubbed on the surface of the article to be plated. Although it generally requires but little rubbing before the desired polish will be given the article, the application of the preparation should be continued until the entire surface has reached the desired polish. There will be a white deposit left after Silver-Quick has been used on a metal and this must be removed immediately with a dry cloth. After a week it would be well to replate the metal as this puts a thicker coat on the brass or copper and renders it more easy to take care of. After the metal becomes tarnished Silver-Quick can be used as a polish. This is one of the Atlas Auto Supply Company's products. This concern is located in Chicago.

Twentieth Century Tire Protector

An improved Twentieth Century tire protector has been brought out and called by the 20th Century Tire Protector Company, of Midlothian, Texas., the model 1913. It is of leather with a heavily studded tread. Its construction is of one-ply of chrome tanned leather which covers the casing from clincher bead to clincher bead. On the center of the protector is placed a tread which is built entirely independent of the body of the protector itself. It consists of two plies of imported Swiss leather tanned by a process which permits it to remain pliable after exposure to dampness. This tread is studded with hardened steel rivets which pass through the two thicknesses of leather on the tread and are clinched on the under side by a machine which presses the two prongs on the rivets far enough into the leather to make it perfectly smooth. The Swiss leather tread is attached to the main body by two rows of rivets.

Patents Gone to Issue

CARBURETER Construction—In which the unit controlling the air-flow consists of a funnel-shaped tube fitting into the mixing chamber port.

The carbureter described in this patent, Fig. 1, is of the float-feed type. The gasoline enters at G and passes through the float chamber inclosed in the container shell C to the air-controlling unit, which comprises, principally, a tubular shell S fitting into a central passage leading from the lower portion of the carbureter container into the mixing chamber. The shell is formed with a downward flaring portion fitting into the central passage mentioned above, while the upper portion of the shell, which is of lesser diameter than the flaring one, is surrounded by a retaining ring R. To hold the shell securely in position relative to the ring R a coiled spring S_1 is interposed between them. Throttles T and T_1 serve to regulate the amount of mixture supplied by the carbureter to the motor.

No. 1,037,834—to John W. Raymond, assignor to the Air Friction Carbureter Company, Dayton, O. Granted September 3, 1912; filed October 9, 1911.

Self-Contained Spark-Plug—In the interior of which a high-tension vibrating coil is located.

The spark-plug, Fig. 2, described in this patent comprises a moistureproof case portion C in which a spark coil C_1 and condenser are contained, which are connected to the outside of the casing, permitting of wiring the plug to a battery. A cap C_2 closing the coil case carries a vibrator V which may be connected to the coil makes a tight, frictional fit with the case C. The lower portion of the plug case is fitted with sparking electrodes.

No. 1,036,760—to Ernest V. Wilcox and Burton L. Lawton, assignors to the Connecticut Telephone & Electric Company, Meriden, Conn. Granted August 27, 1912; filed November 11, 1911.

Force-Feed Lubricator—In which a semi-rotary pump casing makes communication between oil outlets and inlets of the lubricator.

Fig. 3 shows the lubricator referred to in this patent, which consists of a fixed member F having a circular series of alternately arranged oil inlet and outlet ports and of a semi-rotary casing C which bears on the part F and carries a circular series of pump barrels. At the lower ends of the latter are ports which register in turn with inlet and outlet ports of the fixed part F. Pistons are moving in the pump barrels, which are reciprocated at the same time as the pump casing C is imparted a semi-rotary movement.

No. 1,036,929—to Hjalmar A. Swanson, Chicago, Ill. Granted August 27, 1912; filed December 1, 1911.

Motor Lubrication System—In which the overflow of oil is passed from the crankcase through a relief valve to the cylinder walls.

The method of lubricating a hydrocarbon motor described in this patent comprises the use of means for feeding oil under pressure to the crankshaft bearings and of a relief valve in this oil lead. The oil passing the relief valve is delivered to the interior of the motor cylinders and lubricates the pistons.

No. 1,036,756—to Sidney D. Waldon, assignor to the Packard Motor Car Company, Detroit, Mich. Granted August 27, 1912; filed June 16, 1912.

Automobile Engine Starter—In which the engine is cranked through a system of gears.

This patent refers to an automobile engine starter and consists of a starting shaft which may be moved longitudinally and rotated, being adapted to be engaged with the crankshaft by a clutch member. A gear is mounted on the starting shaft, being in mesh with a second gear mounted on a second shaft. On the latter shaft is also mounted a third gear wheel by means of a feather and spline connection. This gear is capable of being engaged with or disengaged from the second gear mentioned, means being provided for this purpose. Other means serve for imparting longitudinal movement to the starting shaft, whereby it is engaged to the clutch member of the crankshaft. On the second shaft mentioned above a ratchet connection is mounted by means of which intermittent rotary motion may be imparted to the shaft.

No. 1,038,286—to Edward M. Card, Bridgeport, Conn. Granted September 10, 1912; filed September 5, 1911.

Vol. XXVII　　New York—October 3, 1912—Chicago　　No. 14

The Automobile

De Palma Wins Vanderbilt Cup

Elgin Victor Repeats at Milwaukee—Averages 68.97 Miles Per Hour—Hughes, in Mercer, Second at 68.79 Miles an Hour—Tetzlaff, the Favorite, Leads Until Out in Lap 26—Pace Slower Than in 1911

IN the longest Vanderbilt Cup race on record, Ralph De Palma drove Mercedes 22 across the finishing line in front of the swift Mercer entry handled by the skillful Hughes, winning the classic in the comparatively slow time of 260:31, with a margin of 1 1-4 minutes. De Palma's victory, though well deserved and clean cut, was not the feature of the struggle. The meteoric flight of the Fiat under the handling of the dashing Tetzlaff and the bitterly hard luck that overtook the Italian car deserves its share of the limelight. Tetzlaff's mount made the pace from the drop of the flag and steadily increased its lead right up to the minute it succumbed. It made some rounds at the rate of better than 75 miles an hour and had lapped the whole field when the misfortune came. A broken driveshaft on the back stretch tells the story.

While the day was delightful overhead and under foot and the course better than at any time since it was selected, the time made was disappointing. The drivers took as few chances as possible and avoided jamming on the turns. The effect of this care is to be seen in the summary which contains the record of no accident. It did not make for record-breaking, however.

The course of the race was fractionally under 300 miles and is about 9 miles longer than the race of last year, which was won by a Lozier in record-breaking time, averaging 94.07 miles an hour.

It was faster than the Alco's time in 1910 or any of the previous marks established for the classic.

Even if the Fiat had stood up to the end, it is unlikely that the Lozier's time last year would have been equalled.

The race was thirty-eight laps of a course measuring about 7.88 miles around. Five cars completed the full distance and the Lozier entry was running at the end, but had completed only twenty-six laps.

The race of the Mercer was wonderfully good as Hughes was well up with the more powerful Mercedes pair throughout, outspeeding the Wishart car in the final quarter and causing De Palma to open his throttle to keep out from under foot.

The Stutz made a gallant showing, running the steadiest race of the field, reeling off round after round in a little over 7 minutes. The car lacked the supreme power to take the pace, but the remarkable sturdiness displayed attracted an immense amount of interest.

The Wishart and Clark Mercedes cars were in the hunt to the end, ready to come on and win if anything happened to the leaders. This did not eventuate as it happened,

Ralph De Palma, Winner of 1912 Vanderbilt

THE SUMMARY

No. Driver	Car	M.P.H.
1—De Palma	Mercedes	68.97
2—Hughes	Mercer	68.79
3—Wishart	Mercedes	65.
4—Anderson	Stutz	64.6
5—Clark	Mercedes	61.6

Teddy Tetzlaff in the Fiat leading the field at over 74 miles an hour in the Vanderbilt cup race at Milwaukee

but they performed with credit to themselves and the drivers.

The Knox had a short airing, succumbing in lap 5, after encountering trouble in two of the earlier rounds. It did well while it was going, but it did not go far. Magneto trouble was announced as the cause of the failure of the Knox.

A magnificent crowd witnessed the running of the race, it being estimated that the stands and points of vantage contained at least 50,000 enthusiastic spectators.

The sentiment of the crowd was with Tetzlaff's Fiat, and as the big car took the pace and whisked away from its competitors in the early stages of the race the Californian was cheered repeatedly by the assembly. He kept shooting the car along under this encouragement and as events proved out his pace was too fast. He was fortunate with his tires and was obliged to draw up at the pits only once. This came in lap 19 and for the first time thus far in the race the Fiat failed to gain on the average time of the contenders. The round was made in about 8 1-2 minutes, and when he started away once more the lead of nearly 10 minutes was not materially reduced.

At this point in the contest the majority of the crowd was willing to concede victory to the Fiat, but the contending drivers, notably the cool, crafty Hughes and the mercurial De Palma, maintained their slower pace in anticipation of just what did happen to the flying leader.

It was a magnificent bit of generalship which was largely overlooked by the crowd, but it paid dividends in the final result. This pair could not be persuaded to sprint with Tetzlaff, but they hung on each other's skirts for 100 miles, waiting, waiting, like a pair of hawks. They nursed their cars carefully, changing tires together and taking supplies as nearly as possible at the same time.

To those who were motorwise in the crowd, this duel was the most beautiful thing about the contest. They both seemed to realize that the Fiat could not survive such a terrific beating as she was getting from the Californian and that the final test would be between them.

The big German car and the little yellow Jerseyite proved to be well matched and the finish, while not so close as some of those developed in Vanderbilt Cup races, was close enough to keep the crowd on tiptoe.

That the Mercedes won was due to the extra power of its motor and the handling it received from a great driver.

As to the Mercer, it can be said that considering its size it made the most wonderful showing ever displayed in a Vanderbilt Cup race.

Although only five cars finished, their performance was consistent throughout and there was plenty of excitement for the 50,000 spectators who lined the course, mostly at the grandstand. Although no records were broken, the time was much faster than was anticipated by the officials of the meet and it looks good for the balance of the race to be run during the week.

De Palma, who crossed the tape well in the lead of most of his competitors, was wildly cheered by the spectators when he strolled back to the grandstand after putting his faithful Mercedes in its camp. It was easily seen that the big crowd was with the plucky driver, although they were sorry for the misfortune that befell Teddy Tetzlaff, who had driven at a daredevil pace until misfortune overtook him. De Palma drove a consistent race and the victory was deserved, coming as it did for the second time this year.

Considering the fact that the race was over a new course, the time which was made may well be regarded as remarkable. Every one rejoiced at the propitious weather conditions as well as at the state of the course which permitted the race to be run off in such good order from the viewpoint of both participants

RACE OF 299 MILES AND 2764 FEET (THIRTY-EIGHT LAPS OF THE COURSE) FOR THE

No.	CAR AND DRIVER	Lap Miles	1 7.88	2 15.76	3 23.64	4 31.52	5 39.40	4 47.28	7 55.16	8 63.04	9 70.92	10 78.80	11 86.68	12 94.56	13 102.44	14 110.32	15 118.20	16 126.08	17 133.96	18 141.84

Ralph Mulford in the big six-cylinder Knox taking a sharp turn on a back stretch of the course early in the race

and spectators. The latter were intensely interested and enthusiastic throughout the contest, cheering madly whenever a favorite driver forged to the front or made a spectacular maneuver and feeling correspondingly depressed when some one was obliged to retire. This was especially marked when Teddy Tetzlaff failed to finish the twenty-sixth lap and was officially declared out of the race on account of his driveshaft breaking on the back stretch of the course.

But the most interesting way to follow an automobile race is to watch it as it progresses, lap by lap, observing the changeful aspect of the situation, so let us begin at the starting line and keep right up with the field to the finish:

The Vanderbilt 7.88-mile race course is in very good condition, the best it has been so far. The weather is ideal and fast time is looked for, although the spirits of some of the drivers are somewhat dampened by yesterday's accident. There are no damp or soft spots and those parts of the course which were in bad shape a week ago have been carefully rebuilt. Fast time should be made.

De Palma in his Mercedes was the first at the line. Hughie Hughes, in the yellow Mercer, was beside him. Back of them were Mulford, in the Knox, and Nelson in the Lozier. The third pair consisted of Wishart, in Mercedes 26, and Anderson, in his Stutz. Clark, who disabled his car at Elgin, was at wheel of the third Mercedes, and he, together with Tetzlaff in the lone Fiat, brought up the rear. Pullen, who was to have driven Mercer 21 was disqualified by the technical committee yesterday because the piston displacement of his car was below the necessary 301 cubic inches. This made the number of starters eight. De Palma got a bad start and did not jump into motion as he usually does. Although his start was slow, he quickly shot away amid the cheers of the 50,000 spectators and the race was on.

Hughie Hughes came in for an equal amount of cheers and was off to a quick start with his Mercer.

The others came in for a like amount of applause and were off in the order mentioned.

Tetzlaff, the last to start, was easily a favorite with the vast throng. It was as though they looked to him to carry off the Fiat honors for himself as well as for his dead team-mate.

At the first lap, De Palma, Hughes and Mulford were running about evenly, although Tetzlaff appeared to be gaining. Wishart came next, having passed Nelson. Tetzlaff followed and was trailed by Clark. Tetzlaff tore past the stand and made the fastest lap of the bunch, completing the circuit in 6:27, at the rate of 73.4 miles an hour. At the end of the initial lap the order was Fiat, Knox, Wishart, Mercedes, De Palma, Mercedes fourth, and Hughes and Clark tied for fifth with Stutz seventh and Lozier last.

On the third lap, Tetzlaff was in the lead, closely followed by De Palma. Then came Clark, Wishart, Anderson, Hughes and Nelson in the order named. Mulford was held on the back stretch for engine trouble. The next lap saw no change in the positions of the two leaders, although Wishart changed places with Clark. The others retained their third-lap positions. Mulford bringing up the rear. On his fourth lap, Nelson stopped at pit on account of engine trouble. He was obliged to stop for 3 minutes on back stretch for the same reason.

Mulford was again forced to stop in his fifth lap for magneto trouble.

The trouble proved of such serious nature that Mulford was obliged to quit the race.

Clark was forced to stop on the back stretch in his fifth lap, which put him in fifth place and gave his former position to Anderson in the Stutz.

Hughie Hughes, who captured second place in the Vanderbilt with a Mercer

On his sixth lap, Nelson's Lozier developed brake trouble which put him out of the running, although on the stretches he appeared to be going well.

On the ninth lap, Tetzlaff was still way ahead, his average for the nine laps being 74.9 miles an hour. De Palma still second in the seventh lap, had covered a distance of 55 miles at an average speed of 70 miles.

It was in the ninth lap that Wishart, in Mercedes 26, succeeded in nosing De Palma out of second place. This Wishart held for three more laps, but on the twelfth, he was forced to stop at the pit to change a tire. This gave the second place to De Palma again. But all this time, Tetzlaff was fairly burning up the course, completing twelve laps or nearly 95 miles at an average speed of 75.4 miles an hour.

At the end of lap 13, with the race practically one-third run, the Fiat had established a commanding lead of almost 5 minutes and was going steadily at the rate of approximately 74 miles an hour. De Palma's Mercedes had maintained second place but was gradually losing. Wishart was third, ahead of the fast coming Mercer. The Stutz held fifth place with the Clark Mercedes and Lozier trailing, the latter completely distanced.

In the fifteenth lap, Wishart again forged ahead of De Palma. The latter was forced to stop at the pit to replace a tire. While at the pit, he also took this opportunity to replenish his oil and gasoline tanks. This allowed Wishart a lead of 22 seconds over De Palma, these two cars furnishing a neck and neck race so far.

From the ninth lap through the first half of the race, or about 150 miles, Hughes ran consistently in fourth position, while Anderson in the Stutz, Clark in the Mercedes, and Nelson in the Lozier, followed in the order named.

As to the three leaders, no change in their respective positions occurred from the fifteenth lap on through the nineteenth, or century and a half mark.

Considerable tire trouble developed thus far in the race, although up to this time Tetzlaff has not been troubled with his tires.

On his nineteenth lap however, he slowed up at the pit to the dismay of the crowd. A left rear tire was replaced and at the same time, water, gasoline and oil were taken on.

On his twelfth lap Clark lost time by misjudging his stop at the pit and being obliged to back up. He changed both rear tires and also took on gasoline.

De Palma's right rear tire had to be changed on the fifteenth round, in which operation 39 seconds were consumed.

Laps twenty and twenty-one were troublesome for several of the drivers although they made remarkably quick changes at the pits. Wishart took 28 seconds to replace a rear tire, a speed record for this operation.

At the start of the second half of the grind, Tetzlaff looked like a sure winner, he being 7 minutes ahead of his nearest rival, Wishart.

At the beginning of the twentieth lap, the contestants stood: Tetzlaff, De Palma, Hughes, Wishart, Anderson, Clark and Nelson. This order held for the next lap, but in the twenty-second, Hughes relinquished his position to Wishart. The former was obliged to stop at the pit for gasoline, oil and water.

Hughes, however, hit it up after thus rejuvenating his car and regained his former position in third place on the twenty-fourth lap. The other cars maintained their positions as at the start of the second half. On the twenty-second lap Anderson was obliged to stop at the pit for oil and gasoline, while in the twenty-third, Wishart had to stop to replace a front tire. Tetzlaff's average speed for twenty-five laps was 72 miles an hour, De Palma's 69.1, Hughes' 67.9 and Wishart's 67.4.

Tetzlaff died in front of lap twenty-six, while leading his field by almost 7 minutes, having averaged 72 miles an hour De Palma finished the lap in the lead. The Fiat had made the pace from the start and averaged fully 3 miles an hour faster than the next speediest up to the moment of withdrawal. The car was timed at 197 miles. The Mercer was second, 3 minutes behind De Palma. Wishart, Anderson and Clark followed in the order named. Nelson succumbed in lap twenty-five.

It was in his twenty-sixth lap that misfortune overtook Tetzlaff, when the drive-shaft of his big Fiat broke on the back stretch, putting him permanently out of the race. After going 205 miles, at an average speed of nearly 75 miles an hour, he was obliged to sit by the wayside and see the honors go to one of his rivals when it seemed almost certain that the race was his. Tetzlaff's hard luck recalled De Palma's fate at Indianapolis last June, and there was a murmur of dismay from the crowd when the husky voice of the announcer proclaimed that Teddy Tetzlaff, easily a favorite with them all, was out of the running for keeps.

Tetzlaff's fastest lap, and which proved to be the fastest lap of the race, was his third, when he completed the circuit in 6 min. 15 sec., an average speed of 75.70 miles an hour. This was 1.35 faster than the average time of last year's Vanderbilt.

With Tetzlaff's misfortune, De Palma took the lead, never losing the premier position from then on to the end, driving the remaining 94 miles at a dare-devil clip.

Nelson in his Lozier rounding the southeast corner of the course near the city limits

Tetzlaff out, Hughie Hughes, in his Mercer, assumed second position. It was only a matter of seconds between him and the leader to the end. Wishart was now third, Anderson fourth, Clark fifth and Nelson sixth. Excitement was running high, for it was seen that, should anything happen to De Palma, Hughie Hughes would be the victor. Only the time required for a tire change separated the leaders.

De Palma and Hughes knew this full well. On the back stretch on his 28th lap, De Palma blew a tire, but this did not materially affect his time, he running to the pit to make the change. On the 29th lap, De Palma led the Englishman by 1 minute 50 seconds.

The 29th lap proved disastrous for three of the cars, although from the 26th on to the end of the race there were no changes of the positions of the contestants. After the 27th lap, the list was cut down to five cars. Nelson in the Lozier in this lap withdrew from the race because he was too far behind. Wishart was obliged to put a new chain on his Mercedes on the back stretch in the 29th lap, while in the same lap Clark, Anderson and De Palma were obliged to call at the pits for new tires for the rear of their cars. Again in the 31st lap, De Palma was forced to stop for a tire change, but Hughes in the following lap had to stop for gasoline and water, which practically evened things up. The other cars were still in the positions which they had held from the 205th mile.

Although De Palma and Hughes were traveling at a terrific pace, their speed was considerably below that which Tetzlaff had set earlier in the day.

De Palma's average speed was 68.9 miles an hour, about 5 miles less than that of Tetzlaff.

On the 33d lap the Italian led by 30 seconds, but Hughes cut this down 1 second ere another circuit had been made. At the end of the 35th, however, De Palma had increased his lead by 8 seconds. He now had the best of his rival in the yellow Mercer by 46 seconds. Again Hughes cut this down, when, after completing 36 laps, he was found to be only 39 seconds in the rear. Two laps later, however, when De Palma flashed across the tape winner of the eighth Vanderbilt cup race, Hughes was still at about the same position. The other cars finished in good shape, Wishart being the third to receive the checked flag, followed by Anderson and Clark. The latter had tire trouble in his 35th lap.

De Palma's time for the distance of 299 miles 27.64 feet was 260 minutes 11.54 seconds, making an average of 68.9 miles an hour for the entire race.

Hughes completed the distance in 261 minutes 14.24 seconds, averaging 68.8 miles per hour. Wishart's time was 276 minutes 35.75 seconds; Anderson's was 279 minutes 40.95 seconds, while that of Clark was 291 minutes 39.75 seconds.

These speeds are good, considering that the course has sharp turns and there are severe grades. For a new course the racing fans should feel well satisfied with the results.

Bruce-Brown's Fatal Accident

The late David Bruce-Brown

MILWAUKEE, WIS., Oct. 1—David Bruce-Brown, millionaire racing driver, died this afternoon at 3:15 at the Trinity hospital here, from a basal skull fracture as a result of the ditching of his Fiat car, in which he was speeding at the rate of about 82 miles an hour on the Wauwatosa course, while in practice for the Vanderbilt Cup race which is to be run tomorrow. His mechanician, Anthony Schudelare, whose skull was also fractured, lies at the point of death.

The accident occurred on the back stretch shortly before 1 o'clock when the entrants in tomorrow's big event were at the height of the day's practice. One of the rear tires of the big Fiat exploded, causing the car to lurch into the ditch. In a vain attempt to right the machine Brown jerked the wheel in the other direction causing the car to jump to the opposite side of the road. Both driver and mechanician were pitched out of the car, which turned over and crashed through a fence. Brown and his mechanician were picked up unconscious by farmers who had witnessed the accident. Word was immediately conveyed to the officials and both men were rushed to the Trinity Hospital where they were operated upon. Brown never regained consciousness. The accident occurred on the lap following that in which Brown had made the circuit in 5:53.82, unofficially establishing a new world's speedway record at 82.2 miles per hour.

The first inkling of the disaster reached the grandstand and officials when Tetzlaff, Bruce-Brown's team-mate, in another Fiat drew up before the stands to inquire where Brown was. Tetzlaff missed the other car which had been close behind on the back stretch. Meager reports of the disaster began to come in soon after. To have escaped disaster after blowing a tire while traveling at such a terrific speed would have been nothing short of a miracle and the accident can in no way be ascribed to the condition of the course, which has been put in excellent shape since a week ago when the races were at first scheduled to take place.

Although practice was called off immediately after the accident, the unfortunate occurrence will in no way interfere with the running of the Vanderbilt Cup race tomorrow as scheduled.

David L. Bruce-Brown was born in New York City, in 1887, and began racing in 1907. His first appearance was in an Oldsmobile at the Empire City track, where he won his first race. In 1908 he acted as mechanician for the late Cedrino at Ormond Beach. His two most brilliant victories were the Grand Prize races at Savannah in 1910 and 1911, the latter in the same Fiat which he was driving today.

In the French Grand Prix this year, he won the first leg of the 2-day event, and finished third, but was disqualified for taking on gasoline outside a regulation station.

As a racing driver Bruce-Brown was looked upon as the best, not only in America but in the entire world. Built around a rugged framework were as stout a set of muscles as any athlete of his age and height could boast of, a fact which made the racing car more or less of a plaything in his hands so far as guiding it on the highway. Born in 1887, he began driving in 1907 when but 20 years of age. His first appearance was in a race at Empire City track in 1907. The following year brought him into the limelight at the Florida beach races where he acted as mechanician to Cedrino and also drove his Fiat, establishing new amateur beach records. After that he gained prominence in hill-climbs, winning Giants Despair, in his Benz, in 1909. His great fame came at Savannah, in 1910, when he won the grand prize race, averaging 70.45 miles per hour for the 415 miles. Last year he again won this American classic, gaining the distinction of being the only driver to win the grand prize twice in succession, averaging 74.45 miles per hour with his Fiat for the 412 miles.

Trade News of the Week

Knox Automobile Company Makes Assignment Because of Lack of Funds To Pay Current Expenses

Ford Cuts Prices and Increases Output—Chalmers Adds to Capital, Lowers Prices and Pays Dividend

SPRINGFIELD, MASS., Sept. 28—Considerable surprise was created here today when the announcement was made that the Knox Automobile Company, one of the best known concerns in the country, had made an assignment for the benefit of its creditors to Edward O. Sutton and Harry G. Fisk. It is estimated that the assets of the company as a going concern are about $2,000,000 and its liabilities exclusive of its capital stock are about $1,300,000. The immediate cause of the assignment was a lack of funds to pay current expenses and it was said that there was hardly enough cash on hand to meet the weekly pay-roll last week. As a result the directors held a meeting Friday evening and they voted to make an assignment, so the papers were made out in the office of Charles H. Beckwith and filed shortly before noon today.

Unless creditors who have not already assented to the program of the directors in making an assignment take such action as will throw the company into bankruptcy, the trustees will keep the factory in operation for the present. The company has been doing a good business lately and there are many orders on the books for both pleasure cars and trucks, many of them fire wagons. Mr. Sutton stated that a curtailment of expenses will be necessary to pull the company through the assignment without going into bankruptcy, and this will be made by a lessening of the force and a temporary reduction in output. This will be divided equally between the lines as the orders have been coming in generally in equal numbers.

The Fisk Rubber Company is one of the largest creditors of the company, the amount being about $75,000. To the estate of the late Alfred N. Mayo, who a few months ago at the time of his death was treasurer of the company, there is due about $900,000, consisting chiefly of the company's notes. Mr. Mayo was the largest owner of Fisk company stock and Harry G. Fisk is a son-in-law of Mr. Mayo, so also is Mr. Sutton, secretary and assistant manager of the company; thus the matter is somewhat of a family affair. Knox company notes aggregating $70,000 indorsed by Mr. Mayo are held by banks, of which $30,000 are held in Springfield. The remaining $270,000 of liabilities are held by about 300 creditors scattered about the country. Not one of them reaches $5,000 and none of them is pressing, so that the company has a good chance to get going again.

There is outstanding nearly $1,000,000 of capital stock, much of which is held in and about Springfield. About one-half of this is preferred stock, and represents the liabilities of the Knox company to its creditors 5 years ago when the creditors agreed to take their pay in this stock. Whether the stockholders will get anything back now is a question. If the company should now be liquidated the outstanding debts could hardly be paid. The $2,000,000 assets are said to include $315,000 for the real estate, $1,200,000 for finished product and stock in process of manufacture and about $200,000 in bills receivable. The Mayo estate is so large that it can withstand the present trouble as it comprises besides the Fisk Rubber Company, the Merrimac paper mill at Lawrence and large interests in a brick making industry.

Mr. Mayo went into the Knox company originally through being a creditor when the company became involved in 1907 after several years of prosperity. An assignment was then made to Mr. Mayo and he took up the management of the company with energy and ability. He cleared things up and returned the management of the business to the company of which he became treasurer. The preferred stock issued in payment of debts at that time reached $494,700 and was cumulative 8 per cent., being preferred not only as to dividends but as to principal in cases of liquidation, to the $500,000 common stock. The first year following the company did a big business, clearing $160,000 and next year double that amount. Three semi-annual dividends of 4 per cent. were paid and things looked bright. But two bad years followed and Mr. Mayo had difficulty to finance the company and on his death last summer there was much speculation as to the future of the company.

NEW YORK, Sept. 30—Parts makers and manufacturers of accessories shortened credit lines to the Knox company, after the death of Mr. Mayo but despite that precaution many of them are heavily involved in the failure. Schedules are being prepared upon which to base a reorganization.

Ford Swells Product: Cuts Prices

DETROIT, MICH., Sept. 30—The Ford Motor Company announces a reduction in price on all models to take effect October 1. The figure on the runabout, model T, has been placed at $525, on the touring car $600, and on the town car $800. This price reduction is ascribed to the great increase in Ford production, it being reported that nearly 200,000 machines will be turned out of the Ford factory during the 1913 season.

Chalmers Increases Stock: Pays Dividend

DETROIT, MICH., Sept. 30—At a meeting of the stockholders of the Chalmers Motor Company held October 1, the corporation voted to increase its capital stock from $3,000,000 to $5,000,000. Of this amount, $1,000,000, was paid in stock dividends to the

Automobile Securities Quotations

Changes noted in the market for automobile and accessory securities were few and unimportant during the past week. While the general range was small, individual securities were slightly irregular. American Locomotive, Firestone common, Goodrich, Studebaker common and United States Motor Company were lower and Consolidated, General Motors, Pope and Studebaker preferred were stronger. The whole trade awaits the official announcement with regard to U. S. Motors. The comparative table follows:

	1911		1912	
	Bid	Asked	Bid	Asked

shareholders, and the other $1,000,000 was placed in the treasury for future use. The regular quarterly cash dividend of 2 1-2 per cent., payable October 1, was also declared at the meeting. This amounts to about $75,000. The closing price of the Chalmers stock on the Detroit exchange on September 28 was 156, and figuring on this basis the new stock issue of 10,000 shares has a value of $1,560,000.

The Chalmers Motor Company since its incorporation has enjoyed a wonderful growth, having extended its factory in 5 years from a single 3-story building to the present plant.

Rubber Off 2 Cents in Quiet Market

Crude rubber dropped 2 cents a pound at the close of the week, sales being made below $1.10 for up-river fine where the level had been maintained at $1.12 heretofore. Trade was sluggish and without sharp selling pressure. The offerings were large but the market absorbed them easily at the recession. The ease of the local market was a reflection of similar conditions in London. Plantations were steady at the former level, which makes a difference between up-river and pale crêpe of 6 1-2 cents a pound, with the crêpe occupying the higher level.

Henderson to Leave Cole

INDIANAPOLIS, IND., Oct. 1—In order to assume the presidency and take active part in the Henderson Motor Car Company, arrangements have been made whereby C. P. Henderson, Director and General Sales Manager of the Cole Motor Car Company, will discontinue the Cole sales work on October 25. This move will be a surprise to the automobile industry in general, as Mr. Henderson has directed Cole sales work and policies since the inception of that company.

Market Changes of the Week

This week's market showed a decrease in rubber of $.02 1-2, in lead of $.07 1-2 and in cottonseed oil, of $.05, all due to lack of trade. Tin varied throughout the week, rising on Monday to $5.10, but falling to $5.03, its price on Wednesday, thus making no gain for the week. Antimony experienced a small gain of $.00 5-8 while copper remained unchanged and lead declined slightly.

Plan for U. S. Motors

Official Announcement Not to Be Made Before Thursday, But Tentative Scheme May Be Satisfactory

Proposes Selling to New $28,000,000 Company—Present Stockholders to Pay $22.50 Per Share for New Stock

WHILE the official situation as regards the affairs of the United States Motor Company is indecisive, the following tentative plan of reorganization has been published in New York covering the reorganization by Wall street specialists in the securities of the company.

According to L. P. Cartier, the plan appended was submitted to all the interests involved in the problem of reorganization and was pronounced accurate except as to the details of distribution under the plan of assessment.

Officially, the reorganization plan will not be announced before Thursday afternoon, but it is generally understood that the plan has been arranged and the steps to be taken between Tuesday and Thursday are perfunctory.

The plan suggested to those interested is as follows:

"The U. S. Motors reorganization plan has been practically decided upon with the possible exception of a few minor details. The plan provides for the equitable protection of all parties at interest and works out to the advantage of both the present preferred and the common stockholders. While the company is now in the hands of a receiver, the receivership is a friendly one and is for the sole purpose of legally conserving the assets of the company in the interest of all concerned.

"A general outline of the reorganization plan is as follows:

"The present company will be sold to a new company, which will have a capitalization of about $28,000,000 par value. The new company will have three classes of stock. $10,000,000 first preferred 7 per cent. cumulative stock, $8,000,000 second preferred 6 per cent. non-cumulative, and $10,000,000 common. There will be no bonds or debentures, and no fixed charges of any kind.

"The present obligations of the company, amounting to about $12,000,000, will be taken care of as follows: The $6,000,000 outstanding debentures will be exchanged for new stock; $4,000,000 notes held by banks will be exchanged for new stock; merchandise bills amounting to about $2,000,000 will be paid in cash.

"Present stockholders will be permitted to exchange their holdings for stock in the new company upon payment of $22.50 a share on their old stock. The proceeds of these subscriptions will amount to approximately $5,500,000. The subscriptions will be underwritten by prominent New York bankers.

"As the company now has in the treasury about $1,500,000, the new company will have approximately $5,000,000 working capital after the payment of the $2,000,000 merchandise bills. The new company will, therefore, start out free of debt and without fixed charges, with no obligations and with about $5,000,000 working capital.

"It is estimated that the present assets of the U. S. Motors Company, which will be owned by the new corporation, have a conservative book value of at least $18,000,000 to an operating company, and are probably worth considerably more in the hands of a new, well-organized concern such as the new company will be. With the $5,000,000 working capital added to these book values the company will have good assets of at least $23,000,000 back of the $28,000,000 total issue of stock. This means that there will be values of two and one-third times the total issue of first preferred stock, one and five-eighths times the second preferred stock and about one-half on the common stock. In other words, there will remain $5,000,000 of assets against $10,000,000 par value of common stock.

"It is conceded by all familiar with the present business of the U. S. Motors Co. that with an adequate working capital the company would have earned in excess of $2,000,000 a year and that $2,000,000 is a conservative estimate of the new company's earnings during the next twelve months. This will leave, after the payment of first and second preferred dividends, about $1,220,000 for depreciation, reserve and dividends on the common stock.

"Upon payment of $22.50 a share on 100 shares of old preferred stock there will be issued therefor in stock of the new company, approximately:

30 shares of first preferred 7 per cent. cumulative stock,
20 shares of second preferred 6 per cent. non-cumulative stock.
30 shares of common stock.

"On the payment of $22.50 a share on 100 shares of old common stock there will be issued therefor in stock of the new company, approximately:

22 1/2 shares of first preferred 7 per cent. cumulative stock,
20 or 17 1/2 shares of second preferred 6 per cent. non-cumulative stock,
20 or 25 shares of common stock.

"Based on the assets that will be in possession of the new company it is estimated that the new stock should have the following values:

First preferred	$90 a share.
Second preferred	70 a share.
Common	10 a share."

British Want $1,000 Car

Manufacturers and Engineers Certain Such a Machine Can Be Successfully Built in England

Would Not Interfere in Any Way with the Existing Automobile Firms in That Country

LONDON, ENG., Sept. 21—Interest in the production of a $1,000 car of all the British manufacturers continues at high tension. The leading engineers who have recently studied the American market are certain that it is possible of attainment. Robert W. A. Brewer, who spent several weeks this summer studying the American industry, thinks it is possible, basing his conclusions on careful observations made during his American visit and also backing it up by figures on materials and parts, for such a car as can be purchased on the home and foreign markets. Mr. Brewer says:

"There is a market for this small car. It must equal similar American cars in performance, so that it will meet the American car not only at home but also in our colonies. In Canada and Australia, bodies could be supplied for such a car by makers in the respective countries. In selling cars, appearance goes a long way, and to develop a rapidly growing business it will be necessary for the manufacturer to cater to the wants of the public in bodies.

"The feeling is gaining ground here that it is far better for the buyer to purchase a stock car for $1,000 and spend a little additional money in adapting it to his own purposes than it is to buy a more expensive car produced to suit his particular whims. It is not the intention of the movement to start a co-operative scheme, as has been voiced by certain trade journals. The plan is that all those who are supplying the manufacturing company with parts, or who are rendering service by sales or otherwise, shall become stockholders in the concern. In this way they make their profit and receive a fair and reasonable payment.

"It is not a question of tariff whether the cars that sell at $1,000 can be made or not. We can make the car at the price. The time will come when by good management and modern business methods the all-British $1,000 car will make itself seriously felt by those who import American cars. We hope that soon a strong unionist government will be in power, and will be enabled to pass such measures in parliament as will put a substantial tariff on the importation of American cars, so that in spite of the cutting of prices, the price to the consumer will remain at least equal to that which is charged for the British product.

"The production of the $1,000 car will not interfere in any way with any of the existing motor car firms in England. It will educate the buying public to the use of a British car in preference to an American one."

S. F. Edge, commenting on the situation, says: "The scheme is excellent, and only wants the proper support of capitalists to make it a success. I am sorry to see any motor cars imported into this country; they should be made here, and the wage money spread through our land."

E. Berkeley Omerod, in speaking on the matter, said: "We must set out to supply the demand for a low-priced British car in a well-thought-out manner. A tariff would greatly affect eventualities, but concerted and immediate action is needed. This is not a question of British makers casting aside established factories and high-class cars, but of formulating a scheme whereby we can establish in this country the manufacture of a low-priced car for the man of small means."

A leading engineer who has studied the situation says: "The majority of motor cars in the United States are not made by one single firm; they are made by dozens of firms, each of which is a specialist in the making of certain parts. They are then assembled at the factory and given a name. The total cost of every part which goes to make a complete car of a really high standard sold in the United States at $1,500 is approximately $625. What we want is a combination of firms in this country, each to supply various parts for the British car."

British Merger Talk Subsiding

According to officials of the federal government, financial interests in New York and several important factors in the automobile, the recent talk about the imposition of a preferential tariff against American automobiles of low and moderate price by Great Britain, is a subterfuge. The subject has been thoroughly aired since it was first announced, and the uniform conclusion reached is that there will nothing develop.

The government officials point out that there is a maximum and minimum clause in the Payne-Aldrich law which provides for such emergencies. Under the law, if any discrimination is made against American manufactures it is possible to slide up the rates against all classes of manufactured imports from the discriminating country and by doing that it would impose an additional duty of 25 per cent.

The financial interests state that the agitation for a tariff is probably a counter-diversion to cover the financing of a big automobile merger in England.

The automobile industry takes the position that the American makers have too long a lead to be caught at this late day and that if retaliatory measures are adopted, the competition would be rendered fiercer and that the smaller production of the British factories and the consequent higher price of the automobiles turned out would accentuate the stress of present conditions without aiding the British makers.

Reply to Be Made in Huber Suit

DETROIT, MICH., Sept. 28—On October 7, a reply to the claims of the Detroit Taxicab and Transfer Company, which concern is the nominal defendant in a patent infringement suit brought through its attorney, R. A. Parker, by the North American Vehicle Company, of this city, owner of the Emil Huber patent relating to the three-point suspension of the main frame of an automobile, will be filed in the United States District Court. The Kelly Motor Truck Company, Springfield, O., whose make of motor trucks the Detroit Taxicab and Transfer Company owns, is defending the case for the latter concern, through its attorneys Staley & Bowman, of Springfield.

Screw Patent to Be Tested

Suit has been filed in the United States District Court by the Du Bois Safety Lamp Company against the Gray & Davis Company for alleged infringement of patent number 919,837, which covers a certain type of set-screws used inside instead of outside the lamp structure. Duell, Warfield & Duell represent the complainant. The matter is returnable on the October rule day, and will be answerable 30 days thereafter. The patent while apparently of minor importance is said to involve considerable values.

Decrees *pro confesso* have been taken by the Enterprize Automobile Company against the following named defendants for violation of the Dyer patent rights owned by the complainant company: Benjamin R. Wurtzel, Sultan; James Barnshaw, Darracq; Oscar L. Lyons, Mais; John J. Conners, Charron; Henry F. Naresca, Lion; Herman Grossman, Sultan, and Frank Ritzo, Hotchkiss.

Adolph S. Bergquist has been granted an individual license and an importer's license has been issued to the Adams-Lancia company.

Hoosiers Hosts to Dealers

Merchants and Salesmen at Indianapolis October 8 and 9 to Study Selling and Advertising

Electric and Commercial Branches of the Industry Interested as Well as the Gasoline Element

INDIANAPOLIS, IND., Sept. 30—Indianapolis swings open her doors to the retail motor car merchant and his salesmen on October 8 and 9. During those 2 days the guests of the Indianapolis automobile manufacturers and those motor car manufacturers from other cities who are coming here to help his dealer and salesmen will be given an opportunity to get the inside on intensified salesmanship and advertising.

This, therefore, is the purpose of the gathering: Every person interested in the automobile field, irrespective of what line he handles, is invited to attend. Not only will the general speakers from the platform talk on their respective viewpoints, but automobile merchants who have been successful will be asked to tell experiences.

The dealer who comes to this convention will be told the basic principles of all good business in such a way that he will never forget them. He is to be told how to plow the soil deeper; how to determine the wants of his customer and how to meet them with the product on his floor. He will be told how to make a sale without cutting the price; he will be told how to keep his customer satisfied after the sale is made, which means keeping the balance on the right side of his own ledger. He will have emphasized for him the importance of keeping his salesroom orderly and attractive. He will be told how to follow up systems that have proven successful for other dealers. He will have the opportunity of discussing with the greatest men in the country his own individual problems.

The dealer will be told that the days of passing out advertising copy to solicitors is past. The friendship ceases when the expense begins. He will be told how to pick mediums, and how to eliminate personal prejudice in the selection of mediums. He will be made to understand that advertising copy can never accomplish more than the bringing of the prospect on his sales floor, and that the placing of an advertisement is a useless effort unless he is equipped to follow it up with practical salesmanship.

Not only has the gasoline pleasure vehicle branch of the motor car game been interested in the project, but the commercial and the electric veins of the industry have been active.

The convention will be held in the Auditorium of the Claypool Hotel. The plans call for business throughout, but arrangements will be made for those who desire morning diversion to visit the Speedway and other places of interest in the city.

Business sessions are scheduled for both October 8 and 9 with a Speedway dinner on the evening of October 8.

Wilbur D. Nesbit, of Chicago, has accepted the post of permanent chairman, which promises real interesting fun.

On the speakers' program are John G. Jones, of the Alexander Hamilton Institute, New York—topic, "Headwork in Salesmanship."

T. J. Zimmerman, *Opportunity Magazine*, Chicago—"The Opportunity of the Automobile Dealer."

J. J. Cole, President Cole Motor Car Company—"Why I Thought of a National Salesmanship and Advertising Convention."

H. O. Smith, Premier Motor Car Company—"Welcoming Address on Behalf of Indianapolis Manufacturers."

Advertising Director Leroy Pelletier, Flanders interests, Detroit—"The Co-ordination of Advertising and Sales."

John Lee Mahin, Mahin Advertising Company, Chicago—"How to Use Advertising in the Retail Game."

Elbert Hubbard, East Aurora, New York—"Ideal Salesmanship."

B. F. Lawrence, *Indianapolis Star*—"How to Get the Co-Operation of Your Local Newspapers."

Ex-Mayor Chas. A. Bookwalter—"Business Methods and the Motor Car."

John Wetmore, *New York Evening Mail*—"How to Spend Your Advertising Appropriation."

Herbert Kaufman and Samuel Blythe are also expected to be here and give inimitable talks. N. H. Van Sicklen, president of the Chicago Motor Club, has already stated he will be present at the convention.

Ward Buys King Assets for $41,000

Artemus Ward, of the advertising firm of Ward & Gow, New York City, has purchased the assets of the defunct King Motor Car Company for $41,000 and will continue the factory indefinitely. His bid was accepted by the United States District Court, receiver, the Union Trust Company of Detroit, last Saturday and the consummation of the agreement means that the creditors of the company will receive about 12 cents on the dollar.

Mr. Ward is the heaviest creditor of the company, having loaned it $100,000 in cash and also has an unsettled claim for advertising against the concern amounting to about $29,000.

The action of Mr. Ward was due to his desire to protect his investment and the determination to continue the company, at least for the present, means that the 219 cars, partially completed and represented by unassembled material and parts will be finished and marketed in the near future.

When the first appeal to the courts was made concerning the affairs of the company, it was found that in order to continue the manufacturing as contemplated by Mr. Ward would require material, parts and money to the extent of $175,000. This did not appeal to the accessory men and the field was left open to Mr. Ward to take the initiative.

The history of the King company has been stormy. The car in its present shape is well regarded in its class but it represents a tremendous number of expensive changes in the original plans. The blue prints show, according to financial experts who have inspected them, that 211 mechanical changes were made from the time the original drawings were completed until they represented the current model.

These changes cost much money and the company found itself with insufficient capital to carry its plan through to a successful termination.

While Mr. Ward declined to forecast anything but the immediate future of the company, it is understood that the organization will be kept together for a considerable period and if the operations prove as successful as expected, that a permanent organization will be effected to continue the manufacture of automobiles, probably under the same name.

Receiver Appointed for Ohio Company

CINCINNATI, O., Sept. 26—Edward G. Schultz was appointed receiver of the Ohio Motor Car Company yesterday. The company is engaged in the manufacture of automobiles at Carthage, O. The suit for a receiver was brought by the Diamond Rubber Company, a creditor on a promissory note for $6,000 which was due on September 15, 1912, but on which payment has been refused. One of the allegations of the plaintiff is that it believes irreconcilable differences exist between C. F. Pratt, president, A. E. Schafer, vice-president, who are in active control of the business, and the officers of the company, and that, unless harmony is restored, the assets will be wasted and reduced in value. The assets of the company are believed to be at least $200,000 in excess of liabilities.

Forty-Nine Experts at Sales Convention

Thirty-Six Companies Represented at First Meeting of Sales Managers of the Automobile Board of Trade

To Meet Again in Three Months—J. S. Marvin Speaks on Freight and Shipping

ONE of the largest and most important gatherings of the sales representatives of the automobile industry was concluded Tuesday when the first sales managers' convention of the Automobile Board of Trade adjourned to meet again in about 3 months. There were thirty-six of the leading companies represented by a total of forty-nine sales experts.

The program of addresses included the following:

Freight and Shipping—James S. Marvin, Traffic Manager, N. A. A. M.

Selling and Advertising—J. G. Monihan, Premier Motor Manufacturing Company.

Motor Car Equipment—George E. Daniels, Oakland Motor Car Company, and C. S. Jameson, Willys-Overland Company.

Territory and Selling Rights—Alfred Reeves, Maxwell-Briscoe Motor Company.

Annual Models—Charles W. Mears, Winton Motor Carriage Company, and S. D. Waldon, Packard Motor Car Company.

Enclosed and Semi-enclosed Bodies—H. O. Smith, Premier Motor Manufacturing Company.

The committee in charge of the convention consisted of the following: H. O. Smith, chairman; E. C. Howard, William E. Metzger, C. W. Churchill and W. T. White.

The Monday session had for its presiding officer William E. Metzger, who occupied the chair until the arrival of Chairman Smith. The liveliest and most intimate discussion attended the presentation of the various papers and the conclusion of those who attended the meeting was that it was one of the most valuable conferences ever held in the industry.

Mr. Marvin's presentation of the subject assigned to him was probably the paper of most general interest to the industry and following is the full text.

When your chairman first requested me to prepare a paper on freight and shipping, I felt that I had been assigned a *task*, but I quickly realized that instead of a task, I had been granted a privilege, for there is much in connection with the shipment of automobiles and the prompt and economical handling of same that is of direct interest to the dealers with whom you are constantly in touch. I am, therefore, glad of this opportunity to bring to the attention of the sales managers some of the points involved in this automobile traffic question which, for reasons which I will attempt to explain, is an unusual one in many respects.

In producing a manufactured article, there is first the purchase of materials to be considered and the question of having them arrive at the factory at the time required. This is a matter for the purchasing department. Working the raw materials into completed articles is the task of the manufacturing department, and when that is finished, the sales department becomes responsible. The handling of finished articles from the factory to the customer is, therefore, of particular interest to the sales manager. Shipping might be termed the last factory process applied to manufactured articles, and it is important that this be properly done, otherwise the efforts of the best organized factory can be marred.

The manufacturer strives to produce an article that will please his trade. There are few, if any, manufactured articles which call for a greater variety of detail than automobiles. From the time each particular model is conceived in the drafting room and in the minds of the management until it reaches the shipping department, consideration must be given to the purchase of a great variety of materials and the workmanship to be applied on them. The article, when completed, is one that can be seriously damaged if turned over to an incompetent shipping department. The problem of the manufacturing department is to produce an article consisting of a powerful and flexible engine combined with strong and accurate machinery and the whole combined into a road vehicle graceful in appearance and of the highest finish that painters can give it.

All this the customers expect, and when it is realized that the entire output is turned over finally to the shipping department, whose task it is to arrange for its safe transportation to all parts of the country, over the speediest routes and at the lowest possible cost, the task of the shipping department is better appreciated. Careless loading, resulting in a chafed tire or a scratched body, will do much to make a bad impression on the consignee, and all the care with which each department of the factory has followed this particular car to its completion with the intention of pleasing him to the utmost, will, in a large measure, lose its desired effect. Or if through inefficiency or clerical errors the freight bill is one hundred dollars, whereas the consignee knows the shipment could have been made for seventy-five dollars; or if the freight car arrives on a railroad whose freight station is a mile or two from the consignee's place of business, whereas it could just as well have been shipped over a road with a nearby freight delivery; or if, instead of arriving within the usual time of perhaps three days, a week passes, and the consignee learns that the shipment is blockaded at some congested point, which a well-informed shipping department might have avoided, then the freight and shipping department of that particular factory has failed to do its work as well as the other departments, and this last function of the factory in its dealing with the customer has, to a certain extent at least, spoiled the good work of the other departments.

This question of transportation is, perhaps, the oldest of all business subjects, and the problem of shipping promptly, safely and economically has been before the people from the days of primitive methods, and it is a self-evident fact that were it not for the great improvements that have been made in this feature of our industrial system, our manufacturing resources could not have been developed to the point they have reached. Nothing illustrates this better than the periods which at times occur when, for some reason or other, the arteries of commerce become clogged. The impossibility of conducting business without suitable methods of transportation are then at once apparent to the manufacturer, who finds his goods indefinitely delayed, and to the dealers, whose customers are demanding delivery and perhaps cancelling orders which these delays render him helpless to fill.

A new device which is a source of wonder today becomes an article of common use tomorrow. So it is with transportation. A few years ago, where a manufacturer at one point and his dealer at another were accustomed to a week's time in transportation of the manufacturer's goods, improved methods of railroading have reduced the handling of freight between these points to perhaps the second morning delivery, and they arrive with fair regularity on this schedule. Both manufacturer and dealer naturally time their orders and tune their business up to this schedule, and chaos results when it is interfered with.

We all know that the automobile, as has been the case with other inventions, had a rapid development from being a new sort of toy to an article almost indispensable, and it has entered very largely and is destined to take an increasing part in the solution of this very question of transportation. Nevertheless, the manufacture of automobiles on a large scale in this country presented a new problem in transportation and one which rendered the task of the shipping department much more difficult than it would have been ordinarily. Most manufactured articles are packed for shipment, but it was apparent at the start that this could not be the case with automobiles.

The first problem, therefore, that presented itself to the shipping department was how to fasten an article on rubber-tired wheels into a freight car so that the tires and finish would not be damaged and the automobile would remain stationary in the car. This problem was quickly followed by another one much more serious, for while a suitable method of blocking was learned after a little experience, the increasing size of automobiles rendered it impossible to load them into ordinary box cars; so here was an article of very high finish, which made shipping on open cars out of the question, but could not very well be packed for shipment, about to be produced in very large quantities, and therefore unable to use the arteries of commerce so far as they had at that time been developed to suit the requirements of other industries. These facts had to be laid vigorously before railroad officials throughout the country, and the objections that some of them made at that time to meeting this situation in the only way that it could be met, are interesting. Box cars in those days were equipped with side doors from five to six feet in width and directly opposite each other. To give the automobile industry transportation facilities, it was necessary to get railroad officials to build cars with doors on an entirely different principle. To do this the traffic officials of railroads had to be convinced first of the necessity of such new cars. It must be remembered that in those days the possibilities of the automobile were not freely admitted in all quarters, and some traffic officials were skeptical; they hesitated to recommend a radical departure in the design of freight cars, especially when they found their mechanical departments strongly opposed to it. Some traffic officials held the opinion that their tonnage in automobiles would be temporary and that, instead of increasing, it would decline; comparisons with the bicycle business were made. A great point was made by them with respect to grain, which they insisted could not be handled in box cars having doors wider than six feet. Officers of the mechanical departments of railroads insisted that freight cars would be so weakened by wide side doors that they could not handle the usual loads of other freight.

In the meantime, the automobile industry was getting along as best it could by using box cars having end doors, a limited number of which had been built up to that time, for shipments of large-sized horse-drawn vehicles. The railroad people gradually revised their views on these points, and one road after another, in building new box cars, provided them with doors suitable for handling automobiles. As the extent of this shipping became more and more evident, increasing numbers of such cars were built, until to-day there are something like 50,000 box cars in service known as automobile cars. The total box car equipment of all the railroads in the country is over 1,000,000, and as the distribution of automobiles from the factories requires that shipments be made to all parts of the United States and into Canada and Mexico, these 50,000 automobile cars become widely scattered and disseminated among box cars of other kinds.

When the building of freight cars with wide doors was brought about through the requirements of the automobile industry, it was soon found that cars of this sort were not only available for handling almost any other kind of freight, but were sought after by shippers of other commodities. An eastern road building a thousand cars of this kind would soon find them scattered all over the country, so that only a small portion would be on their home rails at any one time.

Notwithstanding the rules of the American Railway Association with respect to returning freight equipment to its home rails and the urgent demands of the roads owning the cars, there are times when automobile factories' requirements cannot be met as promptly as desired. The supply of cars generally may be fairly good, but the automobile shipper cannot participate in the general supply and is confined to this particular kind of car, which is the principal thing that renders his task difficult in getting completed machines away from the factory. The problem of providing proper service for these shipments is, of course, one for the railroads. Shippers can have no direct control over the interchange of cars between the different lines. Nevertheless, shippers should, in their own interests, see that they do nothing to make this task unnecessarily difficult for the carriers. A serious shortage of automobile cars occurred last winter at some points, and when we urged the railroads to extra efforts in supplying this demand, we were met with the response that while they would do their best, it would help matters if the practice of using automobile freight cars for storage purposes was discontinued. They made the point that factories should not continue to ship to dealers who did not accept their drafts and take up shipments and thus cause an accumulation of loaded automobile cars at that point. This is a matter in which the sales departments can perhaps render valuable aid.

The purchasing departments can help by requesting shippers of material to use automobile cars for their shipments of material to auto factories so far as possible, instead of ordinary cars; this brings to the automobile factory a car that it can use as soon as unloaded for shipping automobiles, and it makes all of the traffic more desirable to the railroads by reducing the hauling of empty cars to automobile factories. We believe the sales departments can also render assistance by getting their dealers to frequently remind the local agents of the railroads handling their business and enjoying their patronage, that these automobile freight cars when made empty should be given the particular attention of the local freight agent and furnished with a new load destined to a point in automobile shipping territory. This relates particularly to dealers in the West and South. The pressure on the local freight agents for freight cars is, of course, very strong at times, and it is undoubtedly the action of freight agents in the West and South in permitting automobile cars to be re-loaded out of line with the service for which they are intended that accounts for the difficulty in getting automobile cars owned by eastern lines returned from their western and southern connections.

This would be a good time to agitate this matter with dealers. The shipping season is starting and the local freight agents, if this matter is brought to their attention by dealers, will take some notice of it because, if they do not, they will fear the loss of patronage, and if a dealer really took sufficient interest in this matter he could probably get his freight agent to report to him the disposition made of each of these cars after it is unloaded. If a freight agent, for instance, in the Northwest, permits a local shipper to load one of these cars to a point in Texas, the automobile industry will get no service from that car perhaps for months. A freight agent who permits this would not do so if he felt that the automobile dealer was still interested in that freight car and wanted to know that it had been loaded back to the automobile manufacturing territory.

In the beginning I made reference to the possibility of clerical errors resulting in freight charges exceeding what the dealer anticipated. The freight rates and rules governing the charges on automobiles are such as to readily admit of errors on the part of railroad billing clerks, whereby excess freight charges are collected from consignees. We have endeavored in every possible way to overcome this. The National Association offers the use of its traffic department to its members and their dealers, without charge; all the factory or dealer has to do is to send their receipted freight bills to us, each one of which is examined, and if any overcharge exists the money is collected and remitted. We believe that you could render your dealers a great service and one which they would appreciate later on, if you could impress upon them the necessity of having every dollar that they pay in freights properly audited. They can do this by communicating direct with us or through the factories, which in turn can communicate with us to whatever extent is necessary; but, in any event, the immense amount paid annually for the transportation of automobiles should be scrutinized carefully by those who are efficient in that work. The railroads do not intentionally make these overcharges. They occur entirely through clerical errors and are readily corrected when brought to the attention of railroad officials. It takes only a hasty estimate to indicate the amount of money involved in this question. The approximate annual shipment of automobiles is one hundred thousand carloads. These shipments are subjected, of course, to freight charges varying from $30.00 or $40.00 per car up to $400.00 or more. The charge on a 36-foot car from Detroit to New York is $64.50. If that figure is taken as representative of an average haul, the total freight paid would be six and one-half million dollars. This freight is paid at destination, and a large proportion of the several thousand dealers involved do not know whether their freight bills are correct or not. It is absolutely certain that such an amount of money cannot be paid in freights without a good many thousands of dollars occurring in overcharges. The billing of freight is done by clerks in local freight offices who receive memorandums of what has been shipped, and they make out the way bills, applying the rates which, in their opinion, are correct; all this is done in more or less of a rush, and there are naturally frequent changes in the clerical staffs. No one concern paying out large amounts for transportation would think of letting it go unchecked, but in the case of this automobile item it is scattered. Then there are the changes in freight rates and classifications. The clerk in the local freight office is billing all kinds of freight; one bill is for a carload of automobiles, the next is for a carload of lumber, the next one is perhaps for a box of shoes, etc.; each one he must rate. When a new classification or freight tariff, containing several hundred pages, comes out, he is very likely to overlook some change and thus cause an overcharge in the freight bill. These changes may consist of only a word or two in the language of a classification item, the significance of which does not impress him, but it is at once apparent and in fact was probably brought about by the shipper of that particular article. For example, when we succeeded in getting trucks rated separately from passenger vehicles in the Official Classification, it is a certainty that many a freight bill was paid for excessive charges which were never refunded. Instead of the new classification reading "Vehicles, self-propelling, including automobiles and automobile chassis," it was changed to read "Vehicles, self-propelling, including automobiles," and separate items were installed covering automobile chassis and self-propelling freight delivery wagons or trucks. Notwithstanding our advices to the factories covering these changes, we found that chassis were, in some instances, described on bills of lading as automobiles, and they were accordingly charged a higher freight rate than they were entitled to. We also suggested that factories notify their dealers particularly regarding this important change and that all freight bills be checked either by the factories or by sending them direct to the National Association's Traffic Department. We did not get very much response in the way of direct inquiries from dealers regarding the freight bills, but to indicate the possibilities of overcharge on an item of this kind I can mention an instance of one factory which followed the matter up and urged its dealers to send us their freight bills; we heard from nineteen of that factory's dealers and out of the bills received from them presented overcharge claims for $1,066.97. Another factory sent us seven bills and we found four of them overcharged on this point.

Another rule of the Classification that has a very important bearing on the proper freight charge on automobile shipments relates to the size of car ordered by the shipper as compared with the size of car furnished by the railroads. One western dealer sent us some freight bills covering a considerable period of his shipments, and we found on examination that he was overcharged $753.84 on this question of minimum weight applicable to the cars of different sizes.

It is very apparent that the sales departments would render a valuable service to their dealers if they can be made to understand the advantage of having their freight bills audited regularly in this manner.

There are two phases of this question of transportation of automobiles; one pertains to service and the other to the cost of the service. I have endeavored to bring to your attention some of the points in connection with both which I thought would be of particular interest to the sales managers, and which, if kept in mind by you in your dealings with agents and branches, would result in benefit to the industry in getting machines handled promptly and at the lowest possible cost, from the factories, and I want to add that the traffic department of the National Association of Automobile Manufacturers is always at the service of the factories and your dealers in these matters.

Those present included the following:

Auburn Automobile Company	J. I. Farley
Autocar Company	H. M. Coale
Cadillac Motor Car Company	A. C. Howard
Cartercar Company	H. R. Radford
	W. S. Williamson
Chalmers Motor Company	Percy Owen
Jas. Cunningham Son & Company	J. W. Fulreader
Columbia Motor Car Company	F. K. Dayton
Flanders Motor Company	William E. Metzger
Hudson Motor Car Company	R. B. Jackson
	E. C. Morse
	R. D. Chafin
	C. C. Winningham
International Motor Company	H. D. Watson
Knox Automobile Company	H. K. Sutherland
Locomobile Company of America	J. T. Roache
Lozier Motor Company	C. E. Emise
Maxwell-Briscoe Motor Company	Alfred Reeves
Mercer Automobile Company	W. T. White
	E. H. Sherwood
Mitchell-Lewis Motor Company	Leo A. Piel
	J. M. Cram
Moline Automobile Company	C. H. VanDervoort
	Rufus Walker, Jr.
Moon Motor Car Company	W. J. Coglan
	E. I. Moon
Matheson Automobile Company	F. F. Matheson
National Motor Vehicle Company	J. M. Clarke
Nordyke & Marmon Company	Herbert H. Rice
Oakland Motor Car Company	J. B. Eccleston
Packard Motor Car Company	S. D. Waldon
	H. H. Hills
Paige-Detroit Motor Car Company	Jas. F. Bourquin
	H. Krohn
Peerless Motor Car Company	R. S. Schmunk
Pierce-Arrow Motor Car Company	J. Elmer Pratt
Premier Motor Mfg. Company	H. O. Smith
	John Guy Monihan
Alden Sampson Mfg. Company	M. C. Reeves
Selden Motor Vehicle Company	James Joyce
S. G. V. Company	F. F. Weston
F. B. Stearns Company	R. H. Williams
Stevens-Duryea Company	H. C. Beaver
E. R. Thomas Motor Car Company	C. S. Henshaw
	J. E. Quimby
The White Company	Walter C. White
Willys-Overland Company	C. S. Jameson
Winton Motor Carriage Company	C. W. Churchill
	Chas. W. Mears

New Companies in Hoosierdom

INDIANAPOLIS, IND., Sept. 23—With several new companies being organized and old concerns enlarging their plants, together with agency changes, the 1913 season is starting out in a brisk manner in this city.

The H. J. Martin Forging Company has just acquired another tract of ground adjoining its plant and will erect an additional building at once to cost $50,000. The company manufactures motor car steel forgings. A factory branch, service station and repair shop has been opened by the Eisemann Magneto Company with Lon R. Smith, western representative of the company, as manager.

With an authorized capitalization of $20,000, the Glover Equipment Company has been organized and incorporated to manufacture motor car tops, dust hoods and seat covers. F. L. Glover formerly with the R. J. Irvin Manufacturing Company, is president and general manager.

Another new company is the Auto Finishing and Wonder Polishing Company, incorporated with $50,000 capital to manufacture motor car polish. J. W. Cummings and J. J. Sheehan, of this city, and N. S. Tedrow, of Des Moines, Iowa, are interested in the concern.

The Archey-Atkins company has arranged to distribute the truck made by the Brown Commercial Car Company, of Peru, in central Indiana. The Brown company will have an office with the concern. F. N. Martindale has bought at receiver's sale the property of the Indianapolis Auto Top and Rubber Company for $700 and will continue the business.

PHILADELPHIA, PA., Sept. 30—By a decision handed down today by Judge Thompson in the United States District Court, the Penn Auto Supply Company was adjudged bankrupt and John V. Harrigan and Hugh B. Turner appointed receivers, with authority to carry on the business of the concern until further orders from the court.

Security was fixed at $10,000.

S. A. E. Considers Tire Possibilities

Metropolitan Section Hears Interesting Talk on Favary Tire and Various Fillers Are Discussed

THE first meeting of the Metropolitan section of the Society of Automobile Engineers was held September 26, at the United States Rubber building. The topic of the evening was substitutes for pneumatic tires. An interesting session was held, the greater part being devoted to a paper by Ethelbert Favary who has invented a very novel and ingenious form of non-pneumatic tire. After Mr. Favary had answered with dispatch the various questions put to him, O. A. Parker dwelt upon the virtues of Newmastic, a tire filler, and Mr. Phelps of the Zilio company also touched upon the requirements of a successful filler. A part of Mr. Favary's paper follows:

While pneumatic tires have contributed in very large measure to the rapid development of the automobile, nevertheless at the present day pneumatic tires offer a great drawback to motoring, through expense, breakdowns, etc.

Two different principles have been employed in the construction of the tires in general use today, viz.: pneumatic and solid rubber. Besides these, tires embodying springs of a great number of varieties have been experimented with, without success, for reasons well known to those familiar with the art. The different types of tires relying on rubber compositions, rubber fillings, or solid rubber in conjunction with air at atmospheric pressure may all be classified as solid rubber tires, since they rely on the elastic efficiency of rubber as the resilient medium. As is well known, this elastic efficiency is very poor. A simple experiment with a block of rubber will demonstrate this fact quickly. When placing a load or weight on a block of rubber, the depression to the point of rest will not be instantaneous, nor will it reach this point nearly as rapidly as a spring or pneumatic cushion. When the load is removed the last two mentioned will resume their former position immediately, while in the case of the rubber block some time will pass before it resumes its former shape, since rubber changes its form under compression.

Power will be consumed by a rubber tire, since the effect is analogous to running up a grade or in deep sand or mud; there is a resistance against the forward motion, it being necessary to compress the rubber in front up to the central axis, whereas with a good resilient medium the counter-pressure behind the axis is approximately equal to the pressure in front of it. The amount of power wasted will depend on the "give" of the rubber, the quality of the rubber and the speed of rotation of the tire. But apart from the power consumption, vibrations are set up on account of the slowness of the "give" of the rubber, and the greater the speed of travel the greater the rate of vibration set up. Hence for fast travel solid rubber tires are impracticable.

The primary desideratum in a tire is a deformable, accommodating outer periphery, capable of absorbing obstructions on the road without raising the axle; this will eliminate road shocks and vibrations, and therefore greatly increase the life of the machine. The second desirable quality is a good resilient medium which will not waste the power of the engine. The third quality (the most important from the passenger's standpoint) is reliability, which includes economy. While the pneumatic tire fulfills the first two requirements fairly well, the third has been the bane of the motorist's existence.

In the tire to be described a purely mechanical principle is employed whereby resilience is obtained by the flex action of a combination embodying pliable bands under tension.

The bands A and B (Fig. 3) are composed of extra strong belting or fabric, especially woven and waterproofed for the tire. C, D and E are aluminum blocks attached to the bands with tubular steel rivets. The large heads of the rivets rest on the bands and their tubular section is opened on the aluminum blocks. There is no friction in any part of the tire between the blocks or the fabric, they being solidly riveted together. F (Fig. 2) shows small aluminum blocks attached to the canvas of the tread, fitting the blocks C when assembled upon the tire.

The tread is detachable from the tire proper, for the purpose of renewal. The blocks F are riveted to the canvas band of the tread, neither rivets nor blocks resting on the rubber, thus eliminating wear or friction in any part of the tread except on the outer surface contacting with the ground. G, Fig. 5, shows the bottom blocks shaped to fit the blocks E, holding them securely against any displacement. Fig 4 shows how the bottom blocks are removed to demount the tire from the wheel. When all the blocks are in position, and the tire is assembled on the wheel, the bands are under great tension and pressure, blocks E being pressed into blocks G, holding the tire securely on the wheel.

The tire is purely mechanical in both construction and operation. The operation is as follows: Immediately under an applied load the bands dip downward, while adjacent thereto there is an upward movement due to the increased tension of the bands.

With 1,000 pounds on a rear wheel the weight of the car will be about 3,500 pounds. For such a car we employ a 4½-inch tire, and the tensile strength of the band would be about 30,000 pounds. The blocks under the second band very seldom carry the entire load, as in practice they are proportionately closer together and the load therefore rests in part on more than one block; this will also tend to reduce the result by at least 25 per cent., so that the above value should be about 1,500 pounds. It will be seen that the factor of safety is amply sufficient, even when hitting stones at high speeds.

When traveling over bad roads the tires should be softer comparatively for maximum efficiency. Theoretically the degree of resiliency should be such as to absorb obstructions of the average height encountered on the road. Thus tires should be harder on smooth roads and softer on rough roads. In the tire described the tension may be adjusted correctly to meet these requirements. With pneumatic tires the exact reverse is true; on rough roads they must be relatively hard in order to prevent rim cuts. Every motorist knows the effect of traveling over bad roads with hard tires; the vibrations and shocks are bound to increase bills for repairs to the machine. In addition all these shocks and vibrations mean wasted energy.

Fig. 4 shows the tools in position for removing the blocks, after which the tire may be easily slipped off the rim. This being done, the tread may be removed by hand from the tire proper by alternately raising one side of the consecutive blocks and then pulling slightly sidewise. Thus, when the tire is running at high speed the tread will not be raised away from the tire proper by centrifugal action on account of the two halves of the top blocks interlocking. The two levers shown in Fig. 4 (the only tools required with the tire) are also used for tensioning the bands, to make the tire hard or soft or in taking up any slight stretch which may develop after several thousand miles. This tension is accomplished by the insertion of a thin aluminum shim under every second bottom block and under every block subsequently.

While the factor of safety in the bands is high as regards their tensile strength with relation to the tension they carry under load, still when using ordinary belting where the warp threads cross one another, there may be a certain amount of stretch. To overcome this a specially woven fabric is employed having the warp threads absolutely straight in pockets surrounded by thin weft threads. This fabric has been found to satisfy all requirements.

During the early period of development the tires were covered at the sides with a thin canvas and rubber coating, making them in appearance very similar to a pneumatic. This was found unnecessary, however, since centrifugal force prevents any dirt or stones entering the apertures in the tire. When packed by hand with clay and cement and allowed to dry, immediately the tire was in action it rid itself of all foreign substances.

On account of the peculiar construction of the tire, it having no lateral "give," skidding is reduced to a minimum, as compared with a pneumatic, in the case of which the lateral "give" exceeds in magnitude the vertical depression

New Alliance of Speed and Competence in Hygiene—Differentials Still Developing —A Clutch With Minimum Inertia—Starting Motors With Their Own Gas —Cutting Mystery Out of Casehardening—Rise of Two-Cycle Design

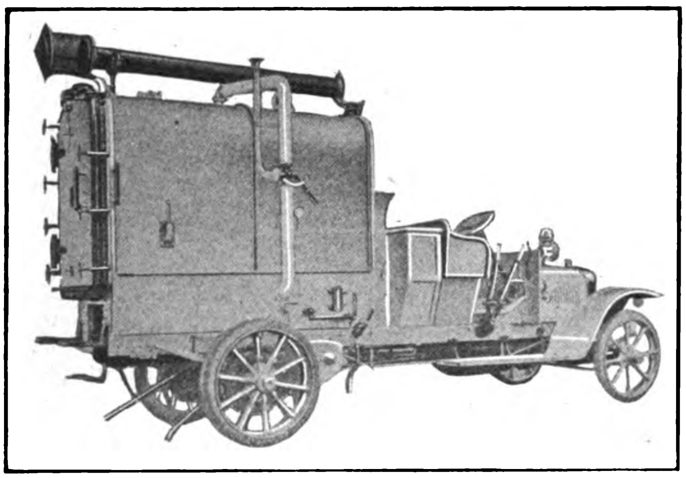

Fig. 1—Disinfector-car proposed for German sanitation districts

SANITATION Centralized by Motor Power—At the recent hygienic exhibition in Dresden, Germany a large number of physicians inspected the disinfector-car whose outward appearance is shown in Fig. 5. It was built at the Benz-Gaggenau works and designed on the basis of the experience of a Dr. Otto, who for more than 1 year has used automobiles for expediting and cheapening the work of disinfection which becomes necessary in the case of contagious and infectious diseases. Sanitation of this order has become more urgent in Germany of late years by reason of the large numbers of foreign agricultural workers who migrate to and from the rural districts twice a year and, generally by reason of the much-increased travel of the population. The system heretofore used has involved the employment of a large number of persons, each of whom, as a rule, trundled or drove a car with a small apparatus within a small radius of action and more or less accurately and intelligently carried out the instructions given them all for guidance in their work. According to the reform plan of the medical profession, large districts are to be placed under a central sanitary administration and motor power is to enable few persons, and these of tried competence in the work, to follow up the notifications received from physicians quickly and at long distance if necessary. The disinfecting is to comprise two processes. First, the nurses or caretakers in a case of disease are provided with means for disinfecting the immediate surroundings of the patient as thoroughly as the nature of the case allows. Secondly, after the case has been disposed of locally, by death, removal or recovery of the patient, complete sterilization of clothing, rooms and of all objects which have been exposed, even remotely, to the infection, is to be effected, and it is for this process that the disinfector-car is required. Some data on the feasibility of the proposition are available. In the lower department of the Seine, in France, thirteen public disinfecting establishments were until recently in operation, Dr. Otto states, and now, thanks to the use of motor power, all the work done at these places and by emissaries from them is taken care of by five disinfectors and one inspector. One of the disinfectors has charge of the final work after each case and has at his disposal a 9-horsepower Dion-Bouton vehicle with a spacious fumigation chamber, while the other four have each a motorcycle carrier with the necessary apparatus for attending to the cases which are in progress. By means of the car it has been possible to effect five thorough disinfections in 2 days at distances involving in all 260 kilometers of travel. During the year 2,550 visits and disinfections were made. The expenses for 1 year for the whole system are given as follows:

Gasoline, lubricating oil and taxes	$590
Operation of garage	192
Repairs and tires of motor car	660
Repairs and tires of five motorcycles	508

Adding to these items the wages, rent, insurance, etc., it is calculated that the cost per capita of the district, which, however, is a metropolitan one, comprising a portion of Paris and suburbs, comes to 1 1-4 cents per year.—From *Automobil-Betrieb,* middle of September.

IMPROVED Shaft-Drive Differential—The demand for a considerable speed reduction at the point where the rotation of the driving shaft is transformed into rotation of the two rear wheel shafts has been held responsible for the introduction of the worm drive on the ground that the size of a bevel gear crown cannot be increased in size without reducing the road clearance. The silence of the worm gear was an incidental advantage. A method for obtaining the desired gear reduction by compounding the bevel gear—placed in front of the rear axle—with a spur gear to the differential casing has long been in use. Other methods adopted largely for the same purpose involve the use of wheel-driving shafts separated from the rear axle and of a spur gear on the brake drum of each wheel. With the rotary speed of motor shafts higher than it ever was before, the greater gear reduction becomes desirable not only for trucks but also for pleasure cars, while the heat treatment and final machining of large bevel gear crowns remains onerous and expensive, and designers are therefore seeking new expedients in those cases where the adoption of worm drive is not considered advisable. In THE AUTOMOBILE of June 13 the new differential used in one of the Mercedes models was illustrated and described. The opportunity which this design offers for in-

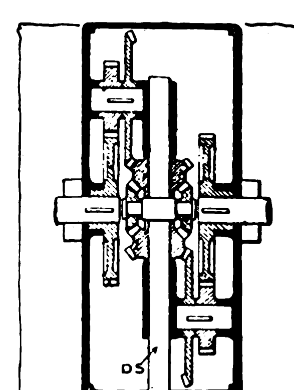

Fig. 4—Renault truck differential with reducing-gear

creased gear reduction is mainly based upon the division of stresses between two bevel gear crowns, so that the gear teeth and therefore also the diameter of the crowns may be made smaller. In the construction recently put forth by Louis Renault and shown in Fig. 3 this feature of the Mercedes design, including the prolongation of the driving shaft DS, is coupled with a further reduction of gear effected by two pairs of spur gears. By this arrangement end thrust on the wheel shafts is also avoided.—From illustration in *Automobil-Welt*, September 13.

PANHARD Clutch and Change-Gear—The clutch and change-gear of the Panhard 15-horsepower car with Knight motor, three-point suspension and unit construction are shown in Figs. 1 and 2, giving respectively a vertical and a horizontal cross-section of these parts. The clutch is said to work with remarkable sweetness and, by virtue of its small weight, stores up very little momentum. It is entirely inclosed in the motor flywheel which is formed of two plates, hollowed out and joined by screws. At the center is the clutch shaft which is joined to the primary shaft of the gear box by a cylindrical boss with six rifles. The clutch shaft carries a steel disk to which is riveted a fiber ring F. A movable ring P2 is placed in the flywheel and can be pressed against the fiber ring by means of two springs R which are placed in the hollowed part of the rear plate of the flywheel. Disengagement of the clutch is effected by six levers L which are controlled from the clutch pedal and draw the ring P2 back. While exact centering of the fiber ring is not imperative, the clutch shaft is extended into a bore in the motor shaft, the extension being provided with oil grooves. Normally this clutch operates with the clutch casing—which is the extended crankshaft casing—one-third full of oil, as a tube from the change-gear box communicates with the clutch cavity at this height, but it is said to be an advantage of the construction that it operates equally well with little and with much oil.

With regard to the change-gear box the principal features of interest are the following: The casing is bolted in front to the crankcasing as in most other unit constructions, while at the rear it is carried on a rounded sleeve fitted upon a cylindrical extension of the universal shaft housing N, which in turn is secured to a stout cross member T of the chassis. The rounded sleeve constitutes a flattened ball joint protecting the casings against stresses which might arise from torsions of the chassis. The primary and the secondary shaft are concentric for their entire length. The most exclusive feature, howevere, is the control of the gear shifters, which are three in number. It is effected by a simple forward and backward movement of the control lever without any lateral displacement. The shaft A of the lever, see Fig. 2, carries an internally toothed sector meshing with a pinion J, and the latter is secured by bolts to the same shaft which carries a cam-plate K in which are formed grooves r1 and r2 which make the shifting forks G1 and G2 slide upon the fixed guide B. The object of the toothed sector and pinion is to cause

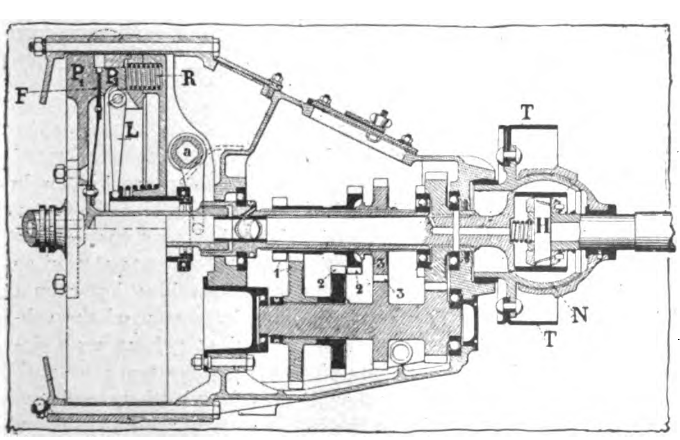

Fig. 2—Showing very light Panhard plate clutch F in flywheel

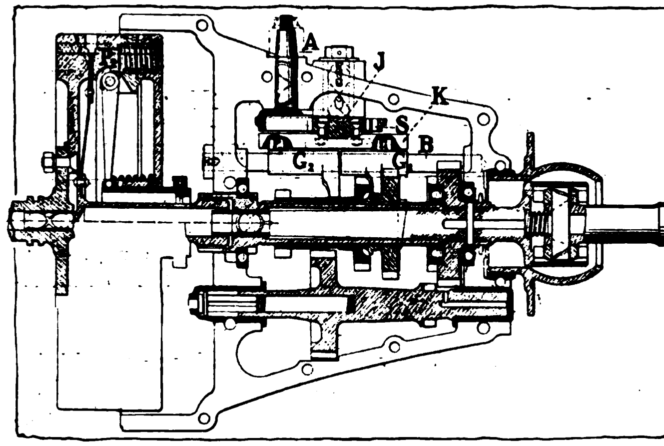

Fig. 3—Panhard change-gear with cam control of shifters

a large angular movement of the cam-plate by a small movement of the lever. As any given position of the cam-plate corresponds to only one possible position of the forks two speeds cannot get in mesh at the same time. The neutral position is double. One is back of the low speed, but a stop on the sector between the second and the third speeds provides a second one which enables the driver to start on second speed by a very short forward movement of the lever, whereafter he gets to the third by drawing the lever back, past the neutral, to third, having the same advantage in the way of short movements that is obtained by lateral displacement.—From *La Vie Automobile*, September 7.

—

IMPROVED Casehardening—A general desire for reducing the casehardening process to mechanical terms, so as to make it fit better into manufacturing routine and render it independent of the personal skill of workmen, finds expression in recent patents. German patent 244,966 to Gio Ansaldo, Armstrong & Company, of Genoa, Italy, provides for the combined use of carbonaceous solids and a gas. Both the depth and the degree of hardening can be regulated by this method, it is claimed. The gas used is the anhydrous carbonic acid gas CO_2 which can be obtained cheaply and in great purity in commerce. According to the equation $CO_2 + C = 2CO$, it forms carbon monoxide by combining with the carbon in the carbonaceous solid—usually a powder—until the chemical balance is established. and carbon monoxide is the most suitable gas for carrying carbon into steel, as its use does not lead to the generation of free carbon, and the free carbon is the element mainly responsible for brittleness in the hardened surface layers of the object. According to the process, the articles are embedded in the casehardening compound, as usual, and the CO_2 gas is circulated through the receptacle of the work, being passed in, gathered and passed back again. Some time before the end of the process, the compound or powdered charcoal is removed. In order to increase the carbon content of the hardened portions, hydrocarbons may be introduced in the receptacle either in liquid or gaseous form. To reduce the carbon content, on the other hand, air may be mixed with the circulating gas. Another patent, No. 245,183, secures to the same firm the method of removing the solid carbon compound which serves to regenerate CO from CO_2. from the objects under treatment during a portion of the time, so as to become able to regulate the casehardening temperature independently of the temperature which is most suitable for the formation of CO.

Another casehardening method is secured to W. R. Hodgkinson, of Blackheath, England, by German patent No. 243,238. It consists in exposing the iron or steel to vapors formed by heating substances or compounds containing nitrogen in carbocyclical or heterocyclical combinations. A number of such substances are mentioned. Their evaporation may be effected by spraying them into the closed muffle in which the work is heated. A hardening which suffices for many purposes is obtained by exposing the

Fig. 5—Design of the Galaine muffler

metal at a temperature from 650 to 800 degrees centigrade to any one of the suitable gases for about 30 minutes.—From *Metallurgie*, August 8.

—

MOTOR Starter—An arrangement for making sure of being able to start the motor of an automobile by means of the spark has been developed by Unterberg and Helmle of Germany, the same firm whose mechanical device for producing a spark from a magneto with the motor at a standstill was noted at the Berlin, Olympia and other automobile shows opening the 1912 season. The new arrangement comprises gas-collector bottles screwed by their necks one into each cylinder head, next to the spark-plug, and a shaft with three cams by the action of which two valves connecting each bottle with the interior of the respective cylinder may be opened and closed. One is a non-return conical valve held to its seat by two springs, one light and one strong, and the latter may be put out of action by one of the cams. The second and lower valve serves to shut off positively all communication between the cylinder and the gas bottle during the normal operation of the motor. The loading of the gas bottles is done while the motor is running to rest with the spark shut off; in other words, every time the motor is stopped. The control shaft of the device is then turned a little, opening the positive valve and putting the strong spring of the upper valve out of action. The compression strokes during the last turns of the motor now force ignitable mixture into the bottle, having only the resistance of the light spring to overcome, and the compression in the bottle comes by a few strokes, it is stated, somewhere near to that normally reached in the cylinder. When the motor has come to a full stop, the control shaft is turned a little more and releases the strong spring of the upper valve which effectually closes the bottle against leakage, while the lower valve is closed at the same time.

To start the motor, the two valves are opened by another turn of the shaft, allowing the gas contained in the bottle to flow into the cylinder, whereafter the two valves are closed again at once. The motor is then in condition to be started by a spark from the ignition apparatus. If the latter is a magneto suppplemented by the magneto-starter device referred to above, the shaft controlling the gas bottles is connected by a sprocket chain with the starting lever of this device. In other cases, as when the initial spark is supplied from a battery, the shaft is carried through the dashboard and is operattd with a small lever within reach of the driver.—From *Automobil-Welt*, September 8.

SIMPLE Formulas for Coil Springs—H. Al. Siebeck publishes in *Revue de Mécanique* for May a simplified method for calculating the dimensions of coil springs with reference to the work for which they are intended. The action of a coil spring is determined by its highest admissible load and by its degree of elongation under a given load. The starting point for calculation is the degree of elongation, the value of which depends upon the load and the stroke of the spring. It contains the following elements: H, the stroke in millimeters; P_e, the final load in kilograms, which approaches more or less closely to the ultimate fiber stress, according to the number of strokes of the spring in a time unit, and P_v, the initial load in kilograms, which may be positive or negative. The useful load with these notations equals P_e minus P_v. These values determine the elongation, h, in millimeters per kilogram of load. The formula arrived at is:

$$h = H \div (P_e - P_v).$$

Experience has demonstrated that the functioning of the spring depends upon an exact choice of the elongation h.

With a given proportion $c = D \div d$, between the mean diameter, D, of a convolution and the diameter, d, of the wire itself, the ultimate fiber stress, P maximum, is obtained by the very approximate formula:

$$P = 1{,}600\, d^2 \div c.$$

The safety factor, S_f, of a spring is often calculated after the formula: $S_f = 1 + (n \div 150)$, in which n designates the number of strokes of the spring per minute.

The necessary number of convolutions, s, is figured from the formula: $s = 10{,}000\, dh \div c^2$.—From *Le Génie Civil*, August, 17.

—

SPEED of Two-Cycle Motors—The success of slide and rotary valve motors in competition with four-cycle poppet valve motors is interpreted by many European automobile engineers as a development which is not only interesting in itself but which should also greatly encourage those who believe in the eventual practical triumph of the two-cycle type of motor, which was the pet of nearly all engineers in the early days and the first form of valveless gasoline engine. The good accounting which the Cote car equipped with a Cote two-cycle engine gave of itself in the recent Grand Prix race at Dieppe and in some of the subsequent racing events in which it took part—running in every instance with great regularity—has confirmed this opinion. A two-cylinder motor of this type gives, according to bench tests, its highest power at 1,380 revolutions per minute, and with 90 millimeter bore (3.6 inch) and 120 millimeter stroke (4.8 inch) this maximum is 22 horsepower. As now built the motor comprises four cylinders, however, and gives 43 horsepower. The speed can be regulated from 250 to 1,500 revolutions. The weight is 135 kilograms (300 pounds). Two smaller four-cylinder models give corresponding results. The fuel consumption is given as 14.7 kilograms for driving a two-seated car 100 kilometers over a level road, while the same work is done by a four-cylinder motor of 65 by 85 millimeters bore and stroke with only 8.4 kilograms of fuel and by one of 75 millimeters bore and 105 millimeters stroke with 11.9 kilograms. As neither the speed nor the road quality is indicated, these figures are of course not conclusive.—From *Automobil-Welt*, September 13.

—

MUFFLERS Which Increase Power—Mention was made in THE AUTOMOBILE of September 5 of the Galaine muffler which had been found by tests, conducted at the laboratory of the Automobile Club of France, to increase the power of the motor to which it was applied. Fig. 4, representing a cross-section of this muffler, shows the construction which was not made quite clear in the first report from France. The partition F was not mentioned. Recapitulating, the exhaust passes through the inner tube, a portion of it expanding through the slits in it into tube A and through holes in the latter into tube B. A hollow conical body with a central passage MN contracts the exit to the atmosphere from the inner tube, increasing the speed of the gases at this point and setting up a suction, by siphon action, in that portion of tube A which lies beyond the partition F, thereby drawing the gas from both A and B as indicated by the arrows.—From *Bulletin Officiel*, August.

TO Improve Traction of Solid Tires—Solid tires perforated with radial holes of nearly 1 inch diameter are known in the American market. A French firm, Abeil & Son, inserts a short corrugated steel tube in each of the holes of such a tire, the corrugations being formed with a saw-tooth cross-section so that the tubes can be driven farther into the rubber but cannot fall out. As soon as they reach the rim, by reason of the rubber wearing down, the lack of elasticity in the tire becomes a signal that its replacement is in order. The rings work as anti-skid rivets or better, filling up with gravel and other road material and having no tendency to eject it, as they are not in themselves elastic—From *Omnia*, September 14.

Chances for Foreign Trade

Items Culled from Consular Reports Showing Where Opportunities for Business Exist Abroad

Inquiries for Automobiles, Trucks, Motor Plows, Engines, Tools and Accessories

AUTOMOBILE **Accessories**—A business firm in a European country, which states that it is in a position to furnish first-class references and is now the agent for a firm handling automobile accessories, advises an American consulate that it desires to receive agencies and selling offers from American manufacturers of automobile accessories of every type, except pneumatic tires. It is especially anxious that the supplies in question shall be new to the local markets. Correspondence should be in English. File No. 9,540, Bureau of Manufactures, Washington, D. C.

Crude Oil—An American consul writes that it would interest American petroleum interests to know that a certain foreign railroad is studying the question of oil versus coal as fuel for its engines. The company will require between 3,000 and 4,000 tons of crude oil annually, if it can be demonstrated that crude oil is cheaper and more satisfactory fuel than the coal now used. The company at present pays about $9.65 a ton for coal delivered. American companies should send proposals and prices to an official named in the report, also to a consular officer who is interested in the proposition. File No. 9,542.

Motors—A report from an American consul states that he is in receipt of a communication from a business firm in his district requesting catalogs from American manufacturers of kerosene and benzine motors. Prices should be quoted c.i.f. certain city, if possible, otherwise freight rates from port of shipment to the city of destination should be given. Correspondence may be in either English or German. File No. 9,539.

Motor Tricars for England and Other Countries—An official in an American trade association has forwarded to the Bureau of Foreign and Domestic Commerce a request from a business man in England, who formerly resided in the United States, for the names of manufacturers in the United States of motor tricars and low-priced motor cars. He is said to have good connections and in the opinion of the official referred to would make a good agent for manufacturers of the articles mentioned who are not already represented in England and Scandinavian countries. File No. 9,533.

Automobiles, Motor Trucks and Parts—A New York firm reports to the Bureau of Manufactures that it has a foreign inquiry calling for a moderately priced automobile similar to a well-known American car, also motor trucks and frames equipped with motors complete. File No. 9,375.

Automobile Tires—An American consul in Mexico has transmitted the name of a person in his district who, according to an article recently published in a local paper, has improved on automobile tires. The improvement consists in a metallic construction of round wires that form an embracing piece, passing through the interior of the rubber tire and fastened by means of these wires to the iron rim of the vehicle. File No. 9,378.

Gasoline Engines—The Bureau of Manufactures is in receipt of a communication from a firm in England requesting to be placed in touch with American manufacturers of four- and six-cylinder gasoline engines for use in automobiles and trucks and engines for propelling motor boats. The firm sells a large number of gasoline engines for farm and stationary uses, and thinks there would be a good market for low-priced engines for motor cars and boats. File No. 9,377.

Automobiles—A business man in a German city requested an American consul to place him in communication with American manufacturers of automobiles with a view to represent some line in that market. Correspondence in German or Italian. File No. 9,472.

Motor Trucks—A foreign business man informs an American consulate that he would like to secure information and quotations on the following: A car, comprising platform for operator, to run on standard gauge tracks, equipped with a motor of sufficient horsepower to haul six flat, platform cars, size 8 feet by 4 feet, height from track to platform 21 inches, weight of each car to be 800 pounds, each car carrying 2 tons of freight, no hauling up inclines, at a minimum speed of 10 miles per hour. He also desires particulars regarding a car as above to haul ten flat cars loaded with 2 tons of freight each. File No. 9,528.

Repair Shop Tools—The Corinth Automobile Company, Corinth, Miss., is in the market for machine tools for its repair shop, including a lathe, drill and milling machine.

Motor Trucks—A business man in the Far East informs an American consulate that he desires to secure illustrated catalogues, with price lists and discounts, gross and net shipping weights, capacity and horsepower of motor trucks for hauling goods from railway stations and steamboat landings to various parts of a certain city. The trucks must be of heavy construction and the wheels fitted with non-skidding solid tires, as the streets and roads are deep in places. Extra copies of the catalogues should be sent to the consulate for filing. File No. 9,520.

Automobiles—An American consular officer in a European country desires to receive catalogues of American manufacturers of medium-priced automobiles ranging in price to agent, f.o.b. New York, from $800 to $1,200. Price lists, discounts, terms and other pertinent information should be furnished. A considerable number of requests are being received by this officer from dealers and agents, and care will be taken to submit the catalogues, etc., to interested inquirers. File No. 9,503.

Automobile Service—An American consul has submitted a report, accompanied by certain documents, relating to a competition that has been opened by a municipal government in his district for the grant of a concession to conduct an omnibus-automobile service to be inaugurated upon the approaching discontinuance of an existing service by horse-drawn vehicles. These documents were received from the mayor of the city, who suggested that they be forwarded to first-class American firms that may desire to compete. Bids must be received by September 30, and the opening of the sealed schedules offered is to take place not later than October 10. The consul writes, however, that a reasonable postponement of these dates would no doubt, if necessary, be granted upon the application of interested firms desiring to submit offers. File No. 9,505.

Motor-Driven Plows—An importer and commission agent in a European country informs an American consulate that several of his clients desire prices and specifications of motor-driven plows. He adds that large numbers can be sold in this country, which is largely agricultural. What is wanted is a light motor-driven plow with two or three shares. The consulate would be glad to receive additional catalogues and price lists of all kinds of machinery, especially agricultural, as there is constant demand for them. File No. 9,510.

Customs Tariff of Japan—The duty on automobiles in general is 50 per cent, while the conventional duty is 35 per cent. The conventional duty applies to products of the United States. On parts the general duty is 30 per cent. and the conventional is 25 per cent.

How Tires Are Protected

Methods Used by Depot Men in Storing Goods to Supply the Automobile Trade of New York

Red Rays of the Lower Solar Spectrum and Dry Heat Are Regarded as Chief Enemies

LIGHT and dry heat are the most potent enemies of the stored tire and tube. Oil, grease and water are less powerful factors tending to deteriorate automobile rubber goods. Storage for a year or even more under scientific conditions will improve a tire and render it more serviceable, but if the conditions are not right, the same length of time will serve to destroy the usefulness of the stored tire.

These axiomatic truths have been recognized almost from the commencement of the gigantic automobile tire industry, but the underlying reasons for each of them have been subordinated to the axioms themselves.

Disposing of the effect of oil and grease, it may be said that the structure of rubber, either pure or in composition, is such that all oily or fatty substances have the property of entering into the rubber surfaces and destroying them. The immense importance of protecting tires and tubes from contact with oil or grease can not be made too emphatic, but ordinary care is sufficient to prevent such contact and so the proposition is not so grave as some of the other factors that go toward tire deterioration.

An interesting fact has been noted by the tire men that appears to be of so little importance that it would scarcely appeal to the casual user of tires as a factor, but in reality may account for apparently causeless blow-outs in a small percentage of tire mishaps.

In the process of manufacture where hand labor is used in building up the carcass of the casing, a drop of perspiration falling from the face or limbs of the workman and lodging between the plies of fabric upon which the tire is based, has been known to wreck a perfectly good shoe. The perspiration contains a certain proportion of grease from the sebaceous glands of the body and that tiny particle of grease embedded in the fabric spreads rapidly and separates the plies. If the original space occupied by the foreign matter is 1-8 inch in diameter it may grow to 1 inch or more under a small amount of travel, and if the separation lies in a vital spot there is a strong probability that the tire will blow at some inconvenient time.

One Little Drop of Honest Sweat

There is no way to guard against such a condition of manufacture until the handling of tires by the workmen shall be obviated by the use of machinery.

However, the proportion of tires ruined by drops of perspiration is exceedingly minute when compared with the total output and the same may be said for the numbers of tires spoiled by oil and grease while under storage at tire depots.

In the hands of consumers, there is a different story to tell; but the facts in the case are so well recognized by tire dealers and so clearly set forth to purchasers that the subdivision of the subject is not vital.

As regards the effect of water and moisture from the tire depot man's point of view, little need be said. It is obvious that if water gets inside a stored shoe and remains there until it is dried out by evaporation and if the process is repeated, the tire will be destroyed. This is unquestionably true if the water reaches the inner layer of fabric and is probably true even where the inside of the shoe is protected with a layer of rubber composition. But, a certain amount of humidity in the air is a good thing for stored tires. It prevents them from drying out to a destructive degree. The instruction books of some of the tire companies contain a caution to the depot man to sprinkle the floors of his storeroom occasionally so that the natural evaporation will render the air more humid.

It is old Sol himself who exerts a baneful influence upon the tire exposed to his rays; providing that such tire is not in service. It has been noted that tires displayed in show windows of shops where the sun has a full swing at them degenerate rapidly. Test of tires that have been exposed for 8 months in this way have been made and compared with tires in daily service. The conclusions are rather startling. It has been shown several times that the rubber in the tire lying in the show window is in worse condition from the viewpoint of service than the rubber contained in the tire that has been used daily on an automobile.

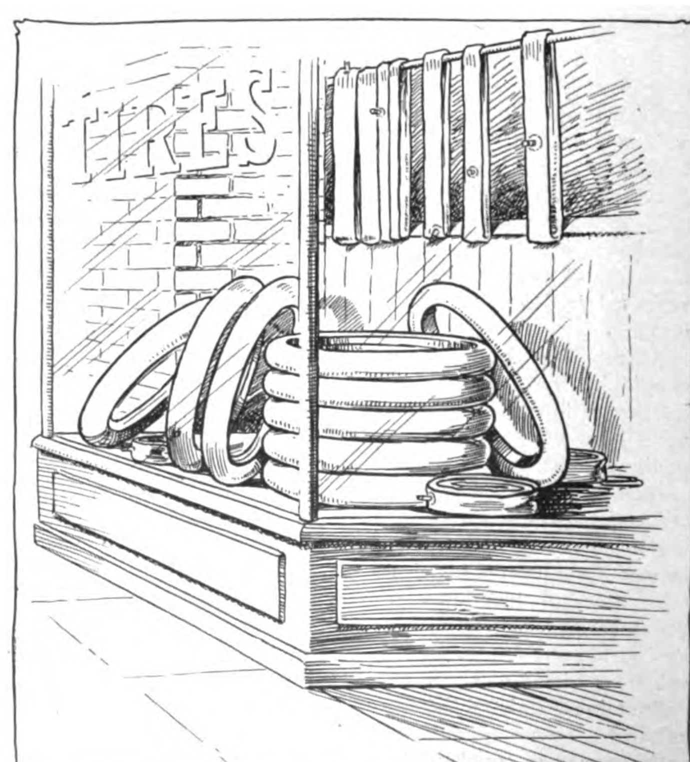
The chemical reasons for the change in the displayed tire are simply that the red rays of the lower part of the solar spectrum have an affinity for the rubber gum. The action of these red rays is the cause of the deterioration. Just what this action is, the rubber chemists still hold different opinions. Some of them hold that the rays set up a process of oxidation and the oxidation results in disintegration of the molecular structure of the rubber. Others state that the process is not oxidation, but is really something else which has not been classified so far.

At any rate the results are pretty well known. The tire surface becomes brittle and crumbles away and its life is short.

One view of this factor is that the effect of the sunshine is to make an extra cure. At every tire factory in the land final inspection of the product shows a percentage of over-cured tires. These are rejected by the inspecting officer and are not allowed to go out as first quality product. The action of the sun probably serves to bring about a condition of over-cure, or some similar condition, and a tire after exposure to the sun progresses to the stage where the inspector would have rejected it had the condition been reached before leaving the factory.

In its natural state as crude rubber, the effect of the sun is deleterious, bringing about a loss of elasticity and rendering the crude rubber less useful for exacting manufacture.

Dry heat ranks higher than all the other factors of destruction to tires in storage. The effect of heat is felt only slightly



Tires displayed in exposed show windows are subjected to an extra cure by the rubber contained in the tires unless it is sufficient in degree to break down the rubber structure. It is chiefly apparent in its action upon the composition of which the rubber forms a part. Dry heat of say 100 degrees Fahrenheit has small effect upon the pure rubber used to impregnate and bind together the various plies of fabric, known to the industry as friction cloth. It does take away some of the moisture that is incorporated into the structure of the tire, but is not a major factor in that direction.

It is upon the tread that the dry heat works havoc. It saps out the moisture and dries the composition so it loses its characteristic elasticity, rendering the substance of the tread brittle and of little use.

The whole subject may be summed up as follows: Oil and grease are generally destructive, affecting fabric, carcass, bead and tread with impartial damage.

Water is chiefly dangerous to the fabric, causing it to rot and separates the plies.

The sun, through the action of its red rays, brings about oxidation, over-cure and loss of elasticity in the gum rubber.

Dry heat affects the rubber composition, robbing it of its resilience.

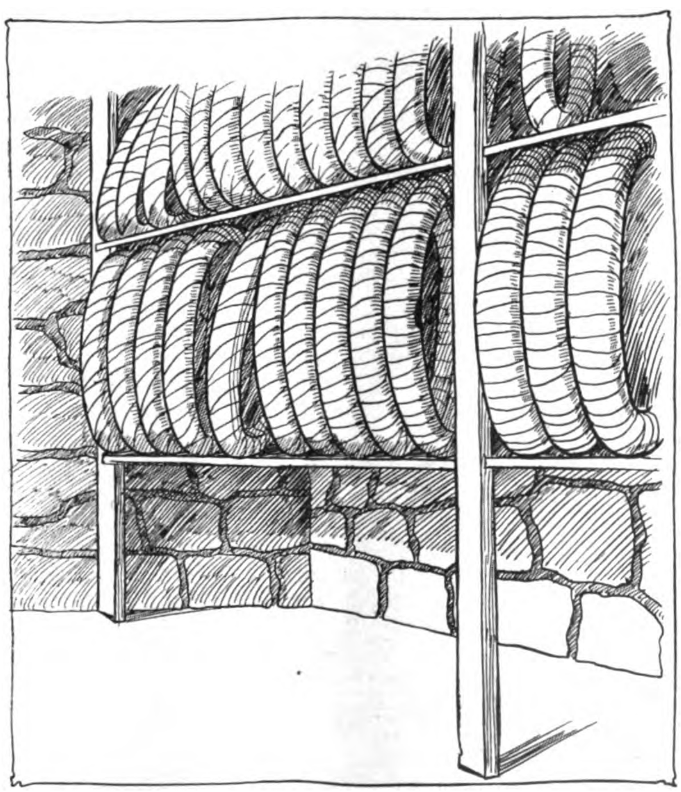
The way to obviate these various effects is to avoid the cause in each instance.

Modern practice is very uniform. In the selection of a storeroom for tires and tubes, the officer who has the responsibility always picks out a location where the sun can not reach his wares. He strives to make such arrangements as will insure moderate temperatures in the storeroom. He may or may not provide for additional humidity in the air by sprinkling the floors or some other expedient.

Stored tires should never be placed flat upon the floor or shelves. They should be arranged vertically, resting upon sectional racks. They should not only be placed out of the sunlight but they should also be stored in such a way that a free circulation of air may be had, under, above and beside them. They should be wrapped carefully in paper or some other protective material.

If tires are laid one on another in a pile, the lower tires will be pressed out of shape and strained unwarrantably by the weight of those above. This method of placing them in storage may well be charged with some of the ruptures of fabric-plies that have plagued automobile operators in the past. Such a method is never used in the modern depot.

Inner tubes must be treated with even greater care than shoes



Casings should be stored in racks away from light and heat as much as possible

Tubes, composed of a much higher percentage of gum rubber than the casings, require much care in storage to guard against heat and light as well as injury through contact with hard, sharp substances. They are usually stored in separate bags or cartons on shelves that keep them away from standing moisture.

The ideal conditions under which tires should be stored are: In the first place, in a dark room, preferably a basement. If there are windows in the room, they should be heavily shaded or else have a northern exposure. It is the direct rays of the sun that are destructive, but reflected and refracted rays probably have some effect also. The room should be comfortably dry in the sense that there should be no standing moisture on the floors or dripping from the wall, but the natural humidity of the air is not destructive and may be increased mechanically with benefit, according to some authorities. The temperature should be moderate and constant, the ideal condition for storage being somewhere between 45 and 70 degrees Fahrenheit. Freezing renders rubber brittle and alternate freezing and thawing of any substance does it no good, to say the least.

Tire Is Improved By Storage

It is stated very positively that if a fresh tire is wrapped and stored in a dark room where the temperature is kept within a moderate range and where it may be protected from oil, grease and water, that at the end of 1 year it will have improved to such an extent that it will deliver from 100 to 1,000 more miles than if it had been put into use as soon as the manufacturing processes had been concluded. Of course, quantities of standard sizes are stored for as much as 6 months and the depot men claim that that period of seasoning has proved to be advantageous.

The limit of time during which improvement takes place has not been set with definiteness. Several of the leading depot men say that they are willing to give the standard guarantee of their factories with tires that have been stored for 2 years. At 3 years they are doubtful but hopeful, the data being insufficient to permit them to be certain.

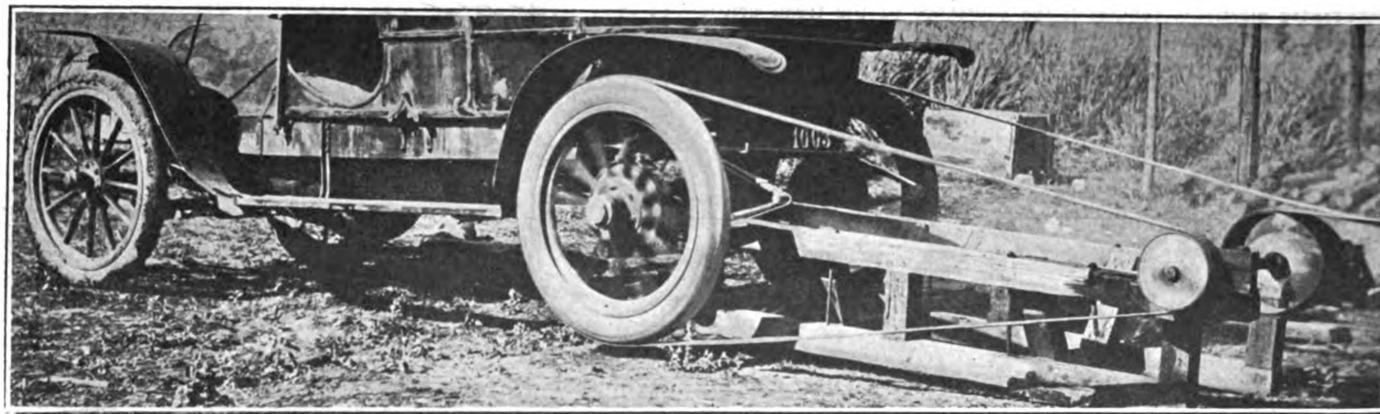


Fig. 1—Franklin car rigged up to run a saw by means of belting taking the drive from the rear wheels

Effect of Valve Chamber Expansion; Commercial Glycerine Contains Acid; Carrying Spare Casings; Radiating Surface Required for 28 Horsepower; Motor Tire Pump; Scraping Brake Shoe; Heating the Garage

Expansion of Cylinder Metal

Editor The Automobile:—Recently you gave instructions as to setting push rods on valves. I would like to have you explain why the walls of the firing chamber do not expand as much if not more than the push rods when they become hot. Are they not hotter than the push rods?

Hillsboro, N. H. W. H. Manahan.

—The metal of the cylinder casting which is in direct proximity to the flame and therefore submitted directly to the heat of explosion would naturally expand more than the metal of the push rods. This would not alter the fact that in the adjustment of the push rods themselves a small amount of clearance would have to be left to allow for the expansion of the rod.

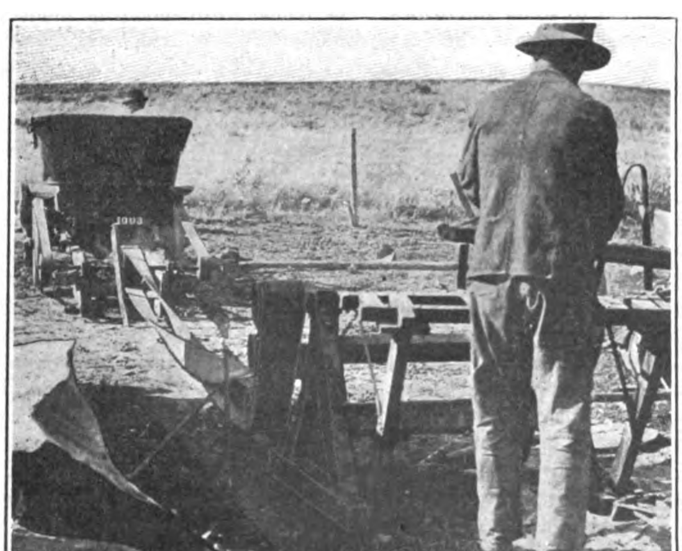

Fig. 2—Final drive to saw when using the car as the driving power for a saw

Glycerine No Scale Preventer

Editor The Automobile:—I read that glycerine, used in the radiator, would prevent the formation of scale. Is there any truth in this statement? Will glycerine form a chemical compound in connection with hard water that will hurt the metal?

Fort Wayne, Ind. George T. Townsend, Jr.

—Attempts to use glycerine as a scale preventer in radiators are rare indeed, as it is difficult to see that it would be of any value for this purpose. Glycerine has been used extensively in radiators, however, as an anti-freezing agent and in this respect is very valuable. The boiling point of glycerine is very high, while the freezing point is so low that it cannot be reached under climatic conditions in any place where automobiling is practicable. The commercially pure glycerine is very expensive, however, and this is a decided barrier in the way of its use. Any other but the commercially pure glycerine is sure to contain fatty acids which destroy the metal-work in the circulating system. A monthly washing out of the radiator with a handful of soda to a pail of boiling water will keep the cooling system bright and clean. The soda solution is poured into the radiator and the motor is run for a minute to thoroughly pass the solution through the cooling system. It is then drained out and fresh water put into the radiator.

How to Carry Spare Casings

Editor The Automobile:—Would you please tell me through The Automobile what is the best way to carry spare casings so they will not be affected by the weather and still at the same time be out of the way? What are some of the most approved methods adopted by the makers of the latest model cars? The manufacturers of automobiles should make some arrangements for an important matter of this kind and I should like to know what they are doing.

Newark, N. J. Prospective.

—There are several means of carrying spare tires, all of them good and some of them especially ingenious. The Rambler concern, for instance, furnishes an entire spare wheel with each of its cars. This is carried on the rear and locked in place with a special lock. The Knox company has a very neat arrangement which is shown in Fig. 4. This is a horizontally-carried tire trunk which can be easily reached and which will prevent the deadly rays of the sun from striking the rubber. It should be known that the practice of carrying the extra tubes without some kind of a protective covering over them is one of the most expensive examples of carelessness possible. The sun will take the life out of the rubber in amazingly short time on a hot day. Light is destructive to rubber, even when the direct rays of the sun are not shining upon it. A tire which is carried in an ingenious and convenient manner is also shown in Fig. 4. It will be noticed, however, that the care of the maker in furnishing a good place in which to keep the extra tire has not extended to the user of the car, who has neglected to furnish some kind of a covering for the shoe, from which he expects his full measure of mileage. A method of carrying tires which is fast becoming obsolete as the advantages of carrying them behind the body are becoming recognized is shown in Fig. 3, where the familiar brackets mounted on the side of the car are shown. On roadsters of the modern type, the rear deck furnishes an excellent support for the spare shoe. It may be stated, as far as care of the casing is concerned in carrying, the important feature is not so much where it is carried, but how well protected it is against sun and water.

Plenty of Radiating Surface

Editor THE AUTOMOBILE:—Will you please answer the following:

1. How many square inches of radiating surface are required per horsepower or how many would be required to properly cool a 4 1-4 by 4 1-2 T-head motor?

2. My radiator, which is composed of ninety-one plain copper tubes, 1-2 inch in diameter, 18 inches long, fails utterly on a hot day, in spite of an advanced spark, a good circulating pump, a tight fan belt and a clean radiator. What is the trouble?

Loudonville, O. JOHN N. GETZ.

—1. It is impossible to state how many square inches of radiating surface are required to properly cool a motor, as this depends upon the type of radiator used, the rapidity of the water circulation and a number of other factors. With the car you mention you have 89.5 square inches of tube area to each horsepower using the S. A. E. rating of 28.8 for your motor. This would be ample if everything was in proper condition.

2. There are many other things to consider other than those you have mentioned before you can positively state that the trouble is due to a radiator which does not answer the requirements of the motor. In the first place, the increased number of accessories which are being placed beneath the hood of a modern car are rendering it increasingly difficult for the fan to bring a supply of cool water beneath the engine bonnet. The hot air backed up behind the radiator cannot escape and as a result very little cooling effect is had from the radiator. Another thing that happens very often is a tear on the inside of the hose connections of the radiator. A flap of loose fabric will stretch across the opening and prevent the free passage of the water and overheating will result. Again, it might be that the cooling system is not to blame, the trouble lying in the oiling of the motor. Insufficient oil will allow the motor to run hotter than would ordinarily be the case and as a result the radiator steams. The steam will escape, thereby lessening the amount of cooling fluid in the system and the trouble will be augmented. A polished radiator will not act well because polish prevents radiation. If you have the radiator a dull black its efficiency will be markedly increased.

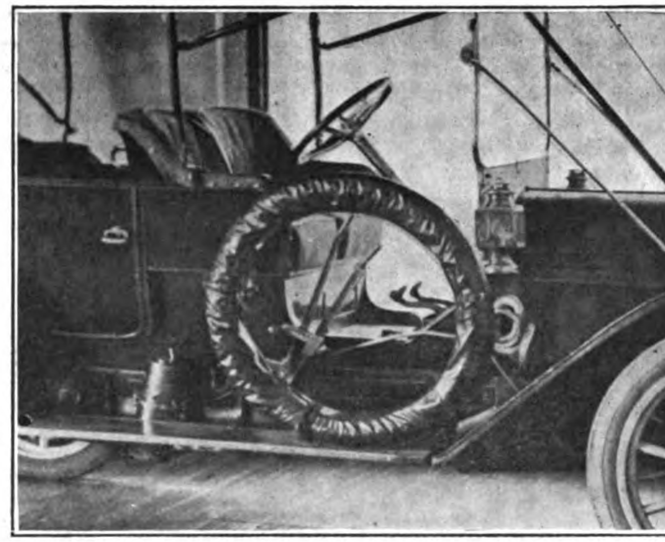

Fig. 3—Method of carrying tires on side; they are safe here, but appearance is bad

Using Car to Run Saw Mill

Editor THE AUTOMOBILE:—Is it possible to drive a buzz saw or other pieces of similar machinery by the engine in a car? How is the belting or shafting arranged when this is done? I have a rotary saw which would do a good part of the work in the preparation of wood for the winter supply of fuel if I could only drive it through the motor of my car.

Wenatchee, Wash. FARMER.

—The illustrations herewith show the method which has been used by a farmer owning a Franklin car. A stiff structure of beams was built up to assure alignment of the belting and two belts from the wheels run to two pulley wheels mounted on a shaft supported by the heavy beam structure as shown in Fig. 2. In the center of the shaft which carries the two smaller wheels at its extremities is a larger pulley wheel from which the power is carried back to the structure shown in Fig. 1. The latter holds the saw and it is here that the work is done.

Suggests Motor Driven Pumps

Editor THE AUTOMOBILE:—I am sending in a drawing of a suggested tire pump (reproduced, Fig. 7) which is attached to

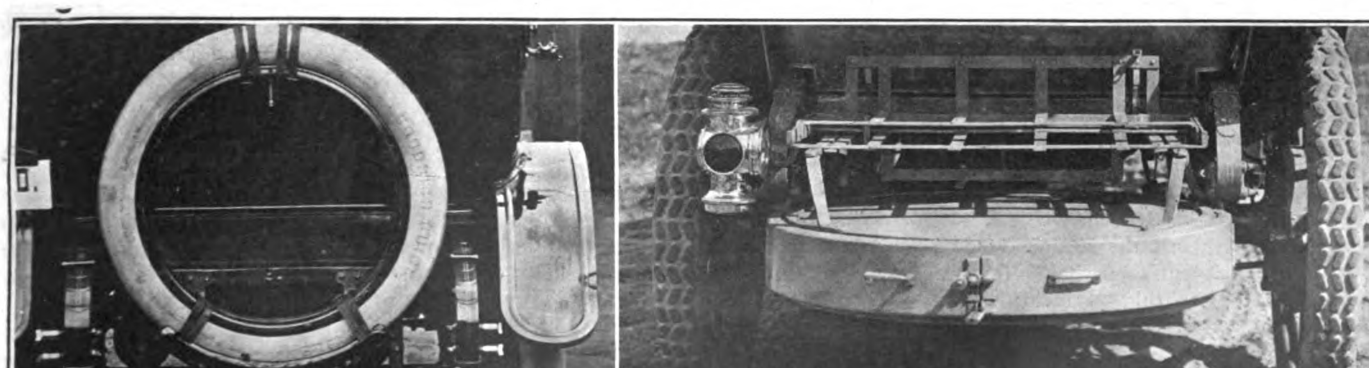

Fig. 4—Tire carried on the rear of a car. The casing should have been covered. The neat Knox tire trunk

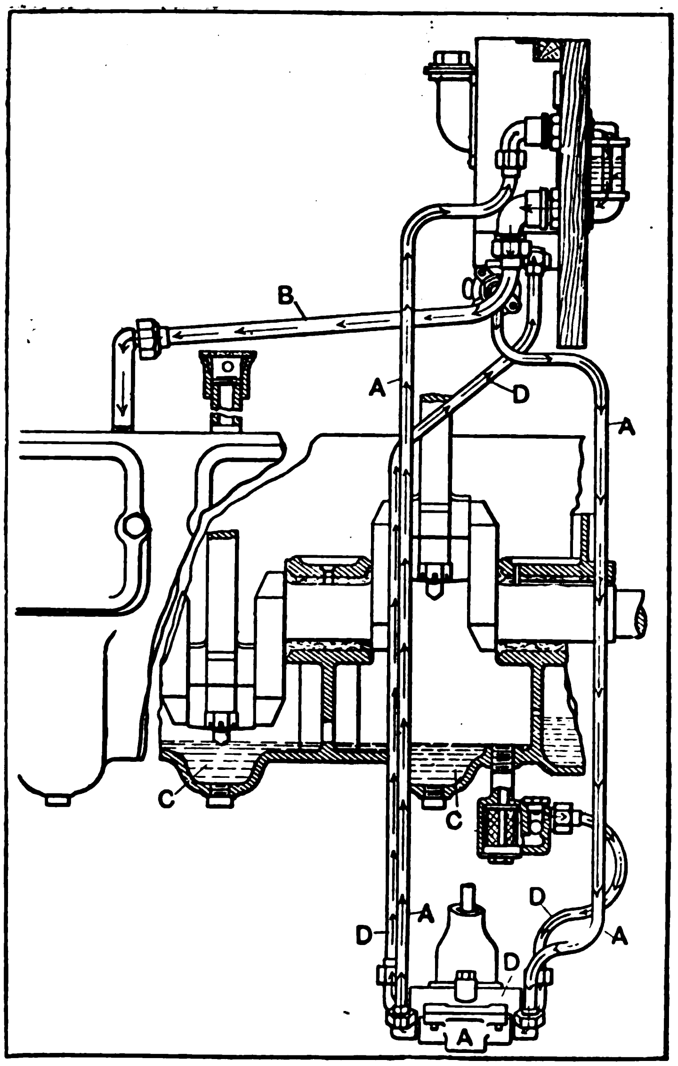

Fig. 5—The oiling system used on the Maxwell Model I cars

the spark-plug aperature of the motor. Would a pump of this kind operate?

Honea Path, S. C. ROGER R. DAVIS.

—You would not be able to put more than about 20 pounds of air into your tires with a pump of this nature. It must be remembered that the compression pressure ordinarily is only about 60 pounds and with the expansion and the work that would have to be done in working the pump and passing through the tubing from the pump to the tire you would be doing well to secure this amount without the use of a differential piston which would raise the pressure considerably. As the device stands it would not work.

Has Carbon and Axle Trouble

Editor THE AUTOMOBILE:—I have a four-cylinder model I 1911 Maxwell touring car on which the two back cylinders carbonize after running about 100 miles. Can you give me any light on the matter as to where the fault is and how to eleminate it? The two front cylinders have been cleaned once in 2,000 miles and seem to be perfectly clean after 3,000 miles of running.

Also the brake band drum where it fits up close to the rear axle end rubs against the support holding the brake rods and is commencing to cut somewhat. How can I set the wheel out far enough to stop this. I inclose a cut showing where the drum strikes.

Orangeville, Ill. H. C. S.

—To understand the trouble which causes carbonization of the two rear cylinders the oiling system used on your car must be thoroughly comprehended. The Maxwell model I is lubricated by the oil spray created by the splash of the connecting-rods into the pools of oil which are held by the series of troughs placed below the respective cylinders. The oil supply is held in the bottom of the crankcase in these splash troughs and also in the supply tank, and is kept in a state of continual circulation. This circulation is kept up by means of a gear-driven pump located on the left-hand side of the motor and operated by means of the camshaft.

The course of the oil as it passes through the oiling system may be traced by following the pipe leads starting from the tank. The oil starts from the tank which is placed at a considerable height above the pump and therefore has a head sufficient to give the oil a ready flow. The lead from the tank to the pump A, Fig. 5, is for the most part straight and leads directly into the suction port. From here the oil is forced up to the sight feed on the dash. After passing through the sight feed the oil will flow down into the crankcase through B, to replenish the supply in the splash trough C and maintain it at the proper level. After attaining this level there will be a flow into the standpipe placed at the proper height to catch the oil and lead it back again to the pump, from where it is passed up to the tank from which it started through D and is thoroughly strained before again passing through the system. All the moving parts within the motor itself are lubricated by the splash.

The standpipe through which the oil flows from the splash troughs C to the lead D, passing on its way the strainer, presents one point at which the oil supply may be adjusted. This standpipe, as stated, is fixed at the factory at the correct height for removing the oil when it reaches the level at which the connecting-rods dip into the oil. By screwing this pipe out a little the level is lowered, and smoking troubles, if there are any, will be abated. The pipe must not be screwed down too far or else the motor will be starved of oil in a very short space of time and as a result a case of seized pistons will develop. It would be unwise to attempt to reduce the supply of oil as per the above directions until you have first examined the piston rings in the two cylinders giving the trouble. It is very possible that they are either badly worn or broken, thus permitting oil to work its way past them into the cylinder heads.

2. In the live axle used on these cars, the weight is carried on the axle drive shaft. If, for any reason, the hub cap which holds the end of this shaft should become loose and should back off it would allow the end of the axle to wear the hub center to such an extent that when the latter is tightened again the wheel will go further up on the axle than it did formerly. This will bring the drum against the bracket and cause it to cut the latter. It is very possible that the hub is loose at the present moment allowing the wheel to cant in at the top, which brings the drum against the bracket in the same maner as would be the case were the whole wheel too far up on the axle shaft.

To cure this trouble, remove the hub and the axle. Examine the opening in the hub center very carefully to see if it is worn. If so, a new hub center will cure the trouble, provided no other parts are damaged. If the car has been run for an extended length of time in a damaged condition it is probable that further damage has been sustained. The parts which could be harmed by such a state of affairs are the hub center, axle shaft, outer roller bearing, taper key on axle end and the brake rod bracket.

Heating the Private Garage

Editor THE AUTOMOBILE:—I desire to learn of an inexpensive but satisfactory method of heating my garage and will appreciate any information you may be able to give me. My garage is of wood construction, shingled. Last winter we used a stove, but found that the temperature varied greatly.

Mount Vernon, N. Y. A. H. B.

—The problem of heating the private garage has long been a source of worry to the owner who does not maintain an establishment in which a chauffeur, and perhaps others, sleep. For the owner who takes care of his own car and who takes a delight in working about it during the winter months, the heating problem is a source of expense which, while necessary, must be cut down to the minimum. It is better for the car that the temperature of the garage be kept above 60 degrees, as cold weather affects both the metal in the car and the enamel upon it. If the car is to be used during the winter it is a necessity that the garage be constantly heated.

The general methods employed for heating a garage may be roughly divided into two classes. The first is where the heating system is within the garage itself and the second is where the heat is carried into the building from an external source, such as from the heating system of the residence, if the garage is on the same premises.

Where the heating system is located directly in the garage there is the choice of the regular stove, gas, hot air or the steam or hot-water apparatus. The stove has the objectionable feature mentioned in your letter and, besides, is unsafe in a frame garage. Gas heaters have the objectionable feature of being unsafe and against the underwriters' laws for garage work. Gas is in itself a dangerous thing about a garage and, although there is a type of gas stove which operates on the principle of the Davy lamp with a screen that prevents the ignition of the gas, this method has not been adopted extensively for the use of the automobilist keeping a private garage because of contrary legislation and also because the stoves of this sort, of which a few meritorious examples have been put upon the market, have never become particularly well known.

It would be impractical in the average small wood garage to have a steam or hot-water plant installed, because it would take up valuable space and would be expensive. When installed, however, it is managed the same way as in any other type of building. If the garage is of wood, care must be used in the installation of the heating plant. Most garage owners, when putting in such a plant, build a small concrete addition to the garage and make the wall thick enough to fulfill the regulations of the underwriters or the municipal fire department.

When the heat is taken in from an exterior source the heating plant of the residence or an electric heater may be used. The latter is expensive, 10 cents per kilowatt-hour being charged generally for the current. The electric heater uses so much current that the cost of running such a plant would be prohibitive.

A system which has been worked to good advantage where the residence was heated by steam, or hot water, was to run steam or hot-water pipes from the boiler in the celler of the house to a radiator in the garage. With the pipes carefully lagged the amount of heat lost through a pipe will be surprisingly small and there will be no difficulty in carrying the warm fluid 50 feet underground to the radiator, although an increased steam pressure will be necessary to take care of the added drain on the resouces of the furnace. When the level of the radiator is below the boiler there will be difficulty in getting the water back to the boiler. For this reason the radiator will have to be placed above the boiler level or the scheme will not work.

Should the hot-air system of heating be used in the house, it will be possible to lead a pipe over to a register in the garage. This will mean very careful lagging with astestos and burying the hot-air pipe in the ground. The walls of the garage will have to be very carefully chinked in order that the temperature can be kept to the required 60 degrees. The hot-air system, if carefully installed, will work well. There will be no danger of water freezing in the pipes and bursting them when the furnace accidentally goes out. Knowing the tendency of furnaces to do that very thing on some of the coldest nights it would be wise not to put entire dependency on it during the cold weather, but to also put a good anti-freezing solution into the radiator. A 30 per cent. solution of denatured alcohol and water, that is, 1 1-2 quarts of alcohol to 1 gallon of water will be safe down as far as zero.

The placing of the radiator or register is very often a matter of conditions to be met and not of choice. If the heat is brought from the residence, the pipe will be invariably led in from the nearest side of the building and the radiator will naturally be near that wall. It is a good arrangement to have the raditor near the point where the radiator of the car will be when it is in the garage for the purpose of keeping the water as warm as possible, even though the fire in the furnace or hot-water plant be low. Placing the heater near a window is also a good arrangement as the currents of cool air are warmed as they enter and an even distribution of heat is maintained.

For the small frame garage, the choice seems to lie between that of using the heating plant of the house or of building a small concrete addition and putting a heating system in this. The system used in the residence will be the cheapest and most satisfactory method in any case where the latter service is satisfactory and the garage not too far away, or if the level on which the garage stands is not lower than the hot-water or heating plant in the basement of the residence.

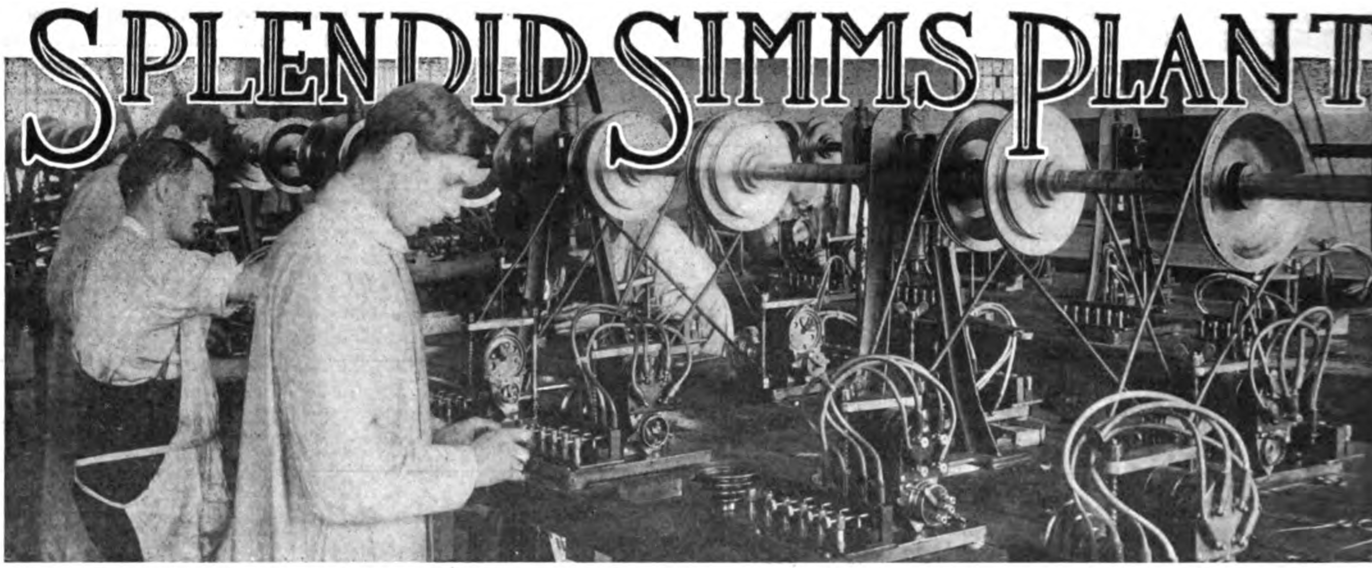
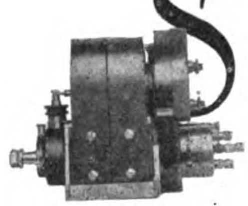
SPLENDID SIMMS PLANT



Running tests in the final testing departments in the factory of the Simms Magneto Company at Bloomfield, N. J.

Company Is Exceedingly Fortunate in Having the Advantage of a Well-Constructed Modern Factory Equipped in the Most Elaborate Manner with the Best of Up-to-Date Machinery Adapted to Its Purposes



A Simms magneto

SELDOM does a newly-organized company have the advantage of being immediately in possession of a commodious, modern plant, fresh from the hands of the builders and yet fully equipped with the most up-to-date machinery. When the Simms Magneto Company, Bloomfield, N. J., was reorganized this summer, increasing its capital from $1,000,000 to $1,750,000, it was fortunate enough to be in such a position. The old company had constructed the factory especially for the manufacture of magnetos and other automobile accessories but had done practically nothing further. The new concern, however, immediately upon effecting the reorganization, set about getting the plant into operation in an energetic way that bodes well for the future success of the undertaking.

Though practically nothing has been done so far in the way of production in quantity, the men in charge have been gradually getting things into shape at the plant, confining their efforts in the manufacturing line to the turning out of 100 magnetos designed for experimental purposes and for samples to be used in introducing the instruments.

Although at full capacity the factory will employ from 500 to 600 men, there are only about 150 now at work, the only active operations being the completion of the 100 magnetos mentioned, making some minor changes in the present design of the instrument and finishing a quantity of tools with which to carry on the work of production.

Some Overtime Work Already

Several departments are working overtime, that is, to about 8 o'clock in the evening. This is necessitated by the immense amount of preparatory work entailed by the approach of the time when the factory is to be put into regular manufacturing operation.

At full capacity, the plant will turn out approximately 50,000 complete magnetos a year together with about 150,000 spark-plugs, which the company will also include in its products. It is also more than likely that a line of carbureters will be manufactured, the company having secured a license from the British owners of the patents controlling the design of the S. U. carbureter. The company may also make some switches and other electrical devices applicable to automobiles.

The factory is situated in the outskirts of Bloomfield, on the line of the Lackawanna railroad, within half an hour of New York City, which promises excellent shipping facilities, the proximity of the metropolis being another favorable factor.

Entire Factory Is Fireproof

One of the striking features of the plant is the type of construction employed. The entire factory is absolutely fireproof, being of concrete, steel and glass, the walls giving the appearance of huge windows, so liberal is the provision for light and ventilation. In this respect, certainly, the plant is unsurpassed. The floors are all of solid concrete. In its general appearance, the whole establishment conveys an impression of solidity and efficiency.

The power house, as at present laid out, comprises a black-

PART OF THE ARMATURE-WINDING DEPARTMENT, SHOWING METHOD OF WINDING smith shop, besides the engine room in which are placed the two 125-horsepower American Ball, two-cylinder combined vertical and horizontal compound engines connected to two direct-driven dynamos generating the power for the entire plant. Two tubular boilers are employed to produce the steam for the engines. Water is pumped directly from the company's artesian well to supply these boilers.

While the buildings of the company could hardly be termed a mammoth plant as yet the two-story concrete main building, which is built in the form of a hollow square, has a floor-space of over 70,000 square feet, the outside dimensions of the building being 231 by 177 feet while the central court measures 137 by 43 feet. The structure is designed with a view to the possible future addition of a third story, the walls being constructed sufficiently strong to bear the added weight.

The most important portions of the plant are equipped with a sprinkling system as an additional safeguard against fire and the remaining parts are provided with high-pressure water pipes and reels of fire hose. For keeping records, blueprints and other valuable but perishable things, there are four steel vaults in various parts of the main building.

Three separate steel stairways, cut off from the floors by fire walls, are located in different parts of the building to give additional protection to the operatives in case of fire.

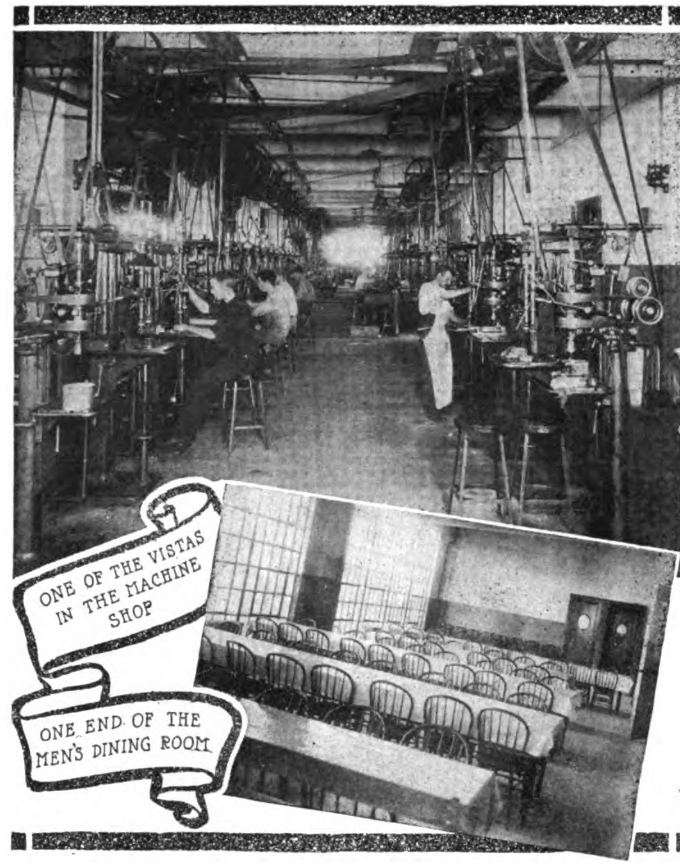
Among the departments on the first floor are the following: receiving, machine, finished parts stores, final assembly, final test and shipping, besides the machine tool department where all the tools and some of the machines used in the factory are made. On the second floor are: the general offices, engineering and drafting department, armature winding and impregnating departments, the separate dining rooms for the men and women employed by the company, the experimental and testing laboratory, etc. Coil assembling and testing departments are also situated on the second floor, together with a special spark-plug testing department and a carpenter shop.

The steel and concrete power house, which is separate from the factory proper, is of ample size for the present needs of the concern and has abundant provision for subsequent expansion.

Material Has Regular Route

In laying out the main building, the principles of system were kept in mind and, as a result, the plant was planned so that the material, after entering the receiving department in a raw state, has a regular path through the factory laid out for it, thus doing away with a considerable amount of unnecessary traveling back and forth from one department to another and a consequent waste of time, labor and expense. In fact, the best way to see the factory, especially if one desires to understand the manufacturing and testing processes through which Simms magnetos pass, is to start at the receiving platform, and then

A CORNER OF THE INSPECTION DEPARTMENT. HERE ALL PARTS ARE INSPECTED FOR SIZE, QUALITY AND WORKMANSHIP



ONE OF THE VISTAS IN THE MACHINE SHOP

ONE END OF THE MEN'S DINING ROOM

to go through the various departments in the order in which the material proceeds from its arrival to the shipping department, where it leaves the factory as a finished magneto.

All the raw material which is used at the plant is received at the platform situated at the right side of the entrance to the inside court. Here everything is carefully inspected before it is moved to the raw material stores department. This is situated at the extreme right of the front building in the big room adjacent to the general machine department.

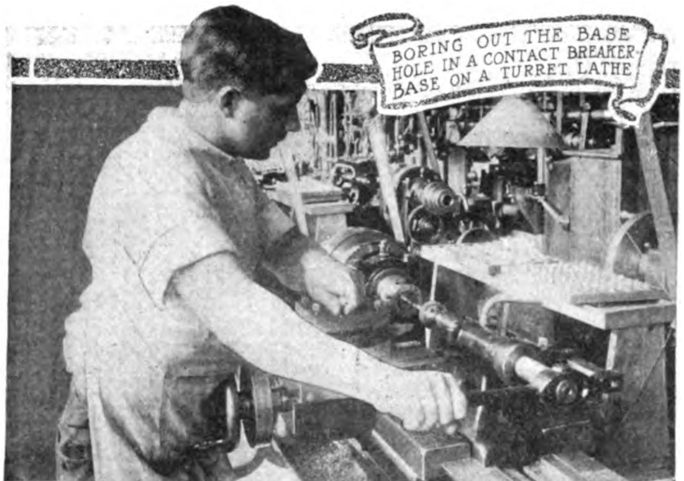
From the raw material storeroom all the material is moved by requisitions from the production department to the machine department where it begins to undergo the process of manufacture into the various component parts of the magnetos, carbureters and spark-plugs which are to form the line of the company.

Between the various steps of construction all parts are carefully inspected, as well as every time they are moved from one machine to another, and after they are completed they are finally inspected and then sent to the finished parts stores department to await requisitions distributing them to the different assembly departments, in which there are assembled into groups or complete machines, as the case may be.

The finished parts stores department is situated at the rear of the main building between the general machine department and the final assembly department and adjoining the inspection department. Consequently, only a small amount of labor and expense is entailed in handling the material to the best advantage.

Instruments Thoroughly Tested

Adjoining the final assembly department is the final test department. After the magnetos come from the assembling room, they are sent to the testing room where they undergo a very rigid test, called the high speed test. In this test, the machine is run at a speed of 5,500 revolutions per minute for a period of 1 hour. This speed is about three times as great as any it would be called upon to sustain in the most rigorous of actual service and over four times as great as the speed at which



Boring out the base hole in a contact breaker base on a turret lathe

Partial view of the assembly department at noon hour

it would run under normal conditions. After the high speed test has been completed, and if the results obtained are satisfactory, the instrument is run at a rate of 3,500 revolutions per minute for over 4 hours, the spark-gap being varied from time to time to test the strength of the spark over various distances. When this test has been carried out, if the magneto gives satisfactory results in every way it is given a slow speed test at a speed of 200 revolutions per minute. This test is also known as the compression test as it consiststs in trying out the magneto by connecting it with spark-plugs incased in an air-tight glass carrying 200 pounds pressure to the square inch. This pressure is almost three times as great as the compression obtained under normal conditions in a gasoline engine. If, after this test, the instrument is found perfect in every respect as regards performance, it is sent to the inspection department where it is carefully looked over to see that none of the screws or connections have become loose under the strain of the tests. If all parts are in good condition it is then sent to the shipping department, which adjoins the final test department, being situated at the front of the building to the left of the entrance to the cenral court.

Special Test for Vibration

In connection with the testing work there is a special test which only a few machines from each lot have to undergo as from their performance the quality of the rest of the lot may be readily determined. This is called a vibration test and consists in putting the magneto on a specially-designed machine which is mechanically vibrated to a much greater extent than could possibly be the case in actual service. The object of this test is to determine whether the condenser or other connections are being made properly and also to find out if any of the screws or bolts used in the machine can be loosened by the vibration, excessive vibration being one of the main causes for magneto troubles.

The winding of the magneto armatures is an interesting step in the manufacturing process. Specially-designed machines are used for this purpose. These are operated in the manner shown in the illustration on page 678, the workers being seated on steel stools constructed with a view to making the work as easy as possible insofar as the worker's comfort is concerned. The core of the armature is placed on the shaft rotated by the crank shown in the picture, thus winding the wire from the spool which is hung on the rack adjustably mounted on the upright shaft at the back of the machine.

After the armatures are wound they are placed on shelves in the rack in the impregnator shown in the accompanying illustration. This is then lowered into the drum which is filled with insulating varnish. This is heated by the steam coil in the sides of the impregnator drum. The cover is then carefully fastened down and the air is exhausted from the interior of the drum until a certain degree of vacuum is obtained. This insures the absolute permeation of the insulating varnish into all the interstices of the armature.

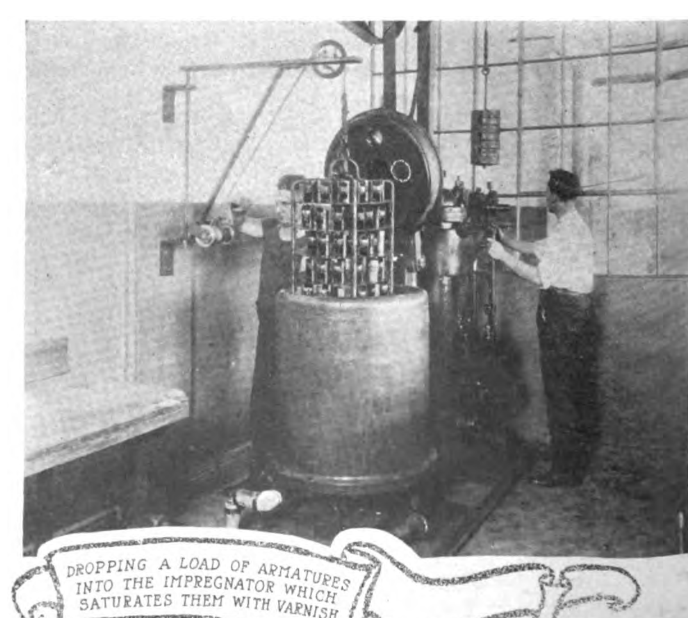
Armatures Carefully Inspected

When completed, the armatures are put to every test known to the magneto experts and then ground to size within a limit of .001 of an inch, when they are again inspected and thoroughly tested before being sent to the finished parts stores department where they are held until needed in the final assembling department.

The condensers are made in the same careful manner as the armatures and of the best obtainable material, being subjected to the same rigid tests and series of inspections. The inspection must be particularly careful in regard to this part of the magneto as a single flaw in the hand-split mica, no matter how small it may be, will eventually render the condenser useless for magneto construction.

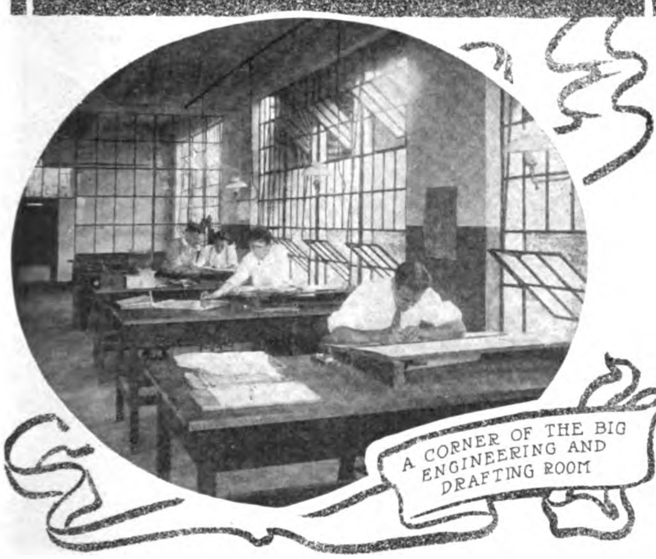
The engineering and drafting room, which is situated on the south side of the main building, on the second floor, is very large, giving ample room for the tables of the draftsmen and the desk of the man in charge, besides leaving a large open space which may be utilized for the enlargement of the department or for some other purpose as the subsequent development of the business may determine.

The experimental and test room is fitted up for all sorts of experimental work in connection with the operation of gasoline motors, being equipped with two motors, one a four-cylinder



Dropping a load of armatures into the impregnator which saturates them with varnish

EXPERIMENTAL AND TEST ROOM WHERE ALL RESEARCH WORK IS CARRIED ON



A CORNER OF THE BIG ENGINEERING AND DRAFTING ROOM

and the other a six-cylinder, mounted on steel and concrete bases. These may be used for testing magnetos, carbureters and spark-plugs, as well as anything else which the company might desire to add to its automobile accessory line. Around the walls are benches for the experimenters to work on, together with provision for whatever tools, etc., they would require in their operations.

The machine department is a delight to a good mechanic's eye, filled as it is with the most modern types of machinery, many of the machines being of special design. All of the tools and fixtures used in the manufacture of the company's product are designed and made in the plant and are so constructed that all parts turned out by them are absolutely interchangeable. It is completely equipped with drills of all the types necessary to the manufacture of tools and magneto parts, milling machines, etc., together with two rows of high-speed automatics. An idea of the splendid equipment of this room may be gained from the illustration on page 679, which is a view down one of the aisles formed by the machines. There are two of these aisles in the shop besides the small one formed by the double rows of automatics.

Grinding Equipment Complete

The grinding room, which opens off the machine shop, is well supplied with grinding machines and lathes, as shown in the illustration at the right. In this picture the method of hanging the electric lights will be noted. The cords are made extra long and then looped up, so that the workman may easily extend the lights to any part of the room immediately surrounding his machine. This idea is followed out throughout the entire factory in the suspension of the lights. Attention to details such as these means comfort for the workmen and a consequent increase in productive efficiency.

The inspection department is an interesting place. An excellent view of this is given on page 679, showing the men at their work, the chief inspectors, or foremen, consulting with the workers and instructing them. Here the parts are all inspected for size, quality and workmanship, micrometers and other accurate instruments being used to insure exactness in all measurements.

The finished parts stores department, located at the rear of the central court, is fitted up with bins for storing each part, the parts coming in from the machine shop and then being moved by requisition to the assembling department, the next step in the regular process of manufacture.

The final testing department has several long benches fitted with the necessary connections for attaching to magnetos to be tested for running qualities, durability, etc. At full capacity, this department can complete such tests on about 300 magnetos a day, due to its large bench capacity. There is also a special slow speed testing device which is employed in making the compression test.

For the comfort of the employes and employees of the company, each department is provided with separate wash and locker rooms as well as a running fountain of drinking water, the stream bubbling up into the air in a delightfully refreshing way and obviating the use of the dangerous common drinking cup.

Two Dining Rooms Provided

The plant is also fitted with two dining rooms, one for the men and the other for the women, part of the men's dining room being shown in the accompanying illustration. In connection with the dining rooms is a commodious and well-kept kitchen, equipped with the necessary paraphernalia for all sorts of cooking, and a large serving pantry. The men in charge of the plant class the entire arrangement as the culinary department. This department is not yet in operation but as soon as manufacturing begins it will be put into regular service.

Steel stools are used throughout the entire plant. These are not only simple and serviceable but also are very durable, besides presenting a neat appearance. Also, they may be readily disposed of when additional space is required as their compactness renders them easy to fit into odd corners.

The Simms company appreciates the productive advantages of the most modern details of equipment, and, in accordance with the principles of systematic management, keeps everything about the plant exceedingly neat and in a well-ordered condition. As a result, the general impression gained from this particular feature of the establishment is one of careful supervision.

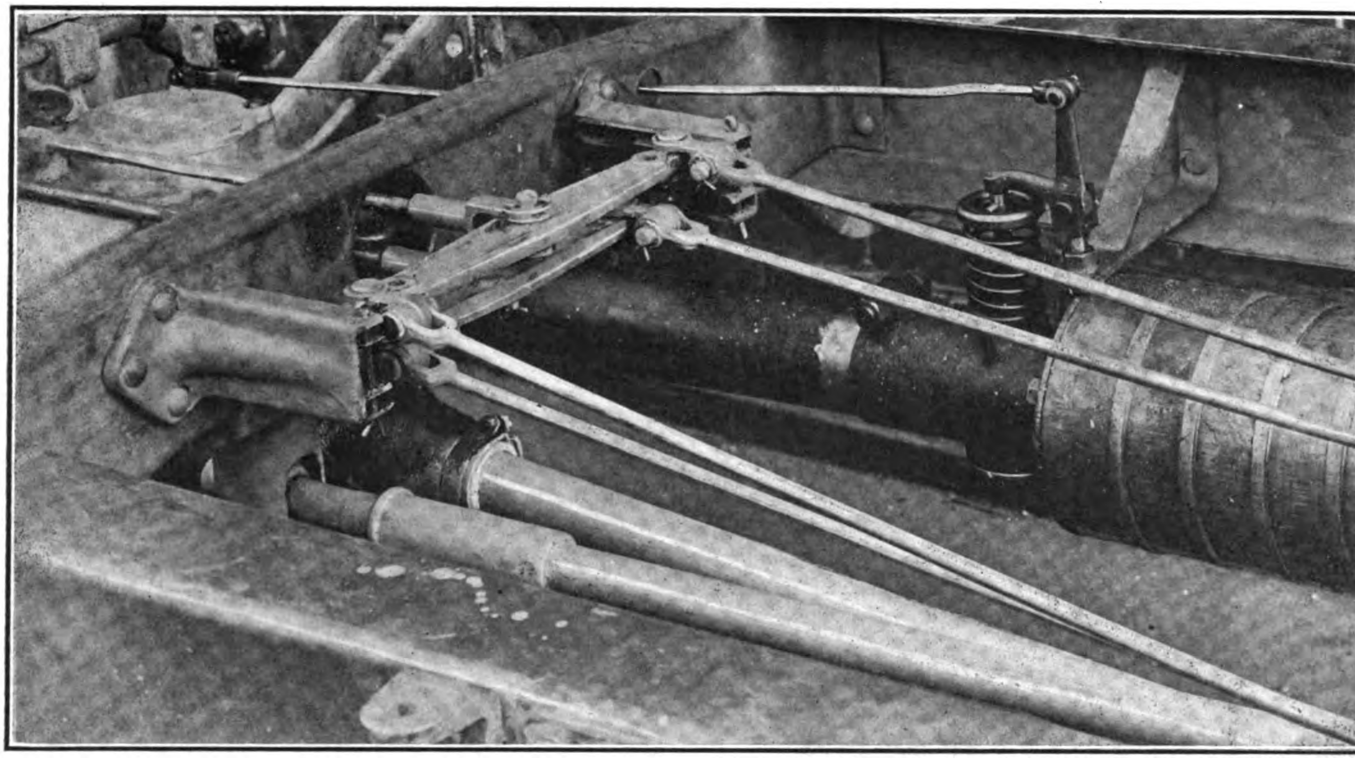

Fig. 1—Service and emergency brake linkage employed on the 1913 Premier models. Note mounting of cut-out

Premier Brings Out A Long-Stroke Six

Abandons Manufacture of Four-Cylinder Motors, Concentrating Attention on Two Six-Cylinder Models

WITH the announcement of the Premier little six for 1913 the company makes the statement that hereafter its attention will be devoted entirely to six-cylinder cars. The gradually increasing number of six-cylinder cars which this concern has had to build in response to the demand of the consumer has led to the abandoning of the four-cylinder type entirely, although service for the owners of previous models will be rigidly maintained. The first Premier six was placed upon the market in 1907 and the increase in demand for six-cylinder cars of this make has been steady even since that date.

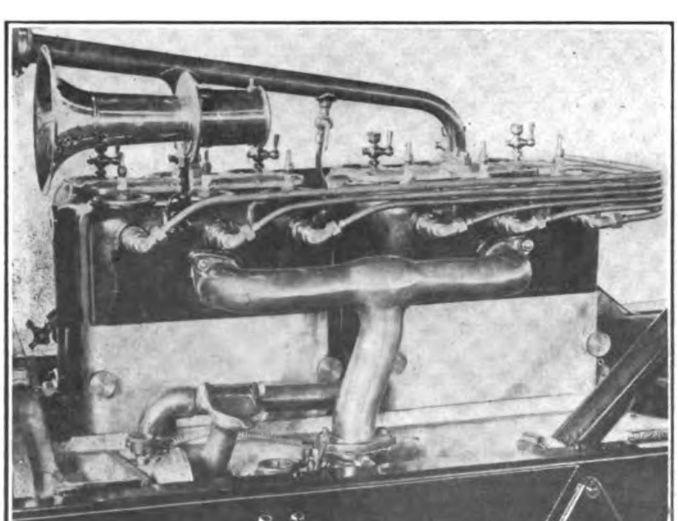

Fig. 2—Left side of little six with cylinders cast in threes

A study of the Premier product is interesting because of the great thoroughness with which the plans were laid to make the car easily kept by the owner in proper working condition. A study of the car reveals the fact that its maker has profited by its experience in reliability contests and is as well a tribute to the worth of rigidly conducted contests of this sort. The Premier concern was one of the early supporters of strict reliability contests and has used the information gained in such contests and in the results of bringing to the maker's attention weaknesses which might develop in guarding against weaknesses of assembly which would show up in use and in making all minor adjustments easy for the owner. This care is illustrated in the fact that practically every nut, bolt and screw throughout the car is permanently locked so that it is impossible for it to jar loose. There is still another point in which this attention towards easy maintenance is well illustrated and that is that on spring ends and all points where brake rods or other rods pass through the frame there are removable bronze bushings, easily replaceable in case of wear.

With this aim of easy maintenance in mind, let us look at the cars themselves. Premier cars for 1913 will appear in two models, both of them six-cylinder and known for the coming year as the Big Six and the Little Six. The Big Six car is the same car as was marketed as the model M-6 in 1912, with its motor, 4 1-2 by 5, cast in pairs, while the Little Six is a new model differing only in its motor size and arrangement and in chassis dimensions. The only change of importance in the Big Six over this year's construction is in the steering-rod connections, which instead of the ball joint used previously will be a universal joint arrangement.

The general design of Premier cars embraces a two-unit power plant consisting of a T-head six-cylinder motor and multiple disk clutch as one unit, and a three-speed sliding gearset as the other unit; a three-quarter floating rear axle and an I-beam front axle and heavy channel frame.

The motor of the Little Six has cylinders 4 inches in diameter by 5 inches stroke, and practically the same construction is used as in the Big Six except that with a smaller bore and cylinder three cylinders can be combined in a unit so that the cylinders are cast in triplets. This permits placing the three cylinders close together, making a minimum distance between end bearings and center bearings.

As with the Premiers of the past the cylinders are cast with large opening in the top of the waterjacket which is covered with a light aluminum plate. The reason for such an arrangement is that it makes the foundry work more uniform so that the thickness of the cylinder and jacket walls would be the same throughout. This also makes possible the removing of lime deposits which may accumulate from the water circulation and the makers have found that this light plate will, as a rule, give way when the motor is allowed to freeze up and will thus save the cylinder. After being cast the cylinders are pickled to remove core sand, then rough machined, heat treated to relieve the internal strains, bored, enameled and finally ground. The bore is said to be accurate to within .0005 inch. The pistons are of gray iron and the clearance between piston and cylinder is .003 inch. Each piston is fitted with three rings, which are individual castings to give increased spring and life. The connecting rods are I-section drop forgings with large bearings, the crankshaft is machined from solid drop forgings. The engine base is made of a close-grained semi-steel said to correspond to that used by the government in army coast defence mortars. The reason for using this particular material is that it is well adapted to hold thread and retain alignment, at the same time thin walls may be used with a weight but slightly greater than aluminum. The lower half of the crankcase, as an oil retainer, is aluminum.

Lubrication of the motor is a circulating system with constant level splash maintained by a gear-driven gear pump. There is a sight feed glass on the dash, located in plain view, by which the operator may watch its action. In the lower half of the crankcase are molded transverse troughs. These have partitions between them so that the dippers on the ends of the connecting-rods dip into oil on any grade below 27 per cent. The oil which overflows from the troughs drains into the reservoirs in the rear and is again forced back into the troughs, thus constituting the circulation. To the lower end of the connecting-rods are screwed brass tubes which dip into the trough and throw the lubricant up into the cylinders. The oil is supplied through a filler pipe and breather in one arm of the crankcase and its height can be judged by a petcock in the side. Pockets in the bearing journal catch the oil and feed it direct to the bearings through oil holes.

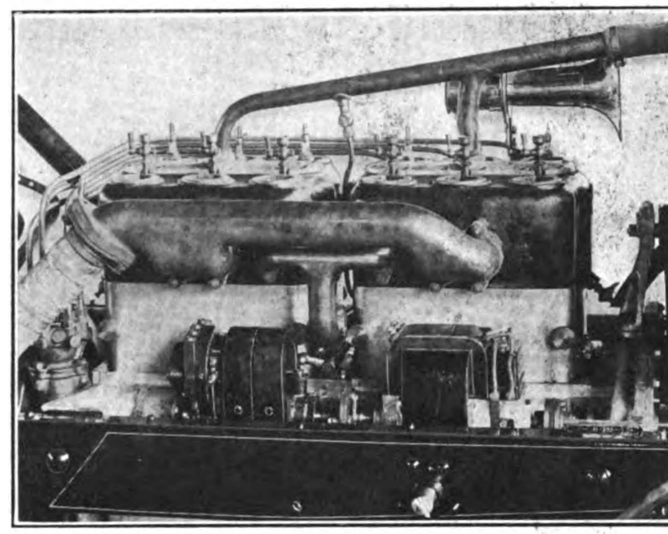

Fig. 3—Right side of little six motor, showing magneto mounting

The valves are completely inclosed and the push-rods have rollers 1 inch in diameter which are ground inside and out. The push-rod guides are die cast bear metal and are held in place by a forked clamp which, when loosened, permits two of them to be removed at once.

The cooling of the motor is by means of a gear-driven centrifugal pump and honeycomb radiator. The water is introduced at the lowest point of the waterjacket and comes out at the highest point. The pump is provided with a space on the outside of the plate so that if the pump were to become disabled the superheated water would naturally rise and the circulation would continue in a reasonably satisfactory manner. In other words, it is a combination pump and thermo-syphon

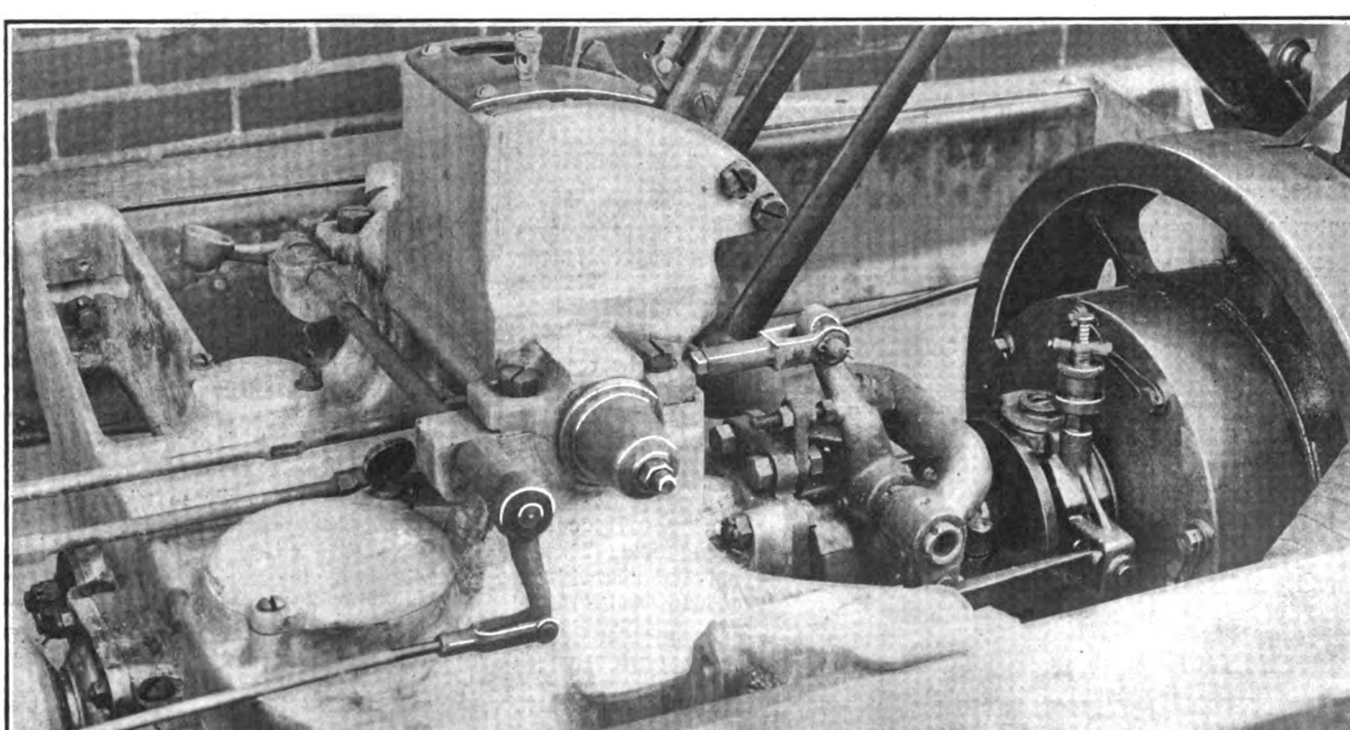

Fig. 4—View of the gearset, control mechanism and clutch, showing oiling and adjustment points and suspension

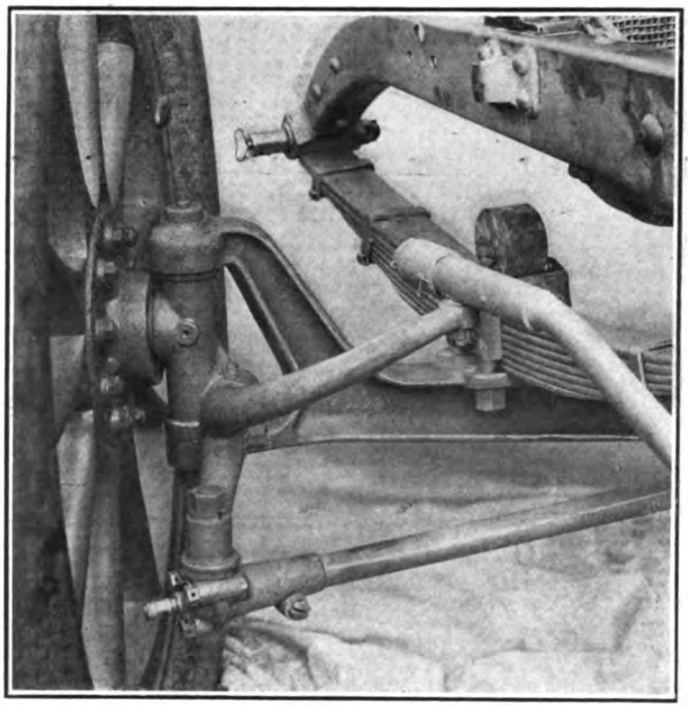

Fig. 5—Steering gear connections on left wheel of Premier six

system. In addition to the radiator there is a belt-driven fan immediately behind it which is driven from a pulley on the end of the pump shaft. The support of the radiator is unique in that it is rigidly fastened to the frame on the right side, while on the left side it is mounted on a trunnion to protect it from strains due to twisting of the frame.

Ignition is obtained by an Eisemann magneto located on the left side just behind the pump and driven from the pump shaft in the case of the Big Six and on the right side on a special gear in the case of the Little Six. On this shaft also is the magneto type electric generator which provides current for the electric lights. In the Little Six there is interposed between the magneto and the generator a fiber coupling. The lighting system consists of a ball bearing Remy magneto generator and a battery floating on the line. The generator delivers current at a pressure of 12 volts to a three-wire circuit so that 6-volt lamps are used. The system is designed to carry 68 candlepower of lighting load in the generator at a car speed of 8 miles per hour. All wiring is run through leaded cable.

Premier cars are made self-starting by means of a compressed air system consisting of a small pump on the gearset countershaft and a storage tank and lastly a distributer feeding

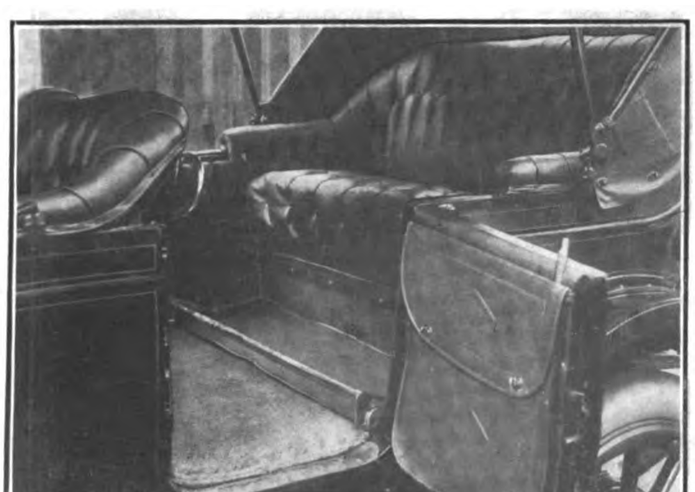

Fig. 7—View into the interior of the 1913 touring tonneau

to six ball check valves, one in each cylinder. On pressure on a foot valve in the driver's compartment air is admitted through the distributer to the cylinders in the order of firing so that the pressure forces the pistons down until the motor takes up its regular cycle. The pump is the single cylinder with air cooling flanges and has a bore of 1 5-8 inches and a stroke of 2 1-4 inches. There is an air gauge, shown at A in Fig. 4, and it is stated that a pressure of 50 pounds is sufficient to turn the motor over for starting.

The clutch is multiple disk running in oil. It has twenty-one plates, the alternate ones having cork inserts to prevent gripping. The plates have four lugs extending from their circumference and on these are attached small coil springs S to facilitate disengagement of the clutch. To make easy the removal of the clutch the shaft between it and the gearset telescopes when a collar is released. The clutch release consists of a bronze collar carrying two annular bearings which work against hardened steel disks, this being part of the release clutch cone.

Thre three-speed gearset is in an oil-tight aluminum housing which has four arms attaching it to the subframe. The gears are cut from nickel steel drop forgings and the shafts run upon five annular ball bearings. At either end of the mainshaft within the case are plates that throw back upon the gears any grease that tends to ooze out. The entire power plant is mounted upon a subframe of channel form, which is bolted to the main frame in such a way that it forms a complete box for the forward portion of the chassis. The gearset control is mounted immediately over the gearset housing so that the lever is in the center of the driver's compartment, as shown in Fig. 10.

Power is delivered from the gearset to the rear axle by shaft equipped with two combination slip and universal joints packed

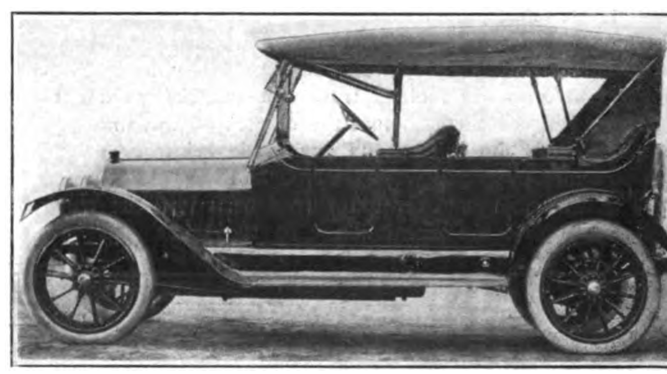

Fig. 6—Premier little six five-passenger touring car with top

in grease. The universal joints embody a feature of Premier construction at the ends of the propeller shaft. These are tapered squares which fit into tapered square holes in the universal joints in order to do away with keys and key-ways. The torsion rod is of the V-type of tubular construction and the front end is retained in a spring cushion ball joint.

The rear axle is a Premier patent and is of what may be called a three-quarter floating type. It has an internally ribbed center housing so that truss rods are dispensed with. The differential is of the bevel gear type and upon it is mounted the main driving gear. Through hand holes in the rear of the housing the gear may be adjusted laterally to take up wear. Correspondingly the pinion which transmits the rotary motion of the driving shaft to the axle gear is adjustable longitudinally so that with these two adjustments the gear can be made to mesh properly should it be necessary to change their setting. There are eight anti-friction bearings in the rear axle. Roller thrust bearings on either side of the differential, annular bearing at the outer end of the axle shaft, and four bearings in connection with the pinion, two of which are thrust bearings. At the ends of the axle housing are the brake supports rigidly attached and hot riveted. The brake drums are integral parts of the wheel hubs. The live axle shafts are square at the inner end to fit into the differential and at the outer ends are provided with three clutch jaws forged integral with the shafts themselves. These engage with three corresponding clutch jaws in the hubs of the wheels through which the drive is transmitted. The brake drum is an integral part of this clutch and hub arrangement, and the wheel is bolted to it with a bolt through each spoke. An annular ball bearing is placed in the load carrying center of each wheel. The rear axle housing itself is in four parts, the center or bell being a crucible steel casting and the taper tubes are forgings riveted to the center.

Braking surface on a Premier car represents a total of 526 square inches, and the fact that the brake drums are integral with the wheel hub makes the braking action positive. The internal brakes are operated by a foot pedal and are steel bands covered with raybestos. The emergency brakes are external and are of the same construction. Full adjustment of both brakes can be made by lifting a floor board under the driver's feet, which gives access to a turnbuckle on brake rod. Additional adjustment is provided by a take-up on the rear end of the rod, which can be done without removing the brake. Equalizing bars anchored to the center of the center cross-members of the frame assures equal pressure on both wheels.

Semi-elliptic springs are used on the front, each 36 inches long, and three-quarter elliptic on the rear with the bottom section 50 inches long and the top 26 inches in length. The forward ends of the lower leaves of the half springs at the rear are longer than the others and are curved under to cushion the blow if the spring strikes the rubber bumper. The front springs in addition to being held by spring clips have drop forged plates binding the leaves at the center. The rear corners of the channel frame are braced by pressed steel channel sections and small gusset plates. At the front there are integral gusset plates extending down to the radiator supports.

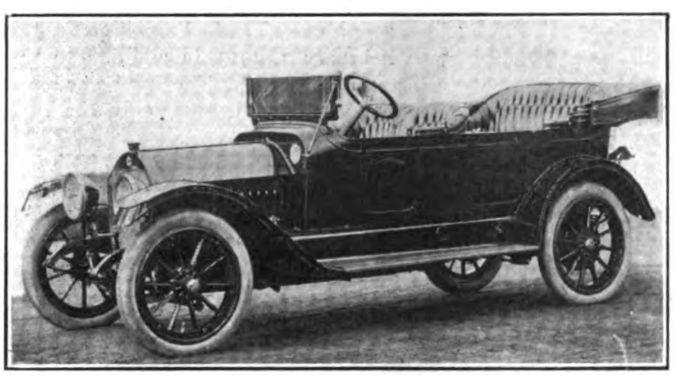

Fig. 9—Five-passenger touring car mounted on little six chassis

Premier steering gears are unique in one or two respects. In the knuckle design the load-carrying center has been brought close to center line through the king bolt constituting the steering center. Truss bearings are used in the top of the king bolt to carry the vertical load and the bottom held in hardened and ground bushings. New this year is the ball connection between the tie rod and the steering arm. This is illustrated in Fig. 5. The steering rod has universal joint connection in place of the usual ball type and is illustrated in Fig. 5. The steering gear itself is of the irreversible type with full gear and worm. This gear travels less than one-quarter of its circumference in any one position of adjustment and in case of wear can be shifted one-quarter of a turn. A further adjustment is provided between the worm and the gear by an eccentric bronze bushing within which the shaft is mounted. The steering column is mounted on the left side.

Notable among the features of the Premier 1913 cars is the clean appearance of the body, tool boxes, battery boxes and similar equipment being removed from the running board. The mahogany cabinet in the deep cowl of the dash has been provided for carrying tools; the battery is suspended in the front of the car and the spare tire carried at the rear. The bodies are of the true straight-line appearance and the door hinges are concealed. The upholstering is unusually deep, the seat springs consisting of a double row of coils, one above the other, with a wire partition between the two. The bodies are of metal and the rear fenders are bolted to flanged projections from the body.

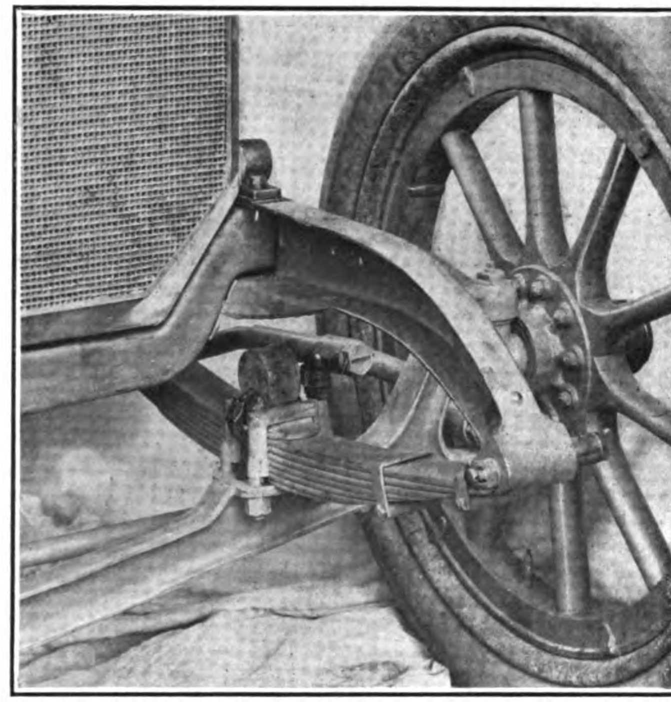

Fig. 8—Front semi-elliptic spring, showing radiator mounting

One of the most commendable features of the equipment is the arrangement for filling the gasoline tank. The latter is located below the front seat and the filler pipe opens between the two seats so that access is gained to it by simply lifting up the seat arm. This obviates the necessity of removing the cushion and seat bottom to fill the fuel tank. Behind the filler pipe is a space for small tools, and so on, which is open when the seat arm is raised.

The lighting equipment consists of electric headlights, bull's-eye port dashlights and a combination tail lamp and license plate holder mounted on the left fender.

The Premier Little Sixes appear in roadsters, five-passenger touring, limousine and berline bodies, while the Big Sixes appear in the touring, roadster and limousine bodies. The wheelbase of the Little Six is 132 inches and that of the Big Six is 140 inches.

Chicago Show Spaces Assigned for 1913

N. A. A. M. Has Drawing for Pleasure Car and Commercial Vehicle Shows to Be Held Next Year—Eighty-two Gasoline Car Exhibitors—Pleasure Electrics Given Block Space in Armory—All Room Taken

OFFICIAL drawing took place this afternoon at the headquarters of the National Association of Automobile Manufacturers for the Chicago pleasure car show and also for the commercial car show to be held following the pleasure show. As formerly, the Coliseum, Coliseum annex, Coliseum basement and First Regiment armory will be used for both shows. Eighty-two car concerns have already received space and three-quarters of the center space of the armory has been reserved for electrics which have not yet drawn. In the main floor of the Coliseum are 39 exhibitors; in the Coliseum annex, 8; Coliseum annex basement, 17, and armory, 18.

In the Coliseum the exhibitors are arranged in four central spaces and also around the wall as formerly. To the left of the center aisle on entering are Peerless, Flanders, Pierce and Haynes, and on the right of this aisle from the entrance are Glide, Buick, Cadillac and Maxwell. Other center floor exhibitors are Stevens, Stearns, Winton, Stoddard, National, Hudson, Packard, Premier, Reo, Franklin, Locomobile, Studebaker, Oldsmobile, Pope, Chalmers and Overland. Around the coliseum walls or under the gallery are: Selden, Columbia, Auburn, Rambler, Fiat, Marmon, Alco, White, Cole, Case, Imperial, Mitchell, Moon, Oakland and Lozier. In the Coliseum annex are American, Kissel, Cartercar, Knox, Velie, Inter-State, Hupmobile and Garford. In the basement of the Coliseum annex are: Colby, Patterson, Halladay, Lexington, Cino, Midland, Ohio, Crow, McIntyre, Cunningham, Edwards, Herreshoff, Republic, Metz, Bergdoll, Davis, Elkhart and Mercer. In the First Regiment Armory are: Jackson, Austin, Matheson, Abbott, Michigan, Regal, Cutting, Kline, Pathfinder, Staver, Pullman, Krit, Westcott, McFarlan, Great Western, Stutz and Speedwell.

For the commercial car exposition spaces were assigned to the following companies:

Coliseum, center: Buffalo Electric, Jeffery, Studebaker, Reo, Selden, Autocar, Waverley, Adams, KisselKar, Speedwell, International, Cramm, Pope, Locomobile, Pierce, Velie, Buick, Peerless, Federal, Hupmobile, Kelly,

Coliseum, along the walls: Durable Dayton, Sternberg, Alco, Walker, U. S. Motor Truck, Garford, Rapid, Reliance, Knox, Krebs, Old Reliable, Clark, McIntyre.

Coliseum Annex: Bowling Green, Universal, Service, Standard, Transit, Dart, M. & P. Electric, Lippard-Stewart.

First Regiment Armory: Chicago Pneumatic, International Harvester, National Motor Truck, Sanford, Commerce, Four-Wheel Drive Truck, Gramm-Bernstein, Poyer, Bessemer, Harwood-Barley, General Vehicle, Avery, Packard, White, Alden-Sampson, A. L. Smith, Lauth-Juergens.

Boston's First Electric Show

BOSTON, MASS., Sept. 28—Boston's long-heralded electric show opened here tonight and the old hackneyed expression "a blaze of glory" was really a fitting one to describe it. For a distance of about a mile on Huntington avenue there are flaming arcs on each side of the street, there being 216 of these so that persons traveling along find themselves walking through a lane of brilliancy never before equaled in Boston. On the outside of Mechanic's building where the show is being held there are 45,000 lights of varying hues. Inside the building there are 200,000.

For the first time in motor history electric motor vehicles have a chance to make a comprehensive display. And the Boston representatives of these machines have taken advantage of it. In the regular motor shows the electrics were not numerous, and some of them were somwhat scattered. Now, however, for a month they will occupy the most prominent section of the electric show. Had some of the newer agencies been placed earlier all the electric pleasure vehicles would have been together. But when one looks over the list he finds that they are nearly all there.

There are sixty-two machines in the building now, and a few more may be brought in early Monday so that the total may reach seventy when the show is well under way. Of this number there is a very close division between pleasure and commercial types. More than 10,000 thronged the building, and with a month to run and special rates on the railroads from all over New England, the show should prove a success.

Two Shows for Montreal

MONTREAL, QUE., Sept. 27—That this city will see two automobile shows during the coming winter seems now assured the preliminary arrangements having been completed for the holding of the Montreal Automobile and Motor Truck Exhibition in the Drill Hall, January 25 to February 1, 1913, in addition to the one to be run by Mr. Wilcox, of Toronto. The last-named exhibition is to be conducted by and under the auspices of the local automobile dealers.

New Financing in Automobile World

Automobile and accessory incorporations of major size that were formed during September, include the following:

	Capitalization.
New York—	
($1,000,000 or over.)	
Motor and Gear Improvement Company	$1,250,000
Rondout Rubber Company	1,000,000
California—	
Michigan Motor Car Company	1,000,000
(Under $1,000,000.)	
New York—	
Continental Motors Corporation	100,000
Englebert Tire Company	100,000
Fiat Motor Sales Company	300.000
Simplex Carbureter Company	150,000
Selden Truck Sales Company	150,000
Delaware—	
Flanders Motor Company (change from Everitt) increase	750,000
L. A. W. Motor Truck Company	200,000
New Jersey—	
Reliance Speedometer Company	100,000
National Chauffeurs' Association	500,000
Maine—	
Co-operative Rubber Company	500,000
Handt Tractor Company	350,000
Ohio—	
Federal Motor Supply Company	250,000
Illinois—	
Universal Welding Company	100,000
Total	$6,800,000

Most of the companies mentioned in the foregoing list are concerns already in operation under some former shape. A few of the incorporations referred to are simply changes in the form of business organization. Some of them, as will be noted, are only incidentally connected with the automobile industry, but there are a few that represent entirely new enterprises.

Y. M. C. A. Hears Talks on Turcks

Introducing the opening of a truck drivers' instruction class by the New York West Side branch of the Y. M. C. A., the members of the association listened to two talks by experts on the subject on September 26. William C. Mack, the designer of the Mack truck, lectured on the possibilities of the motor truck, dealing in a concise way with the development of the commercial vehicle and illustrating his remarks by a large number of interesting stereopticon views. He was followed by George H. Duck, the manager of the New York Alco branch, who spoke on the opportunities of the truck driver. He showed how the number of commercial vehicles had increased rapidly during the past 2 years and dwelt on the probability of the continuance of an equally active increase. He stated that one of the largest factors in the success of a motor truck is the driver, and that consequently the good driver should be encouraged by appreciation of his good work, both in the way of better compensation than the bad driver and by a record of the maintenance cost of his car. He foreshadowed the use of a detailed record system for trucks and spoke of the advantages to the driver who puts his truck to good use. After he had closed, applauded as Mr. Mack, the audience was transported on a sight-seeing truck to the new department of the Y. M. C. A. in West Sixty-sixth street

Dates Set for Electrical Show

The sixth annual New York Electrical Exposition and Automobile Show will be held at the Grand Central Palace, October 9-19. Three floors will be used for the exhibition which promises to be the largest and most complete of its kind ever held. Trucks will be the feature of one section of the show and pleasure cars of nearly a score of types will be exhibited in another. On the third floor, a track 1-10 of a mile around will be installed for demonstrating purposes and for the instruction of customers. The electric vehicle companies that have contracted for space so far include the following: General Vehicle Company, General Motors Truck Company, Buffalo Electric Vehicle Company, Anderson Electric Car Company, Lansden Company, Studebaker Automobile Company, Atlantic Vehicle Company, Baker Motor Vehicle Company, S. R. Bailey Company, Champion Electric Vehicle Company, Cleveland-Galion Company, Ward Motor Vehicle Company, Edison Battery Company, Electric Storage Battery Company, Philadelphia Storage Battery Company and the Gould Storage Battery Company.

Ohio Farmers Buying Cars

COLUMBUS, O., Sept. 28—According to the statistics furnished by State Registrar of Automobiles J. A. Shearer, the rural sections of Ohio are buying automobiles as never before. The wheat and oats crop is being rapidly converted into motor cars as is shown in the number of applications for registration coming from the rural counties.

Of the licenses issued now about 80 per cent. come from the strictly agricultural communities. In Madison, Miami, Pickaway, Ross, Fayette, Licking, Montgomery, Fairfield and other rich agricultural counties the elevators are fairly bulging out with grain and automobiles find a ready sale.

For the first half of September the number of new automobiles registered was over fifty per day. The rule in farming sections now is early selling of grain and this aids the automobile trade.

1913 License Plates for New York

ALBANY, N. Y., Sept. 28—Automobile license number plates being issued by the New York State automobile bureau next year will be different from those now being used. Besides the figures "1913," indicating the year in which they are issued, the new plates will have the word "commercial" on plates intended for commercial motor vehicles. The state's charge for a "commercial" license is $5 while from $5 to $25 is charged for pleasure vehicles, according to horsepower of machine. Heretofore automobile owners are said to have secured pleasure plates at commercial car rates, thereby saving many dollars. Manufacturers' plates used by dealers will continue to bear the letter "M," as in past years.

Rubber Show Is Success

Third International Exposition Concludes By the Sale of the 150 Tons of Crude Rubber Exhibited

Amazonas Wins Chief Award for Wild Rubber While British Malaya Takes Plantation Prizes

DESPITE a few jarring notes the great rubber exposition ended this week in a burst of harmony. The attendance during the 10 days of the show was excellent from the viewpoint of the rubber men but would have been considered microscopic for an automobile show. It made up in quality what is lacked in quantity, according to those most interested.

The show was primarily one of crude rubber, but the original intention of the promoters was to have broadened its scope so that manufactured goods would constitute one of the most attractive features. This plan contemplated a full exhibit of automobile tires. With that end in view, contracts for space were tendered to the various major tire manufacturers and according to A. Staines Manders, organizing manager of the exposition, the contracts were accepted by several concerns.

Mr. Manders states that he obtained written word from the Motor and Accessory Manufacturers that the organization as such would not take jurisdiction of the exposition in the same way that it does of the national automobile shows and that there was nothing in its rules to prevent any of its members from exhibiting.

He states that contrary to the meaning of the letter, the association did take action to prevent the tire makers from showing and that at least one big company shipped its wares to the show but did not install them on account of the later ruling.

The association stands by its former letter and states that as far as it is concerned the tire men could exhibit if they pleased.

The result of the matter was that there were no tires shown at the exposition and the companies insist that the representations made to them when they were solicited to take part were that others in the trade had taken space; therefore the particular company should do likewise.

The United States Rubber Company had a magnificent booth on the main floor but showed no tires; the Swinehart Tire and Rubber Company had a booth but showed no exhibit. The United States Rubber Company declares that it never had any intention of showing tires and the Swinehart company says that it did not want to install its exhibit as long as its competitors were not showing.

But aside from that little jam, the proceedings passed off smoothly. The final act at the show was the sale of the crude rubber that formed the exhibits of various countries, amounting in all to about 150 long tons. The sale was not an auction as the bids were submitted under seal.

The Brazilian state of Amazonas was given the chief award for an exhibit of wild rubber for its 30-ton heap of Madeira and British Malaya was given the principal prizes for plantation rubber shown.

Ontario's Registration Large

TORONTO, ONT., Sept. 30—Ontario's revenue last year from the sale of licenses for motor vehicles totaled $50,831.25, twice the amount received during the year 1910, which was $24,394. The revenue for 1906, the first year fees were imposed, was only $15,235.15. The licenses issued last year totaled 11,339, and for 1910, 4,230, while in 1906, 1,176 licenses were issued. Fee[illegible] lected for issuing charters to automobile corporation[illegible] $235,663.10.

Road Congress in Session

Over 600 Delegates Present and More Coming—Stress Laid on Automobile As a Good Roads Factor

ATLANTIC CITY, N. J., Oct. 2—The 6-day annual convention of the American Road Congress opened on Million-Dollar Pier Monday, September 30, and will continue until Saturday, October 5, with three sessions daily. Over 600 delegates from all parts of the United States and Canada have registered to date and many more will arrive before the end of the week.

The first 2 days were given over entirely to the automobile interests, being known as Road Users' days and conducted by the American Automobile Association which arranged the program and conducted the sessions. The remainder of the week is given over to various road building organizations; Wednesday's sessions are under the direction of the American Association for Highway Improvement; Thursday is financial day in road building; Friday is construction and maintenance day and Saturday is also given over to this department.

Monday and Tuesday's programs included addresses on national systems of marking roads, automobile state laws, the farmer in road making, working state aid, federal aid, transcontinental highways and business organizations in road building.

The necessity of business activity in medium-sized cities in building modern roads from these cities into the surrounding country was emphasized by G. Grosvenor Dawe, of the Chamber of Commerce of the United States of America. Mr. Dawe showed how within the last 15 years such city organizations had actively taken up the problems of real road building and cited scores of cases of what had been done, concluding with that "Improved vehicular transportation, which finds its highest form in the automobile, and the rapid development of commercial organizations cover practically the same period of time—15 years."

Mr. Dawe said in part:

Commercial organizations, in practically every town of any size, are helping along the good roads cause in some effective way—by instigating legislative action, by educational campaigning, by co-operation with state highway commissions by appointing special committees to investigate road conditions, by holding good roads rallies and by distributing literature urging activity for good roads.

The common sense of the situation that has been recognized in rural regions as soon as presented to their consideration by commercial organizations is that good roads must lead somewhere—good roads must be provided for the main lines of travel—the main lines of travel must, in all cases, be toward a market as represented by a good-sized town or a shipping point. Consequently, apart from the improvement of a few scenic highways, the efforts of commercial organizations in the past few years have been utterly practical and have brought immediate return to the country region through increased value of land, through ease of marketing, and through economy of traction.

When I come to detailing all these activities, I am embarrassed by the varied forms of these activities and embarrassed also by the fact that I can not tell you one fraction—in the time allotted to me—of what has been done. I can simply place before you a few activities of unusual interest and ask you to assume that other activities are common the nation over. Let me refer to what has been done in Meridian, Miss., as a type of the effort to link the producing country region with the consuming city. Through the activities of the commercial organization, the Board of Trade, the city of Meridian is now the hub of an arrangement of roads like the spokes of a wheel. In eight directions highways have been improved for a distance of 5 miles. The material used for every yard of the whole distance was novaculite, imported from Illinois.

In a unique undertaking in Ellis, Kan., the Commercial Club brought men together and completed on good roads day the working of all roads leading into the city.

Another example of commercial organizations actually working roads in Kansas was that of the 6-mile road leading from Linn to Palmer in Washington county. All labor was given free; there were 150 men, fifty-seven teams and two traction engines at work The state engineer furnished a man to superintend the work and give personal attention to the building of 1 mile of model road. The two commercial clubs of these towns had the hearty co-operation of the business men and the highway officials.

The Manhattan, Kan., motor club recently held a similar meeting, and has created excellent results by giving a road drag free to each farmer who will agree to keep a piece of road in shape. There are now 100 such road drags in operation near Manhattan.

A number of organizations have been the instigators of good roads legislation. The state good roads association of Florida has prepared a bill to be presented to the Legislature in April, providing for a commission on good roads, to work out a state plan for covering the entire state with a network of hard-surfaced roads.

The Charleston, W. Va., Chamber of Commerce has appointed a committee of seven men to draft a state-wide good roads bill to be presented to the next legislature.

In Massachusetts several of the larger road problems have been advocated and pushed by the various boards of trade, as for instance, the North Adams board of trade was very strongly in favor of the new highway over Florida mountain and the legislature has just appropriated $150,000 for this purpose. Massachusetts now boasts 879 miles of state roads, built in 20 years at a cost of $8,000,000 and over.

The board of trade of Indianapolis is co-operating with the Indiana good roads association in placing before the legislature a bill providing for more effective legislation in connection with good roads.

The Oregon development league and the Portland commercial club have for several years been very active in their endeavors to secure much needed legislation. Both organizations are now backing an initiative road measure to be submitted to the people at the general election in November.

The majority of commercial organizations have done most effective work in this line by co-operation with commissions, either in the government or composed of business men united in the one purpose of securing good road conditions.

Assembly of the delegates from all parts of the state of Illinois to the convention of the Illinois Highway Improvement Associatio Influence in pr

Illinois Road Men Meet

Substantial Results Expected from Convention of Highway Improvement Association Attended by 250

PEORIA, ILL., Sept. 27—Immediate and radical steps toward a comprehensive system of improved highways are almost certain to result from the action taken today by the Illinois Highway Improvement Association in which all parts of the state were represented in convention. A fixed policy was outlined and adopted looking to a general method of procedure for the future and special action to be taken in the next meeting of the legislature. The association in a platform which was unanimously adopted, went on record as in favor of and recommending a state highway commission to devote its entire time to road construction and maintenance throughout the state, improvement by state aid of main thoroughfares through the county by the commission to be turned over to the state for perpetual maintenance; employment of prisoners in road building on an honor system similar to that employed in Colorado; a compulsory dragging of all dirt roads and the payment of all road taxes in cash with the use of the state motor car tax, together with any other funds appropriated in the improvement of highways; federal aid in the construction and maintenance of post roads and transcontinental highways; an annual good roads day to be designated by the governor, and federal aid in building interstate roads.

The report of the committee on policy sets forth that Illinois, foremost among the states in American resources, finds her general welfare retarded by a system of wretched public highways constructed, maintained and administered under a method in vogue centuries ago, which is unadapted to the problems presented by modern traffic and out of harmony with the advancement of the state in other directions. A great network of 95,000 miles of country wagon roads is left to the haphazard work of 4,800 commissioners working independently of each other, poorly paid, largely inexperienced, and provided with inadequate funds.

B. F. Harris, president of the Bankers' Association, announced that the 4,800 road commissioners in the state at present have 4,800 different ways of wasting the taxpayers' money.

Careful investigation has shown that of the $7,000,000 expended annually on the wagon roads of the state approximately 37 1-2 per cent. is wasted, and in some townships a much greater percentage is spent without permanent benefit. Highway improvement is no longer purely a local matter but one in which the citizens are interested to such an extent that the state should assist in solving the problem which the bad roads present to the people.

The recommendation of the committee on policy, which was unanimously adopted as the platform of the Illinois Highway Improvement Association, are as follows:

1. State and county co-operation in the construction and maintenance of main highways and bridges.
2. A non-political state highway commission of at least three competent members, who shall devote their entire time to their duties.
3. Improvement (in such counties as elect to come under the provisions of the law) of main, continuous, in county highways connecting county seats and important cities, principally at the expense of the state and county; such roads to be selected and improved by county authorities, subject to the approval of the state highway commission and after improvement to be turned over to the state for perpetual maintenance.
4. Improvement, maintenance and control of remaining roads (about 80 per cent. of the whole) under supervision of county and township authorities.
5. Effective measures to guarantee maintenance after roads are once constructed.
6. Use of the state automobile tax, together with all other funds as the legislature may appropriate, in the improvement of highways.
7. Extension of the employment of prisoners in state institutions in the preparation of material for road building, and the use of state prisoners —under state direction—on an honor system, in actual work when practicable.
8. Payment of all road taxes in cash.
9. Compulsory dragging of all dirt roads.
10. Safety of road users, such as "Rules of the Road," and the proper construction and guarding of crossings at railroads and intersection of streets and highways.

We favor federal aid in the construction and maintenance of post roads and national highways, and we request representatives of Illinois in Congress to work towards this end.

About 250 delegates from all parts of the state were present at the convention, representing all the varied interests of the commonwealth. All of the associations of business men, laboring men, automobile organizations, bankers' associations, chambers of commerce and agricultural granges were represented by delegations. Several of the larger cities sent large delegations of good roads boosters.

Photo and Copyright by International Stereograph Co., Decatur, Ill.

which met last week at Peoria. About 250 delegates were present at the session, which is expected to have a widespread and increasing
moting better roads

Explains National Chamber of Commerce

H. A. Wheeler Tells Trade Press of the Foundation, Work and Purposes of New Organization

Independent Institution Aims at International Unity and Co-Operation in Commercial Affairs

NIAGARA FALLS, N. Y., September 27—Harold A. Wheeler, president of the recently organized Chamber of Commerce of the United States of America, today addressed the members of the Federation of Trade Press Association here on the organization and scope of this new power which has recently entered American commerce, and gives promise of being one of the most potent factors for good in our business atmosphere. President Wheeler had just come from Boston, Mass., where he was in attendance at the International Congress of Chambers of Commerce in which Europe, Asia, Africa and the Americas were represented with the aim of studying to promote international unity and co-operation in commercial affairs, and where 700 delegates from all parts of the world acknowledged by their attendance the interlacing of the commercial interests of all lands and where they pledged themselves on return home to petition their respective governments to substitute arbitration for warfare.

President Wheeler prefaced his remarks on the newly organized Chamber of Commerce of the United States of America by referring to the unity of world-wide action in commerce, following the examples of Germany, France and England in national commercial organizations. He said in part:

"We, in this country, have organized our chambers of commerce as individual units. We have them on the Pacific coast and through the Central and Southern states and through the East, hundreds and hundreds of organizations representing the civic and the commercial interests of a community or a state, and supplementing them we have the great national trade organizations, but in every single instance working for a specific trade or for a distinct community and in no way representing by a common voice the business demands of the country as a whole, either to safeguard them from adverse legislation or to develop those things which will make the pathway of business easier and promote a greater unity among the several interests which make up our nation's commerce. The need was so apparent in this country that we should tie up our organization as they were tied up abroad, not as a governmental institution, because that would be in a large sense un-American, but **that we should so combine our trade and general organizations relating to commerce that they might take action as a unit and that when that action was taken it could be communicated to the executive or to the legislative branches of the government and find some degree, at least, of heed; whereas in the past, as individual units, we have gone in vain for those things that we were justly entitled to.** Germany many years ago, after its federation was completed, took the old French idea and formed its chambers of commerce in every state and gave them the official sanction of the German Empire and gave them official duties with respect to the appointment of certain classes of public officers, and requested, and in fact required, that wherever it was found that one state was being adversely affected by competition with another state, either one of the German federation or a foreign state, the cause of that adverse effect should be studied by the chamber of commerce there represented, and the conclusions brought to the government, and the government acted in such a way as to preserve the prosperity of that particular line, or those particular lines, of business. That is the kind of co-operation Germany has given to her manufacturers, and that co-operation has meant the rapid spread of German products over the entire civilized world. France is likewise organized, and Great Britain is likewise organized, although not with official recognition in the matter of appointments or the matter of special governmental advice. We, in this country, have held to the idea that individual units could take care of themselves. You know the result.

"James Wilson, a member of the Federal Council, at the time of the charter convention, when the constitution of the United States was under consideration, said that there are two bad forms of government, the one that has too little power, the other that has too much; the one that fails because of its weakness, the other that destroys because of oppression. In this political campaign that is now going on it makes me sick at heart that it seems only necessary for men traveling up and down the country to attack the industrial and commercial interests of our country to find the popular applause, and to observe that whenever they open their mouths to advocate an expansion of the powers of government to a point that would oppress to the degree of destruction, they have encouraged the people to applaud and to accept those sentiments until they have definitely raised class against class, and in the unthinking minds of the people at large have created a great barrier between the two great interests, the employer and the wage earner, that never should exist. Only the other day in one of our papers, in a discussion of these limitations of government, one of the candidates made the remark that we might use whichever philosophy we pleased, but if the limitations of the government were restricted it could lead only to a chaotic scramble in the industrial life of this country to eat each other wherever it was possible and in all cases to oppress the wage earner, placing the whole industrial life of this country in that category of unrighteous organizations or institutions formed only for the purpose of destroying each other if they could, but above all things for absolutely oppressing those dependent upon them for a living. **I say to you gentlemen of the trade press that it has come high time in this country when not only the trade press but the daily press should pay heed to this agitation that is going on and should endeavor in its power to stamp it out rather than to give space in its headlines on front pages to attacks that are as unjust as they are unfounded.** If the press of the United States were to disregard these statements that are unfounded and untrue, that are made only for the purpose of awakening an unnatural and an unreasonable prejudice in the minds of the people, these men would soon cease their campaigns along those lines and come down to saner and truer topics for discussion.

"The Chamber of Commerce of the United States was formed in April, 1912, and I am going to try to give you the reasons why it ought to be formed, some of the reasons for its existence, some of the efforts that it will put forth, as a guaranty of its future. We are not political, we owe nothing to the administration now existing and owe nothing to the administration that shall come, or to any administration that may follow, except loyalty as American citizens, but we are bound to reach the point in such changes where the accusation will arise. Invitations were sent to the known chambers of commerce and the trade organizations of the country, and 700 delegates, representing all but two states, all of the insular possessions and the American chambers of Berlin, of Paris and Constantinople, gathered in Washington on April 22 to discuss the question of forming this chamber, and it was determined that such a chamber should be formed. The organization was put into the hands of a committee representing one man chosen from every state and from each of the insular possessions and ten men chosen at large representing the trades of the country that were not located so that states could be designated as their domicile. That great company met together and outlined and framed and presented the tentative by-laws which should govern the organization during its first year or until its board of directors had occasion to change them. Those by-laws were presented to the congress then in session and unanimously accepted. It then came to a question as to what should be the control, and this same great committee of more than fifty men were made a nominating committee to choose nominees for a board of directors, and again they went into conference and brought names from all sections of the United States, nominating twenty-five men territorially, so that not one single section of this great country of ours should be unrepresented in the board of directors of the chamber. That board of directors, following the adjournment of the congress in Washington, met and elected its officers, and those officers, again, became members of the board ex-officio, one from the Pacific coast, one from the Central West, one from the East, one from the South, as vice-presidents, with the treasurer in Washington, and the president.

First of all we decided that not one dollar of public funds should be asked or accepted from the United States government in the building or the control of such a chamber, that no public officer should be permitted to hold a place upon its board of directors or its official staff, that the organization should be supported by the business men of the country.

and managed by them, clear of all political affiliations and of all accusation of preference, that its officers should forever be chosen from the territorial divisions that were established, giving to each division that representation which it deserved by its numerical strength; and in the new by-laws which have been framed, based wholly upon the tentative by-laws given to us by that earlier conference, we have ever kept in mind the fact that this democracy of control shall be truly held and that no action shall be permitted to be taken simply because even the board of directors, representing all sections, may agree, but that no question shall be acted on finally by the chamber until by referendum that question shall have been put back to every constituent member of the organization, and the voice shall be truly the representative voice of those who speak.

"No membership in this chamber can be had except by organizations. Therefore individual voice has been set aside forever. No question shall be considered by the organization save it is known by the board of directors to be a national question. No question can be submitted either to the annual or to special conferences, or between the conferences, except it comes by the authority of a constituent member after a discussion of that question within the association or board of directors of the association submitting it, and by a formal communication to the chamber setting forth that it is a question which it is desired to have action upon, the reasons for it and a brief giving the argument why it should be placed before the constituent members for their action. The board of directors thereupon take the authority to determine whether or not the question is national and whether it is right that it should be submitted to the constituent members. But if the board of directors shall decide that it is not a national question, properly one to be submitted to the constituent members, there is the right of appeal for the member proposing.

"What are the questions that are to be considered? These are the questions that are closely related to politics inasmuch as they are the basis of legislation. We will take up the study of state and federal regulation of commerce. In order that that study shall be carefully made there will be a group of twenty men chosen and given the responsibility of bringing back a report upon that subject. Five men shall represent the states west of the Rocky Mountains; five men shall represent the states east of the Ohio and Pennsylvania lines; five, those north of the Tennessee line, and five, those south of the Tennessee line drawn straight across from the other north and south parallels. These groups of five men will be located not in widely scattered communities but in one single center, in order that they may get together, that we may furnish them with all of the bibliography that may be found upon a subject and that they may draw their conclusions, as to what form of report should be made to the chamber, based upon the sentiment or the viewpoint of their locality or the locality in which they live. Finally, when those four groups have reached their conclusions, have written their reports, the twenty men will be drawn together, and any differences of opinion will, if possible, be smoothed away. Thereupon, it is believed, when the twenty men agree upon a report coming from all of these sections, we will have a report that will fairly represent the general opinion of the entire country with respect to that particular subject. So the same plan will follow through as to all of the questions to be considered, such as tariff and taxation—not that we are going to touch the question of schedules. I believe there is no man related in the slightest degree to this great national movement who would contend for one moment that anything but trouble and dissolution would result from a discussion of schedules. Every line of business must take its own turn fighting for itself. Every community, where it becomes a sectional matter, must take its own place and fight for its own life. But there is one basic question that we can consider: How shall revision be made?

"On the other side this chamber of commerce will stand just as stanchly as the representative of the laborer, of the wage earner, as it will that of the employer or the capitalist. Those subjects of legislation that relate to the improvement of the workingman's condition will be guarded just as jealously and studied just as carefully as any that may relate to the special matters of regulation of commerce or to tariff revision. Education, by the same token, vocational education, will be studied with the object of making it possible for the children of men working for a living and not able to place their children in the technical schools of the country, to find a place where they may have a better foundation for their life than their fathers had, whence they may go into the activities of life not only better trained but better able to take and hold a creditable place throughout their years.

"In the matter of foreign commerce there is the great question of our over-production and the necessity of finding a permanent foreign field into which our products can be placed. Our committees will be so divided that one group will study European and North American trade; one, Latin American, and, one, Oriental; and in addition to those groups that are studying trade relations and the possibility of expanding our commerce with the world's nations, will be the group that will study copyrights, patents and trade marks, in order that we may not suffer the injustices that have been suffered in the past. There are five under domestic commerce, six under foreign commerce. Then comes that group of subjects under traffic, transportation and communication, of the railroads, of harbor and river improvement, interior, of the ocean traffic, which, of course, takes in the merchant marine; of the post office, of the telegraph, of the telephone. Then, on currency and banking, on immigration and on legislation.

"The chamber of commerce was created in April. The first meeting of its executive committee took place in May, and the first general meeting of its board of directors, yearly elected, in June. There have been filed applications from 150 of the greatest commercial organizations in this country, representing a membership of more than 100,000 firms or individuals, and mostly of firms. Of this number forty-seven are the great national trades organizations of the country. One hundred and one are the general commercial organizations and two are chambers of commerce of insular possessions. That is a very small proportion of the total number of organizations in the country, because the Department of Commerce and Labor through its Bureau of Manufactures tell us that they have a record of 4,000 boards of trade, chambers of commerce or commercial associations in the United States, and we have a record in our office of 2,300, and we know that out of the 2,300 there are probably 1,200 that are thoroughly representative, and the balance of them represent communities so small that they have comparatively little touch with national affairs. We have many months, perhaps, of hard work to do before this organization can be wholly representative, but we have made the dues so low that that little organization in Cattaraugus County, N. Y., by paying ten dollars a year, may have just as thorough a representation, upon its numerical strength, as the largest manufacturers' organization in the United States shall have. And, more, that organization shall be entitled to one delegate for its thirty-five members. The organization with 18,000 members shall be entitled to but ten delegates for its 18,000 members.

"Those are the activities we will undertake to perform. It is going to cost us some money, and we are going to find it. If the business of this country is not big enough to support its own organization, then let the organization die a natural death. If the business of this country is broad enough to look out on the horizon and see the good that can come from such a creation as I have outlined, then it will support that organization, it will be bound to no political party and to no political forces; it will be bound to no commercial party or commercial forces, but will live on to create that condition which in the last analysis must obtain if permanent prosperity and stability comes to our commerce, a condition of absolute equality and justice in the treatment of the capital of the country and of the labor of the country, and in so arranging its reports and advocating legislation that selfishness shall not obliterate from the viewpoint of the people the necessity of making prosperous the man who is doing the work at the anvil as well as the man who controls the check-book in the main office of a manufacturing plant; to give to the children of the laborer the same chance as the children of the employer; to see to it that there is a greater and a better equality of conditions in this country, in order that these things that are today being thrown about the land by our political antagonists shall not find an essence of truth anywhere in our broad country in these accusations, but that we may be able to say, such are the conditions under which the commercial interests are struggling, such are the lines of trade that have raised the standard of living of their employees to such an extent that they are not only unjustly attacked, when these statements are made, but also that it is a burning shame that conditions should be such that an attack can be made and be sanctioned by any living man in this country as applying to those advanced lines of trade which have already done so much for their own people. You gentlemen know in your own lines of work, in the industries closest to your publications, how committees of your national organizations have studied these problems and how they have improved the conditions in their shops and factories and warehouses and places of business, and you know the absolute injustice of visiting the sins of one or two upon the entire commercial community of this country."

Route for Chicago Run

Reliability to Cover 1,107 Miles in 7 Days—Contest News of the Week Alco Truck in Fine Shape

CHICAGO, ILL., Sept. 30—After a trip around Lake Michigan, blazing the trail for the Chicago Motor Club's sixth annual reliability, the Velie pathfinder which carried John G. De Long, Ronald Clark and John Brolley reached Chicago last Thursday night. The car was out 13 days but traveled only 7 days in all. The pathfinders had a rough and ready time of it, but return full of enthusiasm over the possibilities of such a route. They say that while grade 3 rules will prevail, yet the conditions will be strenuous enough to make the reliability fully as stiff a proposition as any of its predecessors. Through the woods of northern Michigan it is practically wild. Yet it can be negotiated although there will be 2 days when the mileage will not be great.

The total distance to be traveled is 1,107 miles, an average of 158 miles a day. Four states—Illinois, Wisconsin, Michigan and Indiana—will be traversed. The run from Newberry, Mich., to St. Ignace, where the cars will be ferried across the straits, is 65.2 miles in length. It is made purposely short because of the road conditions.

Entered already for the trip are two Velies, two Stutzes, a Chalmers six, Falcar, two Stavers, and a Detroiter. Two Cadillacs from the Northwestern Military and Naval Academy of Lake Geneva, Wis., are promised, while it looks now as if at least twenty or twenty-five cars will start in the affair.

Simplex Sets New 50-Mile Mark

DETROIT, MICH., Sept. 30—Louis Disbrow, driving a Simplex, set a new mark for 50 miles on a circular dirt track, when he covered that distance at the Michigan State Fair grounds here on September 29 in 45:32. The previous record of 47:21.65, made at Syracuse, N. Y., a year ago at the New York State Fair by Ralph De Palma, was cut down nearly 2 minutes. Disbrow's record of Sunday will be allowed because the meet was sanctioned by the A. A. A. and it was timed with the Warner electric timing instrument. Several exhibition races were also run off in which Endicott, Kilpatrick, and Ulbrecht participated. The meet was postponed from September 21, when it was scheduled to have been run off in connection with the State Fair. Rain and horse racing events interfered at that time, making necessary the postponement for a week.

Disbrow's race against time had a dramatic finish, the daring pilot completing the last few laps of the 50-mile run in the semi-darkness. On the last lap, he was scarcely discernible from the grandstand. About 10,000 people witnessed the events.

Cross-Country Alco in Fine Shape

Following the completion of the transcontinental trip of the 3-ton Alco truck under rated load, a detailed and thorough technical examination of the vehicle was made at Petaluma prior to loading the truck on a freight car for reshipment to its owners in Philadelphia.

The inspection showed that it was necessary to take up all connecting rod bearings, dress piston number 2, remove carbon deposits from the motor and to drain out the oil from the crankcase and transmission case.

The whole cost of the adjustments was less than $25.

The service inspector at San Francisco who made the examination reported the general condition of the vehicle as very good. This covers power, speed, carburetion, lubrication, timing gears, clutch, main shaft, bearings, springs, ignition and axles. The frame was apparently unscathed despite the series of high centers encountered. No heating was reported nor was any evidence of it apparent, according to the inspector. Following is the table showing daily performances:

TABLE SHOWING SOME ELEMENTS OF OPERATION UP TO

Date	Total elapsed time hrs.	min.	Actual operation time hrs.	min.	Number of stops

Totals for Entire Transcontinental Trip, Beginning June 20, Ending Sept. 20.

Actual number of days in operation	74
Total elapsed time for entire trip	772 hrs. 4 min.
Actual time in operation for entire trip	409 hrs. 21 min.
Average daily elapsed time	10 hrs. 26 min.
Total number of stops	1557
Average daily time in operation	5 hrs. 32 min.
Average daily number of stops	21
Percentage of time truck was in actual operation of the working day	52.9 per cent.

Will Map Route Across Rockies

DENVER, COL., Sept. 30—In order to open up a direct route from Denver to Salt Lake as a link in one of the transcontinental highways, a pathfinding car will leave Denver for the trip over the Great Divide on October 7. The Denver Chamber of Commerce has proposed the trip and has laid out on paper a tentative route which is believed to be entirely feasible for motor cars. The route is to be logged by John P. Dods, of the Automobile Blue Book. The pathfinding party will be carried in a White six touring car and includes C. M. Kittredge, Jr., assistant secretary of the Denver Chamber of Commerce, James A. Harris, advertising manager of the White company, John P. Dods, western manager Automobile Blue Book Publishing Company, N. Lazernick, a New York photographer, and the driver. Both the car and the driver are supplied by the White company.

The proposed route takes in Buena Vista, Leadville, Glenwood Springs, Grand Junction, Price and Provo.

Maxwells Awarded Buffalo Honors

BUFFALO, N. Y., Oct. 1—Maxwell car, No. 25, was awarded the Laurens Enos trophy or sweepstakes prize for going through the 4 days of the recent 800-mile reliability tour of the Automobile Club, of Buffalo, without being penalized. The official decision which was rendered last evening by Arthur W. Kreinheder, who was referee of the run, also returns for winner of the Vars trophy, Maxwell No. 7, which completed the run with only four points against it, these being imposed for adjusting a magneto wire on the first day of the tour. Albert W. Poppenberg's car, the Warren-Detroit, which was supposed to have come clean in the tour was found to have done 20 minutes' work on tires on the second day's run, the work being done while the motor of the machine was not in operation, which violated a rule of the contest.

No Glidden Tour for This Year

The national tour scheduled to run from Detroit to New Orleans starting October 14 has been declared off for this season but will be run over the same course in 1913 at a date to be announced later. It was decided to declare the tour off for this year at a meeting in New York City today of the A. A. A. tour committee, which gave out the following report:

"National tour committee today postponed annual reliability event until 1913. Presidential campaign activities are held responsible for the depleted entry list and suspended interest in long-distance touring. Many cities on the Detroit-New Orleans route have guaranteed teams for next year and many sections of the route at present in bad shape will have been rebuilt by that time."

The feeling is general among automobilists that a national tour should be held in the holiday months of July and August as it is almost impossible for many to get away from business after the middle of September.

Harking Back a Decade

FROM *The Automobile and Motor Review*, September 27, 1902:

Built for speed alone, the two new racing creations made by Henry Ford and Tom Cooper, of Detroit, are first-class examples of simplicity. The cars have a tread of 5 feet 2 inches and a wheelbase of 117 inches and are equipped with the most powerful automobile engines so far produced in America. The cylinders are vertical, four in number and measure 7 by 7 inches, which should deliver about 70 horsepower. The gearing is five to four and it is necessary to turn the engine over 707 times in order to cover a mile. Mr. Ford figures that the speed will be 1,200 revolutions a minute.

Alexander Winton, in Winton's Bullet, broke the 1 and 10-mile dirt track records at Cleveland last week when the car finished the mile in 1:02 3-4 and the 10-mile distance in 10:50.

The Automobile Club of America has amended the rules for the coming reliability tour to Boston by eliminating motorcycles.

The greatest show in the history of the American automobile industry will be held at Madison Square Garden, January 17-24. On the main floor the available space for exhibition purposes amounts to over 20,000 square feet and it has all been contracted for by exhibitors, despite the fact that the application blanks have been issued less than 2 weeks. The restaurant, which was occupied by the loan exhibit last year, has been thrown into the main floor by knocking out the partitions, but it is uncertain that there will be enough space, even with this addition.

Senator Clark has promised the committee in charge of the G. A. R. automobile parade at Washington, scheduled for October 6 that even if it proves to be impossible for him to take part, that his new $10,000 steamer will be in line.

Mayor Higgins, of Racine, Wis., has vetoed the proposed ordinance recently passed by council to limit the speed of automobiles to 6 miles an hour. He stated that he considered 6 miles an hour too slow for automobiles and recommended that the ordinance be amended so that the more reasonable rate of 8 miles an hour could be made within the law.

Burman Breaks World's Record

ST. LOUIS, MO., Sept. 30—Bob Burman and his big Blitzen Benz were the feature of the 2-day race meet which opened at the new St. Louis track Sunday afternoon, September 29. Burman lowered the world's record for a mile on a circular dirt track by 6-100 of a second, making the mile in 47:61.

This is the first time that automobile racing has been seen here for some years and the great interest is attested by the number of local cars that were entered in the races. The summary follows:

Car	Driver	Time
NON-STOCK CARS RACE, FOR CARS OF 301 TO 450 CUBIC INCHES DISPLACEMENT, 5 MILES		
Ohio	Raimey	2:05
Mercer	Ringler	
NON-STOCK CARS RACE, FOR CARS OF 450 TO 600 CUBIC INCHES DISPLACEMENT, 5 MILES		
Cutting	Burman	4:02
Ohio 999	Savin	
REMY-BRASSARD CONTEST, FREE FOR ALL		
1st heat	Burman	3:19.50
2nd heat	Burman	3:06.50
EXHIBITION MILE, AGAINST TIME		
Blitzen Benz	Burman	:48.80
EXHIBITION MILE, AGAINST WORLD'S RECORD		
Jumbo Benz	Burman	:47.61
FREE-FOR-ALL HANDICAP		
	Burman	4:55
Ohio 999	Savin	

Calendar of Coming Events

Shows, Conventions, Etc.

Jan. 2-10..........New York City, Importers' Salon, Hotel Astor, Importers' Automobile Alliance.
Jan. 4-11..........Cleveland, O., Annual Automobile Show.
Jan. 11-25.........New York City, Thirteenth Annual Show, Madison Square Garden and Grand Central Palace, Automobile Board of Trade.
Jan. 20-25.........Philadelphia, Pa., Annual Automobile Show.
Jan. 25-Feb. 1.....Montreal, Que., Automobile Exhibition, R. M. Jaffray, Manager.
Jan. 27-Feb. 1.....Detroit, Mich., Annual Automobile Show.
Jan. 27-Feb. 1.....Scranton, Pa., Annual Automobile Show, Hugh B. Andrews.
Feb. 1-8...........Chicago, Ill., Annual Automobile Show.
Feb. 10-15.........Minneapolis, Minn., Annual Automobile Show.
Feb. 17-22.........Kansas City, Kan., Annual Automobile Show.
Feb. 24-Mar. 1.....Cincinnati, O., Annual Show, Music Hall, Cincinnati Automobile Dealers' Association.
Feb. 24-Mar. 1.....Omaha, Neb., Annual Automobile Show.
Feb. 24-Mar. 1.....St. Louis, Mo., Annual Automobile Show.
March 3-8..........Pittsburgh, Pa., Annual Automobile Show.
March 8-15.........Boston, Mass., Annual Automobile Show.
March 17-22........Buffalo, N. Y., Annual Automobile Show.
March 19-26........Boston, Mass., Annual Truck Show.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Business Needs Good Roads

Merchant and Banker Have Come to Realize Importance of Improved Highways

"IMPROVED vehicular transportation, which finds its highest form in the automobile, and the rapid development of commercial organizations cover practically the same period of time. Within 15 years the commercial organizations of the United States have multiplied by thousands; within 15 years the most effective agitation for road improvement has come, not by initiation in the country districts, but by the recognized dependence of the cities, particularly the cities of smaller size, upon good connection with the country."

In these words G. Grosvenor Dawe, of the Chamber of Commerce of the United States of America, speaking before the American Road Congress now assembled in Atlantic City, N. J., struck a dominant chord in the road construction activities of today showing how that modern business interests have realized the utmost necessity of good roads and how that commercial clubs, chambers of commerce and business men's leagues in smaller size cities which are to a large extent dependent on their highway communication with the surrounding country, have taken up in genuine earnestness the building of modern roads from these business centers at every angle of the compass into the surrounding country.

These business organizations have realized the financial necessity of good roads; they have realized that the good roads movement no longer can be restricted to the confines of the cross-roads orator, but that it is taking its place in the financial columns with crop reports and other live factors in industrial finance.

When various civic organizations not only start talking good roads, but when they actually engineer the construction of them it is high time that the local dealers' organizations in automobiles get in line and do more than talk and add their passive presence. If good roads in a locality will help any line of business it will help the retail car dealer, the retail tire and accessory dealer.

In Illinois the state banking organization has realized the gravity of the road situation and has not only created a good roads department in its organization, but has made state-wide canvasses obtaining statistics on the road situation, on the cost of marketing farm produce and on the increase in land values due to road improvement along the front of such property or in the immediate vicinity. The keen business eye of the banker recognized the necessity of better roads; the acute business judgment of the leading industrial lights of the cities has seen the necessity of it; and the automobile agent, branch manager, garageman, repairman, tireman, accessory dealer and every person connected directly with the automobile interest should be actively on the side of local road improvement.

But it is not only the business and professional men of the towns and cities who owe it to their own interests and to the community in which they reside to foster the cause of good roads, for the great army of agriculturists all over the country should also throw its influence into the balance. For it is obvious that the greatest benefit of improved highways will be the increased facility of getting farm products to market and the improvement in communication with both town and neighbor.

The stress which is being laid on the roads situation at the present time is rapidly growing more pronounced and augurs well for the future national development in this particular. Too much stress cannot be laid upon it. The automobile and the motor truck, with their greater speed and capacity as compared with the horse-drawn vehicle, demand highways which will heighten, or at least will not lower, their efficiency. This demand is imperative.

Synthetic Rubber to Date

SYNTHETIC rubber based on isoprene and butadiene, substances having the five-carbon and four-carbon atom construction respectively, is an accomplished chemical fact. The concrete proof lies in the performance of a set of tires used by Dr. Carl Duisberg, the noted German scientist, who states that in 4,000 miles of service no puncture was suffered or material wear noted. They must be good tires to make such a showing, but it is certain that they were used carefully and with much good fortune as to the roads. As a commercial element, even Dr. Duisberg does not expect synthetic rubber to assume significant proportions in the near future. Apparently he is entirely correct in his judgment.

The factor of cost stands like a stone wall before the synthetic rubber enterprises. The two sets of tires turned out from the Elberfeld factory represent the commercial results of 5 years of research and labor and incidentally the expenditure of $250,000. Individually, the cost of the rubber in those tires might be placed at $31,250. Of course, such a cost would not apply to future production. But the matter of manufacturing cost is the barrier. The synthetic rubber enthusiasts are face to face with commerce. Their problem now is to perfect their processes so that synthetic rubber can compete with natural rubber in the markets of the world. Based upon present prices of material, the artificial rubber men hold that they can produce rubber to sell at 60 cents a pound or thereabouts. It is said that the production of 10,000 tons of synthetic rubber by the fusel oil process would require the starch from all the potatoes grown on 1,000,000 acres of land. Rating the yield per acre at 300 bushels, the potatoes needed would be worth at least $300,000,000. That would make the potato element in the synthetic rubber cost about $13 a pound. If sawdust is used, this cost would be reduced, but the availability of sawdust has been sharply questioned. If coal be the material at the foundation of the product, the cost of material would be within the bounds of reason. But in the light of cold, hard facts and assuming that polymerizing can be utilized on a large scale, a fact disputed by many experts, the cost of manufacturing synthetic rubber will always be a material item. The battle that will be fought, assuming that synthetic rubber is to be manufactured on a commercial scale, will be a fight for the market. The problem that must be solved involves a triumph over rubber grown on the plantations at a cost of from 15 cents to 25 cents a pound in limitless supply. The question that must be answered is: Can synthetic rubber, possessing equal quality with natural rubber, be marketed on a successful competitive basis?

Automobile Stone-Road Project Gets $300,000

AKRON, O., Sept. 30—The Goodyear Tire & Rubber Company has authorized Carl G. Fisher to put it down for a $300,000 subscription toward the stone road from New York to San Francisco, the material of which has to be purchased by a $10,000,000 fund subscribed by the automobile manufacturers, dealers and owners. This is one of the largest single donations to date, and coming unsolicitedly from the concern shows the wide interest already being taken in making road-building a reality by the industry furnishing the money to buy the requisite materials.

To date the following manufacturers representing Indiana have contributed, the gross amount exceeding $350,000, on the basis of each company paying one-third of 1 per cent. of its gross business for three successive seasons: Prest-O-Lite Company, Wheeler & Schebler, Ideal Motor Car Company, Premier Motor Manufacturing Company, Waverley Company, Gibson Automobile Company, American Motors Company, Marion Motor Car Company, Henderson Motor Car Company, Empire Tire Company, Remy Magneto Company, Esterline Manufacturing Company, Motor Car Manufacturing Company, Gus Habich, Gibson Automobile Company, C. Off & Company, Gates Manufacturing Company, Pumpelly Battery Company, Brown Commercial Car Company, Glover Equipment Company, G. A. Schnell, R. J. Irvin Manufacturing Company, A. M. Wasting Company, Cadillac Automobile Company of Indiana, Archey Aitkins Company and the Hoosier Motor Club. These subscriptions amount to $60,000 and downwards. This list includes many dealers and other concerns engaging in manufacturing tops, batteries and various other lines of work.

The industry is at present awaiting the action of Detroit as a unit in this road matter. Messrs. Walden and Chapin, of the Packard and Hudson companies, are enthusiastic over the plan and are working diligently to push it along. Henry Ford has issued a letter to all of his dealers and users with the aim of getting their views on the matter, which may to an extent determine the attitude of this company. Many members in the trade are constantly writing their friends so that the enthusiasm is working rapidly.

President Ancil Martin, of the Phoenix, Ariz., Board of Trade, has wired as follows regarding the transcontinental stone road, taking the southern route by way of Arizona so as to insure a highway open all the year around:

"National Highway Ocean to Ocean must be open all the year around to be fully appreciated and useful. Only route open the year around lies through Salt River Valley and Phoenix. This road endorsed by southern California and big sums appropriated to construct same. Many miles already splendid motor boulevard. We rely on your organization to see to it that this route is adopted by the nation."

Accurate data have already been gathered on the subject of cost of road construction, and the following figures show the actual cost of materials and labor for a stone road and also a brick road. The cost of concrete bridges is also given in these tables:

STONE ROADWAY 12 INCHES THICK AND 2 INCHES SCREENING, NEW YORK TO MISSISSIPPI RIVER

Cost of Material.		Cost per Sq. Yd. Cut 12 In. Thick		
Stone	$1.25 f.o.b. siding	Stone	$ .43	$2,270.40
Excavation	.50 cu. yd.	Screening	.07	369.60
Teams	5.00 per day, 10 hours	Hauling	.43	2,270.40
Labor	2.00 per day, 10 hours	Unloading	.05	264.00
		Grading	.17	897.60
		Oiling	.05	264.00
		Rolling	.10	528.00
			$1.30	$6,864.00

Roadway 9 ft. for 1 Mile=5,280 sq. yds. @ $1.30=$6,864 to $7,000.
Roadway 12 in. for 1 Mile=7,040 sq. yds. @ $1.32=$9,334 to 9,500.

BRICK ROADWAY 12 INCHES EXCAVATION FROM NEW YORK TO MISSISSIPPI RIVER

Cost of Material		Cost per Sq. Yd. Cut 12 In. Thick		
Brick	$10.00 per M. f.o.b. siding	Brick	$ .75	$3,960.00
Concrete	4.50 per yard	Hauling	.16	844.80
Excavation	.50 per yard	Grading	.16	844.80
Sand	1.00 per yard	Grouting	.12	633.60
Teams	5.00 per day, 10 hours	Foundation	.50	2,640.00
Labor	2.00 per day, 10 hours	Rolling	.05	264.00
		Cushion	.06	316.80
		Margin curb	.40	2,112.00
			$2.20	$11,616.00

Roadway 9 ft. for 1 Mile=5,280 sq. yds. @ $2.20=$11,616 to $12,000
Roadway 12 in. for 1 Mile=7,040 sq. yds. @ $2.13=$15,000

Concrete Bridges	Cost if Roadway is 9 Ft.	Cost if Roadway is 12 Ft.
6-ft. span.	$ 150.00	$ 200.00
12-ft. span	350.00	450.00
14-ft. span	400.00	500.00
18-ft. span	700.00	950.00
24-ft. span	950.00	1,300.00
36-ft. span	1,450.00	1,950.00

Cost per Sq. Yd. Cut 12 In. Thick

	Stone @	$.34	$1,795.20
	Screenings @	.06	316.80
	Hauling @	.43	2,270.40
Stone @ $1.00 per cu. yd.	Unloading @	.05	264.00

			$6,336.00

Gathering of branch managers, distributors and representatives of the Oakland Motor Car Company, Pontiac, Mich., in front of the company's plant during their recent convention

OAKLAND Dealers Assemble—At the recent convention of branch managers, distributors and representatives of the Oakland Motor Car Company, Pontiac, Mich., there was an assembly of 125 men from all parts of the country. The above photograph shows the assembled dealers in front of the Oakland company's plant.

Fletcher Denver Locomobile Manager—R. C. Fletcher, formerly with the Van Vliet Fletcher Company, Des Moines, Ia., is now Denver manager for the Locomobile.

Bergdoll Agency in Syracuse—The Louis J. Bergdoll Motor Company, Philadelphia, Pa., will soon be represented in Syracuse, N. Y., and vicinity by a direct selling agency.

Philadelphia Tire Represented in Baltimore—The Philadelphia Motor Tire Company, Philadelphia, Pa., has opened an agency at 107 West Mt. Royal avenue, Baltimore, Md.

Owen & Company Moves—R. M. Owen & Company have moved their executive offices and the New York Reo branch to their new quarters at 19-21 West Sixty-second street.

Portland Club House Completed—The Portland Automobile Club, Portland, Ore., has just completed its new club house on the Sandy River, some 16 miles from the Rose City.

Anderson in Charge Ford Branch—W. C. Anderson is to have charge of the Ford branch which opened October 1, in Minneapolis, Minn. He will have charge also of the St. Paul, Minn., sub-branch.

State Association's Convention—Officials of the New York State Automobile Association have decided to hold their annual state convention this year in Utica, N. Y., during the first week in December.

Welland's Automobile Parade—An automobile parade was held Saturday at Welland, Ont., in connection with the Monck County fair at Wellandport, prizes being awarded to best decorated automobiles.

Toledo Building for Parking Automobiles—A building designed exclusively for the parking of automobiles, now left standing on the down-town streets of Toledo, O., will be erected at 324-326 Huron street.

Automobile Parade in Wilmington—An automobile parade, on the evening of Thursday, October 10, will be a feature of a home coming celebration which will be held in Wilmington, Del., during the week of October 6.

Omaha Wants Mail Automobiles—Two automobiles will soon be put in use for the collection of mail in Omaha, Neb., if the proper machines can be secured at a price satisfactory to the Post Office Department officials.

Chalmers Pathfinder Finished Run—The pathfinder Chalmers Six, driven by V. W. Reynolds, arrived in Des Moines, Ia., after a 5-day trip around Iowa blazing the way for the All Iowa Reliability Run which will be held early in October.

Mississippi Good Roads Tour—There were thirty-eight participants in the Southern Mississippi Good Roads Tour, who completed a trip over Covington county. The tour will be made an annual affair and next year will embrace adjoining counties.

Studebaker Branch Managers Meet—About thirty branch managers and officers of the Studebaker Corporation met at a dinner at the Pontchartrain Hotel September 26, the occasion being the annual meeting for the discussion of the coming season's campaign.

Hunziker Takes Warner Agency—J. H. Hunziker, manager of the Northwestern Shawmut Tire Agency, Minneapolis, Minn., has taken the distributing agency for the Warner autometers, formerly handled by the Standard Distributing Company. The agency is 1204 Hennepin avenue.

Minnesota's 2,700 Miles of Highway—Contracts for construction of 2,700 miles of highway in Minnesota next summer will be authorized by the state highway commission. Seven hundred miles will be absolutely new road in the northern part of the state. Surveying, stumping and sand hauling will be done in the winter. The mileage will be completed by fall.

Stoddard Company Moves—The Stoddard Motor Company, distributor of Stoddard-Dayton cars in the metropolitan territory, has moved from Fifty-seventh street to the building of the United States Motor Company at Broadway and Sixty-first street, New York City. This move is a part of the general plan of concentrating facilities for the sale of products of the United States Motor Company.

Opens Truck Station—What is claimed to be the largest truck service station in the United States has just been opened in Detroit, Mich., by the General Motors Truck Company. The building, which has space to take care of from 150 to 200 trucks, was erected at a cost of about $150,000. There is a total floor space of 50,000 square feet, which is utilized for garage, repair shops and stockroom as well as for offices.

Middleburg Club Elects Officers—James L. Baker was elected president of the Middleburg, N. Y., Automobile Club, recently organized, and other officers elected include: Vice-president, Dr. C. S. Best; secretary, Roger W. Cornell; treasurer, William J. Pindar; committee on good roads, Frank A. Sullivan, Dr. Lyman Driesbach, James C. Borst, and Asa A. Dutton; committee on by-laws, George A. Mill, Dr. Josiah Mann, William G. Deekman, and Charles C. Dutton.

Novel Street Cleaning Device—With a regard for the comfort and safety of the Los Angeles, Cal., traffic, the officers of the Automobile Club of Southern California have worked out a quicker and more efficient plan than the one now employed for cleaning the city streets. The plan involves cleaning the streets by means of air tanks fastened to the street cars. The cleaning of the streets could then be quickly and effectually done during the hours of 2 and 4 a. m. Motorists who have had trouble and accidents caused by tire skidding while the streets were being flooded under the present system are watching the outcome of the safer plan with interest.

New Agencies Established During the Week

Syracuse, N. Y.	Standard Electric	T. A. Reed & Co.

Farmers Using Trucks—Farmers are using motor trucks almost exclusively in Orleans County, N. Y., for delivery to cities of berries, butter, cream and produce, owing to the improvement in good roads in that section.

Welland's Orphans' Day—Orphans' Day was celebrated recently at Welland, Ont., the children of the Welland Orphans' Home being taken in automobiles to Queenstown Heights and return. Many Wellanders loaned their automobiles for the occasion and the event was highly successful.

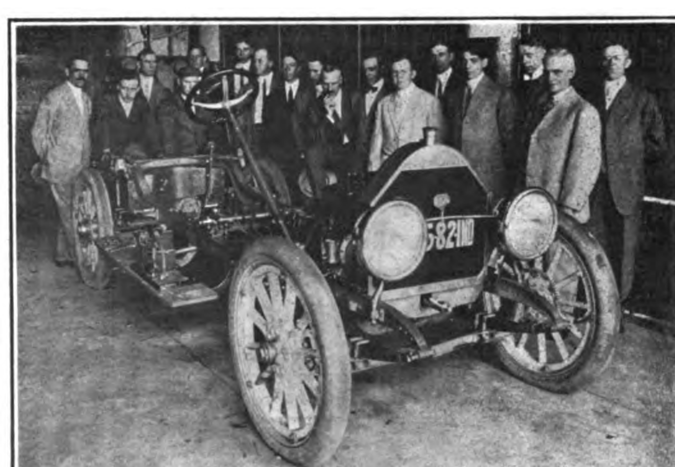
Corse Elected Secretary-Treasurer—W. M. Corse, of the Lumen Bearing Company, Buffalo, N. Y., maker of ball bearings for automobiles, was elected secretary-treasurer last week of the American Institute of Metals in the annual convention at that city. The meeting next year will be in Chicago, Ill.

Protest Rochester Light Law—The Automobile Club of Rochester, N. Y., is fighting for the repeal of the city ordinance which forbids use within city limits of strong headlights on automobiles. The officials of the Rochester association claim that several accidents have occurred because of lack of sufficient light on motor cars.

Good Crops, Good Sales—Prospects of another large cotton crop this year is the most encouraging feature of the fall and winter outlook for the sale of automobiles in the South. Even with a fairly early frost the chances favor a production of more than 12,000,000 bales. This, combined with the heavy yield of rice and corn, insures prosperity for the greater part of another year.

Cincinnati Ordinance Repealed—The traffic ordinance in Cincinnati, O., which for several years has prevented automobilists from using all kinds of warning signals except the hand-operated bulb horn, has been repealed. It has been supplanted by a new law which allows the use of any device which will produce an abrupt sound sufficiently loud to serve as an adequate warning of danger.

Co-operation in Cole Forces—The Cole Motor Car Company, Indianapolis, Ind., has divided the country in territories, with district sales managers in charge of certain allotted territory. The idea is to give Cole agents and owners stimulated co-operation in having these sales managers keeping in direct personal touch with them. These sales managers will work directly in touch with President J. J. Cole and his sales force in Indianapolis.



Agents assisting by suggestions in the construction of the Cole. Rear of chassis, President J. J. Cole, Chief Engineer Charles A. Crafford, Theodore Williams, Canal Dover, O.; Engineer J. M. Smith, C. D. Robinson, St. Louis; F. R. Schubert, Akron, O.; W. F. Blackford, Louisville; C. H. Strout (factory); J. A. Hutchinson, St. Louis; H. S. Haynes, Minneapolis; F. E. Richardson, Cleveland; J. F. Luhrman, Cincinnati; L. W. Hanley, Cleveland; N. H. Strauss, Cincinnati; Oscar Grenwist, H. E. Katrincholm, Sweden; C. H. Corkhill, Omaha; General Sales Manager C. P. Henderson

Transcontinental Alco, which is going back to work

Hopkins Sales Manager Dissette—J. B. Hopkins has been appointed manager of the sales department of the Dissette Motor Company, Toronto, Canada.

Automobile Show in Nashville—An automobile show is to displace the time honored horse show at the Tennessee state fair, Nashville, Tenn., Sept. 23, this year.

Stillman with Amplex Company—Harry Stillman has succeeded George Saltzman, factory superintendent of the Amplex Motor Car company, Mishawaka, Ind.

Delhi Club Organized—An automobile club was organized in Delhi, N. Y., recently and was immediately affiliated with the New York State Automobile Association.

Automobiles Used in Mines—Motor driven cars have been installed in the Sloss-Sheffield Steel & Iron Company's mines near Birmingham, Ala. They take the place of animal traction.

Grinnell Electrics for Antipodes—The Grinnell Electric Company, Detroit, Mich., has just shipped ten more cars to Australia, making twenty in all that have been ordered for the antipodes.

Marmon Leaves Broadway—The Sidney B. Bowman Automobile Company, New York City distributor of Marmon cars, has decided to permanently locate its sales department at its service building, 225 West Forty-ninth street.

Humphries Factory Manager Oakland—S. H. Humphries, who has been manager of the Elmore plant at Clyde, O., will take the position of factory manager of the Oakland Motor Car Company, Pontiac, Mich., succeeding the late Thomas Wilson.

Thibedeau Makes Abbott Change—J. R. Thibedeau, formerly connected with the purchasing department of the Abbott Motor Company, Detroit, Mich., has been made assistant manager of the technical and service department of the same company.

Matheson with Hayes Company—George N. Matheson, for many years purchasing agent for the National Motor Vehicle Company of Indianapolis, Ind., has accepted the position of purchasing agent for the Hayes Manufacturing Company, Detroit, Mich.

Moore Manager Tire Branch—George P. Moore has been appointed manager of the local branch of the International Rosilie Company, 1133 Main Street, Buffalo, N. Y., which concern makes a product for filling automobile tires, headquarters being in Elmira, N. Y.

Winterson Lozier Traveling Representative—J. P. Winterson, formerly connected with the Eastern sales department of the Lozier Motor Company in New York City, has been appointed special traveling representative for that company to cover territory in the Southwest.

Rhode Island Dealers' Outing—The members of the Rhode Island Automobile Dealers' Association enjoyed their annual outing last week when a run was made from Providence, R. I., to Lakeville, Mass. The start was made at noon and the place was reached in a short time.

Nashville Anti-Noise City—Nashville, Tenn., by a city ordinance, has made it unlawful to cut out the muffler within the city limits or to use any warning device other than a bulb horn or an electric bell. A fine of $25 is provided for those convicted of violating the ordinance.

Herding Cattle in Automobiles—The latest use of the automobile in Texas is in herding cattle on the Western plains. During the past week the idea of herding cattle in an automobile was tried out on a ranch in Potter county. This ranch was in fine condition and the test was satisfactory.

Aermore's Unique Selling Plan—The Aermore Manufacturing Company, Chicago, Ill., has devised a plan for quickly obtaining distribution of its exhaust horn. The plan consists of sending out to garage owners or dealers in automobile supplies, accessories, etc., one full sized Aermore exhaust horn for demonstrating purposes free.

Victor Increases Staff—The Victor Rubber Company, Springfield, O., has added to its staff Frank R. Talbott, who has been connected with prominent Akron rubber companies for a number of years. F. B. Patrick, well known in Ohio newspaper and advertising circles, has also accepted a position with the same company, and will be employed in the advertising and sales departments.

Hupp Leases New Detroit Quarters—The Hupp Motor Company has leased the large showroom at the corner of Woodward and Willis avenues, Detroit, Mich., originally leased by the Cole Motor Company, of Indianapolis, Ind. This company placed its car in an agency which occupies the former quarters of the Oakland company and has sublet the corner to the Hupp company for a term of years.

Fargo's Club House—The Fargo Automobile Club, Fargo, N. D., is seeking a site for a club house which it proposes to erect early in the spring. A committee consisting of President Seth Richardson and William Stern has been chosen to look over several proposed sites and report upon the most available. The plan is to build a club house on the banks of the Red River of the North, a few miles from the city. Golf links and tennis courts will be provided and the club will be conducted as a town and country club.

Sister City's Club House—A committee has been appointed, headed by Colonel S. E. Moss, of Dallas, Texas, to make plans for the erection of a $30,000 club house and to be known as the "Sister City's Club House." The erection of the building will be under the direction of the Dallas and Fort Worth Automobile associations. Plans are to erect the building at a point midway on the Dallas-Fort Worth pike and also easily accessible by the Interurban. An option has been secured on several acres of land. In addition a garage will be erected.

Reciprocity Law Pinches—The Springfield, Mass., Motor Club has decided to get busy when the next Legislature meets to try to have a change made in the motor law, whereby there will be a better plan for reciprocity touring in the New England states. Visitors from Vermont, Connecticut and Maine are limited to 10 days in the Bay State, but Massachusetts

Automobile Incorporations

AUTOMOBILES AND PARTS

Atlantic City, N. J.—Pierson-Harris Company; capital, $10,000; to manufacture automobiles. Incorporators: Gilbert Pierson, Edward G Harris.

Austin, Tex.—The Cleburne Motor Car Manufacturing Company; capital, $10,000; to manufacture automobiles. Incorporators: H. E. Luck, W. P. Ball, Brown Douglas.

Brooklyn, N. Y.—Mears Motor Vehicle Company; capital, $600; to deal in motor vehicles. Incorporators: J. W. Mears, E. A. Kellam, C. Mears.

Chicago, Ill.—Schillo Motor Sales Company; capital, $15,000; to manufacture and deal in automobiles, motor vehicles and accessories. Incorporators: Leonard Lorimer, E. W. Schillo, Albert G. Schillo.

Cleveland, O.—Cadillac Auto Company; capital $50,000; to deal in automobiles, parts and accessories. Incorporators: Thomas B. Bolton, William H. Marlatt, F. H. Pelton, M. Jenkins, M. D. Hayes.

Elyria, O.—Elyria Auto Sales Company; capital, $10,000; to deal in automobiles. Incorporators: W. G. Bennett, I. W. Lyon, F. S. Bates, Correll H. Smith, J. J. Dillon.

Grafton, W. Va.—Grafton Motor Company; capital, $5,000; to manufacture motors. Incorporators: Henry J. Proacht, H. D. Caomerford, D C. Peck.

New York City, N. Y.—Motor & Gear Improvement Company; capital, $1,250,000; to deal in automobiles, etc. Incorporators: Henry C. Derham, S. V. Brady, Dwight Partridge, J. Sass, G. M. Stevens.

New York City, N. Y.—Industrial & Trading Company; capital $5,000; to engage in a general commission business in motor vehicles and parts. Incorporators: A. M. Becker, John A. Lemline, E. H. Ferguson.

Raleigh, N. C.—Motor Sales Company; capital, $25,000; to sell motors. Incorporators: D. F. Fort, Jr., T. C. Powell, R. M. Merritt.

Rochester, N. Y.—Fordham Company; capital, $3,000; to manufacture and deal in automobiles, etc. Incorporators: Gerald F. Cox, Eugene A. Reinke, Richard Stanton.

Ruston, Ia.—Malbury Motor Company; capital, $10,000; to manufacture motors. Incorporators: J. D. Barksdale, W. F. Batson.

San Angelo, Tex.—S. L. Henderson Company; capital, $10,000; to engage in the automobile business. Incorporators: S. L. Henderson, J. L. Allison, George S. Allison.

Toledo, O.—Landman Griffith Motor Company; capital, $10,000; to manufacture motors.

Utica, N. Y.—Otis Motor Sales Company; capital, $10,000; to engage in the automobile business. Incorporators: Edward J. Otis, William T. Cantwell, T. Harvey Ferris.

Winnipeg, Can.—Tudhope Automobiles, Ltd.; capital, $60,000; to engage in the automobile business. Incorporators: Walter George Chater, Harry Anderson, George Huntingdon Ross, Douglass Nicholson, Harry Folliott Gyles.

motorists are not restricted in these states. There has been a lot of friction this year over the reciprocity clauses, and a change will probably be made next year in some of the states.

One Toll Road in Indiana—With the purchase of the toll road from New Albany to Paoli, Ind., by the Floyd County, Ind., commissioners, but one other toll road remains in that state.

Columbus Lozier Agent Moves—J. B. Hoover, Columbus, O., agent for the Lozier, has moved from East Broad street to 215 North Fourth street, with the Coats Motor Car Company.

Buffalo-Batavia Road Opened—The New York State Highway Commission last week opened for traffic of motorists the Buffalo-Batavia road through Williamsville and Clarence, N. Y.

Denby with Federal Truck—The Federal Motor Truck Company, Detroit, Mich., has appointed Garvin Denby secretary and treasurer with general charge over the sales department.

Resilio Tire in Columbus—The Resilio Tire Filling Company is the name of a new concern which has opened a sales room and shop in Columbus, O., to fill automobile tires by a patented process.

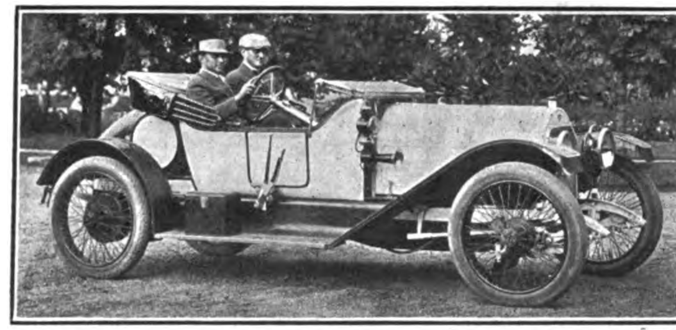
Thomas Lozier Representative—Fred W. Thomas has been appointed special traveling representative of the Lozier Motor Company, Detroit, Mich., in New York and Pennsylvania. He succeeds W. L. Davis.

Opens Rhode Island Branch—President John H. MacAlman of the Boston, Mass., Automobile Dealers Association, has opened a branch at Providence for the Stearns and Columbia with Harry Farrow in charge.

Many Automobilists Visiting New Orleans—Visiting cars are increasing steadily in New Orleans, La. The winter season this year promises to be unusually gay. Cars from other states are allowed to operate here for 30 days without the payment of additional license.

Has Philadelphia Factory Branch—A direct factory branch of the Federal Rubber Manufacturing Company, Milwaukee, Wis., has been established at 707 North Broad street, Philadelphia, Pa., in charge of Harry D. Benner.

Shreveport Taxicab Service Popular.—Taxicab service has been installed in Shreveport, La., and is proving very popular. This means of transportation about the city is in such demand that additional cars have been ordered.



H. C. Stutz in Stutz roadster with wire wheels

Moon's St. Louis Salesroom—The Moon Motor Car Company, St. Louis, Mo., has opened a salesroom in that city, to be known as the Lewis Automobile Company, 4108 Olive street, of which J. D. Perry Lewis is the president.

Firestone Philadelphia Branch Moves—The Firestone Tire & Rubber Company, now located at 256 North Broad street, Philadelphia, Pa., will upon completion of its new quarters some time during October remove to 304 North Broad street.

Tioga Company's New Quarters—The Tioga Automobile Company, 332 North Broad street, Philadelphia, Pa., distributers of the Hupmobile and National cars, will on October 1 remove to its new sales and service building, Broad and Tioga streets.

Henderson with Woods Electric—John C. Henderson, formerly with the Waverley Company, Indianapolis, Ind., and the Westinghouse Company, Pittsburgh, Pa., will from now on travel the eastern territory in the interest of the Woods Motor Vehicle Company, Chicago, Ill.

Stutz's McCue Wire Wheels—The Stutz is one of the first cars in the United States to put wire wheels on their regular models as optional equipment. The accompanying photograph shows H. C. Stutz, president of the Stutz Company, Indianapolis, Ind., with W. D. Meyers at the wheel.

Clearing House Formed—George Tolman and Edward H. Houtz, both well known in Boston motor circles, have formed the Massachusetts Automobile Clearing House with headquarters at 108-110 Massachusetts avenue, and they have arranged with a number of local dealers to handle the second-hand cars taken in trade.

Studebaker's Model Salesroom—As an object lesson to the army of dealers who annually visit its Detroit plants, the Studebaker Corporation, Detroit, Mich., is shortly to open a model automobile garage, salesroom and repair shop, in which will be embodied every advanced idea in arrangement, labor-saving devices and other details.

May Leaves G. & A. Carbureter—Fred May, who since January, 1911, was connected with the G. & A. Carbureter Company, New York City, will leave this company on October 15 to go in the accounting business for himself. He will open an office in New York City and will do business as an accountant throughout the Empire State.

Alco Going Back in Service—Upon arrival from Petaluma, Cal., where it terminated the first transcontinental haul of merchandise, the Alco truck of Charles W. Young & Company, Philadelphia, Pa., will be returned direct to service. The accompanying illustration shows the truck passing over a smooth stretch of road on its overland journey.

Start Good Roads Fund—In order to increase the good roads mileage radiating from the state capital automobile owners of Baton Rouge, La., have started a fund for this purpose. An attempt will be made to secure $100 from each owner of an automobile. Work on the roads is to begin at once. Gravel will be used as surfacing material.

Governor Dix Heeds Petition—Residents of Glens Falls, N. Y., addressed to Governor Dix a petition protesting against acceptance of the new state road between Lake George and Glens Falls, and petitioners received this statement from the executive that the road will not be accepted until after complete investigation of the condition.

White Agents Visit Factory—In a special car attached to "The Wolverine," the fast Western train, a party of New England men who handle the White in that section started for the White factory at Cleveland, O. Before starting they were the guests of Manager J. S. Hathaway, of the Boston branch, at a luncheon at the Boston Athletic Club.

Automobile Incorporations

GARAGES AND ACCESSORIES

BROOKLYN, N. Y.—Monarch Auto Trucking Company; capital, $5,000; to carry on a trucking business. Incorporators: Helen Person, Walter H. Babcock.

CHICAGO, ILL.—Automobile Accessories Company; capital $25,000; to manufacture automobile accessories. Incorporators: Frederick J. Jackson, Frank D. Narelli.

CHICAGO, ILL.—South Park Automobile Garage Company; capital, $250,000; to carry on a garage business. Incorporators: German Frank, Harry J. Lurie, John L. Anderson.

DALLAS, TEX.—Havolin Auto Supply Company; capital, $10,000; to sell automobile accessories. Incorporators: F. E. White, Edwin Hobby, J. W. Crotty.

KINGSTON, N. Y.—Taxicab Transportation Company; capital, $9,000; to conduct a taxicab service business. Incorporators: W. Hilterbrant, F. K. Hilterbrant, E. Hilterbrant.

NEW ALBANY, IND.—New Albany, Corydon and Greenville Auto & Transfer Company; capital, $2100; to operate a motor bus for passengers and freight. Incorporators: J. M. Ferguson, H. F. Rohlfing, J. Schilmiller.

NEW YORK CITY, N. Y.—Forty-Ninth Street Garage; capital, $1,000; to engage in the garage business. Incorporators Paul R. Towne, Harold C. Knapp, Richard H. McIntyre, Jr.

NEW YORK CITY, N. Y.—New York Garage Association; capital, $2,000; to conduct a general garage keepers' exchange. Incorporators: Charles H. Potter, Louis J. Joscelyn, William Burrows.

NEW YORK CITY, N. Y.—Simplex Carbureter Company; capital, $150,000; to manufacture and deal in carburetors. Incorporators: Albert L. Kull, Colcord Upton, Simon J. Mayer.

NEW YORK CITY, N. Y.—Tredvent Tire Company; capital, $100,000; to manufacture automobile tires. Incorporators: Morris Rachmill, Nathan A. Sterling, Samuel Ring.

ROCHESTER, N. Y.—Selden Motor Vehicle Company; capital $150,000; to carry on an automobile truck business. Incorporators: George C. Gordon, W. C. Barry, Jr., R. H. Salmons, C. Strong, Charles N. Stearns.

ST. LOUIS, MO.—Engineer Starter Company; capital $50,000; to manufacture a self-starting device for automobiles. Incorporators: George W. Owens, Louis A. Mesker, Fred G. Decker.

CHANGES OF NAME AND CAPITAL

CHICAGO, ILL.—Henry Lee Power Company; name changed to Old Reliable Motor Trucks Company.

MIDDLETOWN, O.—Crescent Motor Truck Company; increase of capital to $100,000.

MUSKEGON, MICH.—Piston Ring Company; increase of capital from $5,000 to $13,000.

SYRACUSE, N. Y.—C. Arthur Benjamin, Incorporated; increase of capital from $5,000 to $100,000.

Machine used for the grinding of valves in the factory of the National Motor Vehicle Company at Indianapolis, Ind. It will do the work on a four-cylinder motor in 30 minutes

Grinding in valves at the National Motor Vehicle Company's factory at Indianapolis, Ind., does not take a very long time. The machine illustrated above, which was designed and made at the National Company's plant, will do the work for a four-cylinder motor in 30 minutes. The machine grinds four valves at once. The National motor is of the T-head type, therefore it is necessary to grind valves on both sides of the cylinder. The machine grinds all the valves on one side of the cylinder at one time and then, with a simple movement, the operator swings the table carrying the cylinder castings back into position for the next set to be ground in.

It takes but 30 seconds to set up the work. The cylinder castings are lifted into the guides on the tables and centered beneath the spindles carrying the grinding tools. The machine is then started and after 15 minutes has completely finished the four valves on one side of the cylinder. The grinding machine is remarkable in that the motion imparted to the grinding instrument is not merely rotary, but consists in three complete rotations in one direction and then a complete reversal and three motions in the opposite direction. The reversal of the direction of the revolving spindle is entirely automatic. The rate at which the tool is driven calls for 40 reversals per minute or 120 complete revolutions, since there are three revolutions to a reversal. The machine is capable of operating steadily throughout the working day of 10 hours and in that time can turn out 20 complete jobs. This is more than five times the speed, according to the National engineers, than can be attained by skilled workmen. The machine requires but one man to operate it, and to set up the work as well as to maintain it in its proper condition. The result of using this machine is that better work is secured, the results being more uniform, and the cost per valve of performing the operation is considerably reduced, thus giving economy in this respect as well as in point of time.

HESS-BRIGHT'S New Factory—The new factory and office of the Hess-Bright Manufacturing Company, Philadelphia, Pa., is shown in the accompanying photograph. The frontage of the building is 200 feet and the depth is 235 feet. The second floor, to a depth of 35 feet, is devoted to offices. Back of the offices the building is one-story high with saw-tooth roof.

To Manufacture in Norfolk—C. E. Wright & Company are preparing to build a plant in Norfolk, Va., to manufacture automobiles.

Velie Erects Test Building—The Velie Motor Vehicle Company, Moline, Ill., is to erect a $15,000 road repair and test building south of the present factory shop.

Jackson May Build in Canada—The Jackson Manufacturing Company, Jackson, Mich., is considering the location of a Canadian branch of its factory in Baronville, Ont.

Russell Company Instals Machinery—The Russell Motor Car Company, Toronto, Ont., has installed in its local plant additional machinery, the total cost being $100,000.

New Truck Plant Starts—The new Gramm-Bernstein factory in Lima, O., was put into operation on September 13 and the manufacturing and assembling of motor trucks was begun.

Brockway Company Erects Plant—The Brockway Motor Truck Company, Cortland, N. Y., which was recently incorporated, will erect and equip a plant for the manufacture of motor vehicles.

Ford Factory in Minneapolis—W. C. Anderson, of the Ford Motor Company, Detroit, Mich., has gone to Minneapolis, Minn., where quarters for a large assembling plant have been located temporarily while a great building is being erected. Work on this building will start immediately, and it will take 9 months to complete. The Ford Company plans to assemble 10,000 cars at this point for 1913.

Prest-O-Lite Buys Property—The Prest-O-Lite Company, Minneapolis, Minn., has bought 80 feet by 336 feet of property at Charles and Carlton streets, St. Paul, Minn., for $8,000, and will enlarge it.

Body Company Builds Addition—The Herbert Manufacturing Company, Detroit, Mich., manufacturers of automobile bodies, will erect a new factory building at 1123-1135 Vermont avenue, that city.

Grabler Company's Foundry Addition—The Grabler Manufacturing Company, Cleveland, O., manufacturers of automobile parts, awarded contracts for the erection of a foundry addition to cost $7,000.

Goodrich Plant Reduces—The B. F. Goodrich Rubber Company, Akron, O., has laid off 1,000 of its employees. The reason given by the company is that this is considered the dull season in all rubber manufacturing lines.

Western Canadian Automobile Factory—The first automobile factory in Western Canada will be located in Moose Jaw, Sask., The St. Louis, Mo., Car Company will employ one hundred men and turn out an all-Canadian car.

Croxton Plant Finished—The erection of the structural steel work for the Croxton Motor Car Company, Washington, Pa., was completed recently. The company aims to be in operation by October 15. It will use electric power.

Bohemian Expert Sees Big Plants—Guyla Von Fisher, a Bohemian electrical engineer, stopped in Detroit, Mich., recently for inspection of the Detroit factories under escort of E. E. Moskovics, sales manager of the Remy Electric Company, Anderson, Ind.

Lamp Makers Plan Addition—The Corcoran Brothers Company, Cincinnati, O., automobile lamp manufacturers, recently gave orders to prepare plans for a three-story fireproof addition, to be erected north of the main plant. It will be 35 feet by 145 feet, and of brick and steel construction.

Ford's Body-Building Scheme—Plans to construct bodies at the various assembling plants of the Ford Motor Company, Detroit, Mich., throughout the United States will cut down the number of freight cars used in shipping the parts to these plants for assembly. Body building and painting departments are to be added to all plants.

Selden Truck Company Formed—The Selden Truck Sales Company of Rochester, N. Y., has just been incorporated with a capital of $50,000, to handle the entire truck product of the Selden Motor Vehicle Company, of that city. The object of this selling organization is to sell motor trucks direct from the factory to the user upon terms of easy payments.

Long Manufacturing Company's Addition—Another building is to be constructed as an addition to the plant of the Long Manufacturing Company, Detroit, Mich., manufacturers of radiators. The size of the new structure has not been determined upon, but it is designed by this addition to secure sufficient space to enable the company to keep pace with a rapidly increasing business.

Hupp's Large Factory Space—During the fiscal year the Hupp Motor Car Company, Detroit, Mich., has added two large units to its factory space. Several other buildings are now in course of construction. Last spring the new plant included four buildings, two stories in height, covering a factory floor space of 5 acres, and with the recent additions the space will be about doubled.

Landman-Griffith's New Building—Work on a new building to be occupied by the Landman-Griffith Motor Company, Toledo, O., will be started immediately and the place will be ready for occupancy December 1. It will cost about $25,000. There will be a 40-foot frontage. Plans for the building are unique, practically all of the two street sides to be made of glass, giving a complete exposure for the large salesroom.

Tiffin Company in Truck Field—The Tiffin Wagon Works at Tiffin, O., is preparing to enter the motor truck field and expect to place a line of these vehicles on the market next spring. Agencies are already being established and arrangements for placing the new machines on the market perfected. Superintendent Shelly stated that extensive preparations are under way for the manufacture of the trucks at the present factory.

Hupp Declares 50 Per Cent. Dividend—Papers have just been filed with the secretary of state, Michigan, increasing the capital stock of the Hupp Motor Car Company, Detroit, Mich., from $500,000 to $750,000, the increase of $250,000 being accomplished by the transfer of that amount from the company's surplus to capital account. The increase of stock forms a 50 per cent. stock dividend, also voted at the stockholders' meeting.

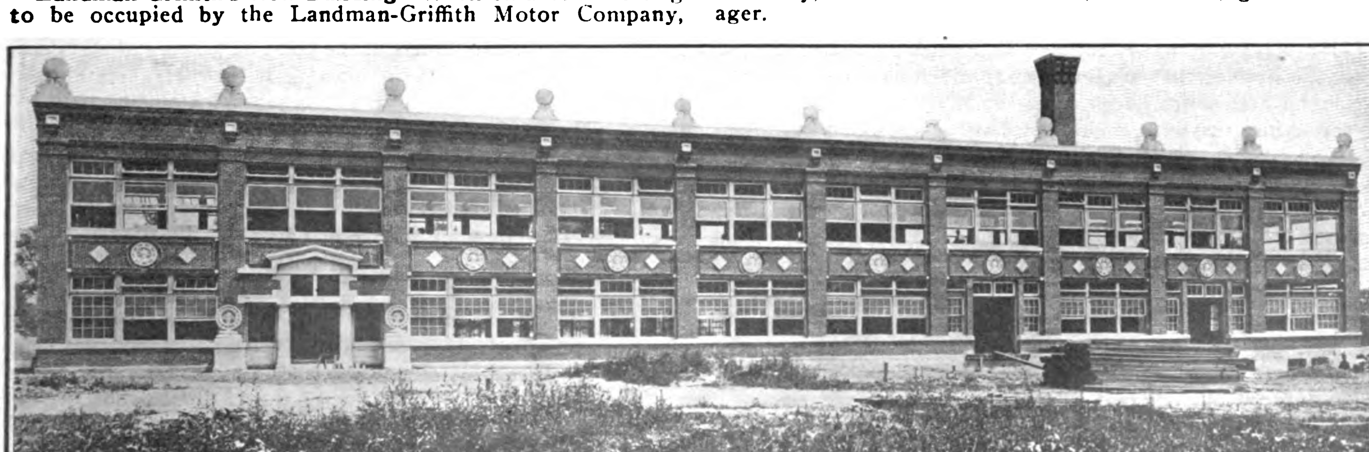
Mitchell Sells to Staver Company—To be better able to accommodate its growing motor car business, the Mitchell-Lewis Motor Company, of Racine, Wis., has sold its entire delivery, spring and mountain wagon business to the Staver Carriage Company, of Chicago, Ill. The department formerly devoted to the production of wagons of this class will be used for additions to the body, trim and paint shops of the automobile works.

Amplex to Enlarge Factory.—If plans now being formed by W. J. Mead, president of the Amplex Motor Car Company, of Mishawaka, Ind., which is the reorganized Simplex Motor Car Company, are carried out the plant will be enlarged to double its present size and all parts of the car will then be made at the Mishawaka factory, including the aluminum bodies. The company will in a short time put on a larger force of workmen.

First Suburban Car Tested—Testing of the first finished car of the Suburban Motor Company, Suburban Village, Mich., has begun. It has just been sent out on a hard trip through Huron county and is to be gone 2 weeks. The new factory of the Suburban Company is being pushed along rapidly. The company is preparing for active building operaand partially completed cars to determine the first design to be developed in the construction.

Premier Plans Plant Additions—The Premier Motor Manufacturing Company, Indianapolis, Ind., is about to let contracts for two large additions to its plant. These will be two-story brick structures, one 40 feet by 148 feet and the other 40 feet by 140 feet. The recent addition of a line of small sixes and the addition some time ago of a commercial car line, together with the increase in other lines, has made it imperative that the company enlarge its plant immediately, or in the near future.

Sterling's Six-Cylinder Engines—Six-cylinder engines for the Sterling Motor Company, which was recently incorporated by W. C. Durant and associates, will be manufactured at the Detroit, Mich., plant of the Chevrolet Motor Company until such time as the Flint factory of the Sterling Company has been completed. W. C. Durant has been elected president of the Sterling Company; Curtis R. Hathaway, of Detroit, is secretary, and William H. Little, of Detroit, general manager.



New factory and office building of the Hess-Bright Manufacturing Company, Philadelphia, Pa., makers of Hess-Bright bearings

Foreign Constructions Designs and Practices
